**NAGPUR**, a city of British India, capital of the province of the same name, and situated near its n. w. extremity, in an unhealthy swampy hollow, 430 m. in a direct line e. n. e. of Bombay. Inclusive of its extensive suburbs, it is seven m. in circumference. It contains no important edifices. The great body of the inhabitants live in thatched mud-tents, interspersed with trees, which prevent the circulation of air, and secrete moisture, thus rendering the town unnecessarily unhealthy. The mean temperature of Nagpur is estimated at about 80° F. Cotton cloths, coarse and fine cottons, turbans, silks, brocades, blankets, woollens, tent-cloths, and articles in copper and brass are manufactured. Here, on Nov. 26 and 27, 1817, a small British force of 1850 men, commanded by col. Scott, defeated a native army of 18,000 men. Pop. 72, 84,441.

**NAG'S HEAD CONSECRATION.** This story, which was first circulated by the Roman Catholics forty years after the event, with respect to archbishop Parker's consecration, was to the following effect. On the passing of the first Act of Uniformity in the first year of Queen Elizabeth, fourteen bishops vacated their sees, and all the other sees excepting that of Llandaff being vacant, there was difficulty in maintaining the hitherto unbroken succession of bishops from apostolical times. Kitchin of Llandaff refused to
officiate at Parker's consecration, and consequently the Protestant divines procured the help of Scory, a deprived bishop of the reign of Edward VI., and all having met at the Nag's Head tavern in Cheapside, they knelt before Scory, who laid a Bible on their heads or shoulders, saying: 'Take thou authority to preach the word of God sincerely;' and they rose up bishops of the new church of England! The story is discredited by the Roman Catholic historian Lingard, and is carefully refuted by Strype in his life of Parker. The facts of the case are, that the election took place in the chapter-house at Canterbury, the consecration at St. Mary-le-Bow's church in Cheapside, and the consecration in the chapel of Lambeth palace. Scory, then elected to the see of Hereford; Barlow, formerly bishop of Wells, then elected to Chichester; Coverdale, formerly of Exeter, and never reappointed to any see; and Hodgkin, suffragan of Hereford, officiated at the consecration. The Nag's Head story probably arose from the company having possibly gone from Bow church, after the confirmation, to take a dinner together at the tavern hard by, according to the prevailing custom. The due succession of bishops in the English church has never been broken.

NAGY, a Hungarian word, meaning "great." It is prefixed to the names of many towns in Hungary and Transylvania. In the present work, many of the monastic names that take this prefix are given under the name that comes after it.

NAGY ENYED, a small town of Transylvania, on the Maros, 17 m. n. n. e. of Karlsburg. It contains a famous Calvinistic college. Pop. '69, 5,779.

NAGY KAROLY (i.e., Great Karoly), a town of Hungary, capital of the county Szathmar, 37 m. e. n. e. from Debreczin, on a small feeder of the Theiss. It has several important annual fairs, and a trade in corn and cattle. Pop. '69, 12,754.

NAGY KÖRÖS. See Körös, ante.

NAGY-SZEBEN. See HERMANNSTADT, ante.

NAGY-SZENÁD. See Grosswardein, ante.

NAHANT, a t. in Essex co., Mass., situated on a peninsula which extends into Massachusetts bay from the township of Lynn, 9 m. s. of Salem, and 14 m. n. e. from Boston. It is divided into Great Nahant, Little Nahant, and Bass Neck. An isthmus leading from the main land to little Nahant is a mile and a half long and very narrow. Then comes a beach 90 rods long connecting Great Nahant, which contains 463 acres of land. In many places the shores are lined with rocks, rising 20 or 60 ft. above the tide, and the beaches are very hard and smooth. It has been a popular resort for citizens of Boston and vicinity for 30 or 40 years, and here and there along the peninsula are many handsome cottages, among which are those of Longfellow, the poet, and the late prof. Agassiz. There are also in the town three small hotels, two churches, and two schools. Pop. (1870) 475.

NAHUM, one of the twelve minor prophets, was a native either of Elkosh, in Galilee, or the son of a man named Elkosh. The identification of his birthplace with Capernaum (Nahum's village) or a place called Elkosh, on the east side of the Tigris, not far from Nineveh, is the result of vague speculation. He was probably a contemporary of Isaiah, and flourished about 713-711 B.c. The burden of his "vision" (in chap. 3) is the destruction of Nineveh and the downfall of the Assyrian kingdom. His style is full of animation, fancy, and originality, and at the same time clear and rounded. His language throughout is classical, and in the purest Hebrew, belonging to the second half of the time of the Assyrian monarchs; and to the time immediately following the defeat of Sennacherib before Jerusalem (2 Kings xix, 35, etc.). A commentary on Nahum, with special reference to the Assyrian monuments lately discovered, has been written by O. Strauss (Berlin, 1853).

NAHUM, BOOK of (ante), has an undoubted place in the canon of Jewish scripture. The precise time at which it was written has not been determined, notwithstanding the diligent investigation of the question by many writers have made. Resemblances are pointed out between it and other prophecies, the most striking being ii. 10, compared with Joel ii. 10; i. 6; and i., 15, almost identical with Isaiah iii. 7. While these passages show quotation, they do not decide priority. An indication of time is furnished by references which Nahum makes to the subject of the Jews to the king of Nineveh, from whom the Lord would soon deliver them, "Now will I break his yoke from off thee, and will burst thy bonds in sunder." This prediction applies well to Sennacherib's signal destruction in the reign of Hezekiah, and is thought to indicate that Nahum was contemporary with Isaiah and Micah. The prophecy is called the burden of Nineveh, the appointed destruction of which, with the resulting consolation to Judah, is the one subject treated of. Chapter i. contains a sublime description of the majesty, retributive justice, power and goodness of God in his government over men; denounces the violence of wicked men against his people as transgression against himself; declares his purpose specifically to break the yoke of the Assyrians, and exhibits the messenger of glad tidings going forth to summon the Jews back to the temple and their homes. Chapter ii. foretells the unparalleled certainty of history the destruction of Nineveh, announcing the invaders bold approach, calling upon the Assyrians to put forth their utmost strength against him; describing the bloody
shields of his warriors, their splendid attire, their chariots, flashing like lightning through the streets; their warriors breaking ranks in their haste to reach the wall, the opening of the river gates, the undermining of the palaces, the flight of the inhabitants, and the reduction of the city to an empty desert. Chapter iii. arraigns Nineveh as a city of blood and abominable crime, because of which the Lord of hosts would heap ruin and desolation upon it; calling on it to read its own doom in the fate of No-Amon, the Thebes of secular history; declaring that its drunkenness would be the occasion of its ruin, that its strongholds would yield as easily as ripe figs fall when the tree is shaken, that its warriors would be cowards, that its gates would be set open, and all obstructions to the advance of the invaders burned down; and that its multitude of rich merchants and crowned warriors would be like the locusts that darken the land one day, but flee away the next, so that the very place where they had been is not known. The particulars of the prophecy have been definitely fulfilled 1. As to the last specified, "Their place is not known where they were." All books written more than 40 years ago, that refer to Nineveh, speak of its exact location as unknown, Murray's Encyclopedia of Geography, the American edition of which was published in 1840—the year in which Layard first saw the mounds that he afterwards explored—gives what was then the general belief of the civilized world: "The village of Nineveh seems to be the ancient city." Some mounds were there, which had been believed hidden there, and which have been found in the ruins of other ancient cities. They were found only a few fragments of gilding, which had fallen from some of the inscriptions; the explorers uncovered it just as the conqueror had left it. 3. Nahum prophesied that the city should be plundered of all its treasures. When the Arab workmen were cutting open the mounds under Layard's direction, they searched eagerly for the treasures which they believed had been hidden there, and which have been found in the ruins of other ancient cities. But they found only a few fragments of gilding, which had fallen from some of the inscriptions; the explorers uncovered it just as the conqueror had left it. 4. Nahum prophesied that the city would be destroyed by fire, other portions escaped the flames. The n.w. palace at Nineveh had not been burned, but in the s.w. corner many of the alabaster slabs, having been reduced to lime by subjection to intense heat, fell to pieces as soon as they were uncovered. In many parts great accumulations of charcoal were found. Some of the large sculptures were cracked into a thousand pieces. When the ruins of Sennacherib's imposing palace were discovered, it was, perceived that a great fire had raged through it, turning the sculptured paneling into lime, and reducing the edifice to a heap of ashes and rubbish.

**Naias.**

Nails, 360

*Naias.*

*Nails.*

Some believe the possession of the power of inspiration; hence, soothsayers and others are sometimes called nympholytai (seized by the nymph). They were represented as half-clothed maidens, and not infrequently as companions of Pan, of Hercules, the patron of warm springs, or of the Sibyls and the Satyrs, in whose jovial dances they join.

**Naiades, Naiadae, or Potameae.** A natural order of endogenous plants, divided by some botanists into several orders (Juncaginaceae, Zosteraceae, etc.), containing in all not quite 100 known species, all aquatic plants, some of them inhabiting the ocean, some found in lakes and ponds, some in streams. They are all of very cellular structure; the leaves have parallel veins, and the flowers are inconspicuous. To this order belongs the pondweed (Potamogeton), of which a number of species abound in the still waters of Britain, and of which some are found as far n. as Iceland. To this order also belongs the Grasswrack (q.v.) of our shores, used for stuffing mattresses. The lattice-leaf (q.v.) of Madagascar is one of the most interesting species, and one of the few which attract notice as in any way beautiful.

**Naiads.** In Grecian mythology, the nymphs of fresh-water lakes, rivers, and fountains. They were believed to possess the power of inspiration; hence, soothsayers and others are sometimes called nympholytai (seized by the nymph). They were represented as half-clothed maidens, and not infrequently as companions of Pan, of Hercules, the patron of warm springs, or of the Sibyls and the Satyrs, in whose jovial dances they join.

**Naiant, or Nantant.** (Lat. natare, to swim), a heraldic term applied to a fish when borne horizontally across the shield in a swimming position.

**Naigue, or Naik.** A native subaltern officer among Indian and Anglo-Asiatic troops, whose functions are somewhat analogous to those performed among European troops by the drill-sergeant.

**Nails** are flattened, elastic, horny plates, which are placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a root, or part concealed within a fold of the skin; a body, or exposed part
attached to the surface of the skin; and a free anterior extremity called the edge. The skin below the root and body of the nail is termed the **matrix**, from its being the part from which the nail is produced. This is thick, and covered with highly vascular papillae, and its color is seen through the transparent horny tissue. Near the root the papillae are smaller and less vascular; hence the portion of nail corresponding to this part is of a whiter color; from its form, this part is termed the **nail-bed**. It is by the successive growth of new cells at the root and under the body of the nail that the discs are forwards, and maintains a due thickness, whilst at the same time its growth in a proper direction is insured. The chemical composition of the nails is given in the article **Horny Tissues**, to which class of structures they belong. According to the observation of Beau, the finger-nails grow at the rate of about two-fifths of a line in a week, while the toe-nails only grow with about one-fourth of that rapidity. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as **in-growing nail**. Its most usual seat is by the side of the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. These parts become swollen and inflamed; suppuration ensues, and an intensely sensitive ulcer is formed, in which the nail is embedded. Surgical advice should at once be resorted to in these cases, as there is no probability that the ulcer will heal spontaneously, especially if the patient continue to move about, and thus keep up irritation. In obstinate cases, it is not unfrequently necessary to remove a portion of the nail, an operation attended with much pain, although quickly performed.

**Nails**, pointed pieces of metal, usually with flattened or rounded heads, used for driving into wood-work, for the purpose of holding the pieces together. A variety, in which the head is very large, and the spike portion small, used by shoemakers for protecting the soles of boots and shoes from wear, is called the **bob-nail**; another, which is made by cutting thin plate-iron into thin pointed pieces of various lengths, is called **brads**; these sometimes are without heads, but are usually made with a slight projection by way of a head. When made small, with flat heads, for attaching cloth or hangings in upholstery-work, they are called **nails**; and when very large for heavy carpentry, **spikes**.

**Nail-making.**—Formerly, all nails were hand-made, by forging on an anvil; and in Britain and the north of Europe vast quantities are still made in this manner, being preferable, for many kinds of carpenters' work, to those made by machinery. In France, the greater part of the nails used for light carpentry-work are made of soft iron wire, pointed with the hammer; and in order to head them they are pinched in a toothed vice, which leaves the portion for the head projecting, and makes below it three or four grooves in the nail, which increase its hold on the wood when driven home. The head is beaten into a counter-sinking on the vice, which regulates the size.

The iron used for hand nail-making in Britain is sold in bundles, and is called **nail-rods**; it is either prepared by rolling the malleable iron into rods or small bars of the required thickness—which process is only employed for very fine qualities—or by cutting plate-iron into strips by means of rolling-shears; these shears consist of two powerful revolving shafts, upon which are fixed discs of hard steel with squared edges. The discs of one shaft alternate with those of the other; they are of the thickness of the plate to be cut and the shafts are so placed that a small portion of one set of the discs are inserted between those of the other set. When the shafts are revolving a plate of iron is pressed between the discs; and it is forcibly drawn through, the steel discs cutting the plates into strips with great rapidity. The quantity produced in this way is enormous, some mills turning out at the rate of ten miles per hour of nail-rods.

Several inventions, in which America took the lead, have been introduced, and are successfully worked, for making nails direct from plate-iron, either by cutting them out cold or hot; and a very large proportion of the nails in use are made in this way. Nail-making by machinery was originated in Massachusetts in 1810.

**Nails (anhy).** The whole enormous industry of nail-making in this country, except for wall-nails and shoe-nails, which are cast, and sprigs, headless brads, etc., which are cut out of the plate, involves various machines for cutting and heading. Nearly two dozen patents for improvements in these machines had been granted here by the beginning of the century. The ore, whether hematite or magnetic, is smelted in a blast-furnace, run into pigs, puddled, squeezed, and, if need be, hammered, rolled in the puddling-bull train, and cut to lengths. These are then forged, that is, piled so as to break joints, reheated to a white heat, drawn, passed through the nail-plate train, and the sheets, of the required width and thickness, allowed to cool. It is next cut across its length (the width of the sheet being usually about a foot) into strips which are a little wider than the length of the required nail. These plates, heated by being set on edge on hot coals, are seized in a clamp and fed to the machine, end first. The pieces cut out are alternate, and slightly tapering, of course, with the fiber, and are squeezed and headed up by the machine before going into the trough. It is evident that the first cut to the right on a
plate and the last cut on the other side are blanks, though it would seem that an automatic weigher, as in coinage, would reject these into the waste heap. The difficulty of the operation lies in the fact that the cuts must be alternate, so that the cutter must either turn half round at each cut, or the plate must be turned over. The great desideratum is to do this automatically and reciprocally. There is no common or unvarying standard for classifying nails. The old way is by sizing from two-penny, 1 in. long, and now 880 to the lb., up to thirty-penny, 4½ in. long, and 16 to the lb. The English names, 7 lb., 8 lb., etc., show that 1000 of that kind should weigh so much. They now, in fact, seldom do. The general divisions are:

1. Material—copper, galvanized, etc.
2. Make—wrought, cut, cast.
3. Length or weight.
4. Size—fine, bastard or medium, heavy.
5. Points—flat, sharp, clinch.
6. Heads—spur, chisel, clout, countersunk, etc.
7. Use—scupper, sheathing, fence, slating, finishing, etc.

NAIN, a village of Galilee, mentioned only in the New Testament as the place where Jesus restored to life the widow's son. Eusebius and Jerome describe it as near Endor. Phocas places it near of Tabor. The crusaders recognized it, and at the present day it is mentioned by travelers. It is now small village of 20 houses or huts, and called Nein, containing remains of very ancient buildings and a fountain. It is 4 m. from Tabor, and 2½ m. from Endor. It is situated beautiful, on the n.w. edge of the "Little Hermon," or Jebel-el-Dahy, where the ground slopes into the plain of Esdraelon. The entrance to the place, where the Savior met funeral, was doubtless up the steep ascent of the plain. On the w. of the village the rock is full of sepulchral caves. On the n. are the wooded hills of Galilee.

NAIN DE TILLEMONT. See Tillemont.

NAIRN, in the county of the same name, is a royal, parliamentary, and municipal burgh, and is 15 m. n.e. by rail from Inverness. It is situated at the mouth of the river Nairn, on the w. side, and for that reason was anciently called Inver-nairn. Lyngard, the southern shore of the Moray firth, which is here about 8 m. across, it commands a grand and extensive view of the coast of Ross-shire, including Cromarty bay, nearly opposite. Nairn was regaled by William the lion. It has little historical interest, and few objects worthy of antiquarian attention. It is principally remarkable for the excellence of its sea-bathing and artificial baths, in which respect it is equal, if not superior, to any town in the n. of Scotland, as a resort in summer. The temperature is mild and equable. The inhabitants enjoy a remarkable immunity from epidemic diseases. There is a commodious harbor. The town has a literary society, a museum, a newspaper, 3 branch banks, and a savings bank. It is conspicuous for good and cheap education. Pop. 71, 3,751. Nairn unites with Inverness, Forres, and Forthrose in sending a member to parliament.

NAIRNE, Carolina Oliphant, Lady, 1756-1845; b. Scotland; celebrated in her youth for her beauty, and called "the flower of Strathearn." She married, in 1806, William Murray Nairne, who became lord Nairne in 1824. She wrote many songs to the old popular tunes familiar to the Scotch peasantry. Among them are the well-known "Call it Heart's "The Laird o' Cockpen;" and "The Lord o' the Lad." Her productions all appeared anonymously, and their authorship was not divulged till shortly before her death. Her complete works, with a life by the rev. Charles Rogers, appeared at Edinburgh in 1869.

NAIRNSHIRE is bounded on the n. by the Moray firth, and on its other sides by the counties of Inverness and Moray, of the latter of which it anciently formed a part. It extends n. and s. 22 m., and 15 m. from e. to w. Its area is 215 sq.m., or 137,500 acres, of which about 26,000 are under cultivation. Pop. 71, 10,225, including the burgh of Nairn. Along with Elginshire, it returns one member to parliament. Constituency (1879-90), 280; rental, £35,729. Nairn is the only royal burgh in the county, but there are the villages of Cawdor and Auldearn. The soil is for the most part light and sandy. There is, however, considerable agricultural activity, though the county is, perhaps, better known for its cattle-breeding. An important cattle "trest" is held at Cawdor once a month during the greater part of the year. The climate of this county is distinguished for its salubrity, and the temperature is remarkably equable. The thermometer in the shade has not risen above 78° F., or fallen below 11° F., during the last 20 years. According to the latest observations, the yearly rainfall did not amount to more than 26 in., the greatest fall being 39 in. in October. At Brackla distillery, which belongs to Robert Fraser, Esq., from 40,000 to 50,000 gallons of spirits are manufactured annually. The river Nairn runs through the county in a beautiful valley, which presents particularly attractive and romantic scenery in the neighborhood of Cawdor castle, one of the residences of the earl of Cawdor. This castle is of uncertain antiquity, and is in an excellent state of preservation. It was the residence of the ancient thanes of Cawdor, one of whom is mentioned in Macbeth. About the year 1510 the estates belonging to the cardon passed by marriage from the old family of Calder into the hands of a
son of the duke of Argyle, and are still in the possession of his descendants. Not a few other objects of antiquarian interest are to be found in the county of Nairn.

**NAISSAINT**, a term applied in heraldic blazon to an animal depicted as coming forth out of the middle—not like *issuant* or *gressant* (q.v.), out of the boundary line—of an ordinary.

**NAJA.** See *Cobra da Capello*, *ante.*

**NAKAMURA MASANAWO**, a Japanese scholar and writer, *b.* in Yedo about 1825, one of a hereditary guild of learned men in the university of Yedo, under the patronage of the Tokingawa "tycoons." To his profound knowledge of Chinese and native literature, he added some acquaintance with the Dutch, but soon abandoned it for the English language, a dictionary of which he laboriously copied with the pen. In 1866 he went to England, and studied there two years. Returning to Japan in 1868, he went into seclusion with his master the tycoon, and while there translated into Japanese the constitution of the United States, Washington's farewell address, John Stuart Mill's essay "On Liberty," a copious selection of long passages from the works of standard American and English authors, and an anonymous piece in behalf of Christianity. Voluntarily resigning his rank among the gentry (samurai), he laid aside his two swords, founded a private school, and became a vigorous reformer and practical philanthropist. In 1875 he was made chief director of the imperial female normal school. He has also translated *Wedlons International Law,* and *Smiles's Self-Help.* He belongs to that quiet but powerful class of men whose words and example have revolutionized Japan.

**NAKAMOORA MASAUWO,** *b.* Tokio, Japan, *about* 1826; from an early age a student of languages. He took an active part in the national scheme of education, and in 1866 went to England in charge of a number of Japanese students. Since his return to Japan he has contributed greatly in introducing the civilization of the west, has published a number of educational pamphlets and has translated the U.S. constitution into his own tongue, also many of the writings of eminent English and American essayists and publicists.

**NAKHICHEVAN,** on the Don, a thriving town of south Russia, in the government of Ekaterinoslav, on the right bank of the Don, and near the mouth of that river, two miles east of Rostov. It was founded in 1779 by Armenian settlers from the Crimea, and has (1867) 16,584 inhabitants, mostly Armenians, belonging to the Greek-Armenian church. The inhabitants are engaged in the manufacture of silver ornaments and wooden goods, and an extensive trade is carried on.

**NAKSHATRA** (a Sanscrit word of doubtful etymology, but probably a compound of an obsolete base, *naksha,* night, and *tra,* protecting, i.e., literally night-protecting) means properly star, and is used in this sense in the Veddas. At a later period it was applied to the asterisms lying in the moon's path, or to the mansions in which the moon is supposed to rest in her, or rather, according to Hindu notions, his path. The number of these asterisms was reckoned originally at 27, later at 28; and mythology transformed them into as many daughters of the patriarch Daksha, who became the wives of the moon. See Moon. Biot, the distinguished French astronomer, endeavored to show that the Hindu system of the Nakshatras was derived from the Chinese *sien,* but his theory, though supported by very learned arguments, has been refuted by prof. Whitney. In his notes to Burgess's translation of the *Sirya-Siddhanta* (New Haven, United States, 1860), and by prof. Müller in his preface to the fourth volume of the *Rig-Veda* (Lond., 1863); for their arguments leave little doubt that the system of the Nakshatras originated from the Hindu mind.

**NAKSHIVAN,** a *t.* in Russian Armenia, near the Aras river; *pop.* 8,772. According to Armenian tradition it is the oldest city in the world, and was founded by Noah, after the flood. It passed into the hands of the Russians in 1827.

**NALA** is a legendary king of ancient India—a king of Nishadha—whose love for Damayanti, the daughter of Bhima, king of Vaidarbha, and the adventures arising from, or connected with it—the loss of his kingdom, the abandonment of his wife and children, and their ultimate restoration—have supplied several Hindu poets with the subject of their muse. The oldest poem relating to Nala and Damayanti is a celebrated episode of the *Mahabharata* (q.v.), edited both in India and Europe, and translated in Latin by Bopp; in German by Kosegarten, Bopp, Rückert, and Möser; and in English by dean Milman. The two other renowned poems treating of the same legend, but with far less completeness, are the *Nalodaya* (q.v.) and the *Nakshatradharmaita* of Sri-Harsia.

**NALODAYA** is the name of a Sanscrit poem which is highly prized by the modern Hindus. Its subject is the story of Nala (q.v.), but more concisely narrated than in the episode of the *Mahabharata,* whence its contents are borrowed; and its reputed author Kålidåsa (q.v.). Great doubts, however, must attach to the attribution of the authorship, if by Kålidåsa the author of *Siddhânta* is meant, and not some other poet bearing the same name; for the merits of this poem consist neither in elevation of thought nor in richness of fiction: they are sought for by the Hindus in its elaborate and artificial diction, and in its alliteration of every variety, which, to a European mind of culture and taste, would be no more than an intolerable jingle of sounds, devoid of all poetical worth. The text
of the poem, with a modern commentary, has been edited (Berlin, 1830) by F. Benary, and (Calcutta, 1844) by W. Yates, who added to his edition a free metrical translation of the text and an essay on Sanscrit alliteration.

NAMHAQLAND, GREAT. The extensive region in South Africa n. of the cape Colony, extending from the Orange river, lat. 29° 30', to Walfish bay, lat. 23°, and stretching inland from the w. coast to the Kalihari desert, comprehending an area of about 100,000 sq. m., is known under the name of Great Namaqualand, being principally inhabited by wandering tribes of Namaquans (q.v.). This region is drained principally by a large periodical water-course, called the Oup, Borradale, or Great Fish river, which, running from n. to s., a distance of about 450 m., joins the Orange river nearly at right angles, about 90 m. from its mouth. It is generally, except in its northern parts, where the country rises into extensive and lofty plateaus, a most sterile and barren region, and along a coast-line of upwards of 400 m. does not present a single running stream much less a navigable river, although little bays along the coast, such as Angra Pequena, Sandwich harbor, and Walish bay, afford safe anchorages. The valley of the Orange is bounded on each side by ranges of flat-topped barren mountains, which to the eastward die away into the waterless though wooded flats of the Kalihari desert, and coastwards stretch into vast sandy downs, against which the southern Atlantic beats an unceasing surf, rendering landing very dangerous, and enveloping the coast in a perpetual mist. The chief productions of the region are cattle, for the rearing of which the country seems favorable. On the edge of the Kalihari, ivory and ostrich feathers are collected, and copper ore seems abundant in several localities. Guano is found at Ichaboe and many little islands on the coast, and considerable fisheries are carried on by cape houses in many of the bays.

The bear, giraffe, rhinoceros, hippopotamus, and large game generally, are still found in Namaqualand, although fast diminishing before the fire-arms of the Namaquans. The snakes are considered especially venomous. The gemsbok, chad, and other large antelopes, now almost unknown by the Cape Colony, are still numerous in the little frequented wastes of this region. The climate is extreme, and though, on the whole, not unhealthy, is very trying to European constitutions. The water is generally brackish. The first English traveler in Namaqualand, was sir J. Alexander, who, in 1837, traversed it from n. to south. Charles John Andersson has also explored every part of it. Information on the region may be also found in the travels of Moffat, Campbell, and Le Vaillant. The native tribes, who may perhaps number about 40,000 souls, speak the Namaqua language, the purest type of the Hottentot.

NAMHAQLAND, LITTLE, is a division of Cape Colony s. of the Orange river, form­erly part of the district of Clanwilliam, and included with the country n. of it under the general name of Namaqualand. It is a very barren region, covered with rugged volcanic-looking hills, through which the Gariep or Great Orange river appears, through some convulsion of nature, to have forced its way to the sea. Little Namaqualand has of late years afforded a very large supply of copper ore of excellent quality (in 1878 near 12,000 tons); but the mines, although well known to the Dutch 200 years ago, were not worked until after 1852. The principal river is the Orange of the colonists, which divides the Cape Colony from Great Namaqualand; all the other streams are merely periodical torrents, often dry for years. The seat of magistracy is at Springbok Fontein, about 80 m. from the principal harbor, Hondeklip bay, and where are situated the very rich mines of the Cape copper company. Many scattered tribes of Namaquas and Basaraid Hotten­toots roam along the bank of the Orange river, and in the neighborhood of the mines are numerous Dutch farmers and English settlers. All the larger mammalia, except a few gemsbok, are extirpated; but troops of ostriches are still numerous on the grassy flats of the Boshman country. The geological features of this region are peculiarly interesting, and have been thoroughly explored by A. Wylie, on behalf of the Cape government. The rocks are generally of granite or gneiss, intersected with numerous veins of cupriferous indications, and near the Orange river present many very curious features. The coast line extends for 100 m., with a few little bays, such as port Nolloth and Hondeklip, where there is tolerably safe anchorage, and generally presents a shore covered with low granite rocks. At Hondeklip bay a large boulder painted red forms a distinguishing landmark.

Namaquas, the principal existing tribe of the race generally known under the name of Hottentot. They inhabit the region called Great Namaqualand, n. of the Gariep or Orange river, and the country a few miles s. of it, as far as the Kamiesbergen. They are a pastoral people of rather predatory habits, and live under the rule of their chiefs, whose powers, however, are of a very limited nature. Differing from the Basjesmen Hottentots, the Namaquas are a tall, well-made, active people, although possessing the usual peculiarities of the race, such as the light olive complexion, the oblique eye, and short tufted hair. They speak a dialect of the Hottentot language, which, however, differs considerably from that used by other tribes of that people. Mission stations of the Rhinish and Weslyan societies have been for many years established amongst them, and in a few localities, near the Cape Colony, with considerable success; and the New Testament and some elementary works have been translated into the Namaqua dialect. On the northern borders of the regions they inhabit, the Namaquas, under the chief
Africaner, the descendant of a fugitive slave from Cape Colony, have for many years kept up a predatory and bloody war with the tribes of Ovampos and Damars, who live on Wallisht bay. The total number of Namaquas cannot exceed between 50,000 and 60,000 souls, scattered over a region of at least 150,000 sq.m.; and there is every prospect of the pure Hottentot tribes soon becoming extinct, or at least absorbed, being gradually supplanted by the more energetic and civilized Bastard races, who, in point of civilization and appearance, are very little inferior to the ordinary Dutch Boer of Cape Colony. Many of the southern Namaquas possess wagons and oxen, and are employed in the transport of copper ore from the mines of Little Namaqualand to the shipping port at Hondeklip bay.

A few of the peculiar customs of the Hottentot tribes, described by Kolben nearly 200 years ago, may be still traced amongst the more wester tribes of the Namaquas; but contact with the Cape Colonists, and the efforts of the missionaries, have partially civilized this race, so that an ordinary Hottentot is quite as respectable a savage, or perhaps more so than his Botjouana or Amakosa brethren.

**Namaqualand, Name.**

Namaqualand, Kame.

A fish nearly allied to the salmon and trout, a native of the great lakes and interior rivers of North America. It is often taken of a size varying from 20 to 40 lbs., and is said sometimes to reach 60 lbs. It is much esteemed for the table. It is caught at the same fisheries with the still more prized whitefish (q.v.).

**NAME (Sax. namen, Ger. name, Lat. nomen, Gr. oμοιος), the word by which a particular person or thing is signified in distinction from other persons or things. A name attached to a person is called a proper name. Names distinguishing one individual from another have been in use from the earliest ages of human society. Among the Jews, the name given to a child either originated in some circumstance of birth, or was an expression of religious sentiment. Old Testament names are almost all original—i.e., given in the first instance to the person bearing them; but the Jews, like other nations, after accumulating a considerable stock of names, began to repeat them, and we find few names in the New Testament which had not been used before. In Old Testament times, it was an occasional practice to adopt a change of name on the occasion of an important event in one's life.**

The Greeks bore only one name, given on the tenth day after birth, which it was the right of the father to choose, and alter if he pleased. The earliest Greek names are generally expressive of some quality in high estimation, as valor, skill, wisdom, or gracefulness (Callimachus, excellent fighter; Pherocrates, strength bringer; Sophron, wise; Melanthus, black flower). In later times, when the faith in the gods was a fading one, names derived from Apollo and Athene, or indicative of the favor of Olympus (Apollocorus, gift of Apollo), came more into fashion. The eldest son generally bore the name of his paternal grandfather, and the confusion arising from the repetition of the same name was attempted to be obviated by appending the father's name (either simply, or turned into a patronymic), the occupation, the place of birth, or a nick-name.

The Romans at a very early period bore two names, and afterward every Roman citizen had three. The nomen, like our Christian name, was personal to the individual—Caicus, Marcus, Cneius; in writing, generally abbreviated to an initial or two letters, C., M., or Cn. It was given in early times on the attainment of puberty, and afterward on the ninth day after birth. There were about thirty recognized praenomina. Whatever had no praenomia till marriage, when they took the feminine form of that borne by their husband. Every Roman citizen belonged both to a gens and to a _patera_ included in that gens. The second name was the nomen gentilicium, generally ending in _-ius, -iicus, or -iicus._ The third name was the hereditary cognomen belonging to the _familia._ Cognomina were often derived from some bodily peculiarity, or event in the life of the founder of the family. A second cognomen, or _apennomen_, as it was called, was sometimes added by way of honorary distinction. In common intercourse, the praenomen and cognomen were used without the nomen gentilicium, as C. Cesar for C. Julius Cesar, M. Cicero for M. Tullius Cicero. The Roman names were in their origin less dignified and aspiring than the Greek; some were derived from ordinary employments, as Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, Cressus (fat), Naso (long-nosed); a few from numerals, Sextus, Septimus. In contact with the Teutonic names, like the Jewish and Greek, had been originally very significant; but at an early period their exuberance became checked; people contented themselves with repeating the old stock. While the speech of Europe was undergoing a transformation, the names in use remained the same; belonging to an obsolete tongue, their significance by and by became unintelligible to the people using them. Many are derived from "God," as Gottfried, Godwin; some from an inferior class of gods known by the title _as_ or _aus_, whence Anselm, Oscar, Esmond; others from elves or genii, Alfred, Alboin, Elinor (Elf King). Bertha is the name of a favorite feminine goddess and source of light, from the same root as the word "bright;" the same word occurs as a compound in Albrecht, Bertram. To a large class of names indicating such qualities as personal prowess, wisdom, and nobility of birth, belong Hildebrand (war brand), Konrad (bold in counsel), Hodwig (glorious warrior), called by us Clovis, and the
original of Ludwig and Louis. The wolf, the bear, the eagle, the boar, and the lion entered into the composition of many proper names of men, as Adolf (male wolf), Arnold (valiant eagle), Osborn (God bear). Respect for feminine prowess also appeared in such names as Matilda (mighty Amazon), Wolfaide (wolf heroine). The spread of Christianity threw a number of the old names into comparative oblivion, and introduced new ones. The name selected at baptism was more frequently taken from the history of the Bible or the church than from the old traditional repository, which, however, was never altogether disused. Many names, supposed to be local and very ancient, particularly in the Scottish highlands, Wales, and Cornwall, are in reality but corruptions of names of Christian origin which are in use elsewhere. Owen, Evan, and Eoghan (the latter often anglicized into Hector) seem all to be forms of Johann or John. A change of name was sometimes made at confirmation.

Periods of religious and political excitement have had a very powerful influence in modifying the fashion in names. The Puritans would only admit of two classes of names, those directly expressive of religious sentiment—praise-God, live-well—and names which occur in Scripture, these latter indiscriminately made use of; hence to obscure their meaning, or however indifferent the character of the original bearer of them. Old Testament names were used in preference to New, probably because they did not convey the notion of a patron saint. Old Testament names still prevail largely in America, where exists a medley of Christian names from all possible sources. At the French revolution, names supposed to savour of either loyalty or religion were abandoned, and those of Greek and Roman heroes came into vogue instead. The Augustan period of English literature gave a temporary popularity to such feminine names as Narcissa, Celia, Sophia. In Germany, the names in use are particularly free from foreign admixtures; they are almost all either of Teutonic origin, or connected with the early history of Christianity. In Britain, the number of names has, particularly since the reformation, been more limited than in most other countries. In some families of distinction, unusual names have been handed down from father to son for centuries—e.g., Peregrine name, commonly found in England. The English, however, appear to have taken more Christian names only became common in the present century, and another practice which has gained ground in Britain is the use of surnames as Christian names. More recently, various old names, particularly feminine names, as Maud, Florence, Ethel, have been withdrawn from their obscurity, and resuscitated.

The use of fixed family surnames cannot be traced much further back than the latter part of the 10th century. They first came into use in France, and particularly in Normandy. At the Conquest, they were introduced into England by the Norman adventurers, and were general at the Domesday Valuation. Many of the followers of William had taken names from their paternal chateaux or villages on the other side of the channel, names which were used with the French preposition de before them. Their younger sons and others applied the “de” to estates awarded them as their portion of the conquered country, and called themselves De Hastings, De Winton, etc., a prefix probably never in vernacular use in England, and completely discarded with the disappearance of Norman-French, unless in a few cases where it was retained for the sake of euphony, or from a desire to distinguish the line of De Hastings from the De Harvies, De Bures, De Caversfield (d’Angerville). When English was used in place of Norman-French, the “de” was always rendered into “of.” The affectation of resuming it in recent times is as unwarrantable in theory as in taste. Such a designation as lord De Tabley of Tabley House is an unmeaning tautology. The Scotch have a more expressive designation when they say Colquhoun of that ilk. In France and Germany, a territorial surname (denoted by “de” or “von”) came, when surnames spread to all classes, to be the mark of nobility, so much so that in latter times, when any one was ennobled by the sovereign, the “de” was prefixed to his previously plebeian and not territorial name. In Britain, the “de” was never considered the test of nobility; the names of some of the most distinguished families were not territorial—e.g., Stewart, Butler, Spencer. In Scotland, surnames were hardly in use till the 12th c., and were for a long time very variable. The use of surnames by the common people is everywhere of much later date than those of the gentry and clergy. In Wales yet, they can hardly be said to be adopted by the people of the wilder districts of Wales.

There are many existing local surnames in Britain besides those derived from the names of the manors of the gentry or landholders. Farms, homesteads, the natural features of the country, all gave their names to those who resided at or near them; hence such names as Wood, Marsh, Dale. The preposition “at” is in a few cases retained, as in Atwood, A’Court. Nash (at ten ash, i.e., at the ash). The travelling habits of the Scots account for such names as Inglis, Fleming, Welsh (the original of Wallace), applied to those who had visited foreign parts; and sometimes a Scotsman, wandering into England, returned with the acquired name of Scott.

A large class of surnames are patronymics, often formed by “son,” or its equivalent in the language of the country, added to the Christian name of the father. Names of this sort often fluctuate from generation to generation. Alan Wallerson had a son, Walter, who called himself Walter Alson. The genitive case of the father’s name sometimes served the same purpose, as Adams, Jones, and similarly in Italian,Dosso, Dossi. A fashion of using “Fitz,” the equivalent of “son,” before the ancestral name, as in Fitz-
herbert, prevailed temporarily in Normandy, whence it was imported into England. In the highlands of Scotland, the prefix "Mac" (Macdonald) served the same purpose, which, however, fluctuated far longer than the patronymic surnames of England and the lowlands; so also the "O" (grandson) of the Irish (O'Neil), and "Ap" of the Welsh (Ap Rhys, otherwise Apreeche). The "de" of France had sometimes a similar origin, as in d'André d'Hugues; and still more frequently the "de," "dei," or "de" of Italy—di Cola, di Giacomo, 

Office, occupation, or condition, gives rise to surnames—e.g., Knight, Marshal, Page, Smith, Brewer, Shepherd; in Germany and Holland, Baber and de Rogyer (rubber), and from such appellatives, patronymics may be again derived; thus, we have Smithson, de Maistre (master's son), M'Nab (son of the abbot), McPherson (son of the parson), del Sarto (son of the tailor), etc. So also personal qualities—Black, White, Strong, Stark, Lang (long), Littlejohn, Cruikshanks; and nicknames have not infrequently been perpetuated as surnames. We have also surnames derived from the signs and cognizances which were borne in the middle ages, not only by inns and shops, but by private houses. John at the Bell became John Bell; at Middelburg, in Holland, Simon, apothecary in the "Drake," or Dragon, became Simon Drake; hence, probably, the frequency of family names derived from animals, and also of those beginning with "Saint;" though this last class may, perhaps, sometimes have had its origin in the first owner of the name dedicating himself to the service of the saint in question. In Scotland and Ireland, "The" is a distinctive title borne by the heads of some old families—as "The Chisholm," "The O'Connor Don." In the highlands of Scotland, the chief a clan is usually addressed by the name alone in a marked manner: thus, "Macleod" implies specially Macleod of Dunvegan, in Skye, head of the clan Macleod; "Mackintosh," in like manner, applies solely to Mackintosh of Moy, in Inverness-shire.

In England, the number of existing surnames approaches to 46,000, or about one to every 500 individuals; in Scotland, there are far fewer surnames in proportion to the population. The remarkable predominance of certain surnames in certain localities—as Campbell, Cameron, Maclean in Argyleshire, Macdonald in Inverness, Mackay in Sutherland, Gordon and Forbes in Aberdeen-shire, and Scott, Ker, Elliot, Maxwell, and Johnstone on the borders—arises from the clansmen having made a practice of taking the name of their chiefs, considering themselves members of their family by adoption, if not otherwise. Elsewhere than in Scotland, surnames often adopted the names of their lords, and servants of those of their masters. Two or more surnames are often borne by one individual, in which case the paternal surname is sometimes placed first, sometimes last; and, in recent times, it is by the name which occurs last that the bearer of the two surnames is most frequently known.

The wife, with us at least, changes her surname to that of her husband on marriage. In the continent, it is not unusual for the husband to append his wife's name to his own; and in Spain, the wife retains her own name, while the son is at liberty to use either paternal or maternal name as he pleases, the choice generally falling on the best family.

Change of Name.—Prior to the reformation, surnames were less fixed than they have since become. Occasionally, younger sons, instead of retaining their patronymic, adopted the name of their estate or place of residence. A great matrimonial alliance was a frequent cause for adopting the patronymic of the wife. With the clergy, ordination was a common occasion of a change of name, the personal surname being exchanged for the name of the place of birth—but, William Long became William of Wyckham. In time of political troubles, a new name was often assumed for concealment; and in Scotland, the name of McGregor was proscribed in 1664 by an act of the privy council. In modern times, injunctions in settlements of land, and deeds of entail, are frequent grounds for a change of name, it being made a condition that the devisee or disponee shall assume a certain surname under penalty of forfeiture, a stipulation which the law recognizes as valid. Such an obligation is often combined with one relative to arms. In a Scotch entail, it is a very frequent condition that each succeeding heir of entail, or husband of an heiress of entail, shall assume the entailor's name and arms, or his name and arms exclusively; if the entailor's name is used, it may, if he pleases, be used without arms. An entailor's name is also that of the assumed one. The heir of entail is not held legally to take up any arms not otherwise his own, unless he have applied to the heraldic authorities for leave so to do. Where a Scotch entail contained an injunction to bear arms which had no existence in the official record of arms, the condition has not been held to be null; the heir of entail must apply to the lord Lyon for a grant of arms bearing the designation of those dispensed. In England, it used to be common to obtain a private act of parliament to authorize one to change his surname; an authority for such a proceeding has generally been given in later times by royal license, which is granted only on a reasonable ground being established for the alteration, to the satisfaction of the kings-at-arms, to whom a remit is made. It has sometimes been supposed that this royal license is necessary to legalize such a change, but the highest legal authorities have laid it down that there is nothing in the law that prevents any one from changing his or her surname, or even his christian name. The idea, lately prevalent to some extent, is equally erroneous, that an advertisement in a gazette or newspaper, or the execution of some deed, is a necessary form in order to effect a change of name. There are always great inconveniences in changing one's name, which sufficiently account for
the general indisposition to do so, except from a questionable motive. As there is no law to prevent a person from changing his name, so there is, on the other hand, no law to compel third parties to use the new name, and disputes and annoyances arising from such a state of things are matters of course. The change tends, to a certain extent, to destroy the means of identification after the lapse of years, which may or may not be the object desired. Notwithstanding these difficulties and inconveniences, there are many examples of persons who have succeeded after a few years in being generally known under a new name, and of the public as well as his friends recognizing it. The change of name, in general, produces no change whatever on the legal status. A party is equally punishable for swindling, larceny, and other cognate offenses, whatever name he uses; and, on the other hand, if he is legitimate, he is not prevented from establishing and receiving his legacy, whatever name he has adopted. It follows from what precedes that no person is punishable for using a new name, though it is sometimes an ingredient for a jury to take into consideration when they are required to infer a particular motive of conflict. The royal license is practically required to be obtained by Englishmen (not Scotchmen) holding commissions in the army, as also when the change of name is to be accompanied by a change of arms, it being the practice of the English heralds' college to refuse to grant arms corresponding to such change, unless the royal license have been obtained. In Scotland a bona fide change of name requires neither royal, judicial, nor parliamentary authority, the sole exception being the case of members of the college of justice, who require the permission of the court of session. A royal license is not generally applied for by natives of Scotland, as it is not required to be produced to the lord lyon on applying for a corresponding change of arms. The arms will generally be granted when the lord lyon is satisfied that the change has been made on some reasonable ground, and not from a purely capricious motive; and the fact of the change of name, with the reason why it has been made, are narrated in the new patent of arms. When such change of surname and corresponding change of arms has been made by a Scot who is an officer in the army, the authorities of the war office are in the habit of requiring a certificate from the lord lyon office to the effect that the change is recognized there.

Names of Places.—These, like names of persons, belong, in a great measure, to the language of past races. All over Great Britain, a very large proportion are derived from the Celtic names for natural features of the country. From *berg*, aberg, aub, avey, avay—in the Celtic speech, equivalent to *wirrit* or *river*—we have Esk, Avon, Wye, Thames, Tyne, Clyde. *Bein* or *ben*, hill, gives rise to the names of hills in England and Wales (Penriths, Penzance), and still more in Scotland (Ben Nevis). So, also, *con*, *cony*, *valley*—as in Cumberland, land of valleys. The memory of the Roman invasion has been preserved in the termination *chester* (derived from *cestres*) in the names of towns, as Manchester. Though surnames often originated in local names, the reverse process also occurred; as where *ville*, *ton* or *tynron*, *houn*, or *burgh*, has been appended to the name of the owner of the land, e.g., Charleville, Johnston, Wymondham, Edinburgh (i.e., Edwin's burgh).

See Pott's *Die Personenamen und ihre Entstehungsarten* (2 vols., 1853; 2d, ed. 1859); Miss Yonge, *History of Christian Names* (Lond. 1863); Lower, *On English Surnames* (Lond. 1849); professor Innes, *Concerning Some Scotch Surnames* (Edin. 1860).

**NAMES** (adv.). It is well settled in the United States that no process of law is necessary to effect a change of name. The reason is seen in the fact that names are not originally given by the law, but are established by usage. Thus the founding named by the first-coner has, from every legal point of view, as good a right to that name if commonly applied to him during his youth as if he had been christened by the highest ecclesiastical authority. Again, a change of name can in any event have but little legal significance; for, if John Doe signs a conveyance as Richard Roe, he cannot void the agreement on that ground; or, if he so signs a bond, he will be estopped from setting it up as a defense. Where the maker of a will has for many years gone under a name not that given to him by his parents, and signs the will in the assumed name, the instrument will not on that ground be set aside. So, in criminal practice, it is of no moment under what name the accused is indicated in a warrant, identification being the only requisite. Nevertheless, the legislatures of the different states have provided a legal process by which a change may receive legal sanction. In New York, application must be made to the county court, or, in New York city, to the common pleas, by petition, stating the grounds of the desire to change, and after due notice and publication an order is granted authorizing the use of the new name. In Massachusetts the application must be made to the legislature; other states require application to the probate or surrogate's court.

**NAMUR**, a province of Belgium, bounded on the n. by Brabant and Liège, e. by Luxemburg, w. by Hainault, and s. by France. Area about 1400 square miles. Pop. Dec., '74, 819,832. The principal river is the Meuse, which entirely intersects the province—the Sambre, and the Lesse. Namur presents generally an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the Ardennes and are densely wooded, they attain a considerable elevation. With the exception of the land in the s.w., where there are large tracts of bog and heath, the soil is extremely rich, yielding abundant crops and fine pasture. The chief products
of Namur are wheat, oats, hops, oil-yielding plants, and flax. Besides iron, copper, lead, and coal mines, Namur has marble and slate quarries, and yields sulphur, alum, cadmium, alumina, flints, etc. It has good steel, iron, and smelting works, breweries, paper-mills, etc. Namur is divided into the three arrondissements of Namur, Dinant, and Philippeville. At the close of the 13th c., Namur was united to Luxembourg, after having preserved its independence for upwards of 400 years. Towards the middle of the 13th c., it was passed by purchase to the house of Flanders, which retained possession of it till 1429; when, on the death of count John III., without direct heirs, the countyship, which was in a state of extreme financial embarrassment, was purchased for 132,000 gold ducats, by Philip the good, duke of Burgundy, and subsequently shared the fate of the other Burgundian states.

NAMUR (Flem. Namen), the chief t. of the province of the same name, is situated at the confluence of the Sambre with the Meuse, and is a strongly fortified town and the seat of a bishop. Pop. 76, 25,066. Among its 17 churches, the cathedral, or St. Aubin's, which was consecrated in 1722, is one of the most beautiful churches of Belgium. Namur has an academy of painting, a conservatoire for music, two public libraries, a museum, an hospital for aged paupers, a theological seminary, and 2 colleges, one conducted by Jesuits. The present citadel was constructed in 1784, but the city has been fortified from the earliest period of its history; and in 1692, its defensive works were repaired and strengthened by Cochoorn, only, however, to be taken the following year by Louis XIV. and Vauban, the latter of whom added considerably to its original strength. The reputation of its citadel made Namur a prized stronghold in every war of later times; and after having been gallantly defended by its French conquerors in 1815, against the Prussians under Pech, it was finally restored to the Netherlands after the battle of Waterloo, and at once put into thorough repair. Namur is noted for its cutlery, its leather-works, and its iron and brass foundries.

NANAK, or NAYAK. See NIKKH, state.

NANAS, a t. of Hungary, in the midst of extensive morasses, about 110 m. c.n.e. from Pesth. The population, partly Protestant and partly Roman Catholic, is employed in cattle-breeding and agricultural pursuits. Pop. 11,300.

NANA SAHIB, a Hindu, one of the leaders of the sepoys revolt of 1857. He is said to be the son of a Brahman from the Deccan, and his real name was Dinmud Pant. He was b. about 1820, and was adopted as a son in 1827 by Bajee Rao, the childless ex-peishwa of Poorna, thereby, according to Hindu law and custom, acquiring most of the rights of a legitimate son. He was educated as a Hindu nobleman—taught English, and brought much in contact with the European officers, in whose annuements he seemed fond of participating. A decision was, however, come to by the government of Calcutta, that they should not recognize rights to pensions or indemnities acquired by adoption; and in consequence, Nana Sahib was refused the continuance of a pension of eight lacs of rupees, paid to his adopted father under a treaty made in 1818. This is believed to have rankled in his mind, along with slight he received from the supercilious English youth with whom he came in contact. He was allowed to retain some of the state of a native prince—a retinue of 200 soldiers, with 3 field-pieces, and a fortified residence at Bithoor, 10 m. w. of Cawnpore. When the mutiny broke out in May, 1857, he offered to assist the English, but instead he treacherously placed himself at the head of the mutineers. The European troops were induced, on June 25, to capitulate to Nana Sahib, who promised they should be sent down the Ganges in safety. They got on boats provided for them, but had no sooner done so than two guns were unmasked, and a murderous fire was opened upon them. The sepoys were ordered to shoot the men, but to spare the women and children, who, when their husbands and parents had been shot, were removed to a house in Cawnpore. On July 15, sir H. Havelock, who had advanced to their assistance from Allahabad, defeated the sepoys in two engagements, one within 8 m. of Cawnpore; and Nana Sahib next day directed that the women and children should be put to death, an order carried out with unparalleled atrocity. A long series of engagements against Nana Sahib followed, in which he was always the loser, and he was ultimately driven beyond the English frontier into Nepal. In 1860 his death was announced, but, two years later, new movements were discovered, which were attributed to him, and it is not certainly known whether he is dead or alive. Several persons have been arrested on suspicion of being Nana Sahib, but in all cases a mistake has been made. A column has been erected at Cawnpore in memory of those who perished in the massacre.

NANCY, a beautiful t. of France, capital of the department of Meurthe-et-Moselle, is situated on the left bank of the river Meurthe, at the foot of wooded and vine-clad hills, 220 m. c. of Paris, on the Paris and Strassburg railway. Pop. 76, 60,393. It is divided into the old and new towns (the former irregular and with narrow streets, the latter open and spacious) and the two suburbs. It contains many handsome squares and imposing edifices, and owes much of its architectural ornamentation to Stanislaus Leszczynski, who, as, abdicating the crown of Poland in 1733, continued to reside here as duke of Lorraine till his death in 1766. His statue stands in the place Royale, a fine square, surrounded by important public buildings, as the hôtel de ville, theater,

U. K. X.—24
etc. The gates of Nancy look more like triumphal arches than the ordinary entrances of a town. Among the institutions are the university-academy, the normal school, the school of medicine, the lyceum, the public library, and numerous art and scientific societies. Cotton, woolen, and linen manufactures are carried on; but the principal branch of industry is the embroidering of canvass, muslin, and jacquard goods. Nancy is known to have existed in the 11th century. Two centuries later, it became the capital of the duchy of Lorraine (q.v.). Charles the bold was killed while besieging Nancy in 1477.

NAND'I'E. a family of fishes found in the fresh waters of India, containing three genera, batillus, nankeen, and octopus. They resemble the basses and sunfishes of America.

NANDU, or AMERICAN OSTRICH (c느냐), a genus of South American birds allied to the ostrich, cassowary, and emu, and most nearly to the ostrich, from which it differs in having the feet three-toed, and each toe armed with a claw; also in being more completely feathered on the head and neck; in having no tail; and in having the wings better developed than any other of the struthionidae, although still unable to fly. The neck has 16 vertebrae. There are at least three species. The best known species (R. Americana) is considerably smaller than the ostrich, standing about 5 ft. high. It is of uniform gray color, except on the back, which has a brown tint. The male is larger and darker-colored than the female. The back and rump are furnished with long feathers, but of a more ordinary kind than those of the ostrich. This bird inhabits the great grassy plains of South America, southward of the equator, abounding on the banks of the La Plata and its more southern tributaries, and as far s. as lat. 42° or 43°. Its range does not extend across the Cordilleras. It is generally seen in small troops. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs in a common nest, or drop them on the ground near the nest, to which the male rolls them. Contrary to the usual habit of birds, incubation is performed by the male. The Nandu is shy and wary, but is successfully hunted by the Indians, generally on horseback. The flesh of the Nandu is most unpleasant. The Nandu is capable of being domesticated.—A smaller and more recently-discovered species (R. Darvinii) has light-brown plumage, each feather tipped with white. It inhabits Patagonia. A third species (R. macropterus) is distinguished by its large bill.

NANKEEN CLOTH. Calico of the kind called "nankeen," or naked, was formerly imported extensively from China to Europe, and said to be the manufacture of Nanking; the color, a yellowish-buff, being a favorite one. It was supposed that the Chinese held a secret for dyeing this color, which was found to be remarkably durable; but it became known that it was not an artificial color at all, the cloth being made of a colored variety of cotton, which was produced occasionally in China and India. Artificially dyed nankeen cloths now form a considerable export from England to China. The color of artificial nankeen cloth is produced by an elaborate process, in which the yarn or cloth is first dipped in a saturated solution of alum; then in a decoction of oak-bark; then in a bath of lime-water; and next in a bath of nitro-muriate of tin. Another, but less permanent, nankeen dye is produced by boiling annatto in a strong solution of pearl-ashes, and diluting with water to the required tint.

NANKING, capital of the province of Kiangsu, formerly the capital of China, on the Yangtze river, 90 m. from the beginning of its estuary, n. lat. 32° 40' 40", e. long. 118° 47'. Its name signifies the southern capital. Since the removal of the seat of government to Peking (northern capital) it has been called by the Chinese Kian-k'ing. It lies in an area of nearly 20 m. in circumference, the water part of which, however, is entirely waste. They reach in many places an elevation of 70 ft., and are fully 30 ft. in thickness at the base. According to Chinese accounts, the population of Nanking was once 4,000,000, but a more recent estimate made it 300,000. As the city, however, has of late passed through so many vicissitudes, it is impossible to ascertain its present number of inhabitants. The inhabited portion of the walled area lies toward the west, and several miles from the bank of the river. It is no longer possible to speak of Nanking in the language which former travelers used. The barbaric desolations to which it was subjected during the Taeping rebellion left it a sort of wreck, and one can only describe it as it was, before the victorious assault of the rebels, Mar. 19, 1853. Nanking is the seat of the vice-regal government for the provinces grouped together under the name of Kiangnan. Here, as elsewhere in China, there was, and again is, a Manchu garrison, or military colony, separated by a wall from that portion of the city which is occupied by the Chinese. Some of the finest streets of Nanking were in the Tartar city; several being nearly 40 ft. wide, having a space in the middle of about 8 ft. in width, flagged with well-hewn blocks of blue and white marble, and on each side of this a brick pavement 14 ft. or more wide. A deep canal or ditch runs from the river directly under the walls on the w. serving to strengthen the defenses of the city on that side. The ancient palaces have all disappeared. The offices of the public functionaries were numerous, but, like the shops, presented the general features common to all Chinese towns. The objects most worth the inspection of the traveler are found, in ruins, outside the precincts of the modern city. Among these is the summer palace of the emperor Kienlung. It consisted of a number of one-story buildings, with spacious courts
between, and flanked by smaller buildings on the sides. Enough still remains to show that the workmanship was of the most elaborate and unique character. When under cultivation, the spot must have been exceedingly beautiful. The tombs of the kings are remarkable for their sepulchral statues, which form an avenue leading up to the graves; they consist of gigantic figures, like warriors cased in a kind of armor, standing on either side of the road, across which, at intervals, large stone tablets are extended, supported by huge blocks of stone instead of pillars. Among the buildings totally destroyed by the rebels was the far-famed Porcelain tower. It was erected by the emperor Yung-lo, to reward the kindness of his mother; the work was commenced in the 10th year of his reign (1413); at noon, on the 15th day of the moon, in the 6th month of the year, and was completed in 19 years. The board of works was ordered, according to the plan of the emperor, to build a tower 9 stories high, the bricks and tiles to be glazed, and of five colors; and it was to be superior to all others, in order to make widely known the virtues of his mother. Its height was to be 322 feet. The ball on its spire was to be of brass, overlaid with gold, so that it might last for ever and never grow dim. From its 8 hooks as many iron chains extended to the 8 corners of its highest roof; and from each chain 9 bells, suspended at equal distances apart; these, together with 8 from the corners of each projecting roof, amounted to 144 bells. On the outer face of each story were 16 lanterns, 135 in all; which, with 12 in the inside, made 140. It required 64 catties of oil to fill them. On the top of the highest roof were two brazen vessels, weighing together 1200 pounds, and a brazen bowl besides, weighing 600 pounds. Encircling the spire were 9 iron rings, the largest being 63 ft. in circumference, and the smallest 24 ft., altogether weighing nearly 5,000 pounds. In the bowl on the top were deposited one white shining pearl, one fire-avertiug pearl, one water-avertiug pearl, one dust-avertiug pearl, a lump of gold weighing 50 ounces, a box of tea-leaves, 1000 tael of silver, one lump of opalment, altogether weighing 4,000 pounds; one precious stone-gea, 1000 strings of copper coin, two pieces of yellow satin, and four copies of Buddhist classics. Nanking continued in possession of the Tae-ping rebels till the successes of the troops under maj. Gordon had crushed one after another all their outlying forces, while at length, July 19, 1864, the city was stormed by the imperialist soldiers under the viceroy Tseng Kwo-fan. The last blow was thus dealt to the Tae-ping rebellion, whose principal leader perished by his own hand amid the blazing ruins of the palace he had occupied for 11 years. Since its recapture, Nanking has resumed its former position as the seat of the vice-regal government, but shows few signs of revival from its desolation. It has, however, been made the headquarters of a large military force, and also of an arsenal for the manufacture of cannon and other warlike stores on the European model. Although specified in the treaty of Tientsin (1858) as a river-port to be opened, little or nothing has come of this concession, and but few foreigners are resident in Nanking. Cotton grows abundantly near Nanking.

NANSEMOND, a co. in s.e. Virginia adjoining North Carolina; bounded on the u. by Hampton Roads, drained by Nansemond river and its branches, and crossed by the Seaboard and Roanoke, and the Atlantic, Mississippi, and Ohio railroads; 390 sq.m.; pop. 70, 1870. - The surface is level, and heavily wooded with cypress, pine, and other trees. The soil is sandy. The principal productions are corn, wheat, oats, and sweet-potatoes. Co. seat, Suffolk.

NANTASKET, a narrow peninsula in Massachusetts that extends from Cohasset township into Massachusetts bay about 5 miles. The town of Hull is situated on it, about 9 m. by water and 32 by railroad from Boston. It is a popular summer resort, and has several hotels.

NANTES (anc. Namo, or Nannes), an important seaport t. of France, capital of the department of Loire-Inférieure, is situated on the right bank of the Loire, 30 m. from its mouth, and at a point of confluence with it of the Erdre and the Sèvre-Nantaise, both navigable streams. Besides railways, there is communication with the interior by steamers on the Loire. The natural beauties of the site have been much improved by art, and now, the noble river on which the town is placed, covered with craft of every size and description, the islands that stud its channel, the meadows that skirt its banks, and the bridges (upwards of 16 in number) that cross it and its tributaries here, combine to make the scene a highly picturesque one. Nantes contains numerous squares and churches. Several districts of the town are nearly as fine as the best districts of Paris, the old town having been pulled down between 1865 and 1870. This town possesses numerous striking and beautiful buildings; among which the cathedral of St. Pierre, containing the splendid monument of Francis II., the last duke of Bretagne, and of Marguerite, his wife; and the old castle, the temporary residence of most of the kings of France since Charles VIII., and built in 928, art the chief. There is a public library containing 50,000 vols.; a museum of paintings; and a museum of natural history. The quays, lined on one side with houses, and in some cases planted with trees, afford an agreeable and interesting promenade of about 2 m. in length. The most beautiful promenade, however, formed by the Cours St. Pierre and the Cours St. André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. The harbor, 1965 yards in length, is capable of accommodating upwards of 200 vessels. Formerly, vessels of no more than
200 tons could reach the port, all vessels of greater burden unloading at Paimbœuf, at the mouth of the river; but within recent years, much has been done by dredging for the improvement of the river-bed, and large vessels can now reach the harbor. The chief manufactures of Nantes are varieties of linen and cotton fabrics, calicoes, flannels; musical, mathematical, and optical instruments; refined sugar and salt, chemical products, cordage, etc. It contains tan-yards, copper foundries, branny distilleries, etc., and numerous establishments engaged in the various manufactures to which a port gives rise, as ship-building, the preparation of preserved meats, etc. In 1872 the imports of Nantes were valued at 70,000,000 of francs, the exports at 53,000,000. Pop. 76,110,003.

NANTES, EDICT or, the name given to the famous decree published in that city by Henri IV, of France, April 12, 1598, which secured to the Protestant portion of his subjects freedom of religion. Among its more important provisions were—liberty to celebrate worship wherever Protestant communities already existed; to establish new churches, except in Paris and the surrounding district, and in the royal residences; and to maintain universities, or theological colleges, of which they had four, those at Montaigu, Sauvey, Montepelier, and Sedan, adherents of the reformed faith were made to be eligible to all civil offices and dignities; but, on the other hand, they were not allowed to print books on the tenets of their religion, except in those places where it existed; and they were obliged to outwardly celebrate the festivals of the Catholic church, and to pay tithes to the Catholic priesthood. From this period, the Reformers or Huguenots (who then counted 700 churches) had a legal existence in France, but gradually their political strength was crushed by the mighty genius of Richelieu—who, however, never dreamed of interfering with their liberty of worship. Neither did his successors, Mazarin and Colbert; but under the influence of a "penitence," as corrupt and sensual as the sins which occasioned it, Louis XIV., after a series of detestable Dragunades (q.v.), signed a decree for the revocation of the edict. Oct. 18, 1685. The result of this despotical act was that, rather than conform to the established religion, 400,000 Protestants among the most industrious, the most intelligent, and the most religious of the nation—quitted France, and took refuge in Great Britain, in the principal states of Prussia, Switzerland, and America. The loss to France was immense; the gain to other countries, no less. Composed largely of merchants, manufacturers, and skilled artisans, they carried with them their knowledge, taste, and aptitude for business. From them England, in particular, learned the art of manufacturing silk, crystal glasses, and the more delicate kinds of jewelry.

NANTUCKET, an island and t. upon it, on the s.e. coast of Massachusetts. The island is 15 m. long and an average of 4 wide, with an area of 50 sq. miles. It was bought from the Indians by Thomas Macy, in 1659, for $30 and two beaver-hats. Nantucket was at one time a great seat of the whale fishery, having, in 1775, had as many as 150 whaling vessels; but this branch of industry has declined since 1846, and since the civil war has become extinct. The harbor is commodious and safe. Nantucket has two newspapers; pop. (1870) 4,123.

NANTUCKET (Isle), a co., t., and island, in Mass., is 18 m. s. of cape Cod, 85 m. s.e. of Boston, and is separated from Martha's Vineyard on the w. by a channel 8 m. wide. It is triangular in shape, has a level surface in the s., and is slightly hilly in the north. The soil, for the most part, is sandy and nearly destitute of trees or shrubbery. During the past fifteen or sixteen years farming and fishing have been the chief pursuits of the inhabitants, and, in the summer months, the town is the resort of invalids and pleasure-seekers. It has two banks, five public schools, several public schools, a weekly newspaper, and Baptist, Congregational, Episcopal, Friends, Methodist, Roman Catholic, and Unitarian churches. There is also a public library, containing about 5,000 volumes, and a museum of marine curiosities, the latter of which was founded in 1826 by admiral sir Isaac Coffin. A steamboat runs daily between the town and Wood's Holl, on cape Cod, connecting with a railroad to Boston.

NANTWICH, a small market t. of Cheshire, England, on the Weaver, 20 m. s.e. of Chester. Many of its houses are interesting from their age and construction, being built, in many cases, of timber and plaster, and with overhanging upper stories. The parish church, one of the finest country churches in England, was thoroughly restored in 1864 at great cost. Nantwich was famous in former times for its bruise-springs and salt-works. Shoes, gloves, and cotton goods are manufactured, and malting is carried on. Pop. (1871) 6,673.

NAOS (Gr. a dwelling), the cell or inclosed chamber of a Greek temple.

NAPA, a co. on the coast of California, n. of San Pablo bay; drained by Napa river, and Putah creek; 828 sq. m.; pop. 7,163, a part of which are Chinese. It has fertile valleys, and a range of mountains. The principal mountain is St. Helena, situated at the head of Napa valley, which rises 4,343 ft. above the sea. In the co. is a wonderful forest of petrified trees of large size, also springs of sulphur and borax, and a cinnaabar or quicksilver mine. The leading products are wool, grain, butter, and wine. It is traversed by the California Pacific railroad. Co. seat, Napa City.

NAPHTHA is derived from the Persian word nafista, to exude, and was originally applied to an inflammable liquid hydrocarbon (or rather a mixture of several hydrocar-
toons) which exudes from the soil in certain parts of Persia. (According to Pelletier and Walter, it consists of three hydrocarbons—viz., \( \text{C}_4\text{H}_{12} \), which boils at 190\(^\circ\); \( \text{C}_6\text{H}_{12} \), which boils at 239\(^\circ\); and \( \text{C}_4\text{H}_{14} \), which boils at 37\(^\circ\).) The term is, however, now used not only to designate a similar and almost identical fluid, that issues from the ground in many parts of the world, and is known as petroleum, rock-oil, etc., but is also applied to other liquids which resemble true naphtha in little else than their volatility and inflammability. Thus, wood-spirit, or methyl alcohol, is often spoken of as wood-naphtha, and acetone is sometimes described as naphtha. Coal-tar yields by distillation a liquid which has a heavier specific gravity and a lower boiling-point than Persian naphtha, but resembles it in general properties, and can generally be substituted for it. See Gas-TaR.

Crude naphtha, whether occurring as a natural product or as obtained from coal-tar, is purified by agitation with strong sulphuric acid; after which it must be well washed with water (in which it is quite insoluble), and finally distilled from quicklime. Pure naphtha is colorless, and of a peculiar taste and odor; it is soluble in about eight times its bulk of alcohol, and dissolves in all proportions in ether and in essential oils. Hot naphtha dissolves phosphorus and sulphur, but deposits them on cooling. It is an excellent solvent for gutta-percha, caoutchouc, camphor, and fatty and resinous bodies generally; and hence it is extensively used in the arts for these purposes, and its employment as a source of artificial light is now becoming universal. In consequence of its containing no oxygen, it is employed by chemists for the preservation of potassium and other metals, which have a powerful affinity for oxygen. Owing to its volatility and inflammability, it must be handled with great caution, many fatal cases having arisen from the vapor condensed as on the approach of a candle. The principal kinds of naphtha known in commerce are native naphtha, coal naphtha, Boghead naphtha (also called paraffin oil and photojen), shale naphtha, and naphtha from caoutchouc and caoutchouc.

Native naphtha, petroleum, or rock-oil is found in many parts of the world, as in Japan, Burma, Persia, the shores of the Caspian sea, Siberia, Italy, France, and North America. It is of various degrees of consistency, from a thin, light, colorless fluid found in Persia, with a specific gravity of about 0.950, to a substance as thick as butter, and nearly as heavy as water. But all the kinds when rectified have nearly the same constitution. They contain no oxygen, and consist of carbon and hydrogen compounds only. Bitumen and asphaltum are closely allied substances in a solid or semi-solid form. From a very early period in Persia and Japan, and at least since last century in Italy, natural naphtha has been employed in lamps. Coal-tar naphtha (see Gas-TaR), as stated above, is of a higher specific gravity than native naphtha—viz., from 0.860 to 0.900, and has a more disagreeable and penetrating odor.

Paraffin oil, for some time known also as Boghead naphtha, has become, of late years, so important a manufacture that a brief history of its origin cannot be uninteresting. In the year 1847 Mr. James Young, now of the Bathgate chemical works, had his attention called to a petroleum spring at Alfreton, in Derbyshire, from which he distilled a light thin oil for burning in lamps, obtaining at the same time a thicker oil, which was used for lubricating machinery. After a year or two the supply began to fail, but Mr. Young, noticing that petroleum was dropping from the sandstone roof of a coal-mine, conjectured that it originated by the action of heat on the coal-seam, the vapor from which had condensed in the sandstone, and supposed from this that it might be produced artificially. Following up this idea, he tried a great many experiments, and ultimately succeeded, by distilling coal at a low red-heat, in obtaining a substance resembling petroleum, which, when treated in the same way as the natural petroleum, yielded similar products. The obtaining of these oils and the solid substance paraffin from coal formed the subject of his now celebrated patent, dated Oct. 17, 1850.

In the years 1860 and 1864 long and costly litigations as to the validity of Mr. Young's patent took place in Edinburgh and London, resulting in the main in his favor. Many years ago Reichenbach had, by distilling 100 lbs. of pit-coal, obtained nearly 2 oz. of an oily liquid exactly resembling natural naphtha; and various other chemical writers were appealed to, as proving that methods substantially the same as Mr. Young's were previously known and practiced. One thing seems to have been admitted, that previous to his patent no one had succeeded in producing the oil on a commercial scale.

The processes by which the oil and paraffin are obtained are simple. The material best adapted for the purpose was for years believed to be Boghead coal, a very rich gas coal, occurring in a field of limited extent near Bathgate, in Linlithgowshire. All carbon coals, however, give the same products, and some of them in nearly as large quantity; but, as stated below, shale is now generally used and treated in the same way. The coal is broken into fragments like road-metal, and gradually heated to redness in cast-iron retorts, which are similar to those used for coal-gas (see Gas). The retorts are most usually upright, about 10 ft. long and 14 in. in diameter at the bottom, tapering to 12 in. at the top, and built in sets of 3, 4, or 6, so that one fire may heat each set. The coal is fed by means of a hopper on the top of the retort, and after passing through it at a low red-heat, is drawn out as coke at the bottom, where there is a water jet to prevent the escape of oil or gas. There is a spherical valve in the hopper, counterpoised
Shale naphtha, or "shale-oil," is a substance which has been manufactured, for many years, from bituminous shales, both in England and on the continent. Partly because the Boghead coal has become practically exhausted, but chiefly because the volatile products from it are more easily purified than from any coal, beds of bituminous shale found in the carboniferous formation are now almost entirely used in Scotland as the raw material from which paraffine oil and paraffine are obtained. Previous to 1856 these shales were tapped in a manner being subjected to hydraulic pressure three or four times, is chiefly purified, by repeated crystallizations, from naphtha. Steam is afterwards blown through it in a melted state, and when finally treated with 3 per cent of animal charcoal it is an exquisitely beautiful substance, resembling the purest white wax. It is largely manufactured into candles, which equal, or even excel, in appearance those made from wax, and are only about half as costly. Paraffine has now a number of curious minor applications.

Until the discovery of the Pennsylvania, the Burmese (Rangoon) petroleum, or rock-oil, was one of the best known. It is obtained in a treacly state by sinking wells about sixty feet deep in the soil, and consists of several fluid hydrocarbons, with about ten or eleven per cent of the solid hydrocarbon paraffine. The different naphthas it contains are highly prized as burning and lubricating oils, and for removing greasy stains, on account of their agreeable smell. The naphtha which is found abundantly at Baku, on the shores of the Caspian sea, closely resembles the Rangoon in its qualities. The Persian naphtha is frequently pure enough for burning without rectification.

Naphtha from caoutchouc, or caoutchune, is obtained from caoutchouc by destructive distillation. In composition it consists mainly of hydrocarbons, having the same proportion of carbon to hydrogen as India rubber. Caoutchune has the reputation of being one of the best known solvents for India rubber.

Much curiosity exists respecting the origin of these great natural sources of petroleum. It seems to be the general opinion of geologists that it has in most cases been produced by the decomposition of both vegetable and animal matters. In this respect it differs from coal, which has arisen from the decay of vegetable matter alone. It would appear that the Pennsylvania petroleum proceeds from shales of carboniferous age, the Canadian from those of Devonian age. In both countries the oil is found in cavities in sandstone, and has therefore been derived from subjacent rocks. It is now known that petroleum has formed in rocks of nearly all geological ages. Prof. Dana, the American mineralogist, says that the conditions favorable to the formation of native naphtha, as shown by the characteristics of the deposits in which it is found, arc: (1) the diffusion of organic material through a fine mud or clay; (2) the material in a very finely-divided state, and (3), as a consequence of the preceding, the atmosphere excluded as far as possible from the material undergoing decomposition.

In Pennsylvania the first borings for petroleum took place in 1859, and in that year.
82,000 bbls. (reckoned at 43 galls. each) were obtained; in 1861 the produce had reached 2,000,000 bbls.; and since then, as a rule, it has increased from year to year. In 1872 the total produce of North America was 7,394,000 bbls.; Canada furnishing 550,000 bbls. In the same year the total exports from the United States of refined petroleum amounted to 3,951,310 bbls., an enormous quantity, considering the first exports took place so recently as 1861. Of late years the petroleum trade is said to have employed in North America as many hands as coal-mining and the working of iron.

In 1862 and 1871 acts of parliament were passed limiting the amount of petroleum to be kept in store, and regulating the sale of such kinds as give off an inflammable vapor below 100° F. There are special warehouses for the reception of petroleum at the London and Liverpool docks.

Terrible accidents have now and then happened with some of the more inflammable American oils, by reason of their vapors exploding in the reservoirs of lamps. Most of these have, no doubt, taken place with oils whose vapors form an explosive mixture with air at a temperature below 100° F., but they can hardly be considered safe if their vapors will take fire on the approach of a light at less than 120° F. The vapor of the paraffine oil prepared for illuminating purposes by Young's mineral oil company, and no doubt, by other firms, from Scotch shale, will not form an explosive mixture below 120° F., and it is therefore quite safe. Since this oil has to compete with petroleum, such a standard can only be kept up at a loss, and there is therefore a great temptation to keep down the firing-point of these burning oils as low as possible, with a view to greater profit; and although accidents have happened with paraffine oil, as well as with American petroleum, there is little doubt that the latter cannot be so thoroughly relied upon for safety. It could easily be made so, however, if the lighter hydrocarbons which it contains were carefully removed.

NAPHTALI. TRIBE, named after a son of Jacob, recorded as numbering 55,400 adult males at the exodus, being then the 6th in numbers among the 12 tribes. On its arrival at the outskirts of Palestine, it was only 8th in number. In the journey through the wilderness its place was n. of the tabernacle, near the tribes of Dan and Asher, with which it constituted the "camp of Dan." The ensign of the tribe is represented by the Jewish legends as a serpent, bearing the inscription "Return, O Jehovah! unto the many thousands of Israel." The territory allotted to Naphtali was situated in n.e. Palestine, bounded on the n. by the Leontes river, on the e. by lakes Galilee and Merom, and the Jordan, on the s. by the Zebulun, and on the w. by Asher. It included the w. shore of the sea of Galilee. Its surface and scenery were more diversified than those of the other tribes. Its s. portion, and especially the plains along the shore of the sea of Galilee were the most fertile region of Palestine. The tribe of Naphtali, under the leadership of Barak of Kedesh-Naphtali, repelled the invasion of the Canaanites under Sisera and Jabin (Judg. x.), and their valor is extolled in the song of Deborah. In the reign of Solomon, Naphtali was under the charge of Ahinnaaz, his son-in-law. The head of the tribe in David's time was Jerimoth ben Azriel. In the reigns of Asa, king of Judah, and Baasha, king of Israel, Benhadad, king of Syria, "sent the captains of the host which he had, against the cities of Israel, and smote all Cinneroth, with all the land of Naphtali" (I. Kings, xx. 20). About 730, Tiglath Pileser ravaged n. Palestine and carried off the population to Assyria, and the history of the tribe ends at this point.

NAPHTHALIC GROUP or SERIES. The starting point of the group is Napthallic acid, a substance of great interest in the history of organic chemistry, from its being that upon which Laurent chiefly founded his theory of substitutions. It may be obtained in various ways, but is most easily and abundantly produced from the last portions of the distillate of coal-tar, which become semi-solid on cooling. The liquid part of this mass is got rid of by pressure, and the naphthalin is then taken up by hot alcohol, from which it is obtained in a pure state by crystallization and sublimation.

Naphthalin crystallizes in large, thin, rhombic plates, which are atractious to the touch, and have a pearly luster. Exposed to light under a glass covering, it gradually sublimes at an ordinary temperature in splendid crystals. It has a somewhat tar-like odor, and a pungent and somewhat aromatic taste. It fuses at 174°, and boils at 429°. Its specific gravity, in the solid state, is 1.15, and as a vapor, 4.528. It is not very inflammable, and when ignited, burns with a white smoke and flame. It is insoluble in water, but dissolves readily in alcohol, ether, and the fixed and essential oils.

By acting on naphthalin with an excess of sulphuric acid, we obtain salpho-naphthalic acid \( \left( C_2H_4H_5S_2O_8 + 24a \right) \), from which, by substitution processes, a large number of compounds are produced. With nitric acid, naphthalin yields nitro-naphthalin \( \left[ C_4H_7H_4(NO)_{12} \right] \), binitro-naphthalin \( \left[ C_4H_7H_4(NO)_{12} \right] \), and trinitro-naphthalin \( \left[ C_4H_7H_4(NO)_{12} \right] \), the group \( NO \), or its multiples, being substituted for one, two, and three equivalents of the hydrogen of the naphthalin. The final product of the prolonged action of boiling nitric acid on naphthalin is a mixture of oxalic and naphthalic or phthalic acid; the reaction being shown by the equation:

\[
\begin{align*}
\text{Naphthalin} \cdot \text{Oxygen} \rightarrow \text{Naphthalic Acid} + \text{Oxalic Acid} \\
C_4H_7H_4 + O_{2,\text{a}} & \rightarrow 2\text{H}_2\text{C}_4O_6 + 2\text{H}_2\text{C}_4\text{H}_4O_6
\end{align*}
\]
This acid is also obtained by the continued action of nitric acid upon alizarin, which is an important fact, since it indicates a connection between naphthalin and the coloring matter of madder.

Laurent has discovered a very numerous series of substitution compounds formed upon the type of naphthalin, into the composition of which chlorine enters. They are of little practical importance although their investigation has exerted a remarkable influence upon the progress of organic chemistry.

NAPIER, Sir CHARLES, K. C. B., English admiral, was cousin to the hero of Scinde and the historian of the peninsula war. His father was the hon. capt. Charles Napier, R. N., second son of Francis, fifth lord Napier. He was born March 6, 1786, at the family seat, Merchiston Hall, in the co. of Stirling. At 13, he went to sea as a naval volunteer. In 1808, he received the command of the Berenice, 18 guns, and had his thigh broken by a bullet. He kept up a running fight, in his 18-gun brig, with the rearmost of three French line-of-battle ships, the D'Hautpoulit, which escaped from Guadeloupe; and was thus instrumental in her capture. This obtained him a post-capta
tivity; but being thrown out of active service, he served ashore as a volunteer in the peninsular army, and was wounded at Busaco. Commanding the Thames in 1811, he inflicted an incredible amount of damage upon the enemy in the Mediterranean, and also conducted several desperate land operations with marked success. In 1814, he was ordered to America, and led the way in the hazardous ascent and descent of the Potomac. He afterwards took an active part in the operations against Baltimore. In 1829, he received the command of the Galatea, a 42-gun frigate, and was employed "on particular service" on the coast of Portugal. Becoming acquainted with the leaders of the constitutional party, he accepted the command of the fleet of the young queen; and by defeating the Mignette fleet, he concluded the war, and placed Donna Maria on the throne. He was made admiral-in-chief of the Portuguese navy, and attempted to remodel it; but official and corrupt influence was too strong for him, and he returned to England. During the war between the Portuguese and Brazil, he conducted a fleet of twenty-one ships, of which he stormed Sidon, and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre, and did not hesitate to disregard the orders of his chief, admiral Stopford, when he saw the way to bring the battle to a speedy termination. He next blockaded Alexandria, and concluded a convention with Mehemet Ali. In 1847, he received the command of the channel fleet. When the Russian war broke out, he was sent out to command the Baltic fleet; but the capture of Bomarsund failed to realize the high expectations formed of Napier's exploits. He twice sat in parliament, and, until his death, Nov. 6, 1860, he labored with success to reform the British naval administration. He was at the time of his death a vice-admiral and a knight of several foreign orders.

NAPIER, Sir CHARLES JAMES, G. C. B., English gen., one of several brothers distinguished for their bravery, three of whom—Charles, William, and George—were known in the peninsular war as "Wellington's colonels." They were sons, by a second marriage, of hon. col. George Napier, grandson of Francis, fifth lord Napier, who was fifth in descent, but through two females in succession, from the inventor of Logarithms. Charles, the eldest, was born at Whitby, Westminster, Aug. 10, 1782. Before he had finished his twelfth year, young Napier received a commission in the 23rd Foot. His first service was in Ireland, where he assisted in putting down the rebellion. He commanded the 50th Foot during the retreat on Corunna; and, after the fatal battle in which six of his brothers were wounded, obtained a post of great responsibility in the late war, was made a baronet in the peerage, and was appointed to the post of commander in India. It was at this time that Marshal Ney dismissed him, with permission to go to England on parole. On his return, he engaged in literary work, and even wrote an historical romance. In 1811, he returned to the peninsula. At Cora, where he fought as a volunteer, he had two horses shot under him. At Busaco, he was shot in the face, having his jaw broken and his eye injured. He recovered in time to be present at the battle of Fuentes d'Onoro and the second siege of Badajoz. After distinguishing himself in innumerable skirmishes, the daring soldier returned to England. He next took part in a fighting cruise off the Chesapeake, capturing American vessels, and making frequent descents upon the coasts. He did not return to Europe soon enough for Waterloo, but was engaged in the storming of Cambray, and accompanied the army to Paris. After the peace he was, in 1818, made governor of the island of Ceylon, the affairs of which he administered with great energy and intelligence. Being, however, of an excessively combative disposition, he became embroiled with the authorities at home. In 1841 he was ordered to India to assume the command of the army at Bombay. This was the most splendid period of his career, resulting in the conquest of Scinde against terrible odds. His destruction of a fortification called Emmanuel Ghur in 1843, was described by the duke of Wellington as one of the most remarkable military feats he had ever heard of. The fearful battle of Meane followed, where Napier, with 1600 English and sepoys, defeated near 30,000 Beloochies, strongly posted, with the loss of 6,000 men. The Amiers surrendered, except Shere Mahomed, who brought 25,000 men into line of battle at Hyderabad. Napier had only 5,000 men, but in three hours his little army gained a decisive victory. A few days afterwards, Napier was in the palace of the Amiers, and master of Scinde. He was fortunate in possessing the entire confidence of lord Ellenborough, who made him governor of Scinde. His
civil administration was scarcely less remarkable or less successful than his military operations. He gained the respect and reverence of the inhabitants, but soon became engaged in an acrimonious war of dispatches with the directors. In 1847, he returned to England. After attending a series of festivals in his honor, he lived in retirement until the disasters of the last Sikh war caused the eyes of his countrymen to be turned to the hero of Scinde as the deliverer of our Indian empire. He went to India, but found on his arrival that the Sikhs had been routed. He now turned his attention, as commander-in-chief of the army in India, to the subject of military reform. He gave a final adieu to the east in 1851, and returned to his native country, where he resided until his death, which took place at his seat, at Oaklands, near Portsmouth, Aug. 29, 1853. He had then attained the rank of lieut. gen., was G.C.B. and coll. of the 22d Foot. It must be remembered to his honor that he was the first English gen., who ever recorded in his dispatches the names of private soldiers who had distinguished themselves, side by side with those of officers. Brave to rashness, ready alike with tongue, pen, and sword, quarrelsome with his superiors, but beloved by his soldiers, and, to crown all, of a strangely wild yet noble and striking appearance. Napier was one of the most remarkable men of his time, and in losing him the country lost one of its brightest military ornaments. His statue was, after his death, erected in Trafalgar square.

The story of his *Conquest of Scinde* has been written by his brother, lieut. gen., Sir William Francis Patrick Napier, K.C.B., born Dec. 17, 1885, who served in the peninsular campaign and was engaged from 1824 to 1840 in preparing his *History of the Peninsular War*, the greatest military history in the English language. He has also written *History of the War in Scinde*, *Campaigns in the North*, and was followed in a few weeks by the tomb at his wife, lady Napier, niece of the great C. J. Fox. Her extraordinary skill in translating French documents written in cypher, and her indefatigable labors as her husband's amanuensis, are touchingly commemorated in the preface to the edition of the *History of the Peninsular War*, published in 1851.

**NAPIER, John.** Laird of Merchiston, was b. at Merchiston castle, near Edinburgh, in 1530, and d. there on April 4, 1617. After attending the regular course in arts at the university of St. Andrews, he traveled for some time on the continent, and returned to his native country highly informed and cultivated for the age. Declining all civil employments, for which his many accomplishments eminently fitted him, he preferred the seclusion of a life devoted to literary and scientific study. From this time his history is a blank till 1593, when he published his *Plaine Dis Discovery* (or "interpretation") of the *whole Revelation of Saint John* (Edin. 5th ed. 4to, 1645), a work displaying great acuteness and ingenuity, but, it is scarcely necessary to add, not in any sense a "plaine discovery" of the apocalypse. In the dedication to king James VI. he gave his majesty some very plain advice regarding the propriety of reforming his "house, family, and court;" and on republishing the work he added a supplement, resolving "certaine doubts moved by some well affected brethren." About this time he seems to have devoted much of his time to the invention of warlike machines, but these inventions were never perfected, probably from motives of humanity. Like other eminent men of the time, Napier, though a strict Presbyterian, seems to have been a believer in astrology and divination, but there is no satisfactory proof that he ever practiced these arts. In 1596 he proposed the use of salt as a fertilizer of land, an idea which, though scouted at the time, is now generally received. Another large blank in his history here occurs, and terminates in 1614, at which date he first gave to the world his famous invention of logarithms (q.v.), in a treatise entitled *Mirifici Logarithmorum Canonis Descriptio* (4to, Edin.). This was followed by another work, *Rudagogia seu notations per Virginias libri duo* (Edin. 1617), detailing an invention for simplifying and shortening the processes of multiplication and division. See *Napier's Bones*. He also prepared a second work on logarithms, showing their mode of construction and application, with an appendix containing several propositions of spherical trigonometry, and those familiar which are now known by his name. This work was published after his death by his son Robert, under the title of *Mirifici Logarithmorum Canonis Constructio, etc.* quibus accessorie Proposiciones ad Triangula sphærica factiære calendo resolventa, etc. (Edin. 1619), and occurs along with the *Canonis Descriptio*. The latter work is included in baron Macvic's extensive collection, the *Scriptores Logarithmici* (Lond. 1808). Napier's eldest son, Archibald, was raised to the peerage as the first lord Napier by Charles I. in 1627, and his descendants still bear the title. Two lives of Napier have been published, the one by the earl of Buchan (1857), and the other by Mr. Mark Napier (1834).

**NAPIER, Macvey, 1776-1847:** b. Scotland: educated at the universities of Glasgow and Edinburgh. He was intended for the law, and served an apprenticeship with a member of the society of writers of the sig-", of which he afterwards became librarian. He was soon chosen by the society to fill a lectureship on conveying, newly established by the society, and soon after transferred into a professorship at the university of Edinburgh. In 1814 he was selected to edit the *Supplement to the Encyclopaedia Britannica*. He was to have edited a new edition of that work, but was prevented by the failure of his publisher, Constable of Edinburgh. In 1850, on the accession of the whigs, he was appointed principal clerk of session, and resigned his office of librarian. He had long been an occasional contributor to the *Edinburgh Review*, to the editorship of
which he succeeded upon the appointment of Jeffrey as dean of the faculty of advocates. Thereafter he wrote little himself, but he was a successful editor, and enjoyed the confidence of the many distinguished contributors to the *Review*.

NAPIER, Romer, 1791–1876; b. Scotland; son of a blacksmith, who sent him to a grammar school, where he learned, besides the ordinary English rudiments, French, Latin, and landscape drawing. After serving an apprenticeship with his father he went to Edinburgh, and afterwards to Glasgow, where, in 1815, he began the blacksmith’s business, with two apprentices. In 1823 he built his first marine engine, which was the beginning of a prosperity which gradually extended his works till they employed a force of 3,000 men. In 1830 he furnished the steamships for the Dundee and London shipping company: in 1839 he built the *Fire-King*, the fastest steamer then constructed, and in 1840 he supplied the Cunard company with their first four steamers. He received the great gold medal at the Paris exhibition in 1855.

NAPIER, The Right Hon. Sir Robert Cornelis, Baron Napier of Magdala, was b. in Ceylon, Dec. 6, 1810, and was educated at the military college at Addiscombe. He entered the Bengal engineers in 1826, served in the Sutlej campaign, was wounded while acting as chief engineer at the siege of Moultan, and had a prominent share in the battle of Gujerat. As chief engineer of the Punjab, with the rank of col., he greatly developed the resources of the country. During the Indian mutiny he was chief engineer in sir Colin Campbell’s army, and especially distinguished himself at the siege of Lucknow. For his services in the Chinese war of 1856 he was made maj. gen., and k.c.b. As commander of the expedition in Abyssinia in 1861 he achieved a brilliant success, both by his whole management of the short campaign and in the storming of Magdala, which ended it. On his return he received the thanks of parliament, an annuity of £2,000, and a peerage. In 1870 he was appointed commander-in-chief of the forces in India, and nominated a member of the Indian council. In 1877 he was made governor of Gibraltar.

NAPIER’S BONES, an invention of the celebrated Napier (q. v.) of Merchiston for the purpose of performing mechanically the operations of multiplication and division. The “bones” were narrow slips of bone, wood, ivory, or metal, about 3 in. long by \( \frac{3}{8} \) ths of an inch in breadth, and divided by transverse lines into nine compartments; each of these compartments being divided into two portions by a diagonal line running from the upper right hand to the lower left hand corners. The “bones” were divided into sets, all those of one set having the same digit occupying the top compartment, and the several multiples of that digit occupying in order the eight lower compartments; when the multiple consisted of two figures, these were placed one on each side of the diagonal line. There was necessarily a set of bones for each digit. There was also another rod similarly divided into compartments, in which were placed the nine digits; this was called the *index-rod*. Multiplication was performed as follows: e.g., if \( \times 738 \) is to be multiplied by 9584, four rods whose top digits were 6, 7, 9, 5 are selected and arranged in the order of the figures in the multiplicand, and the index-rod placed alongside them; the several figures of the multiplier are then sought for on the index-rod, the two lines of figures opposite each figure on the index are then added together diagonally, and the five sums thus obtained are arranged as follows:

\[
\begin{align*}
9 & \times 47565 \\
8 & \times 54360 \\
7 & \times 20835 \\
6 & \times 27180 \\
\hline
664720630 & = \text{the product required.}
\end{align*}
\]

Division is performed in an analogous manner. The contemporaneous invention of logarithms for the same purpose of converting multiplication and division into addition and subtraction caused Napier’s bones to be overlooked, and they are now scarcely ever used.

NAPIERVILLE, a co. in s.w. Quebec, Canada, on the Grand Trunk railroad; 152 sq. m.; pop. 70, 11,688. Co. seat, Napierville.

NAPLES, The Italian provinces (formerly kingdom) of Naples and Sicily, or the Two Sicilies, occupy the south end of the Italian peninsula, and consist of the continental territory of Naples and the insular dependency of Sicily. The distinctive physical features of Naples and Sicily are noted under the names of the different provinces of Italy and in the article Sicily. They are favored by nature with a salubrious and almost tropical climate, unbounded fertility, and teeming population; and they present natural features of rare attractiveness. The rural population are an acute, frugal, and laborious race, and form a strong contrast to their idle, and debased brethren of the towns. For statistics of products, exports, and population, see Italy and Sicily. Naples, in ancient times, was divided into numerous petty states independent of each other, and its inhabitants were of various races. Many of these states arose from Greek colonies, which had been founded in the country previous to the 7th c. B.C. The ancient historical importance of Naples is attested by the splendor of its cities, and the warlike renown of its population. On its conquest by the Romans, the great Neapolitan cities severally adopted the munici-
pal, federative, or colonist form of government, and gradually assimilated their laws and customs to those of their conquerors. After the downfall of the Western empire, Naples was seized by Odoacer, but soon afterward (490 A.D.) it was subjected by the Goths, and in the following century by the Lombards, who established in it various independent dukedoms, as Benevento, Spoleto, Salerno, Capua, etc. Most of these were overthrown by invading bands of Arabs, Saracens, and Byzantines, who were in turn expelled, and the whole country subdued by the Normans in the 11th century. The Normans subsequently erected Naples and Sicily into a kingdom, and established a new political, ecclesiastical, and military system. To the Norman dynasty succeeded that of the Hohenstaufen, whose rule was marked by an immense intellectual and social advancement of the people; but the vindictive enmity with which the papal see regarded this dynasty, led to the invasion of Naples by Charles of Anjou, who, notwithstanding the heroic resistance of King Manfred (q.v.), by the battle of Benevento (1266) annihilated the power of the Hohenstaufen. The ascendency of Charles of Anjou was further effectually secured by the treacherous defeat and decapitation (1269) of Conradin (q.v.), the last made heir to the throne. By the Sicilian Vespers (q.v.) the island of Sicily was, however, wrested in 1282 from his grasp, and became an appanage of the Spanish crown. The predominance of the Neapolitan Guelph or papal party during the glorious reign of Robert I., who was the patron of Dante and Boccaccio, the depraved libertinism of his heirs and granddaughter Joanna, the fearful ravages committed by predatory bands of German mercenary and by the plague, the futile attempts of the Anjou sovereigns to recover Sicily, and the envenomed fangs of rival claimants to the throne, are the leading features of the history of Naples during the rule of this dynasty, which expired with the croftliche Joanna II. in 1455; and was followed by that of Aragon, which had ruled Sicily from the time of the Sicilian Vespers. During the tenure of the Aragon race, various unsuccessful attempts were made by the house of Anjou to recover their lost sovereignty; and the country, especially near the coast, was repeatedly ravaged by the Turks (1480). In fact, after the death of Alfonso, the first ruler of the Aragon dynasty, the country groaned under a load of misery. Wars, defensive and offensive, were incessant, the country was impoverished, and a conspiracy of the nobles to remedy the condition of affairs was productive of the most lamentable results, both to the conspirators themselves, and to the other influential Neapolitan families. In 1495, Charles VIII., invaded Naples, and though he was compelled to withdraw in the same year, his successor, Louis XIII., with the treacherous assistance of Ferdinand (the Catholic) of Spain, succeeded in conquering the country in 1501. Two years afterward, the Spaniards under Gonsalvo de Cordova (q.v.) drove out the French, and the country from this time became a province of Spain. Sicily had previously (1479) been annexed to the same kingdom. During the two centuries of Spanish rule in Naples, the parliaments which had existed from the time of the Normans fell into desuetude, the exercise of supreme authority devolved on viceroys, and to their ignorance, rapacity, and oppressive administration may be solely ascribed the unexampled misery and abasement of this period. In the words of Simondi, "no tax was imposed save with the apparent object of crushing commerce or destroying agriculture, and the viceregal palace and the tribunals of justice became public offices in which the highest dignities and most sacred interests of the state were openly bartered to the wealthiest bidder." During the Spanish rule, a formidable rebellion took place in 1647, headed first by Massaniello (q.v.), and afterward by Henry V., duke of Guise: the whole population of the province renounced their allegiance to their Spanish sovereigns, but the arrival of a new viceroy, who was equal to the occasion, resulted in the capture of the duke of Guise and the re-subjugation of the country. At length, during the war of the Spanish Succession (q.v.), Naples was wrested from Spain by Austria in 1707, and Sicily in the following year; but while Naples was secured to Austria by the treaties of Utrecht (1713) and Rastadt (1714), Sicily was handed over to Savoy by the former treaty. In 1790, however, both Sicilies were reunited under the Austrian rule, and in 1792 were given to Don Carlos, third son of Philip V. of Spain, who ascended the throne as Charles I., and founded the Bourbon dynasty. His reign was marked by equity and moderation; great reforms were effected in the administration of public affairs, science and literature were encouraged, and splendid works of public utility were erected throughout the kingdom. It was during his reign that Pompeli and Herculaneum were discovered. His successor, Ferdinand IV., followed in the course of legislative reform; but on the proclamation of the French republic (1789), his states were invaded by a French army, and the kingdom of Naples was erected into the Parthenopean republic (1799). Ferdinand retired with his court to Sicily, and for a brief period enjoyed the restoration of his sovereign rights in Naples; but a second invasion by Napoleon (1806) caused in the proclamation of his brother Joseph Bonaparte as king of Naples; and on this latter assuming the Spanish crown in 1808, that of Naples was abandoned to Murat, brother-in-law of Napoleon. On the defeat and execution of Murat in 1815, the Bourbon monarch, Ferdinand IV., was restored. The liberal insurrectionary movements in Naples in 1821 and 1830 were the forerunners of the revolution of 1848; and in each case the party of progress was combated by the respective kings with ruthless severity, and perfidious concessions, to be canceled and avenged with sanguinary fury when the disarmed and cowed patriots were at the mercy of the sovereigns. See article GARIBALDI for the ultimate overthrow of the Bourbon dynasty in the kingdom of Naples.
and its subsequent annexation to the kingdom of Italy under King Victor Emmanuel; also articles Ferdinand II. and Italy. For the history of Sicily previous to its annexation to and during its various separations from Naples, see Sicily.

**Naples** (Ital. *Napoli*, ane. *Neapolis*), a city of southern Italy, capital of the province of Naples; is built partly at the base, partly on the slopes of two crescent-shaped acclivities on the famous bay of the same name. Pop. '72, 446,333. Lat. 40° 41' 8" n., long. 14° 15' 5" e. The wonderful beauty of the site and of the surrounding prospect, the delicious softness of the climate, and the clear atmosphere make Naples famed among the cities of the world. It is one of the chief centers of commerce and industry of Italy, possesses a very extensive mercantile shipping, and is one of the principal stations of Mediterranean steam navigation.

The public buildings of Naples are numerous and grand, but are devoid of architectural symmetry in consequence of the antiquity of their origin, and the irregularity of their site. Many of the old streets are paved with lava, and inconveniently narrow, with houses of great height. The modern streets, however, are spacious and splendid. The city is divided into the old and the new town, or the east and west crescents, by a lesser range of heights—viz., the Capodimonte, the St. Elmo, and the Pizzofalcone, terminating in the rocky promontory called the Castel dell'Ovo. In 1868 a land-slip destroyed a number of houses at the foot of Pizzofalcone. The eastern division of Naples is the most ancient and the most densely peopled; it contains the principal public structures, and is intersected by the splendid Via, or street, di Toledo. The western, or modern section, contains the famous Riviera di Chiaja, or the quay, a fine road running along the bay in a curved course of three miles, flanked on the right by a row of palaces, and bordered on the left by the beautiful pleasure-grounds of the Villa Reale, which lie between it and the sea, and of which the natural beauty is heightened by the interspersion of temples, fountains, and statuary groups amongst the acacia, myrtle, and orange groves. The public squares, or *largo* of Naples are adorned with fountains and obelisks; and within the precincts of the city there are several highly-prized springs both of fresh and mineral water. The fortified castles are numerous. Amongst the principal are the Castel Nuovo, called the Bastille of Naples, the Tower of London, and adorned with a fine triumphal arch, erected in honor of Alfonso of Aragon; the Castel dell'Ovo, so called from its oval or egg shape, standing on a promontory, and connected by a bridge with the mainland; the Castel Sant' Elmo, commanding a magnificent view from its ramparts, and formerly of immense strength; and the dismantled Castel del Carmine. The churches are upwards of 300, and many are rich in architectural and archaeological interest. The cathedral dedicated to St. Gennaro (Januarius; q.v.) contains the celebrated phials in which the liquefaction of St. Gennaro's blood is alleged to take place on two annual festivals; it also contains the tombs of Charles of Anjou and of Pope Innocent IV., besides numerous fine paintings and statues. The educational institutions of Naples embrace famous schools of surgery, law, and general science. A magnificent aquarium has been opened since 1871, with a zoological laboratory in which many distinguished foreign naturalists are at work. The philanthropical establishments for the education and re-education of the poor are also several. There are four grand theaters in the city, of which that of *San Carlo* (devoted to the opera) is one of the largest and most celebrated in Italy; but the characteristic theater of Naples is the *Teatro di San Carlo*, the headquarters of *Patriziello* ("the Italian Punch"). There are four grand public libraries; and in the Museo Borbonico, Naples contains an unrivaled collection of art, comprising frescoes, paintings, mosaics, sculptures, bronzes, antiquities, coins, medals, inscriptions, and the renowned collection of precious objects excavated from Heracleum and Pompeii.

The environs of Naples, apart from their extreme beauty of scenery, are highly interesting. The locality which contains the tomb of Virgil, the disinterred towns of Heracleum and Pompeii, Vesuvius (from an eruption of which Naples suffered in 1872), and the Roman remains, must possess an inexhaustible source of interest for scientific, antiquarian, and classical investigators. The modern villas of Naples are splendid and luxurious. One of the most striking features of Naples is its unique population and the peculiar methods by which the people are bestowed. There are also several thoroughfares, where an incessant throng of vendors, purchasers, and idlers intimately with asses, mules, hand-carts, and conveyances, dazzling the eye with their brilliant variety of costume, and the pantomimic expressiveness of their frantic gestures and attitudes; while the ear is stung by the shrill conflicting cries of the ambulatory vendors of every conceivable commodity, by the piercing notes of the improvisatore's song, and the uproarious hilarity and high-pitched paetios of the colorless masses, whose sole abode appears to strangers to be the thronged public squares and streets. The popular language of Naples, which is a corrupt dialect of Italian and Spanish, is in prevalent use among all classes of society; it lends itself especially to the satirical and facetious squibs and compositions in which the Neapolitans excel. The popular Neapolitan songs in the native patois are exquisitely naive and expressive in sentiment, and are set to popular melodies which exert a maddening charm over the southern populace. The physical condition of the lower classes of Naples and especially of the lazzaroni (q.v.), has of late years sensibly improved both as regards raiment and lodging.
The name Naples (Gr. Neapolis, new city) had reference to an older town in its neighborhood, called originally Parthenope, and, after the foundation of the new town, Paleopolis (old town), which was situated most probably on the ridge called Posilipo, that separates the bay of Pozzuoli or Baia from that of Naples. Both towns were Greek settlements, apparently colonies from the neighboring Cumae, joined by immigrants direct from Greece. In 327 B.C. Paleopolis was besieged and taken by the Romans, and thenceforth disappears from history; Neapolis submitted without resistance, and became a favored and faithfultly, or rather provincial city of Rome. It long, however, retained its purely Greek character and institutions; and there is evidence that the Greek language continued to be used, even in public documents, as late as the 3d c. of the Christian era. Naples was a flourishing and populous city during the Roman empire; and, notwithstanding the vicissitudes of the Gothic conquest of Italy, and the reconquests by the Byzantine emperors, it continued to be one of the most important and opulent places in Italy. About the 8th c. it threw off allegiance to the Byzantine emperors, remained independent till it fell into the hands of the Normans in 1140 A.D., and became the capital of the kingdom of Naples.

NAPLES. Bay of, an indentation of the Mediterranean sea on the s.w. coast of Italy, opposite the city of Naples, is 20 m. wide from cape Miseno on the n.w. to cape Campanella on the s.e., and from this line extends inland for about ten miles. The scenery is very beautiful. On the shores are many towns and villages; the prospect is bounded on the east by mount Vesuvius, and on the outskirts of the bay are the islands of Ischia and Capri.

NAPLES-YELLOW is a pigment used by artists. It consists of antimionate of lead, and is obtained by the direct combination of antimony acid and oxide of lead under the influence of heat.

NAPOLEON BONAPARTE, Emperor of the French, was b. at Ajaccio, in the island of Corsica, Aug. 15, 1769. (For an account of the family to which he belonged, see Bonaparte, FAMILY OF.) At the age of 10 he entered the military school at Brienne, as a king's pensioner. Here he remained five years and a half. During that period he displayed a great aptitude and predilection for mathematics, history, and geography, and an indifference to merely verbal and literary studies. His manner was somber and taciturn, but as Bourrienne (who was his schoolfellow) says, this arose chiefly from the circumstance that he was a foreigner, poor, and unaccustomed to the use of French, which he first learned at Brienne. In Oct., 1784, he proceeded to the military school to complete his studies for the army, and in rather less than a year obtained his commission as adjutant in the artillery regiment de la Fère. When the revolution broke out Napo- léon was in garrison at Valence. He took the popular side, but in a quiet and undemonstra-tive way, for he did not love the boisterous enthusiasm of unmanageable mobs. When the armed rabble of Paris poured out to the Tuileries on the famous 9th of June, 1792, Napoléon, who was then in the city, followed the "despicable wretch" (as he called them), along with his friend Bourrienne; he saw them force the poor king to stick the red cap on his head, and smile fatuously from the windows of his palace. "It is all over henceforth with that man," said the young officer, and returned to Paris graver and more thoughtful than Bourrienne had ever seen him. After the scenes of Aug. 10 he left for Corsica, where gen. Paoli held the chief command. The excesses of the Septemberists and terrorists, however, induced Paoli to throw off his allegiance to the convention, and to seek the assistance of England. Napoléon was active but unsuccess-ful in his opposition to the designs of the general, and was obliged, along with his relatives, to flee from the island.

He now petitioned the convention for employment, and was sent to assist in the reduction of Toulon, with the rank of lieut.en. of artillery. The city was captured (Dec. 19, 1793) entirely through the strategic genius of Napoléon, and in the following Feb- ruary he was raised to the rank of brig.gen., and placed at the head of the artillery in the army of the south. Later in the year he was sent to Genoa, to examine the state of the fortifications of the city, and to discover the political disposition of the inhabitants. In the beginning of 1795 he was again in Paris seeking active employment, and thinking, from sheer enmity, of transferring his services to the sultan of Turkey. The convention was now in great peril, on account of the mutinous spirit of the arrondissements of the capital, and, on the suggestion of Barras, Carnot, Tallien, and others, Napoléon was made commander of the troops provided for its defense. On the 15th Vendémiaire (Oct. 4, 1793) the national guard, 30,000 strong, attempted to force its way into the Tuileries, where the convention was sitting, but was routed and dispersed by a terrible cannonade directed by the young artillery officer. Napoléon was immediately appointed to the command of the army of the interior. About this time he made the acquaintance of Josephine Beauharnais, whom he frequently met at the house of Mme. Tallien. Cap- tivated by her elegant manners and amiable disposition, he proposed marriage to the graceful widow, and was accepted. The ceremony took place Mar. 9, 1796. A few days before he had been appointed to the supreme command of the army of Italy, and he was obliged to leave his bride almost at the altar. On his arrival he found the troops in a wretched condition. He had only 38,000 available men, and even these were half-starved and only half-clothed, to oppose to an Austrian and Piedmontese force of 75,000. Yet he
was not afraid to undertake the conquest of upper Italy. Leaving Nice at the close of March, he won his first victory over the Austrians at Montenotte (April 11), which opened the Apennines for him; three days later a second success at Millesimo separated the allied armies; and, finally, his victory at Monção (on the 23d) compelled Sardinia to impose peace. He now hoped to utterly crush the Austrian army under Beaulieu, and at the battle of Lodi (on May 10) nearly accomplished it. His opponent did not venture to defend the line of the Mincio, but hastily throwing a garrison into the city of Mantua, retreated into the Tyrol. Napoleon immediately entered Milan, and took possession of all the principal cities of Lombardy. Now began that system of enormous and inscrupulous plunder in northern and central Italy which gives something of a barbaric character to the conquests of the French. The directory gave orders that Napoleon should levy contributions from all the states which he had gratuitously freed, and according to his own account he sent to France not less than 50,000,000 francs. His officers and commissaries actually seized whatever they wished, provisions, horses, and all manner of stores; and because Pavia ventured to make some slight resistance to the shameful extortions of the republicans, Napoleon gave it up to havoc for 24 hours. A body of savans (including Monge, Berthollet, and others) were dispatched to Italy to superintend the spoliation of its artistic treasures; and both now and in the subsequent Italian campaign pictures, statues, vases, and MSS. were carried off in great numbers, to gratify the vanity of the Parisian sight-seers. In this way Lombardy, Parma, Modena, Bologna, and the states of the church were savagely harried before the end of June—Pope Pius VI., in particular, being forced to submit to conditions of extreme rigor.

Meanwhile Austria had resolved to make another effort for the recovery of Lombardy. About the close of July marshals Wurmser advanced from Trent at the head of 60,000 men, forced Napoleon to raise the siege of Mantua, but was himself defeated, with the loss of all his cannon, near Castiglione (Aug. 5), and again at Bassano (Sept. 8), in consequence of which he was driven to take refuge within the fortress of Mantua with some 16,000 troops—the shattered remains of his 60,000. Austria, however, was not disheartened. A third army was dispatched in two divisions: 30,000 from Carinthia, under marshal Alvinzi; and 20,000 from the Tyrol, under gen. Davodwich. This was a terrible campaign for Napoleon; his veterans were exhausted, his new supports had not arrived; he himself was despondent, while the Austrians were fresh and hopeful. At first the latter were completely successful; but the great victory of Arola, won by Napoleon (Nov. 17) after three days' fierce fighting, in which he lost nearly all his general officers, decided the fate of the campaign. His dispatches to the directory, penned about this period, show how thoroughly he apprehended the state of parties in Italy, and also how utterly indifferent he was to any considerations beyond those that advanced the interests of France. In Jan., 1797, a fourth campaign was commenced by Austria. At the head of 50,000 fresh troops, Alvinzi descended from the Tyrol, but was completely routed by Napoleon at Rovoli, on the 14th of the month; while, not long after, Wurmser was starved into surrender at Mantua. A fifth army was assembled on the Tagliamento, under the command of the archduke Charles, but his troops were mainly raw recruits, while those of Napoleon were inured to war and flushed with innumerable triumphs. In consequence he was forced to retreat, which, however, he did slowly and in good order, hoping to surround his opponent in the interior of the country. Napoleon's design was to march on Vienna, and he actually penetrated as far as Judenburg, in upper Carniola. But during the first desperate charge of the French, the city's length was seized with alarm, made overtures of peace, and finally on Oct. 17, 1797, the famous treaty of Campo Formio was signed, by which Austria ceded the Netherlands, Lombardy, and some other smaller territories to France; while she herself obtained in return, through disgraceful treachery on the part of the victor, possession of the province of Venice. It is generally said that Napoleon's military genius was never more brilliantly displayed than in these early Italian campaigns. In ingenuity of plan, celerity of movement, audacity of assault, he far outshines all his adversaries; it is, moreover, but just to him to state, further, that he made desperate efforts to stop the excesses of the most scoundrelly commissariat in Europe; and that while in the main he showed no hesitation in carrying out the brigand-like orders of the directory, he does not appear to have appropriated a single penny to himself. It was power, not gold, that he cared for.

In Dec., 1797, Napoleon returned to Paris, where he was received with the utmost enthusiasm. At this time there was much talk, and probably some vague design, on the part of the directory, of invading England, and Napoleon was appointed commander-in-chief of the invading army. It has been thought, however, that this was merely a feint to mask the real design of the directory; viz., the invasion of Egypt, as perhaps a preliminary step to the conquest of British India. Be that as it may, an expedition against Egypt was resolved on by the directory; and on May 19, 1798, Napoleon sailed from Toulon, with a fleet containing 30,000 soldiers and a body of savans to investigate the antiquities of the country. He reached Alexandria on June 29. At this moment France was at peace with Turkey; the invasion of Egypt, a Turkish dependency, was therefore an act utterly unjustifiable, and reminds us not of European warfare, but rather of the irruption of a horde of barbaric Tartars. Napoleon, having landed his troops, captured Alexandria and marched on Cairo. The Mamelukes prepared resistance: but on July 21, at the battle of the pyramids, they were completely defeated, and the French became,
in a surface-way, masters of Egypt. Napoléon now entered the capital, and immediately commenced to reorganize the civil and military administration of the country; for he took a great, but also an ostentation, pleasure in this sort of work. Meanwhile, on Aug. 2, Nelson had utterly destroyed the French fleet in Aboukir bay, and so cut off Napoléon from communication with Europe. A month later the sultan declared war against him. This was followed by disturbances in Cairo, which were only suppressed by horrible massacres. It was obviously necessary that Napoléon should go somewhere else. He resolved to meet the Turkish forces assembling in Syria; and in Feb., 1799, according to his decision, he led the army of Morea, under Murat, on the 10th of March, where he made resistance on the part of the Turks, marched northwards by the coast, and reached Acre on the 17th. Here his career of victory was stopped. All his efforts to capture Acre were foiled through the desperate and obstinate valor of old Djezzar Pasha (q.v.), assisted by sir Sydney Smith with a small body of English sailors and marines. On May 21 he commenced his retreat to Egypt, leaving the whole country on fire behind him, and re-entered Cairo on June 14. It was during his absence that the savans made their valuable researches among the monuments of upper Egypt. About the middle of July the sultan landed a force of 18,000 men at Aboukir, who were attacked by Napoléon on the 25th, and routed with immense slaughter. But the position of the victor was far from comfortable, and he therefore resolved to return to France—especially as news had come to him of disasters in Italy and confusions in Paris. On Aug. 23 he sailed from Alexandria, leaving his army behind him under the command of Kleber; and after narrowly escaping capture by the English fleet, landed near Frejus on Oct. 9. He hastened to Paris, soon mastered the state of affairs, threw himself into the party of Sieyès, and overthrew the directory (q.v.) on the famous 18th Brumaire. A new constitution was drawn up, chiefly by Sieyès, under which Napoléon became first consul, with the power of appointing to all public offices, of proposing all public measures in peace or war, and the entire command of all administrative affairs civil and military. In a word, he was ruler of France; and though far from satisfied with the clumsy machinery of Sieyès's plan, he could afford to wait the future. About the end of Jan., 1800, he took up his residence in the Tuileries. The country was tired of revolutions, discords, and confusions; it was proud of its young leader, who seemed inspired but not enslaved by the ideas of his age, and who knew how to enforce obedience as well as to panegyricize principles. If therefore he disregarded his assumption of sovereign power with positive satisfaction, Napoléon displayed extraordinary vigor as an administrator, recruited the national treasury by various sagacious expedients, repealed the more violent laws passed during the revolution, such as punishment for matters of opinion, reopened the churches, and terminated by policy the Vendéan struggle. But he knew well that his genius was essentially military, and that his most dazzling and influential triumphs were those won on the battle-field. France was still at war with Austria, and he resolved to renew the glories of his first Italian campaigns. Leaving Moreau in command of the army of the Rhine, he assembled, with wonderful rapidity and secrecy, an army of 36,000 men on the shores of the lake of Geneva, and on May 13 (1800) began his magnificent and daring march across the Alps. Almost before the Austrian general, Melas, was aware, Napoléon had entered Milan (June 2). Twelve days afterwards was fought the fiercely contested yet decisive battle of Marengo, which compelled the Austrians to resign Piedmont, with all its fortresses, and (for the second time) Lombardy to the French. Later in the year hostilities were recommenced; but the Austrians, beaten by Moreau in Germany (at Höhenlinden, etc.) and by Napoléon in Italy, were at last forced to make peace; and on Feb. 9, 1801, signed the treaty of Lunéville, which was mainly based on that of Campo Formio. In the course of the same year France and England also made peace; but the treaty (known as that of Amiens) was not definitively signed till Mar. 27, 1802. Not less important for the consolidation of affairs in France was the famous concordat (q.v.) between Napoléon and Pope Pius VII., also concluded in 1801. In Jan., 1802, Napoléon became president of the Cispéline republic; and on Aug. 2 following was declared consul for life by a decree of the French senate. Meanwhile Napoléon was busy superintending the drawing up of a code of civil laws (the Napoleonic code) for assembly of the lawyers in the nation, under the presidency of Cambrières, and frequently took part in their deliberations; the results of their labors were the code civil des Français, code de procédure, code penal, and code d'instruction criminelle, besides commercial and military codes, all of which often go loosely under the name of the code Napoléon. The first of these is an admirable production, and is in force to the present day. Considerable attention was besides paid to such branches of education as were likely to promote efficiency in the public service. Mathematics, physical science in all its departments, engineering, etc., were as vigorously encouraged as philosophy, ethics, and political speculation were discouraged. But the best proof that Napoléon wanted not an educated people, but only active and expert tools and agents, was the indifference that he manifested to primary and elementary education. In a population of 32,000,000, the number of pupils under 10 years is given by Donceray at only 75,000. The internal government was the acme of despotic centralization. Napoléon appointed all the agents of department, and made no attempt to vestige of provincial or municipal freedom remained. He ruled France as he ruled the army of France, and was already an emperor in almost everything but the name.
Peace between France and England did not last long. Napoléon's policy in Italy irritated the British government, and, as remonstrances were ineffectual, war was declared against France May 18, 1806. The English fleet secured the seas, paralyzing the commerce of France; while Napoléon threatened to invade England, and assembled a large army at Boulogne. So utterly did he misconceive the character and condition of Englishmen that he felt sure (by his own statement) he should be welcomed as a liberator by the people. While these warlike preparations were going on occurred the dangerous conspiracy of the French chief, George Claudel (q.v.), Pichegru (q.v.), Moreau (q.v.), and others. Its discovery (Feb., 1804) alarmed Napoléon excessively, and led to what has been considered one of the blackest deeds in his career—the murder of the duke d'Enghien (q.v.) on Mar. 20 following. He now appears to have felt it necessary to assume the title of emperor. France, he alleged, wanted an empire as a symbol of permanent security. An appeal was made to the nation. Upwards of 3,000,000 votes were given in favor of the proposed change in the form of government; only 3,000 or 4,000 against it. But where there is no municipal freedom, one does not know what value to put on votes. On May 18 Napoléon assumed the title of emperor at St. Cloud, and was crowned by, or rather in the presence of the pope (for Napoléon rudely crowned himself), on Dec. 2. In the following summer (May 26), he was also crowned king of Italy, in the great cathedral of Milan; and Eugène Beauharnais, his step-son, was appointed to the office of vice-roy.

This policy of aggrandizement, which set at naught the conditions of the treaty of Lunéville, alarmed the other nations of Europe, especially Austria, who saw her Italian possessions seriously threatened. In 1805 a coalition was formed between England, Russia, Austria, and Sweden, mainly through the persevering policy of the first of these countries; and war again broke out in the month of September. Napoléon acted with amazing celerity. Concentrating his widely scattered forces at Mainz, he marched at once across Bavaria, compelled Gen. Mack to capitulate at Ulm with 20,000 men (Oct. 17), and on Nov. 13 entered the capital of Austria. France was electrified; the rest of Europe was thunder-struck. But a more glorious triumph was yet to come. The Russian army was already in Moravia, under the immediate command of the emperor Alexander I., and was there being joined by the scattered Austrian troops. Napoléon did not lose a moment. Hurrying north, he gave battle to the allies at Austerlitz on Dec. 2. The contest was tremendous, but the victory was complete. Napoléon's opponents were utterly crushed; and next day the Austrian emperor sought an interview, and signed the Treaty of Presburg on Dec. 26, by which Austria ceded to France all her Italian and Adriatic provinces; other changes effected by it were, the dissolution of the old German empire and the formation of the confederation of the Rhine (q.v.).

In Feb., 1806, a French army conquered Naples, and the crown was conferred by Napoléon on his brother Joseph; in the following June another brother, Louis, was made king of Holland. Prussia now, when it was too late, assumed a hostile attitude. She had hung out, partly through fear and partly through selfishness, from the great anti-French coalition of the previous year, and now, when circumstances were almost hopelessly adverse, she madly rushed against her colossal enemy. Austria, with more magnanimity than prudence, lent her help, but the star of Napoléon was still in the ascendant. The battle of Jena (Oct. 14) absolutely annihilated the power of Prussia; five days later Napoléon entered Berlin, whence he issued (Nov. 21), his celebrated edicts, against British commerce, hoping to ruin her by shutting off her ships from every harbor in Europe. His expectations, it need hardly be said, were disappointed. His policy well-nigh ruined the commerce of his own and other countries, but it only increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be got from the colonies save through her, and the merchants of the continent were obliged—in order to supply their customers as before—to let her carry on a vast contraband traffic. See ORDERS IN COUNCIL.

After the capture of Berlin, Napoléon proceeded northwards to encounter the Russians, who were advancing to the help of Prussia. On his way he summoned Poland to rise, but only with partial success. At Pultusk (Dec. 18, 1806) and at Eylau (Feb. 8, 1807) the French were beaten and driven back on the line of the Vistula; but after some months he received heavy re-enforcements, and on June 13 fought and won the great battle of Friedland, which led to the treaty of Tilsit, signed on July 7. By a secret article of this treaty, Russia promised to close her ports to British vessels. It is important to observe here that, as the military triumphs of Napoléon increased, the civil and political liberties of his subjects diminished. Consequent on the treaty of Tilsit, a decree of the imperial senate abolished the tribunate—the only political body in France that preserved the semblance of national self-government. In August, Napoléon created his brother Jerome sovereign of Westphalia—having patched up a kingdom for him in his usual unscrupulous way—and soon after entered on a war with Portugal—the beginning of the great peninsular war. The occasion of the war was the refusal of the prince-regent of Portugal to carry out the Berlin decree in regard to British shipping. In Mar., 1808, occurred that extraordinary instance of trepanning at Bayonne by which the whole royal family of Spain fell into the hands of Napoléon; and in the following July his "dearly beloved brother" Joseph was ordered to exchange the throne of Naples
for the "crown's of Spain and the Indies." His successor was the "handsome swordsman" (beau sabreur), Joachim Murat. Spain rose in insurrection, and an English force, under Sir John Moore, was dispatched to its assistance. Napoleon invaded the country about the close of October, defeated the Spanish forces, and captured Madrid (Dec. 4). But his presence was urgently needed elsewhere, and he was forced to let Soult and other generals conduct the war in southern France. Austria remained neutral, and Napoleon, in consequence, entirely abandoned his two-pronged policy, especially in Italy (where he had seized Tuscany and the states of the church), once more prepared for war, which broke out in the spring of 1809. Her army of Germany, commanded by the archduke Charles, was in splendid condition; but still fortune was adverse. Napoleon hurried into Bavaria, routed the archduke at Eckmühl (April 22), compelled him to retreat into Bohemia, and on May 12 entered Vienna for the second time. But the struggle was not over. The archduke rallied his scattered forces, worsted Napoleon in the terrible conflicts of Aspern and Essling (May 21 and 22), and drove him to take refuge for a time on an island of the Danube. The battle of Wagram (July 6), however, once more prostrated, or at least intimidated, Austria; and on Oct. 14 she signed the peace of Schönbrunn.

Napoleon appears to have now come to the conclusion that he could only put a stop to the hostile machinations of the old legitimate dynasties by intermarrying with some one of them. Besides, his wife Josephine had no children, and he was ambitious of perpetuating his power in his family. With that curiousness to everything except his own interests, which is a prominent feature of his character, he immediately proceeded to divorce her. The act of divorce was solemnly registered on Dec. 16. Less than three months afterwards he married Marie Louisa, archduchess of Austria. He was now at the zenith of his power, and so, according to the old Greek belief, Nemesis was on his track. What caused his ruin was really that outrage on civilization, the Berlin decrees. Russia found it impossible to carry it out, without permanent injury to her great landowners; Sweden and other countries were in a similar predicament. This led to evasions of the decree, and these, again, involved Russia particularly in further complications, until finally, in May, 1812, Napoleon declared war against her, and opened the spirit of the act of his most prudent counselors, resolved to invade the country. Every one knows the dreadful history of the Russian campaign. Napoleon—wringing contingents from all his allies, Germans, Austrians, Italians, Poles, and Swiss—concentrated between the Vistula and the Nienau an army of half a million of men. The vast horde crossed the latter river (June 24 and 25) in three divisions, captured Wilna (June 28), and ravaged Lithuania. The Russian generals retreated before the invading host, deliberately wasting the country and carrying off the supplies, but avoiding, as far as possible, all engagements; their design being to surround Napoleon in the heart of the country, and by the help of famine and the rigors of a northern winter to annihilate him in his hour of weakness. Napoleon followed up the retreating foe with reckless resolution. He risked everything upon the chance of striking some overwhelming blow. The horrors of his march—in Lithuania alone 100,000 dropped off (dead, sick, or captured by the swarms of Cossacks that hung upon his flanks)—are too familiar to require description. When he reached Smolensk (Aug. 19), the Russians had just left it—on fire. Three weeks or so later he made up on the enemy at Borodino, where an obstinate and bloody battle was fought (Sept. 7). The French remained in possession of the field, but of nothing else. A week after Napoleon entered Moscow, hoping to find rest for a time in the ancient metropolis of the country. But the city was deserted by its inhabitants; and on the 16th a fire broke out, which raged till the 19th and left Moscow a heap of ruins. After five weeks' stay, Napoleon was obliged to commence his retreat (Oct. 19). His army was reduced to 150,000 men. The winter set in much earlier than usual, and he had to return through the very districts which had been wasted on his advance. When he left Smolensk (Nov. 14), he had only 40,000 fighting-men; when he crossed the Beresina (Nov. 26 and 27), he had not more than 25,000. With the excuse—which was in itself no doubt, and indeed his presence was urgently needed in France, he now abandoned the miserable remains of his army; and on Dec. 5, leaving Murat in command, set out in a sledge for Paris, where he arrived on the 18th of the same month. He instantly set about a fresh conflagration; and in the spring of 1813 marched into Germany at the head of 250,000 men; but the Russian campaign had broken the spell of terror which his name had till then exercised. The spirit of all Europe was thoroughly roused. A conviction was, somewhat unconsciously, seizing every mind (at the close of the campaign of 1814 even France shared it) that the world had had "enough of Bonaparte" (assez de Bonaparte), Prussia, in particular, was burning to wipe out the disgrace of Jena and all the bitter humiliations to which she had been subsequently subjected. The victories of the British in Spain, the fame of which was spreading all over the continent, also proved to her that French soldiers could be beaten, not once or twice only, but through whole campaigns. An alliance was formed between the king of Prussia and the emperor Alexander. At first Austria remained neutral, but afterwards she joined the coalition. Napoleon's military genius, it has been often remarked, never showed to greater advantage than in this and the next campaign, which cost him his crown and his liberty. He was for some months successful in winning battles—at Lützen (May 2), Bautzen (May 21), and Dresden (Aug. 24, 25, and 27); but the invincible temper of the allies, who knew that he was playing his last card, made these victories almost fruitless. They were convinced that
one grand defeat would neutralize all his triumphs. This was inflicted, after several minor defeats, at Leipzig—the great battle of nations, as it has been called (Oct. 16, 18, and 19). The result justified their expectations—Napoleon was hopelessly ruined! He commenced his retreat towards France, followed by the allies. When he recrossed the Rhine, he had only 70,000 or 80,000 men left out of his 350,000. All the French garrisons in the Prussian towns were compelled to surrender. Napoleon appeared at Paris Nov. 9; and though great discontent prevailed in the country, and a spirit of opposition showed itself even in the legislative body, the senate decreed, at his bidding, another conscription of 300,000 men, with which Napoleon began, in Jan., 1814, to attempt to drive the allies out of France. The skill and energy which he displayed were extraordinary, but they only marked the intensity of his despair. On Mar. 26 the allied forces captured, after a severe engagement, the fortifications of Paris; next day the emperor Alexander and the king of Prussia entered the city, and the shouts of the populace; on April 4 Napoleon abdicated at Fontainebleau. He was allowed to retain the title of emperor, with the sovereignty of the island of Elba, and an income of 6,000,000 francs, to be paid by the French government. A British ship conveyed him to Elba, where he arrived on May 4.

After a lapse of ten months, most of which was spent in intrigues, Napoleon made his escape from the island, landed near Frejus on Mar. 1, 1815, and appealed again to France. The arm in went over to him in body, and several of his marshals, but the majority remained faithful to Louis XVIII. On Mar. 26 he reached Paris, reassumed the supreme power, promised a liberal constitution, and prepared once more to try the fortune of battle with the allies. At the head of 125,000 men, he marched (June 15) towards Charleroi, on the Flemish frontier, where the English and Prussian forces were assembling. The duke of Wellington, who, the year before, had completed the deliverance of Spain, was appointed by the congress of Vienna commander-in-chief of the armies of the Netherlands. The campaign lasted only a few days. On the 16th Napoleon defeated the Prussians, under marshal Blucher, at Ligny, which compelled Wellington to fall back on Waterloo, where, on the 18th, was fought the most memorable and decisive battle of modern times. It resulted in the utter and irrevocable ruin of Napoleon. The despot, who knew what awaited him—for France had not recalled him from Elba; he came at the desire of a faction, whose interests were identical with his own—to Paris. The house of representatives fiercely insisted on his abdication. He held so (June 22) in favor of his son, Napoleon II.; they further demanded that he should leave the country forever, and he retired to Rochefort, with the design of embarking for the United States. On July 7 the allies again entered Paris, and refused to acknowledge the acts of the French provisional government. Napoleon, who saw that he could not escape either by sea or land, voluntarily surrendered (July 15) to capt. Maitland of the Hellephant, claiming the protection of British laws. It was, however, resolved by the British government to confine him for life on the islet of St. Helena, a lonely rock in the southern Atlantic, 1000 miles from the coast of Africa. He was conveyed thither by admiral Cockburn, and landed at St. Helena Oct. 16, 1815. The remainder of his life was politically insignificant. His chronic quarrels with his governor—or jailer, as the French prefer it—sir Hudson Lowe; his conversations with friends and visitors about his past career; his deliberate attempts to falsify history in his writings, are familiar to every one. After more than a year of bad health, he expired, May 5, 1821. He was buried with military honors. In 1840 his remains were removed to France, and deposited in the Hôtel des Invalides.

NAPOLÉON II., son of Napoléon Bonaparte. See Reichstadt, Duke of.

NAPOLÉON III., nephew of Napoléon Bonaparte. See Louis Napoléon.

NAPOLÉON, or, in full, Napoléon Joseph Charles Paul Bonaparte, is the son of Jerome, king of Westphalia, and was b. at Trieste in 1822. When the insurrection broke out in the Romagna in 1831, he was staying in Rome with his grandmother, Mme. Letitia Bonaparte, but was forced to leave the city for Florence on account of his cousins (see Louis Napoléon) being implicated in the revolutionary disturbances. He was educated at a boarding-school in Geneva, and at the military school of Ludwigsburg, in Württemberg, completing his studies in 1840, after which he traveled for five years in Germany, England, and Spain. In 1845 he obtained permission to visit Paris under the name of the comte de Montfort; but his relations with the democratic party and his advanced political opinions rendered him suspected by the government, who ordered him to quit the country. He, however, again made his appearance on the eve of the revolution of Feb., 1848. After the fall of Louis-Philippe he offered his services to the provisional government, and was elected by the Corsicans a member of the constituent assembly, where he voted with the moderate republicans. He held for a short time, in 1849, the office of minister- plenipotentiary at Madrid. After the coup d'état he withdrew into private life; but on the restoration of the empire he reappeared to share in the honors that now fell thickly on his family. By a decree of the senate, Dec. 23, 1853, he was pronounced a French prince, with the right to a place in the senate and the council of state; at the same time he received the insignia of the grand cross of the legion of honor; and—though he had not served—the rank of gen. of division. In the Crimene war he commanded a division of infantry reserves at the battles of Alma and
Napoleon, Narcissus.

Iakerman, but soon after returned to France, on the plea of ill-health. Napoleon was president of the imperial commission of the Paris exhibition in 1855. In 1858 he was appointed head of the ministry for Algiers and the colonies, but held the office only for a short time. During the same year he married the princess Clothilde, daughter of Victor Emmanuel, and in the Italian war of 1859 commanded the French army of reserve in the south of Italy, but was not engaged in actual hostilities. In 1861 he made a speech in the senate reflecting on the Orleans family, for which he was challenged by the duc d'Amade. The challenge was not accepted, much to the disgust of the French army. Napoleon was president of the French commission at the London exhibition of 1851. In 1865 he resigned several public appointments, owing to a reprimand from the emperor about a speech. Afterwards, however, he was intrusted with many delicate missions, and urged the emperor to a liberal policy. In 1876 he was returned to the French assembly for Corsica, but in the election of 1877 was rejected. The death of the prince imperial in Zululand in 1879 gave Napoleon and his sons a more prominent position in the Bonaparte family.

NAPOLEON-VENDEE, Bourbon-Vendée, or La Roche sur Yon, a t. of France, the capital of the department of Vendée, pleasantly situated on a hill on the right bank of the Yon, 37 m. s. from Nantes. The town has no manufactures and little trade, but derives its importance chiefly from its being the seat of departmental administration. The town contained only 800 inhabitants when Napoleon I. selected it for the capital of the department, granted great sums for its improvement, and called it Napoleon-Vendée, changed to Bourbon-Vendée at the restoration of the Bourbons, the former name coming again into use under Napoleon III. It is now known as La Roche sur Yon. Pop. 76, 9,021.

NAPOLI DI ROMA. See NAUPLIA, ante.

NARA, the ancient capital of Japan during the reign of seven mikados, four of whom were women. This most interesting town lies 29 m. e. of Osaka, and contains a pop. of 21,000—one-tenth of its former number. From 708 to 782 Nara was the national seat of art, letters, religion, and government, being visited by envoys from China, Siam, India, and Corea. Libraries, monasteries, and temples flourished. Among the relics of the past extant are the monster bell, 13 ft. high, 9 ft. in diameter, 8 in. in thickness, and weighing 36 tons; and the colossal gilded bronze image of Buddha, 54 ft. high. The industries of Nara in the manufacture of fans, silk, lacquer, cloisonne enamel or porcelain, etc., are still famous. Mikasa Yama (the hill of the three hats), near by, is a natural feature, famous in native poetry and art, being frequently depicted on fans, cabinets and scroll paintings.

NARADA is the hell of the Hindus. Manu (q.v.) enumerates 21 hells or divisions of Naraka, and gives a general description of the tortures which await the impious there. The Puranas, however, are more systematic. The Vishnu-Purana, for instance, not only names 28 such hells, but distinctly assigns each of them to a particular class of sinners. Thus a man who bears false witness is condemned to the hell Ravana (i.e., fearful); the murderer of a Brahman, stealer of gold, or drinker of wine, goes to the hell Sātovra (i.e., swine), etc. Besides these twenty-eight which the Purana knows by name, we are told of "hundreds and thousands of others in which sinners pay the penalty of their crimes."

NARBONNE, a t. in the s. of France, in the department of Aude. 55 m. s.w. of Montpellier, on a branch (La Robine) of the canal du Midi. It is the Narbo Martius of the Romans; but there is reason to believe that it was well known to the Greeks 500 years before the Christian era. It was colonized by the Romans 118 B.C., and probably got the designation Martius from Q. Marcus Rex, one of the consuls at the time. Situated only about 8 m. from the sea, on the direct road into Spain and into the basin of the Garonne. Narbonne was in early times a place of great commercial prosperity. It was the second settlement founded in south Gallia by the Romans, and was considered by them an important acquisition, both for its strength and as the key to the road into Spain. Under Tiberius it flourished greatly, the arts and sciences being cultivated with success, and its schools rivaling for a long time those of Rome. About 309 A.D. it became the capital of Galia Narbonensis, and contained among other buildings a capital, theater, forum, aqueducts, triumphal arches, etc. It was taken in 719 by the Saracens, who planted here a Moslem colony, and destroyed the churches. In 859 it fell to the arms of the Northmen. During the 11th and 12th centuries it was a flourishing manufacturing city, but subsequently it fell into comparative decay, and is now entirely destitute of any monument of its former splendor. A considerable number of architectural fragments—as capitals, marble slabs with inscriptions, friezes, etc.—have been found, and have been grouped into a collection of antiquities. The present very dirty town contains one imposing building, the cathedral of St. Just, founded in 1271, but still unfinished. The honey of Narbonne is the best in France, both for color and flavor. Manufactures are carried on to some extent. Pop. 76, 18,925.

NARCISSUS, according to a Greek fable, was the son of the river god Cephissus and of the nymph Liriope or Lirissa of Thespiae, in Boeotia. He was a youth of extraordinary beauty, of which he was excessively vain; and for this he was punished by
Narcissus, a genus of plants of the natural order amaryllidaceae, having a perianth of six equal petal-like segments, and a bell-shaped corona of various magnitude. The species are natives of the s. of Europe, the n. of Africa, and the temperate parts of Asia. The common daffodil (q.v.) is the only one which can be regarded as truly a native of Britain. Many are cultivated in gardens for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of daffodil (q.v.) and jonquil (q.v.). The name narcissus is popularly restricted to those which have flat—not rush-like—leaves, and a short, not bell-shaped corona. Of these, one of the best known is the poet's narcissus (N. poeticus), with generally one-flowered scape, the flower white and fragrant, the corona with a deeply-colored border; others, with one or two flowers on the scape, are in common cultivation.—The Polyanthus Narcissus (N. Tazetta) has a number of flowers on the scape. It grows wild in stony places near the Mediterranean and eastwards to China. Many varieties of it are in cultivation. It is not only grown in gardens and green-houses, but in water-glasses, like the hyacinth. It is very common in gardens in India, where it is highly esteemed as a flower. "The narcissi in general are propagated either by seed, or by offset bulbs. They succeed best in a rich light soil.

Narcotics (Gr. ναρκη, stupe) are remedies which, in moderate doses, lessen the action of the nervous system. Their full operation is sleep or coma. Opium is the type from which most descriptions of this class of medicines have been drawn; but although most narcotics more or less resemble opium in their action, almost every one presents some peculiarity in the way in which it affects the system. These medicines are primarily stimulating, especially when given in small or moderate doses; but this stage of their action is comparatively short; and when the dose is large the excitement is scarcely perceptible. Their power of inducing sleep has procured for them the names of hypnotics and sedatives; while many of them are termed narcotics, from their possessing the property of alleviating pain. Next to opium, henbane, Indian hemp, and acouite may be regarded as the most important narcotics. It has been already mentioned that there are differences in the mode of operation of the different members of this class. "Some dilute, while others contract the pupil; some appear to concentrate their sedative action more particularly upon the functions of the encephalon, others upon the contractile power of the alimentary and bronchial tubes, while a strict distinction is to be drawn between those which occasion constipation and those which do not; all these things being of great practical importance."—Ballard and Garrod's Elements of Materia Medica, p. 13.

Narcotics are usually administered either with the view of inducing sleep or of alleviating pain or spasm. As, however, their action is much modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution; and, as a general rule, only under competent advice. The various quick delivery medicines for the sick which are known as calmatives, soothing mixtures, etc., contain some form of opium, and are a fertile cause of the great mortality that occurs in early life, especially among the poorer classes.

It is almost unnecessary to add that all the narcotics when taken in excess are poisonous.

Narcotine (C₁₆H₂₄NO₁₁+2Aq) is one of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 or 8 per cent. It is nearly insoluble in water, but dissolves readily in alcohol, ether, and chloroform. Its ethereal solution, when submitted to spontaneous evaporation, yields it crystallized in colorless acicular groups or in rhombic prisms. A mixture of concentrated sulphuric and nitric acids produces a blood-red color with narcotine and its compounds. Narcotine possesses very slight alkaline properties; its salts do not readily crystallize, and are even more bitter than those of morphia, although the substance itself is almost tasteless. When first discovered (in 1803), it was supposed to be the stimulating principle of opium; but in reality it possesses very little activity. It has been prescribed in gradually increased doses up to a scruple, without the least injury. Its sulphate has been used in India as a substitute for quinine; and nearly 200 cases of intermittent and remittent fevers, treated by it with success, have been published by Dr. O'Shaughnessy.

Nardo and Nardos Tachys. See Spikenard.

Nardo (anc. Neretum), a t. of South Italy, in the province of Lecce, 8 m. n.n.e. from Gallipoli. Nardo has manufactures of cotton goods and snuff, from cotton and tobacco grown in the neighborhood. The surrounding country abounds in olive plantations. Pop. about 8,500.

Nardos, Marsilia crassifolia, a plant of the acotyledonous natural order marisicaceae (q.v.), the only plant of that order which is used in any way by man. It has but recently become known to botanists. It is found in Australia, and affords important supplies of food to the natives of some regions; it has also been of great use to some recent exploring-
It grows in places occasionally covered with water; vegetating while moisture abounds, and then exhibiting abundance of green clover-like foliage, the leaves consisting of three leaflets at the top of a stalk some inches in length. When the water dries up the remains of the plants are often covered with dried mud. It is then that the spore-cases are gathered for food. They are oval, flattened, about an eighth of an inch in length, hard and horny, and requiring considerable force to pound them when dry, but becoming soft and mucilaginous when moistened. The spore-cases, pounded with their contents, are made into cakes like flour.

**NAR** **DUS**, a genus of grasses, having a simple spike, spikellets all on one side, no glumes; each spikellet consisting of one floret, which has two palae, the outer ending in a long point. *N. stricta* is one of the most common of British grasses, growing in dry elevated situations, and very characteristic of them. It grows in tufts, and is often called Mat-grass. It is perennial, purplish, short, rigid, and very worthless, as almost no animal but the goat will eat it.

**NARES, Edward**, D.D., 1762-1841; b. England; son of Sir George Nares and cousin of Robert Nares; was educated at Christ church, Oxford, and became a fellow of Merton college in 1788. Ten years later he became rector of Biggin, in Kent; and in 1814 regius professor of modern history at Oxford. He wrote, among numerous works: *On the Plurality of Worlds; Discourses on the Three Creeds; Evidences of Christianity; Elements of General History; Heraldic Anomalies; Memoirs of the Life and Administration of William Cecil, Lord Burghley*; and a novel entitled *Thinks I to Myself*, which passed through several editions in 1811.

**NARES, James**, 1715-83; b. Stanwell, Middlesex, England; studied music under Bernard Gates and the famous Dr. Pepusch at King's chapel, London. In his nineteenth year he became organist of the York cathedral. He published *Lessons for the Harpsichord* in 1748; was made doctor of music at Cambridge in 1755; was appointed organist to George II., and removed to London in 1756; was made master of choristers in 1757, and resigned the position in 1780. He published *Catches, Canons, and Glos*, dedicated to the earl of Mornington, 1778; also his *Twenty Anecdotes in Score*, which still continue in use. His works show a thorough knowledge of the science of music.

**NARES, Robert**, 1758-1829; b. England; son of James Nares, an organist and musical composer, studied at Oxford; in 1778 took orders, and soon became rector of Sharnford, Leicestershire, and preacher at Lincoln's Inn. As critic, essayist, and theologian he held a high rank among the writers of his time; he was archdeacon of Stafford 1790, rector of St. Mary's, Reading, and canon of Lichfield, and for sometime rector of Allhallows church, London. Associated with the rev. William Beloe he founded the *British Critic*, which he assisted in conducting for four years as a high-church literary review, conservative in principle, and opposed to the dogmas of the sympathizers with the French revolution. He was at one time assistant librarin of the British museum. He was a contributor to the *Classical Journal*, and published, in 1784, *Elements of Orthogony*, and in 1805, *Chronological View of the Prophecies relating to the Christian Church*. One of his most important works is *A Glossary of Words, Phrases etc.* in the *Works of English Authors of the Age of Queen Elizabeth*, new edition 1801. In 1815 he published the *Veracity of the Evangelists Demonstrated*. In 1823 he was vice-president of the royal society.

**NAREW**, a river of w. Russia, an affluent of the Bug, rises in the government of Grodno, and flows w.s.w. to the main stream, which it joins at Sierock, after a course of 294 miles. The waters of the Narew are about as great in volume as those of the Bug. It is navigable to Tykoczin, 150 m. from its mouth.

**NARNI**, a t. of the province of Perugia, Italy, about 45 m. n.e. of Rome, 8 m. from the city of FERN; situated on a precipitous hill on the left bank of the Nar. The Romans colonized the place and gave it the name of Narnia about 500 n.c., and it was a military post on the Flaminian way. Ruins of a massive marble bridge built by Augustus and of a very ancient aqueduct are still to be seen. Narni has been the seat of a bishopric since 366, and the cathedral dates from the 13th c.; the only other buildings of interest are the castle and convents. In the 9th c. the town was seized by the duke of Spoleto, and in the middle ages was burned and laid waste. Pope John XVIII. and the emperor Nerva, 98 A.D., were natives of Narni.

**NARO*, a t. of Sicily, in the province of Girgenti, and 14 m. e. of the town of that name. It has 10,253 inhabitants, who trade in oil, wine, and sulphur. Numerous tombs, medals, and other antiquities have been found here.

**NARRAGANSETT BAY**, an inlet of the Atlantic ocean, e. of Kent and Washington counties, R. I., extending n. 28 m. to Bullock's Point, 6 m. from Providence, and w. from Seekonnet to Point Judith, 12 m., and with a width never less than 2 miles. The Pawtucket, Pawtuxet, Providence, and Taunton rivers empty into it, and it contains a number of islands, of which Rhode Island, Providence, and Conanicut are the most important. Newport is at its s. extremity; Bristol and Warren are on its shores. It is navigable by large vessels to Providence. The n. part is called Providence bay.

**NARRAGANSETT PIER**, a village in s. Rhode Island, in the township of South Kingston, Washington co.; pop. '70, 301. It is 7 m. e. of Kingston, the county-seat,
about 26 m. s. of Providence, and 8 m. s.w. of Newport; delightfully situated on the w. shore, near the mouth of Narragansett bay, and has an excellent beach. It is a popular summer resort. Excellent facilities for fishing and boating are amply provided, and it is celebrated for its fine drives and scenery. It has a number of elegant private summer residences, and 6 or more hotels. Three miles from the pier are Narragansett heights, 400 ft. above the bay, commanding a magnificent view, and on the rising ground near the most fashionable hotel is Sliver lake, a beautiful sheet of water enlivened in trees. A line of horse-cars connects the heights with the beach. Steamboats run between Providence and this place, and a newspaper is published here.

NARRAGANSETTS, e. tribe of Indians that inhabited Rhode Island and the western shore of Narragansett bay; after whom the latter was named. They were originally a part of, and spoke the dialect of the Algonquins. They were friendly towards the colonists, their wars being waged generally against other Indian tribes. Canonicus, their chief sachem, warmly befriended Roger Williams, and gave him a large tract of land. In 1636 King Philip, chief of the Pequots, sought alliance with the Narragansetts, which Roger Williams prevented by appearing, at the risk of his life; in the camp of the latter while the Pequots were there. Canonicus died in 1647. In 1675 the Pequots were driven from the Narragansetts. The people of Boston and Plymouth at this time extorted a treaty of peace from Canonchet, the last chief of the powerful Narragansetts. King Philip, having spread havoc through the valley of the Connecticut, returned to Rhode Island, when the Narragansetts joined him, violating their treaty. The colonists, to punish the Indians for their treachery, attacked them in an immense swamp in the southern part of Rhode Island, where several tribes, including the Narragansetts, had built their wigwams and gathered together their families and supplies for the winter, their fort being on an island in the swamp. The whites burned 500 of their wigwams, and their provisions, men, women, and children perishing in the flames. Canonchet was made prisoner and killed. After this war only a few of the Narragansetts were left; these intermarried with the colonists, and became civilized. A few of the tribe still remain in the region of Charlestown, R. I.

NARES, a celebrated statesman and gen., and almost the last stay of the old Roman empire in Italy, was b. toward the last quarter of the 5th century. The place of his birth is uncertain. His parentage was obscure, and he was probably sold as a slave in childhood, having, according to the barbarous usage of the period, been previously emasculated. From some menial office in the imperial household at Constantinople, he rose by successive steps to the post of cubiculiaris, or private chamberlain of the emperor Justinian, and ultimately to that of keeper of the privy purse. In the difficult art of courtiership, Nares was so skilful and adroit as to make enemies. More remarkable, however, considering his condition, was the distinction which he attained in military affairs. In 558 he was sent to Italy in command of a body of troops, professedly to act in concert with Belisarius (q. v.), but in reality, it is conjectured, with a secret commission to observe and control that general. After some successes, Nares, having disputed with Belisarius, assumed an independent authority; but his separate command was unfortunate, and he was recalled to Constantinople in 559. After some years, however, Belisarius was recalled, and Nares was appointed to the chief command in Italy. His conduct of that expedition extorted the admiration even of his enemies. Not having the command of a sufficient number of transports, he marched his army along the whole circuit of the shore of the Adriatic, and while the enemy's fleet were still in possession of the sea, was enabled to encounter them in the plain of Sentaglio, near Tagina, where, after a desperate engagement, the Goths were totally defeated, and their king, Totila, slain. Nares took possession of Rome, and after a series of successes both in south-eastern and northern Italy, completely extinguished the Gothic power in that peninsula. Justinian appointed Nares exarch of Italy in 553. He fixed his court at Ravenna, and continued, till the death of Justinian, to administer the affairs of Italy with a vigor and ability which did much to stay the progress of that decay which had long infected all its social, political, and military institutions. The only blot on the character of his administration is the avarice with which he is charged by his contemporaries. His exactions pressed heavily on the exhausted resources of the population; though their severity may be in some degree palliated by the splendor and utility of the public works on which he partly expended the public resources. On the death of Justinian, his ascendency came to an end. The Romans, on the accession of Justinian, complained to him of the exactions of Nares, and that emperor deprived him, in 563, of his office; a proceeding to which a special indignity was imparted by an insulting message from the empress, that it was time for him to replace his arms, and to serve among the women of the palace." To this his bitter taunt (according to Paulus Diaconus, De Gest. Long. ii. 6), Nares replied that he would "spin for her a thread which she would find it hard to unravel;" and he is accused of secretly intriguing with Albinus, king of the Lombards, to incite a new invasion of Italy, at the same time submissively offering his services to the emperor for the purpose of repelling the invasion. This account, however, seems uncertain, and perhaps improbable; and as Nares died at Rome in 568, just on the eve of the Lombard invasion, no light is thrown upon this story by the actual events of the war. His
age at the time of his death is a subject of much curious controversy. According to the popular account, it was no less than 95 years; but this is doubted by most of the historians.

NAR THEX, a part of the early Christian churches separate from the rest by a railing or screen, and to which the catechumens and penitents were admitted.

NARUSZE WICZ, Adam Stanislap, 1733-96; b. Lithuania. After completing his studies at the university of Vina, in 1748, he entered the order of Jesuits, traveled through Germany, France, and Italy, and on his return became director of the Jesuit college at Wawel and a friend of king Stanislap-August. Upon the fall of his order he was appointed coadjutor to the bishop of Smolensk in 1788, secretary of the council, and finally bishop of Lutsk. After the death of the king he resided in Janovice (Gallicia), where he died. His chief work is the History of the Polish Nation, in 10 vols., which gained for him the title of the Polish Tacitus. He published also an excellent translation of Tacitus, a History of the Crim-Tartars; a Life of Khodkiewich Hetman of Lithuania; and 4 vols., of poems, odes, satires, fables, etc.

NARVA, a Russian t. in the gov., and 95 m. w.s.w. of St. Petersburgh, is situated on the Narva, 10 m. from its mouth in the gulf of Finland. It was founded in 1223 by Waldemar II., king of Denmark, and came into the possession of Russia in 1704. The navigation of the Narva is impeded by a waterfall near Narva, 14 ft. high. In 1833 168 ships, of 18,175 lasts (1 last=114 ton), entered the port; the exports, chiefly flax and timber, were £150,693; the imports £402,340. At the waterfall above the town there are sawmills, and an extensive cotton-mill which employs 1700 workmen. Though belonging to the government of St. Petersburgh, Narva is ruled by the laws of the Päble provinces. Here, in November, 1700, Charles XII., with 8,000 men, defeated a Russian army of 60,000 men, under Peter the great and the duke of Covy. Pop. 67, 675.

NARVAEZ, PAMPILIO DE, 1490-1528; b. Spain; sailed for the West Indies not long after the discoveries of Columbus. In 1501 he was in Santo Domingo, in the conquest of which, as also of Jamaica and Cuba, he participated; and in the reduction of the latter he was second to Velasquez, the governor, in command of the Spanish forces. In 1520 Velasquez sent him on an expedition to Mexico to bring Cortes to submission, and with orders to arrest him and take his place in the government of the country. But Cortes fell upon him at Zempoalla, and took him prisoner; and Narvaez lost an eye in the battle. He was imprisoned by Cortes for five years; but his adherents joined the army of Cortes and took part with it in the battles which resulted in the conquest of Mexico. On his liberation Narvaez returned to Spain, and attempted in vain to induce the government to punish Cortes. He succeeded, however, in obtaining an extensive grant of land in America, and arrived at Tampa bay in 1528 with a force of 400 men whom he intended to settle somewhere in Florida. He went on to Appalachee, but was met everywhere by the bitter hostility of the natives; and the country, contrary to his expectations was sparsely settled and poor. He reached the sea-coast, and attempted to go to Mexico in boats; near the mouth of the Mississippi his boat was sunk, and he was drowned. Only a few of his companions, after suffering great hardships for nearly 8 years, succeeded in reaching Sonora, where they went to Mexico.

NARVAEZ, Don Ramon Maria, Duke of Valencia, a Spanish general and statesman, was b. at Loja, in Andalusia, Aug. 4, 1803, and when very young served in the war of liberation against the French. He was an officer in 1820, when constitutional government was re-established in Spain; and in 1822, when a reactionary party of the royal guard took up arms to destroy the work of the revolution, Narvaez ranged himself on the side of the liberals, and contributed by his courage to the repression of the mutiny. Shortly after, under the command of Mina, he made the campaign of Cataluña against the guerrillas, who were assisted by the monk's. The invasion of Spain by a French army in 1813 forced him to retire from active life. He withdrew to Loja, and lived there in obscurity until the death of Ferdinand VII. in 1832. In 1834, as capt. of chasseurs, he maintained a hot struggle against the Carlists of the Basque provinces, and signalized himself in various engagements. In 1836 he commanded a division under the orders of Espartero, and in November of that year completely routed the Carlist leader Gomez, near Arcoz. This was an epoch-making victory; it made Narvaez immediately popular, aspired to the highest offices of the state, and was regarded as the rival of Espartero. In 1838, by acts of terrible severity, he cleared the district of La Mancha of brigands, and was appointed in 1840 capt. gen., of Old Castle, and general-in-chief of the army of reserve. When Espartero gave gen. Alnix a place in the ministry, Narvez resigned his command. He took part in the insurrection against Espartero that broke out at Seville in 1840, but that having failed, he was compelled to flee to France, where he was shortly after joined by queen Christina (see MARIA CHRISTINA), and commenced those plots against the government of Espartero which, in 1843, effected its overthrow. In 1844 he was appointed president of council and created duke of Valencia. His ministry was thoroughly reactionary. He recalled Maria Christina, and revised the liberal constitution of 1837. The progressista party was dissatisfied, and petty insurrections broke out, which the rigorous soldier-statesman repressed with an iron hand. But his dictatoria manners finally alienated even his personal friends, and his ministry was-
thrown (Feb. 10, 1846). After a brief exile as special ambassador at the French court he returned to power in 1847, but soon afterwards quarrelled with queen Christina, and found it necessary again to retire from office in 1851. In 1856, on the overthrow of O'Donnell's ministry, he again became president of council, and immediately commenced to strengthen the royal authority and to restrict the liberty of the press. The intrigues of the court compelled his resignation in 1857. He returned to power in 1864, and (1865) was succeeded by O'Donnell, with whom he suppressed, in 1866, a military revolt in Madrid. He replaced O'Donnell in the same year, and, despite the efforts of O'Donnell and Pius IX, retained power till his death in 1868.

**Narwhal, Monodon, or narwhals, a genus of whale, of the family delphinids, resembling the beluga (q.v.) in form, and in the want of a dorsal fin, but remarkably characterized by having no teeth at all, except two in the upper jaw, supposed to be canines, which sometimes remain quite rudimentary, even in the mature animal, as they are in the young, and are sometimes developed into great twisted straight tusk-like projecting from it, which the animal has received the name of **Sea Unicorn**. A mature narwhal is generally about 15 or 16 ft. in length, without reckoning the tusk, which is from 6 to 10 ft. long. The body is less thick than that of the beluga; the head is small, the forehead rises abruptly, the muzzle is very obtuse, the upper jaw projects a little; the first half of the body is nearly cylindrical, the remainder to the tail fin is conical. The tusk is hollow nearly to the point. Its use is rather conjectured than known. It is probably a weapon of defense, but Scoresby has suggested that it may be also used for breaking thin ice in order to obtain opportunity for respiration; and for killing fish, as he found remains of skates and other flat-fish in the stomach of a narwhal, which it is not easy to imagine how a toothless animal, with rather small mouth and lips, could capture and swallow, unless the formidable tusk were first employed. Cephalopodous molluscs, however, are believed to constitute a principal part of the food of narwhals. The narwhal is a very active animal, swimming with great rapidity, lively, and playful. A group of narwhals playing together, projecting their great horns from the sea, and crossing them in their sport, is a very interesting sight. The narwhal is pursued by the Greenlanders and other inhabitants of the north, for the sake of its blubber, with which its whole body is invested to the thickness of about 3 in., amounting to nearly half a ton in weight, and yielding a large proportion of excellent oil. The tusks are also valuable, being of an extremely compact white substance—denser, harder, and whiter than ivory—which is used as a substitute for ivory. The kings of Denmark have long possessed a magnificent throne of this material, which is preserved in the castle of Rosenberg. The flesh of the narwhal is used by the Greenlanders as food. Great medicinal virtues were formerly ascribed to the tusks, but were merely imaginary.

**Nasalis, or Pronoscis Monkey, Nasalis larvatus, a monkey allied to the *doves or *seamouathers*, but distinguished from all other monkeys by an extreme elongation of nose, that organ being nearly 4 in. in length in the mature animal. In the young the nose is comparatively undeveloped. The nostrils are placed quite at the extremity of the nose, and are separated merely by a thin cartilage. Of what use the magnitude of its nose is to the animal is unknown. The nasalis inhabits Borneo and neighboring islands. It is gregarious. It is an animal of about 3 ft. in height if placed erect a position it does not often assume. It can leap 15 ft. or more. Its fur is thick, not long, nor woolly; chestnut red, and in some parts golden yellow.

**Nascapes', or Nascaps, a tribe of Indians inhabiting Labrador, of the Algonkin family, of whom very little is known, as missionary effort has had small influence among them, and there has been little other opportunity offered for investigating their history or their manners and customs. No linguistic works concerning them have been published, though grammars of their language are said to be in existence in manuscript. The number of the Nascapes was estimated in 1870 to be about 2,800.

**Nascent State, in chemistry. When an element or compound is liberated from some chemical combination in which it had previously existed, the element or compound so liberated is at the moment when it escapes said to be in a nascent state; and it is then often capable of exerting far more powerful combining action with other bodies than it can exhibit when brought in contact with them after it has been liberated. Arsenic and hydrogen will not directly combine if brought in contact with one another under ordinary circumstances, but the application of Marsh's test (see *Arsenate*) depends upon the direct union of the nascent hydrogen (liberated by the decomposition of the water) with
the arsenic, giving rise to arseniureted hydrogen gas. Again, if hydrated protoxide of nickel (NiO,HO) be suspended in a solution of caustic potash (KOH,HO), it will undergo no change if a current of oxygen gas be passed through the solution; but if a current of chlorine be substituted for the oxygen, the whole of the metallic protoxide will be converted into the brown sesquioxide (Ni₂O₅), the resulting decomposition being shown in the equation:

\[
\begin{align*}
\text{Protoxide of Nickel} & \quad \text{Solution of Potash} & \quad \text{Hydrated Sesquioxide of Nickel, Potassium} \\
2(\text{NiO,HO}) + \text{KOH,HO} + \text{Cl} & = \text{Ni₂O₅,3HO} + \text{KCl}
\end{align*}
\]

This change arises from the action of the chlorine upon the potash, during which chloride of potassium (KCl) is formed, while the nascent oxygen which is liberated from the potash combines with the oxide of nickel. Again, cyanogen (C₂N) and chlorine do not enter directly into combination, but if cyanogen at the instant that it is liberated from one of its compounds (as, for example, cyanide of mercury) comes in contact with chlorine, the two combine; and many other examples of similar action might be adduced.

NASEBY, a parish and village of England, in the county of Northampton, 12 m. n. of the town of that name. Pop. 71, 693. The battle of Naseby, between Charles I. and the parliamentary army under Fairfax and Cromwell, took place here, June 14, 1645. It resulted in the total defeat of the royalists, the king being compelled to flee, after losing his cannon and baggage, and nearly 3,000 of his army as prisoners.

NASH, a co. in n.e. North Carolina, bounded on the n. by Swift creek, on the s.w. by Contrety creek, and drained by Tar river; 500 sq. m.; pop. '80, 17,731—17,718 of American birth, 8,313 colored. The surface is irregular and heavily wooded. The principal productions are Indian corn, cotton, sweet-potatoes, wheat, and oats. Co. seat, Nashville.

NASH, ALEX., 1750—86; b. Va., brother of gen. Francis; when very young removed from Prince Edward co. to Newbern, N. C., where he studied law, entered at the bar, and continued a successful practice for many years. He was a member of the provincial congress in August, 1774, and of the council in 1775. In 1776 he was a member of the commission which framed the state constitution of Virginia, and was elected to the house of commons session of 1777—78. In 1779 he was elected president of the senate, and governor of the state in 1780, resigning in the following spring. He married for his first wife the widow of governor Arthur Dobbs. In 1782 he was again elected to the assembly and was sent by that body as delegate to congress 1782—84 and 1785—86.

NASH, FRANCIS, b. Va.; settled in Orange co., N. C.; was clerk of the superior court of the county before the revolution; was a member of the provincial convention of 1775, by which he was appointed lieut. col.; in 1777 was made brig. gen. by the continental congress; commanded a brigade at Brandywine and Germantown. At the latter place he was mortally wounded, and died at Kalpsville, Penn., Oct. 17, 1777. A monument was erected by the citizens of Germantown and Norristown.

NASH, John, an architect, was b. in London in 1732. He underwent the usual course of training for his profession, but soon entered into some building speculations which enabled him to buy a small property in Cemmarchone. Here in fresh speculations he lost much money; therefore, in 1792, returned to London and architecture, in which he speedily rose to eminence. On the strength of having obtained a patent in 1797 for improvements in the construction of the arches and piers of bridges, he was in the habit of claiming a great part of the credit of introducing the use of cast-iron girders. A large part of his time was occupied in designing and constructing mansion-houses for the nobility and gentry in England and Ireland, but he is chiefly celebrated in connection with the great street improvements in London. From Feb., 1815, when he was appointed "architect, valuer, and agent to the board of woods and forests," down till near the end of his professional career, he was busily engaged in the planning of routes, grouping of buildings, and flying of sites. Regent street, Haymarket theater, Langham place church, and the terraces in Regent's park are specimens of his designs. The pavilion at Brighton was another of his works. He retired from his profession in 1824, and died May 13, 1835. Nash, notwithstanding his many defects, possessed great power of effective grouping, as is well shown in his works. In the architecture of mansion-houses the designing of "interiors" was his forte.

NASH, Joseph, b. in England 1812; began his career as an artist in 1835 by exhibiting drawings of French cathedrals and other ancient buildings. He soon acquired high rank as a painter in water-colors and has made a specialty of illustrating old English architecture and domestic interiors. He has published two series of these illustrations, Architecture of the Middle Ages (1858), and Mansions of England in the Olden Time (1839—40). He has also produced historical paintings in water colors, such as "Charles V. visiting Francis I. during his Confinement," "Queen Catherine, Campeius, and Ladies," and "The Queen's Visit to Lincoln Hall" (1846). In 1878 an annual pension was bestowed upon him in recognition of his services to art.

NASH, Richard, better known by the name of Beau Nash, a fashionable character of the last century, who attained to a very remarkable notoriety, was the son of a Welsh
gentleman, and was born at Swansea, in Glamorganshire, Oct. 18, 1675. After studying at Oxford, he held for some time a commission in the army, and subsequently took rooms in the Temple, but the dissipations of society had more attraction for him than the pursuits of law. He became a ducker-out, a frequenter of good society, and contrived to support himself by gambling. But the grand turning-point in his fortunes was his visit in 1704 to Bath—then a favorite haunt of elegant invalids, and the scene of the gayest intrigues. Nash undertook the management of the public balls, which he conducted with a splendor and decency never before witnessed. In this way he came to acquire an imperial influence in the fashionable society of the place. It appears that he was also distinguished by a species of sentimental benevolence. He played hard and successfully; yet if he heard an individual sighing behind his chair, "Good Heavens! how happy was that money make me," Nash would thrust his own winnings into his hands, with theatrical generosity, and exclaim "Go, and be happy." His own equipage at this period of his career was sumptuous. He used, we are told, to travel to Tunbridge in a post-chariot and six grays, with outriders, footmen, French-horns, and every other appendage of expensive parade. He is praised for the great care which he took of the morals of the young ladies who attended the Bath balls, always putting them on their guard against needy adventurers—like himself. In his old age, Beau Nash sunk into poverty, and often felt the want of that charity which he himself had never refused. He died at Bath, Feb. 3, 1761, at the age of 87.

NASH, Thomas, 1564-1601; b. England; took a bachelor's degree at Cambridge, from which he was expelled for lampooning the college authorities. After a long tour on the continent he settled in London, and became a literary free lance. He began his career by some clever satires on the Puritans, whom he ridiculed in his *Pop with a Hatchet, An Almond for a Parrot, and A Counterfeite to Martin Junior*. His powers of satire soon made him a favorite with the wits of the day. In 1590 he was associated with Marlow in the composition of *The Tragedy of Queen Dixo*, and two years later his comedy, called *Summer's Last Will and Testament*, was produced in the presence of queen Elizabeth. But witty as he was as a pamphleteer, he had little talent as a dramatist: his play fell flat, and, as writing for the stage was then the only remunerative field for an author, he was soon miserably poor. In his *Pierce Pennesse, his Supplication to the Divell*, he describes himself as "sitting up late and rising early, contending with the cold, and conversing with scaric*</quote>
Nashville, Chattanooga, and St. Louis, the St. Louis and Southeastern, and the Louisville and Great Southern railroads; pop. 80, 43,461. It is built on gradually rising ground, with regular streets, at right angles to each other. The finest public building is the capitol, on an abrupt eminence 175 ft. high; it is 240 by 135 ft., built of limestone and iron, at a cost of nearly $1,500,000. It is three stories high, surmounted by a tower 200 ft. high from the ground. The corner-stone was laid in 1845. Among the other public buildings are the state penitentiary, 310 ft. by 50; the court-house, market-house, county jail, and a lunatic asylum, with accommodations for 400 patients. There are also many handsome private residences. The city is supplied with water from the river by an elaborate system of water-works. A suspension bridge and railroad drawbridge span the river, connecting the city with Edgefield opposite. The educational facilities of Nashville are unsurpassed in the south-western states. Besides its public schools, it contains Nashville university, founded in 1875 under the name of Davidson academy, and which received its present name in 1826; the Fisk university, for the education of colored teachers, founded in 1867, under Congregational control; the Vanderbilt university, founded in 1875, named after the late Cornelius Vanderbilt, of New York, and controlled by the Methodist Episcopal church (south); the central Tennessee college, for colored people, also under Methodist control, founded in 1869; the Nashville medical college, the Tennessee college of pharmacy, St. Cecilia's academy and St. Bernard's academy, Roman Catholic, and others. There is a fine government building, used as a custom-house and post-office. The city has many churches, a state and public library, an opera house, 2 theaters, an elegant Masonic temple, national and savings banks, fine hotels, and 22 periodicals, including 2 dailies. The river is navigable during high water from its mouth to Nashville. On account of its situation and ample railroad connections Nashville is the center of a great wholesale trade with the surrounding region. Groceries, cotton, dry goods, liquors, flour and wheat, boots and shoes, are the largest components of this trade. There is a large cotton-factor}'y; and there are saw, flour, and planing mills, iron-foundries, machine-shops, paper-mills, tanneries, etc. The city is divided into 10 wards, governed by a mayor, a common council of 20, and a board of aldermen of 10 members. Nashville was settled in 1779, incorporated as a town in 1834, as a city in 1860, and made the state capital in 1843.

NASHVILLE, BATTLE OF. After the battle of Franklin, Nov. 30, 1864, between Hood and Schofield, the latter withdrew to Nashville, which he reached the next day, taking up his position on the heights about the city. Before Hood had established his lines, the Union forces, under Thos. Kilpatrick, had been re-enforced by Morgan's division from Chattanooga, by Steedman's advance of 5,000 men, by the 3rd. South's division, and by additional recruits, so as to be about equal to Hood's except in cavalry. The greater part of the cavalry force of Thomas had gone with Sherman. A storm on the night of Dec. 8, prevented operations for nearly a week. On the night of the 14th a plan of operations was agreed upon and was successfully carried out the next day, in spite of a dense fog in the morning. Hood was driven back of his line of works, to a position at the foot of Harpeth hills. His loss in killed and wounded was heavy; and some 1200 prisoners and 16 pieces of artillery were taken from him. The federal loss was much less. On the morning of the 16th the battle was renewed, and by evening the Confederate army was in retreat, having lost in the 2 days' fighting, 4,462 prisoners and 53 pieces of artillery. The federal army followed up the pursuit till the 27th, when the remainder of Hood's army crossed the Tennessee. The main federal army then gave up the pursuit, and the Confederates retired by a line of march upon Nashville, where they were caught up with the retreating army and destroyed a large amount of property. The loss of Thomas was estimated at about 10,000, during the entire campaign, from Sept. 7, 1864, to Jan. 20, 1865. In the same time 13,189 prisoners and 72 pieces of artillery were captured from the Confederates. Hood was relieved from command Jan. 23, 1865.

NASMYTH, JAMES; b. Edinburgh 1808; son of Alexander, the landscape painter. By the sale of models of steam engines and other machinery he was able to pay his fees at Edinburgh university, where he studied mathematics, natural philosophy, and chemistry. In 1829 he became assistant to the celebrated London engineer, Henry Maudsley, and in 1834, he began the manufacture of mechanical tools at Manchester, on his own account. The capacity of his Manchester works soon grew too small for the demands of his business, and he built a series of great workshops, called the Bridgewater foundry, near Manchester. Among the mechanical tools which he has invented are the steam-hammer, steam pile-driver, the suction-fan for ventilating mines, the safety foundry-lade, for pouring castings with safety to the workman, a spherical seated safety-valve, and a of Nasmyth on the which does away with the necessity of the safety-valve in all engines. He retired from business in 1857, and has since been engaged in researches into the structure of the sun and moon, with telescopes of his own manufacture. He has published Remarks on Tools and Machinery, 1858; and in association with James Carpenter, The Moon Considered as a Planet, a World, and a Satellite.

NASO, at. in the province of Messina, Sicily, 43 m. w.s.w. from Messina; pop. 2,596. It is a walled t., with a number of fine buildings. There are mineral springs in the vicinity.

NASOY, ELIAS; b. Mass. 1811; graduated at Brown university in 1835; devoted himself to music, botany, and the languages; was a teacher and editor in Georgia, and
in 1840–49 an instructor in Newburyport, Mass.; has been pastor of Congregational churches in Massachusetts and New Hampshire. He published Lives of sir C. H. Frankland, Susanna Rowson, Nathaniel Howe, Charles Sumner, and Henry Wilson; and a Gazetteer of Massachusetts.

NASR-ED-DIN, b. Persia, 1831. On the death of his father, Muhammad Mirza, Sept. 10, 1848, he ascended the throne of Persia. Its reign has been principally distinguished by his successful contests with the neighboring tribes, his suppression of the sect of the Babis, who revolted and attempted his life in 1852, his defeat in the war with England in 1856–57, the famine which desolated a large part of his country in 1871, and his visit to the principal courts of Europe in 1873, which he described in a curious diary translated into English by J. W. Redhouse. The concessions which he made to Baron Reuter for establishing railroads and canals, and working the mines in Persia, ended in no practical results. He has three sons and eight daughters, the heir presumptive is Muzaffer-Ed-din, gov. of Agerbaidjan.

NASSAU, an island in the Pacific ocean, lying in lat. 11° 30′ s., long. 165° 30′ w. It is low and uninhabited, was discovered in 1685 by a captain of an American whaling ship.

NASSAU, formerly a German duchy, now Wiesbaden, a district of the Prussian province of Hesse-Nassau, in 49° 50′—50° 50′ n. lat., and 7° 30′—8° 45′ e. long., is bounded w. and s. by the Main and the Rhine, the Prussian-Rhenish provinces, and the grand-duchy of Hesse; n. by the Hesse and Frankfort territories; and e. by Westphalia. Area, 1892 sq. miles. Pop. 75,080,215. Wiesbaden possesses very great physical advantages. In its southern districts, nearly the whole of its area is occupied by the Taunus mountains, whose highest point, the great Feldberg, attains an elevation of about 2,750 feet. This range includes within its boundaries the fertile valley known as the Rheingau. To the south of this the barren highlands of the Westerwald, whose most considerable peak, the Salzburger Head, is nearly 2,000 ft. high. Besides the Rhine and the Main, which are the boundary-rivers, Wiesbaden is traversed from e. to w. by the Lahn, which becomes navigable at Wetzburg, and is augmented by the confluence of numerous other streams, as the Weil, Emba, Anr, Dill, and Elbe. The productivity of the soil is proved by the excellent quality of the numerous vegetable products, which include corn, hemp, flax, tobacco, vegetables, and fruits, including grapes, which yield some of the most highly esteemed Rhenish wines. The hills are well wooded, and abound with game of various kinds, and the rivers yield an abundance of fish and crustaceans. In the more mountainous districts, iron, lead, copper, and some silver are obtained, together with good building stone, marble, and coal; the chief mineral wealth is, however, derived from the numerous springs, which, directly and indirectly, bring the government a clear annual gain of more than 100,000 guineas. The most noted of these springs, of which there are more than 100, are Wiesbaden, Weilbach, Lungen-Schwalbach, Schlangenbad, Eins, Selters, and Gelman, the majority of which were the property of the duke.

Wiesbaden, which is divided into 12 circles, has few towns of any commercial importance, but it boasts of many fashionable watering-places, which are annually crowded with visitors from every part of the world. Of these, the most considerable are Wiesbaden (q.v.), the capital of the district—pop. 75,433,671—Schwalbach, Schlangenbad, Fachingen, Selters, and Gelman. Höchst, an active little place on the Main, is the only manufacturing town of the duchy, but a brisk trade is carried on at many small ports on the Rhine, Main, and Lahn, from whence the mineral waters, wines, and other natural products of the country are exported. The exports are wine—including some of the choicest kinds, as Hochheimer, Johannisberger, Rüdesheimer, Markobrunner, Asmannshäuser—mineral waters, corn, iron, manganese, cattle, etc.; while the imports embrace colonial products, manufactured goods, salt, jewelry, etc.

Nassau had a representative form of government, based on the constitution of 1814; and the duke, who was also a count-palatine of the Rhine, count of Sayn, Königstein, Katzellenbogen, and Dietz, etc., was assisted in the government by a council of state, presided over by a prime-minister. The legislative assembly consisted of an upper chamber composed of 24 representatives, chosen for six years, and a second chamber, chosen annually. More than one-third of the population belonged to the Catholic church, which was under the ecclesiastical jurisdiction of the bishop of Limburg, who was assisted by a board of commissioners, located at Eltville, on the Rhine; and excepting about 19,000 persons who belonged to the Jewish and other persuasions, the remainder of the people, including the then reigning house, professed the "evangelical" form of German Protestantism, and were comprehended in one episcopal see under the bishop of Wiesbaden. Ample provisions were made in the district for popular education, in full accordance of which there were upwards of 72 elementary schools, in addition to about 1000 teachers, 10 normal schools, a gymnasium, various training, theological, polytechnic, military, and other educational institutions. In accordance with a treaty with Hanover, Göttingen constitutes the university for arts for Wiesbaden, which has also a Roman Catholic theological faculty in conjunction with Hesse-Cassel at the university of Marburg. Wiesbaden, which is the principal seat for all national institutions of literature, science, and benevolence, has a good public library, containing 60,000 volumes, a museum, etc.
Nassau occupied, in conjunction with Brunswick, the thirteenth place in the limited council of the diet, but it had two votes in the _plenum_, or full council. It furnished a contingent of 4,279, with a reserve of 1835 men, to the army of the old confederation.

The receipts, according to the budget of 1866, were 4,461,410 florins derived from the crown domains and indirect taxes, and 317,935 florins from direct taxation, while the expenditure was estimated at 5,804,975 florins. The national debt at the close of 1864 represented a capital of 6,088,300 florins. The duke, who was in possession of very extensive domains, ranked as one of the richest princes of Germany.

In tracing the history of Nassau to its earliest origin, we find that the districts now known by that name were anciently occupied by the Alemani, and on the subjugation of the latter by the Franks, became incorporated first with the Frankish, and next with the German empire. Among the various chiefs who raised themselves to independent power in this portion of the Frankish territories, one of the most influential was Otto of Laurenburg, brother of King Conrad I., who became the founder of two distinct lines of princes. The heads of these lines were Walram and Otto, the sons of count Henry I., who, in 1255, divided the land between them. Walram II., the elder, was the progenitor of the house of Laurenburg, which, towards the close of the 12th c., assumed its present name of Nassau from the name of its chief stronghold; while Otto, the younger, by his marriage with the heiress of Gelders, founded the line of Nassau-Gelders, whose last male representative died in 1423, but which still survives through a female branch, in the family now occupying the throne of the Netherlands. This junior branch of the house of Nassau, by inheritance from a collateral representative, acquired possession, in 1544, of the principality of Orange; and since that period the representatives of the Otto line have been known as princes of Orange (q.v.). The Walram line, which in 1292 gave an emperor to Germany, in the person of Adolf of Nassau, was subdivided by the descendants of that prince into several branches, until, by the successive extinction of the other lines, the Nassau-Weilburg family, which at present reigns over the duchy, was left, in 1816, the sole heir and representative of the Walram dynasty in Germany. Nassau had been declared a duchy in 1806, and in 1817 the reigning duke William granted a new constitution; but during the first sitting of the assembly, dissensions arose between the ducal government and the representatives, the former having attempted to establish the proposition that the ducal domains were the unconditional property of the royal house, and that all the expenses of the state would consequently have to be met by taxation.

This proved a fruitful source of dissension between the duke and his people, and the opposition and discontent to which it gave rise were not finally allayed till 1834, when a more liberal ministry under count Waldorff, succeeded the unpopular cabinet which had hitherto directed public affairs. Concessions were made by the ducal government, which met the requirements of the chambers, and a satisfactory compromise was effected in regard to the crown revenues. In 1836 Nassau joined the German Zoll-Verein, and subsequently to that period it has continued to advance in material prosperity. The reigning duke Adolphus William, who succeeded his father, duke William, in 1839, showed the same conservative tendencies as his predecessor. The revolutionary crisis of 1848 found the people, who had been harassed by over-government and by a jealous dread of liberal sentiments, ripe for insurrection. The peasantry rose _en masse_ in the rural districts, and revenged themselves for the severity of the game-laws and other obnoxious restrictions by perpetrating the most wanton destruction of game and wood in the forests belonging to the crown and nobility. These disorders were speedily put down by the aid of federal troops, but, notwithstanding the concessions made by the government, the relations between the people and their ruler continued for many years to be unsatisfactory. For the events which led to the incorporation of Nassau with Prussia, see Germany.

**NASSAU**, a co. in n.e. Florida, bounded e. by the Atlantic, n. and n.w. by Georgia, from which it is separated by St. Mary's river; drained also by the Nassau river, its s. boundary; traversed by the Florida railroad; about 600 sq.m.; pop. '80, 6,635—3,560 colored. Amelia island is included in the county. The surface is level, and the soil toward the coast, sandy; rice, sweet potatoes, Indian corn, and molasses are the chief products. Co. seat, Fernandina.

**NASSAU**, the capital of New Providence, is the center of the trade of the Bahmas (q.v.). It is pleasantly situated on the face of a hill, in lat. 25° 5' n., long. 71° 21' w. Pop. 9,000. The town is well laid out; has several handsome public buildings, and an excellent and well-sheltered harbor. The climate is very salubrious, and Nassau is a great resort of invalids from the north. It has extensive hotel accommodation, a lunatic asylum, and a leper-house, and is defended by two forts. Nassau exports cotton, pimento, and salt. During the civil war in the United States, it became notorious in connection with the blockade-runners.

**NASSAU HALL**, Sec New Jersey, College of.

**NASSIK**, or NASHIK, t. of British India, in the district of the same name, in the presidency of Bombay, 95 m. n.e. of Bombay, on the river Godavery, not far from its source. It is a town of great sacredness in the estimation of the Hindus—more revered
than even Benares—is a great place of pilgrimage, the chief seat of Brahmanism in the Deccan, and the residence of many families of Brahmans, some of them living in great affluence. It contains many temples, which are built along both banks of the Godavery, and on rocks in the river. They are all of black basalt, and dedicated to Siva. Of far greater interest, however, are the Buddhist caves, about 5 m. from the town, which are situated in a conical hill, at a height of about 100 yards from its base. They are rudely executed. The figures which they contain are in a state of good preservation, and the leading figures are those of Budhas; but the whole character of the remains is thought to indicate Buddhism in a state of transition or compromise with Brahmanism. One cave is 45 ft. sq., and its flat roof is wholly unsupported. Notwithstanding the Buddhist origin, and character of these caves, the Brahmans of Nassick, for the sake of gain, encourage the popular reverence for them. Nassick contains a resident population of (1872) 22,456.

NAST, THOMAS, b. Bavaria, 1840. His parents emigrated to America in 1846, and when only 14 years of age he was employed as a draughtsman on *Frank Leslie's Illustrated Newspaper*. Without having received any regular instruction in drawing, he furnished acceptable sketches for the engravers. He went to England in 1890 to illustrate the Hecean and Sayers prize-fight for the *New York Illustrated News*. He then traveled to Italy to follow Garibaldi, and made sketches of the war which appeared in the *New York Illustrated News*, the *Illustrated London News*, and *Le Monde Illustré*. Returning to America he formed a connection with *Harper's Weekly*, which has continued uninterrupted to the present time. His contributions to that journal are mostly political cartoons, in which he effectively caricatures and satirizes the blunders of public men, and illustrates the leading topics of the day. He appeared as a lecturer in 1873 in many cities of the United States, illustrating his lectures by caricatures drawn on the platform. He started the publication of *Nast’s Illustrated Almanac* in 1872, and has illustrated *The Tribute Book*, Nashby’s *Swinging round the Corkle*, and other works. He also illustrated the *Pickwick Papers* and *Pictures from Italy* in Harper’s household edition of Charles Dickens’ works. Although a clever painter in oil and water-colors, he confines himself mainly to drawing upon wood. His quickness of conception and facility of execution are remarkable, and few artists have executed so many pieces in his special sphere.

**NASTURTIUM.** See CRESS and TROPEOLEUM.

**NATAL.** The region now forming the colony of Natal derives its name from its being discovered by the Portuguese on Christmas day 1497. It was visited about 1522 by several white traders from the Cape, who found the country in possession of the Zulu chief Chaka, who ruled in a most sanguinary manner over all the tribes from the Umzimkulw to the St. Lucia river. He was killed and succeeded by his brother Dingan in 1838, but the latter having treacherously murdered a party of emigrant Dutch Boers, who had paid him a friendly visit by invitation to buy land, he was attacked and finally destroyed by the Boers, who at that time had emigrated from the Cape Colony in large numbers, and who made his brother Panda paramount chief in his stead, and then settled themselves down in the country as his lords and masters. The British government, however, now interfered, and, after a severe struggle on the part of the Boers, the country was formally proclaimed a British colony on May 12, 1843, since which time it has progressed very satisfactorily. In 1856 it was erected into a distinct and separate colony, free from the control of the governor of the Cape. In 1873 Langalibalele, a chieftain of Zulus within the n. frontier, was on suspicion treated very unfairly by the colonial government, and banished. The English government decided that the proceedings were illegal, and sir Garnet Wolseley was sent as temporary governor. It was mainly because the security of Natal was menaced by the warlike forces and equipments of Cetewayo, nephew of Dingan, king of the free Zulus, that the Zulu war of 1879 broke out. Zululand was invaded by the British, and after a fierce defense was finally parceled out amongst various chieftains, nominally independent, but under the supervision of British residents.

The colony of Natal is on the s.e. coast of Africa, about 800 m. e.n.e. of the cape of Good Hope, between the 29th and 31st parallels of south latitude. Its n.e. boundary is the Tugela or Buffalo river, which divides it from Zululand, and its s.w. boundary is the Umzimkulu and Umbamona rivers, separating it from Kaffraria proper. A lofty and rugged range of mountains called the Quandlandia, or Drachenberg, divides it from the Free State and Basutoland, and it contains a well-defined area of 20,214 square miles. These mountains are composed of a confused mass of granite, gneiss, sandstone, basalt, veins, and shale, and present both the flat top and serrated summits of the chain, of which they are so well known in the Cape Colony as the Sneewlberg and Stormbergen. About lat. 28° 30’ these mountains seem to reach their culminating point, and probably attain a height of 10,000 ft., forming a summit line of watershed, from which flow to all points of the compass the waters of the Orange, Umzimuvo, Vaal, Tugela, and other large South African streams. Towards the coast these mountains present a scarped and almost inaccessible face; towards the interior, however, they gradually die away into the immense rolling plains of the Free State. Many offshoots from these mountains traverse the colony, dividing it into a series of steps.
or plateaux, gradually rising from the coast region to the foot of the mountains, and forming so many zones of natural productions.

The coast region, extending about 25 m. inland, is highly fertile, and has a climate almost tropical, though perfectly healthy. Sugar, coffee, indigo, arrowroot, ginger, tobacco, and cotton thrive amazingly, and the pine-apple ripens in the open air with very little cultivation. The midland terrain is more fit for the cereals and usual European crops; while on the higher plateau, along the foot of the mountains, are immense tracts of the finest pastureage for cattle and sheep.

The climate is very salubrious; the thermometer ranges between 90° and 38°, but the heat, even in summer, is seldom oppressive. The mean annual temperature at Pietermaritzburg, the capital, is 64° 71'. The winter begins in April and ends in September; the average number of rainy days being 13. In the summer season the thunder-storms are very frequent and severe. The annual rainfall on the coast is about 35 inches. Inland it varies a good deal in different districts, and is greatest in summer. The south-east is the prevailing wind here in the summer months, as in the Cape Colony. Occasionally the sirocco or hot wind from the north-west is felt, which generally terminates in a thunder-storm.

Natal has but one harbor on its coast, and that is D'Urban, or Port Natal, in lat 29° 53'. It is completely landlocked, but a bar prevents vessels above a certain tonnage from entering. There is, however, generally a depth of water on it varying from 9 to 18 feet. There is secure holding-ground in the outer anchorage. The harbor of D'Urban is of great importance to Natal, as it is the only one worthy of the name on the south-east coast. Many extensive engineering operations have been carried on with the purpose of improving the harbor and increasing the depth of water at the entrance. The principal rivers are the Tugela or Buffalo, the Umcomanzi, Umguni, and Umzineku; like the majority of South African rivers, they are of no use for purposes of inland navigation; but their streams are permanent, and often available for irrigating purposes, thus giving Natal in one very essential point a decided superiority over the Cape Colony.

Coal, copper-ore, iron, and other minerals are found in several places, and there is no doubt that when the great mountain-range is properly explored it will be found very rich in mineral wealth. Large forests of valuable timber abound in the kloofs of all the mountain-ranges, and many tracts along the coast are also well wooded. Natal is divided into the following counties: D'Urban, Victoria, Alexandra, and Alfred on the coast region; Pietermaritzburg, Umcomansi, and Umrini, central; and Klip River and Weenen at foot of the mountains. The capital is Pietermaritzburg, with about 6,800 inhabitants, on a tributary of the Umguni river, about 50 miles inland. It possesses a large military establishment, and many substantial public buildings. Its name is a compound of the Christian name of Pieter Rietief, and the surname of Gert Maritz, two celebrated leaders of the emigrant Boers who were murdered by Dingaan. D'Urban, or Port Natal, is also a very flourishing town, having a railway connecting the landing-place at Point Natal with the town, and a population of (1872) 6,276. It has two newspapers, and several banks and other public institutions. Verulam, Weenen, Richmond, Newcastle, and Ladysmith are also flourishing towns, and several other new villages have been recently formed.

Natal is governed by a lient.-gov., aided by a legislative council, consisting of thirteen members appointed by the colonial office, and fifteen elected by the constituencies into which the colony is divided. Municipal institutions have been granted to the principal towns. It forms the diocese of a colonial bishop, and many stations of the Wesleyan, American, Norwegian, and Berlin missions exist. Education is receiving much attention, and schools are multiplying.

The De Beer and Beznidenhout passes are the only practicable roads across the mountains, and lead by very circuitous routes across the Free State into Cape Colony; and the numerous mountain streams wanting bridges render internal communication very difficult. Three lines of railway, of a total length of 104 miles, are in course of construction; the chief to connect D'Urban with the capital.

The principal articles of export from Natal are wool, sugar, ivory, and hides. The wool exported to Great Britain in 1875 was valued at £514,310, and weighed 8,328,524 lbs. The total value of exports for the same year was £955,695. The exports comprise cotton, ivory, sugar, coffee, arrowroot, wool, hides, feathers, mohasses, and rhinoceros horns. The value of imports in 1875 was £1,268,838. The revenue of the colony in 1875 was £260,271, principally raised from custom duties, transfer dues, and taxes on native huts, etc. In 1843 the value of imports was £11,712, that of exports £1361, while the revenue was only £12,000. Natal's productions were very respectably represented in the great exhibition of 1862, and formed one of the most interesting of British colonial compartments. The population consists of Dutch Boers, who remained in the country after it became a British colony; of English and German settlers; and the remains of the Zulu tribes, who originally possessed the country. It numbered, in 1877, 239,339, of whom 22,654 were whites. The natives, the most industrious of the Kaffir races, possess horses, cattle, sheep, etc., valued at £1,500,000, and, properly managed, make excellent servants.

The total tonnage of the vessels that entered and cleared the port of Natal in 1875 was
Natal.

N. Nation.

137,227 tons, of which 121,322 were British. The discovery of diamond-fields on the Vaal river is an event in which the colony is deeply concerned.

The large animals are gradually disappearing, although elephants are still occasionally met with in the dense bush of the coast region. Lions, leopards, wolves, and hyenas still hang on the outskirts of civilization. The smaller antelopes are plentiful, and alligators are met with in nearly all the rivers north-east of the Unzimkulu. Natal, besides several poisonous snakes, produces a small species of boa, which sometimes attains a length of 16 feet. The hippopotamus is still found near the mouths of the rivers on the eastern frontier.

The botany of this region resembles that of Kaffraria proper, although generally of a more tropical character. All the timber-trees of the Cape Colony are found here, besides many new ones. The climate of the coast region, however, is too warm for the grape, at least for the purpose of wine-making.

Brook's Natal, by Mann (1869); Hall's South African Geography; Natal Almanac (1873); The Cape and South Africa, by John Noble (1878).

NATAL, or Río Grande do Norte, a fortified seaport of Brazil, capital of the province of Río Grande do Norte, and built on low lands about three miles from the mouth of the river of that name, 100 m. n. of Parahiba. Pop. 10,000.

NATAL, JOHN WILLIAM COLENSO, D.D., Bishop of, a divine of the church of England; was b. in 1814, and educated at St. John's college, Cambridge, where he graduated as second wrangler and Smith's prizeman in 1836. From 1838 to 1842 he was one of the masters of Harrow school, and for the next four years tutor of St. John's college. In 1846 he was appointed rector of Forncett St. Mary, in the co. of Norfolk, and in 1854 first bishop of Natal, South Africa. The works by which he was, until recently, most widely known were his two treatises on algebra and arithmetic. The treatise on algebra was first published in 1849, and that on arithmetic in 1853. They soon acquired great popularity, and have been adopted as text-books in many of the principal schools and colleges in Great Britain. He has also published other educational works. He first attracted public notice, however, by the dedication of a volume of sermons to the rev. Mr. Maurice (q.v.), at the moment when that gentleman was in disgrace with the "orthodox" section of the religious world. His affection and respect for Mr. Maurice were further shown by his edition of the Communion Service, with Selections from Writings of the Rev. F. D. Maurice (1855).

In the same year appeared his Ten Weeks in Natal; in 1861 his Translation of the Epistle to the Romans, commented on from a Missionary Point of View; and A Letter to his Grace the Archbishop of Canterbury, upon the Question of the Proper Treatment of Cases of Polygamy, as found already existing in Converts from Heathenism, in which he recommends, on grounds both of reason and Scripture, that converts to Christianity, already possessing several wives, should not be forced to put them all away, except one. He admits that monogamy is most in harmony with the genius of Christianity, but would enforce it only in the case of those who married after their conversion. The outcry raised by his professional brethren against the Letter was sufficiently loud, but it was nothing to the tempest of disapprobation that burst forth in the following year (1862), when he published The Pentateuch and Book of Joshua Critically Examined, in which the endeavour was made to prove that, as they stand, the books are not the products of the age to which they are usually assigned, or of the authors whose names they bear; and that they are not entirely historical, but in many most important passages are overlaid with legendary, mythical, and symbolical incidents. Part VII. of this work was published in 1879. The bishop of Cape Town, the metropolitan bishop, declared Colenso deposed from his see; but on an appeal to the privy council in 1865, the deposition was pronounced null and void. In 1874 Colenso visited England to plead the cause of Langalibalele (see Natal). Other works by this bishop are Natal Sermons (1866) and Lectures on the Pentateuch and the Mobibale Stone (2d ed., 1879).

NATANT. See NAIANT.

NATATORES (Lat. swimmers), the name given by Illiger and many other ornithologists to the order of birds called pelmipèles (q.v.) by Cuvier.

NATCHEZ, a tribe of Indians who formerly occupied the country including the site of the present city of Natchez, and who, when discovered by the Spaniards in the latter part of the 16th c., possessed a civilization far in advance of other tribes in their neighborhood, and in some particulars exhibiting the characteristics of the Aztecs. They were sun-worshippers, and preserved the custom of maintaining a sacred fire in their temples perpetually burning. Their ancestry was mythical, but they were ascribed to the Huaxteco Maya family. They were brave, but possessed many vices; and although they established and sustained friendly relations with the French, which were seldom interrupted, they were in 1729 guilty of an act of treachery towards the latter, in organizing their wholesale massacre on account of some fancied harshness of treatment at the hands of the French commander, which brought about a general war. The French, with the assistance of the Choctaws, attacked and destroyed a large portion of the tribe, and sold as many as 400 into slavery, driving the remainder over the Texas border. The remnant of the Natchez, about 300 in number, at present live in company with the
Chickasaws and Muskogees, and continue to retain their ancient form of organization and certain of their customs and rites.

NATCHEZ, a city and port of entry in Mississippi, on the e. bank of the Mississippi river, 280 m. n. of New Orleans. It is finely situated on the bluff, 150 ft. high, which here forms the bank of the river. A portion of the town at the bottom of the bluff is called Natchez-under-the-Hill, and was formerly the resort of the river gamblers, pirates, and other desperate characters. The city has eight churches, a court-house, jail, U. S. marine hospital, a daily and two weekly papers. It is the shipping port of a large and fertile cotton district, and has steamboat connections with the whole Mississippi valley. Natchez, which derives its name from a noted tribe of Indians, was settled by the French in 1716 and destroyed by the Indians in 1729, who were subsequently defeated and banished to the West Indies. Pop. '70, 9,057.

NATCHEZ (sate) is in Adams co., and in population is the second city in Mississippi. It has a historical record full of vicissitudes. Its site was chosen by the French in 1700 as the chief place of a number of proposed settlements in the lower Mississippi territory; and it was a French military and trading post 63 years, when it passed into the hands of the British. Next, it was occupied by the Spaniards; then by treaty in 1798 it came into the possession of the United States, and became the capital of the state. Seventeen years later, however, the seat of government was removed to Jackson. It has been laid in ruin once by a tornado, and was captured during the civil war by Farragut. It was formerly a residence of many wealthy planters, and is still a typical southern city, with broad, handsomely laid-out streets, and residences adorned with large gardens. The annual shipment of cotton is usually from 13,000 to 20,000 bales.

NATCHITOCHES, a tribe of Indians of the Huaxteco-Maya family, presenting the same characteristics as the Natchez, and who formerly inhabited lands along the Red river in Louisiana. Here, on an island, they possessed a fortified town, which they were forced by the Natchez to evacuate, when the latter were expelled by the French from their own territory in 1731 and forced to flee into Texas. The Natchitoches united with the Calddoes, with whom the few of them who still exist continue to live.

NATCHITOCHES, a parish in n.w. Louisiana, bounded on the e. by Saline bayou, and drained by Red river; 1200 sq. m.; pop. '80, 19,722—19,473 of American birth, 12,680 colored. The surface is mostly level and heavily wooded, and there are several lakes. The soil, especially in the river bottoms, is fertile. The principal productions are Indian corn, cotton, and sweet potatoes. Other staples are cattle and wool. Co. seat, Natchitoches.

NATCIDE, a family of gastropod mollusks, of the section branchifera, order prosobranchia, sub-section holostomata. See Invertebrate Animals. This sub-section also includes the periwinkles, river-snails, top-shells, ear-shells, tooth-shells, and limpets. In naticlea the shell is globular, of few whorls, small spire, outer lip acute; foot very large; mantle lobes hiding more or less of the shell. The most important fossil genus is natiae, in which the shell is thick, smooth, and polished, often with colored markings. Fossil natiae have been found in upper Silurian, Devonian, carboniferous, and Permian formations, and they are abundant in the triassic, Jurassic, cretaceous, and tertiary. The family is extensive, and is distributed throughout all seas. The following genera are now recognized: natiae, strophocheles, perluctites, pyramidula, sermonia, annularis, annuropops, natielea, and signets, most of the species belonging to these genera being found on the American coasts. They are carnivorous, feeding upon other mollusks, and also upon dead fish. The teeth, situated upon the lingual ribbon, enables them to perforate shells. Some of them make a peculiar nest in the sand, in the shape of a bowl, in which the eggs, with their embryo shells are contained, each in a small cell; and they were formerly mistaken for corals.

NATICK, a t. in Middlesex co., e. Mass., 17 m. from Boston and 4 m. from Framingham; incorporated 1781; on the Boston and Albany railroad, the terminus of a branch road to Saxoville; pop. '80, 8,480. Lake Cochituate lies directly n., between this town and Wayland. The Charles river waters its s. portion. It was for several years the residence of Henry Wilson; has a public library of 10,000 vols. in an elegant building, excellent schools, a weekly newspaper, a national bank, a savings bank, water-works, and gas-works. Its leading industries are the manufacture of hats, base-balls, and shoes, and it is celebrated for its extensive boot and shoe manufactories. Farming and market gardening are carried on to some extent. In the cemetery is a monument to John Eliot, who brought the settlement of "praying Indians" from Nonantum to Natiek in 1631, and established a church there in 1669, which flourished for many years, on the site of which the Unitarian church now stands. The town includes Pelchville and South Natiek, each having churches and schools, the latter a museum of natural history and a shoe factory.

NATION (Lat. natia, from natur, born), a word used in two distinct senses. 1. A state or independent society united by common political institutions; 2. An aggregate mass of persons connected by ties of blood and lineage, and sometimes of language.

U K X-26
The modern dogma of nationalism, as maintained by a class of continental politicians, starts from an assumption that a nation in the latter sense ought necessarily to be also a nation in the former, and endeavors to assign limits to the several races of Europe, with the view of erecting each into a distinct state, separated from other states or nationalities. The extreme politicians of the national school seem to consider the supposed rights of nationalities as paramount even to the obligations of treaties, and the political conjunction of one nationality with another is looked on by them as an adequate ground for a revolt or separation, apart altogether from the question whether the nationality is well or ill governed. In point of fact, the different races in Europe are so commingled, that any reconstruction of the political map of Europe, on ethnological principles, would be impossible, even if desirable. The blood of nine-tenths of Europe has been mixed within the historical period. The test of language, on which nationality has sometimes been based, is a deceptive one, in so far as it is indefinite and perpetually fluctuating. The people on the frontier between two races, as in the south Tyrol, generally speak two languages. Then we have dialects, like the Walloon, the Grödnerisch of the Tyrol, and the Romansch of the Grisons—as also the Breton, Welsh, Gaelic and Irish languages, which could hardly be made the basis of independent communities. The well-being of the people governed is properly the end of all government, and it has practically not been always found that a state is better governed when it consists of one race only, than when it includes an aggregate of races. Highly diversified nationalities may be united in one political system, provided only that the government respects and consults the peculiarities of the several races and does not attempt to force the usages, habits, or language of one on the rest. See ETHNOLOGY.

NATIONAL CONVENTION, an assembly of deputies of the people, which assumed the whole government of France on the overthrow of the throne in 1792. When the national assembly (see Assembly, National) had decreed the suspension of the king, Aug. 10th, 1792, it appointed the election of the national convention, which commenced its sittings Sept. 31st. Its first act was to declare France a republic, Sept. 25th. Upon this followed the trial and condemnation of the king. Through the support of excited mobs, the extreme Jacobin party became predominant in the convention; where, from the elevated seats on which its members sat, it received the name of the mountain party. The revolutionary tribunal was established; the chief administration of affairs was intrusted to the committee of public safety, which exercised the most despotic powers. The Girondists (q.v.), at first a powerful party in the convention, were destroyed, many of them perishing by the guillotine; and a new constitution, thoroughly democratic, was adopted Aug. 10th, 1793; but its operation was suspended until peace should be restored. Meanwhile, the actual rulers of the country displayed marvelous energy; almost a million of citizens being placed under arms, and immense provision of all warlike stores made by means of requisitions. They also proceeded with merciless severity against their political opponents, dealing with them as traitors; hundreds of thousands were thrown into prison; and the number who died by the guillotine increased daily both in Paris and throughout France. The national convention itself latterly became so dictatorial a power as to cause the fall of Robespierre; many of its members were guillotined within a few weeks; and independent opinion was no longer expressed. The overthrow of Robespierre was followed by a great reaction; the Jacobins were suppressed; and finally, the national convention, after concluding peace with Prussia and Spain, dissolved itself Oct. 26th, 1795 (4th Brumaire of the year IV.), leaving to the nation a new constitution which placed the government in the hands of a directory (q.v.).

NATIONAL COVENANT. See Covenant.

NATIONAL DEBT. See Debt, National.

NATIONAL EDUCATION. The general subject of education has been already treated under that head. By the term "national education" is understood (1) the means taken by the body of a nation, either through the state or other organizations, for educating the people; (2) the objects which the nation ought to place before itself in its educational measures. These questions involve the whole inner and outer history of education, and are far too large and important to be capable of such treatment here as would convey accurate notions to the reader. All we can do is to glance slightly at the history of the two branches into which the subject divides itself. Among ancient nations, and among not a few nations now existing, education in any definite sense did not, and does not, exist for the masses of the people. The children grown up in a reflective or unreflective imitation of their surroundings. The nation itself, which has only quite emerged from the savage state, have had some more or less organized scheme of education for the leisure and governing classes. The purpose kept in view in such education has been to fit the pupils to discharge certain duties of war or government. In addition to this, the priesthood had the education which their traditional hymns, laws, and customs afforded. That man as such, apart from any special practical ends, should be educated, was an idea late of being recognized, and occurred first to the Greeks, to whom the world owes so much. But neither among them nor their imitators, the Romans, was the education of the masses of the people ever contemplated. Education, properly so called, was confined to a few. In the centuries which succeeded the introduction of Christianity, the
church was the great educating body—training those intended for the service of the altar, not only in Christian doctrine, but in all the learning of the past. This, at least, was the general tendency of education in the church. But it was not till the reformation in the 16th c. that learning, even to the limited extent of reading and writing, was considered a worthy object of pursuit by any save those who, in some form or other, were destined to be drawn within the clerical ranks. The reformation introduced the idea of educating the masses of the people—the leaders of this movement being, no doubt, forced to this conclusion by the necessity which their view of man's personal religious obligations imposed on them. It was manifestly a corollary from the position they took up that every man's intellect should be so trained as to be able to read, and inquire, and think for itself. It was only very slowly that so large a conception of the sphere of education could be given effect to. Gradually, however, popular schools arose in many parts of the continent of Europe, especially in Germany, and the number of gymnasias or grammar-schools was, during the same period, increased. In Scotland, so early as 1695, the government took up the matter, and ordained that there should be a school as well as a church in every parish, at the same time providing for their maintenance by a tax on land, and for their management by putting them under a certain number of those who paid the tax conjointly with the minister of the parish—all being subject to the presbyteries within whose bounds they were situated. The example of Scotland cannot be said to have been followed on anything like a national scale by any country till after the French revolution had exhausted itself. Since 1815, the distinguishing idea of government administration may be said to be the necessity of educating the people, and all the people—even the outcast and the criminal. During the last fifty years, the German states, and more especially Prussia and Saxony, have developed excellent national systems of education, and France has followed their example. Russia and the new kingdom of Italy are also now organizing primary instruction; and at the same time, as in all European countries, they are making provision for the instruction and professional training of the teachers in normal schools (q.v.). The schools for instructing the middle classes, and grammar schools (French, lycées; German, gymnasiurns), whose object is to prepare pupils for the universities, have received increased attention. Universities themselves, too, have been further developed, their curriculums extended in range, their objects elevated, and their number increased.

To return to primary instruction. In England there was no national system, properly so called before 1870, but voluntary efforts were largely aided by the state in the form of privy council grants. These grants were also extended to Scotland, as it became necessary to improve the parochial schools there; owing to the increase of population. The principal conditions on which these grants were made were that they were only to supplement local efforts, that the schools should pass a satisfactory examination before a government inspector, and that the Bible should be read in them. As much additional religious instruction might be given as the school managers pleased, but no schools were admitted to privy council aid from which the Bible was excluded. Under the stimulus afforded by these grants, the educational wants of England were, after 1830, to a great extent supplied; but many districts were left unprovided with schools, and many more very badly supplied. In 1870 an important measure, entitled "An act to provide for public elementary education in England and Wales," was passed by parliament, according to which it is enacted that "there shall be provided for every school district a sufficient amount of accommodation in public elementary schools available for all the children resident in such district, but whose elementary education is not otherwise provided for." It is enacted further, that all children attending these schools whose parents are unable, from poverty, to pay anything towards their education, shall be admitted free, and the expenses so incurred be discharged from local rates. The new schools are placed in each district under "school-boards" invested with great powers—among others, that of compelling parents to send their children to school. An act in most respects similar to the above was passed in 1872 for Scotland, whose educational wants had previously been well supplied.

In Ireland, a national system, instituted and maintained by the state, exists, and one of its main features is the separation of the religious from the secular teaching—at least in theory. The extent to which this principle has been encroached upon in the course of working out the scheme, is not accurately known, but is worthy of special inquiry.

In the British colonies, as in the U. S. of America, adequate state systems of education have been provided on the basis of the secular principle. See the articles National Education, and Privy Council, Committee of, on Education.

**NATIONAL EDUCATION, Systems of,** the provision made by various states for the education of their citizens. In England the term national education is commonly used as implying only a provision made for the instruction of children of the poorer classes. But it is capable of a much more extensive application, and in most of the countries in which the state provides for the education of the people, the state regulates, more or less, all instruction, from that of the primary school to that of the university. In England, national education in this sense has no existence. The parish schools (q.v.) of Scotland at one time were all but national, but the altered circumstances of the country
gradually deprived them of that character. The imperfect means supplied to the
deficiency in both parts of the kingdom are described under the head of PRIVY COUNCIL,
COMMITTEE OF, on EDUCATION. See also SCHOOLS, PUBLIC AND GRAMMAR; INDUS-
TRIAL SCHOOLS; REFORMATORY SCHOOLS, etc. In Ireland the foundation of a really
national system was laid in 1833 in the "national schools" (supplemented since by the
queen's colleges and university), the principle of which is briefly stated under IRELAND.
These schools have exhibited a steady and even surprising progress, when we consider
the determined opposition they have met with from powerful ecclesiastical parties, both
Catholic and Protestant. In several of the British colonies the local legislatures have
bodily dealt with the question on the national principle, in opposition to the denomina-
tional. See VICTORIA.

In this article we propose to give some account of the national system in various coun-
tries, and to indicate some of the matters as to which we have to look for instruction to
foreign experience. Before doing so, it may be well to notice the obstacles in the way
of the establishment of national education among ourselves. And first, in Great Britain
the establishment of a national system of education, and of all interference with educa-
tion on the part of the state, has until lately been opposed upon principle by a numerous
and respectable body of politicians. They, for the most part, consisted of dissenters, who,
beginning with voluntarism in ecclesiastical matters, had passed on to the doctrine of
laissez faire in politics. The others were chiefly speculative persons, deeply imbued with
the same doctrine, who, profoundly disbelieving in the wisdom of statesmen and the
capacity of officials, and apparently in the possibility of foresight in large affairs, held
that the state should undertake as little as possible, and leave things to what they called
their natural course. The arguments used by these two classes were not always alike.
Individuals of the former class were apt to go back to the religious ground from which
they started, maintaining that education ought to be religious, that the state ought not
to teach religion, that therefore education was out of the province of the state. But
what the spokesmen of both classes most insisted on was this: that education should be
left to the law of supply and demand, or rather, to the voluntary action of individuals,
single or combined. It was in that way, they declared, that the education of the people
could be most efficaciously carried on; for so carried on, it would always be, both in kind
and in extent, what, on the whole, the circumstances of the people required. In the
hands of government, they said, an educational system must be, more or less, an instru-
ment of state. And, at the best, the extent and the quality of the instruction provided
must depend upon the will of persons who might be very ignorant of the wants of the
people. They used declamation about the bad way in which governments did every-
thing they attempted; about the danger of creating a host of new officials; and about the
impropriety of interfering with natural laws, and of discouraging voluntary agency.
Then they enlarged upon the great progress which education had made in England since
the beginning of this century, independently, as they said, of the state—maintaining not
only that it had been as great as the circumstances of the country permitted, but that
it was almost as much as the state had accomplished in any country; and that it
proved that in England, supply and demand, or the voluntary principle, would soon
provide for all education. To this argument of theirs, the supply of education, so far as it was not due to the action of the state, had come from the
benevolent exertions of individuals. But their chief reliance was upon the agency
of individuals or societies inspired by benevolence or religious zeal. They held that the
same objections did not apply to voluntary organizations which lay against the state;
they said, was consonant with the national habits and institutions; it was a part of the
system which had made the English a free, self-reliant, and enterprising race; it should
be fostered, not discouraged; and it was worth our while to pay a price, if necessary,
rather than let it be superceded by the action of the state.

It was answered, first, that the commercial principle of supply and demand, unless
supplemented by the benevolence of individuals, could not be expected to educate the
technicians and mechanics of the future. And it was shown that the ordinary means of
instruction; that children of the lower classes in large towns, without assistance or stimulation
came to them from without, had at present no more chance of receiving instruction than
if they were living in Africa. And the nation would lose inestimably by delay in edu-
cating the masses; for nothing would so greatly increase its power and prosperity, so
materially improve the condition of the humbler classes, as the education of the whole
people. The importance of voluntary agencies was admitted; but why was the state to
be precluded from at least co-operating with them? The state, it was said, had a greater
interest in educating the people than any of her citizens could have; and, moreover—
this was the real question—could undertake it more successfully. Voluntary agency,
it was maintained, was too slow, too uncertain, too spasmodic in operation, to be perma-
nently and solely relied upon in a matter of such great national concern. The friends
of state education confidently appealed to the experience of foreign countries as showing
the superiority of state education, and pointed to the effects which government stimula-
tion, on a limited scale, had had at home. It is now several years since this contro-
versy was at its height. The voluntary agencies have since that been acquiescing in the inter-

ference of the state with education; and recently, several of their foremost men have frankly admitted that they had been mistaken, and that the state, by what it has done for education, has made good its claim to the regulation of it. The course of political events has recently added greatly to the importance of popular education; and at present it may be said that there is practically no opposition upon principle to the control of education by the state.

There have always, however, been obstacles to the establishment of a national system more formidable than the opposition of private bodies, and these are well-nigh inevitable.

The most important of them are those which are concerned with the place, if any, to be assigned to religion in the school instruction. Upon this matter there is a conflict of opinions which seems almost irreconcilable. A party, which is growing in numbers, and which is respectable from its activity and intelligence, holds that the state should give nothing but secular instruction; that religion is beyond its province, and should not be taught within its schools; that, indeed, with a population divided into numerous sects, a practicable scheme of state education embracing religion cannot be devised. To this party a portion of the English voluntaries now seems disposed to ally itself. There are others who believe it possible to teach an undenominational Christianity in schools; who desire that the state schoolmaster should confine himself to this; and that dogmatic teaching should be left to the religious bodies. A third party hold that dogmatic teaching should be given in state schools; that religious teaching, to have any value, must be dogmatic; but that arrangements might be made for the religious instruction of children by persons of their own persuasions; and, at any rate, that children should be exempted from the religious instruction given in a school if their parents should so desire. The most numerous body of all are satisfied with the system of aiding denominational schools which now exists; because they approve of schools being, as for the most part they now are, under clerical supervision, and fear that by any change the influence of the clergy upon education would be weakened. Among the managers of church of England schools fault is scarcely found with more than one point in the old substitute for a system; there was an incessant agitation against the "conscience clause," which the state has placed among the conditions of its aid, stipulating that religious instruction should not be given contrary to the wish of the parent. Between the denominationalist and the secularist there is a difference which scarcely admits of compromise, and is a serious hindrance in the way of any national system. The former is naturally opposed to any scheme for supplementing the denominational system—for the purpose of educating the classes which this system does not educate—unless it include religious teaching.

The question of religious instruction has been found a troublesome one in nearly every country where the state regulates education, and there is nothing more instructive, in foreign experience, than the ways in which, in different systems, this difficulty has been disposed of. Next to this, the most important thing to be observed is the parts which, in different systems, are assigned to the state and to the locality respectively; for it is unquestionable that there are some dangers attaching to state education, when the influence of the state is predominant, and that the function of the state in education must be carefully defined. By the mere selection of school-books, the state could powerfully influence the rising generation; and in Austria, and, it is said, in France also, the school has been made use of as an instrument of state policy. With a popular government, however, there is not much risk of it being used for sinister purposes; and in this country we are in more danger of having recourse too little to the powers of the state than of trusting it too much. The possibility of making education compulsory is another matter upon which foreign systems of education throw much light: we are perhaps more interested in noting how far indirect methods can be resorted to for compelling attendance at the schools. Upon the limits of the instruction which should be attempted in schools for the poorer classes—a subject which has been much discussed in connection with the Revised Code of 1861—and upon the results of government regulation of the middle and upper schools also, there is much to be learned from the foreign educational systems. We begin with

State Education in Holland.

There are several countries in which—if school statistics could be taken as a test—popular instruction is more widely diffused than it is in Holland; but in no European country is it so uncommon to meet a man who cannot easily read and write. The primary schools of Holland have a high reputation for the solidity of the instruction they impart, and have, by competent observers, been declared to be the best in Europe. A small and wealthy state—rich, too, in the public spirit of its citizens—with a population singularly docile and orderly, the task of educating the people has been for Holland exceptionally free from difficulty. It had the start of most other European nations in the work of popular education. So far back as 1811 its primary schools had been celebrated in a report by the famous Cuvier. It has had an education law since 1806; and of this law, though it underwent modification in 1857, it is necessary to give some account. Secondary education in Holland was officially instituted and organized for the first time by the law of May, 1863.

On the face of it, the law of 1806 seemed far from making a complete provision for
the education of the people; it left much—in any other country, it would have been a
great deal too much—to the public spirit of local authorities. It did not make educa-
tion compulsory; it did not even enforce the establishment of public schools; but it pro-
vided for two things being done thoroughly—the inspection of the schools and the exam-
ination of the teachers—and to this seems to have been chiefly due its eminent success.
Each province of Holland was formed into a certain number of school-districts, and over
each school-district was placed an inspector. The inspector was made supreme over
primary instruction in his district. He was a member of every school-committee, and
school-committees could be named only with his concurrence; no teacher, public or
private, could exercise his calling without his permission; and he inspected every school
in his district twice a year. The united inspectors of the province formed the provin-
cial commission for primary education. This commission met three times a year, and
received from each of its members a report upon his district; once a year, it sent a dep-
uty to the Hague, to form with the deputies from other provinces, a commission to
discuss and regulate school-matters, under the direction of the minister for the home
department and his inspector general. The inspectors in the various provinces were
appointed by the home office, on the presentation of the provincial commission. It has
been said that in Holland public spirit is very strong. State employments are thus
deemed very honorable; and the inspectors gave their services gratuitously—receiving
only an allowance for expenses. It was one of the duties of the provincial commission
to examine teachers for certificates. First, the teacher had to get a general admission—a
certificate of competency, admitting him into the teaching profession; he had to get a
special admission also, before he could exercise his profession.
There were four grades of certificated teachers, which had to be obtained in succes-
sion; every effort was made to draw candidates to the public Schools, both of
private, in the towns; the third grade qualified for a village school; the fourth grade
was for under-masters and assistants. To the highest grades were admitted those can-
didates only who gave signs of a distinguished culture. For public masterships, when
they fell vacant, a competitive examination was held; the successful candidate received
his special admission—his appointment to exercise his profession in the school. For
special admission as a private teacher, there was no second examination; it was in the
power of the municipality, with the concurrence of the inspector, to grant it upon appli-
cation. Although there were no obligatory provisions in the law, the provincial and
communal administrations were charged by the government to provide the means of
instruction in their localities, to insure a comfortable subsistence for teachers, and to
obtain a regular attendance of the children in the schools; and they did all this to the
best of their ability. Free schools for the poor were provided in the towns; in the vil-
lage school, the poor could be received gratuitously; the pupils in the three grades
were taught both by the lay authorities and the clergy, to draw poor children into the schools; and
the school-masters were provided with incomes much superior to what is usually paid to
school-masters in any other European country. To this M. Cuvier attributed much of
the success of the Dutch schools. Some of the best scholars were kept in the school
to assist in the teaching; they became under-masters, and eventually masters; and thus,
even before the institution of normal schools, an efficient body of teachers was provided.
In the normal schools which were afterwards established, school methods and the prac-
tice of teaching formed a more prominent part of the instruction than in those of other
countries. It soon appeared that the free schools for the poor in towns were giving
better instruction than could be obtained by the lower middling classes; and intermediate
schools had to be established in the towns (tusschen-scholen), in which, for a small fee,
an excellent education was provided. Above the intermediate school was the French
school, in which, besides a sound commercial education, modern languages were
taught; above that was the Latin school, giving a classical education, and preparing for
the universities. The classical schools and the universities of Holland do not receive
from foreign observers the commendation so freely bestowed upon the other parts of
the educational system of the country.
Under this law, the public schools were non-denominational; no dogmatic instruc-
tion was to be given by the teacher or in the school; but the instruction was to be such as
to “train its recipients for the exercise of all social and Christian virtues.” The religi-
ous education of the children, however, was not overlooked. The government exhorted
the clergy of the different communions to take upon them the religious instruction of
children of their own persuasions; and this the clergy willingly did—giving up a portion
of every Sunday to this duty. The school-master instructed the children in the truths
common to all religions, and on Saturdays, when the Jews were absent, in the New
Testament and the life of Christ. M. Cuvier, in 1811, stated that he found the instruc-
tion religious, though not dogmatic; and in 1836, he expressed the opinion of others
on this subject, that the instruction was entirely non-sectarian, and that the religious
education was considered a part of the public school system. Holland has been
found to be a singular exception among foreign countries with respect to its religious
education, not only in the general manner of teaching, but in the spirit of the
movement. The government, as an instrument of education, used it simply for
the benefit of the public; and it is thought that the provisions of the law, and the
result of the religious instruction under the law, had a very beneficial effect upon
the French people.
It was thought desirable that the duties of the commune in regard to education should be carefully defined by law. The changes made, however, were not of much practical importance.

The law of 1857 granted "liberty of instruction;" still requiring from the private teacher the certificate of competency; it rid him of the veto of the municipality and the inspector. It expressly prescribes that primary schools, in each commune, shall be at the commune's charge; they are to be sufficient number to satisfy the supreme government are to judge whether, in any commune, they are in sufficient number or not. If the charge of its schools is too heavy for a commune, it receives a grant in aid, of which the state and the province each contributes half; but there is no fixed point at which the commune can demand this aid. The law fixes the minimum salary for a schoolmaster at 400 florins (about £34); for an under-master at 200 florins. (The schoolmaster's salary, however, is usually much higher; in towns, not unfrequently four times as much.) It provides that when the number of scholars exceeds 70, the master is to have the aid of a pupil-teacher; when it exceeds 100, of an under-master; when it exceeds 150, of an under-master and assistant; for every 50 scholars above this last number, he is allowed another pupil-teacher; for every 100 scholars, another under-master. School-fees are to be exacted only of those who can afford to pay them; and the municipalities are enjoined to "provide as far as possible for the attendance at school of all children whose parents are in the receipt of public relief." The law defines the subjects of primary instruction as follows: Reading, writing, arithmetic, the elements of geometry, of Dutch grammar, of geography, of history, of the natural sciences, and singing. There is still a competitive examination for the office of public schoolmaster; a list of those who have acquitted themselves best is made up by the inspector and a committee of the communal council, and from this list the selection is made by the whole body of the council. For the provincial commission, consisting of the inspectors of the province, there has been substituted a salaried provincial inspector; and the provincial inspectors are assembled once a year to deliberate upon the state of primary instruction. The minister of the home department, assisted by a referendary, is the supreme authority in matters connected with education.

Upon the subject of religious instruction, the law was left unaltered. The enactment of 1857 provides as follows: "Primary instruction, while it imparts the information necessary, is to tend to develop the reason of the young, and to train them to the exercise of all Christian and social virtues. The teacher shall abstain from teaching, doing, or permitting anything contrary to the respect due to the convictions of Dissenters. Religious instruction is left to the different religious communions. The schoolroom may be put at their disposal for that purpose, for the benefit of children attending school, out of school-hours." This was the conclusion arrived at, after much excited discussion.

In 1848, all religions were, in Holland, placed by the law on a perfect equality; and immediately thereafter, an attack was begun by the Roman Catholics on the religious instruction of the schools. Professedly neutral, they maintained that it was really Protestant, and probably they were right. The schoolmasters, on the demand of the Roman Catholics, were ordered to obey strictly the law; and whenever there began among the orthodox Protestant bodies a violent agitation against the law—a movement for connecting every public school with some religious communion. The Roman Catholics, believing that in Holland neutral schools must be Protestant, desired that the instruction should be purely secular; and a considerable party among the Protestants contended for the same object. The only party in favor of the existing law were the rationalist or new-school Protestants, who attach more importance to the moral and civilizing side of Christianity than to its dogmatic aspects. Between the denominationalists on one hand and the secularists on the other, the victory fell to this last party. Of course, the decision was a compromise; and neither the high Protestant party nor the Roman Catholics regard it with satisfaction. The consequence has been that, advantage being taken of the newly-conceded freedom of instruction, there has been a great increase in the number of private elementary schools conducted on the denominational basis. The non-denominational school in Holland cannot be considered entirely successful, since the opposition to it seems to be leading to primary education being to a considerable extent taken out of the control of the state.

**State Education in Switzerland.**

In no part of Europe has the education of the people been more successfully prosecuted than in Switzerland. In all the cantons, French and German, it has been carefully attended to by the governing bodies; and for small communities, provided the rulers have intelligence and public spirit, it is comparatively a simple and easy task. To those who are interested in school-methods and school-management, nothing can be more instructive than the education of the German cantons. Their primary schools are unsurpassed; those of the canton Aargau have a reputation of being the best in Europe. The experience of the French cantons throws light upon much that is of the question which occur in the construction of a national system. It is with the latter class of questions that we are concerned; and to the French cantons—Geneva, Vaud, Freiburg, Neuchatel, and Valais—the following statement is confined.

In these five cantons, the school-system was, until recently, the same in its main out-
lines: it was a system designed to put public education in harmony with the democratic
constitutions established after the war of the Netherland. In Vaud, it was founded in
1846; in Geneva and Freiburg, in 1848; in the Valais, in 1849; and in Neuchâtel, in
1850. In Freiburg, it underwent modification in 1856. Its main features were as fol-
lows: The commune were required to provide and maintain public schools, the state
assisting them when the charge became too heavy. In general, every place with more
than 20 children of school-age was required to have its school; every place with more
than 50 or 60, a second school; and so on. Infant-schools were recommended and aided
by the state, but their establishment was not made obligatory. The council of state—
the supreme executive—of the canton appointed a board of public instruction toexercise
the government of education; but in important matters, an appeal lay from this body to
the council; and by the council only could a master be dismissed. The municipality
appointed a communal school-committee, which had the local superintendence of the
schools. Ministers of religion were eligible for this body, but were not members of it
by virtue of office. It was the duty of the school-committee to visit the schools of its
commune not less than once a fortnight, besides holding a public general examination
of the schoolmasters. The teacher required to get a certificate of capacity; the examina-
tions for the certificate being under the management of the board of public instruction.
In Vaud, however, five years' service in a public school exempted a teacher from the
obligation of a certificate; and in other cantons, it does not seem to have been rigidly
insisted on. For vacant masterships, there was a competitive examination, to which
persons qualified by certificate or service only were properly admitted; in Vaud, how-
ever, failing qualified persons, other candidates might be admitted to examination, and
 provisionally appointed. In Geneva, Freiburg, and Valais, there were school inspectors
who periodically reported to the board of public instruction; Vaud and Neuchâtel had
no inspectors; the duty of inspection in these cantons devolved upon the school-com-
mittee. The subjects taught were religion, reading, writing, grammar, arithmetic and
book-keeping, geography, Swiss history, and singing. The instruction given had two
or more degrees (in Geneva, six degrees), according as these subjects were taught with
more or less extension; in the other cantons, the instruction was in the primary school,
and by the same master. Education was to be based upon the "principles of
Christianity and democracy." Hours were to be set apart for religious instruction; from
the ordinary school-lessons dogma was to be strictly excluded; and it was regarded as
the province of the minister of religion, not of the schoolmaster, to give religious
instruction, though the latter was not prevented from giving it in the room of, and
under the responsibility of a minister. In all the cantons, except Geneva, education
was made compulsory; attendance at school was required from the 7th to the 15th, or
from the 8th to the 16th year. If children were privately educated, the state must be
satisfied that their education was sufficient; such children could be called up for exami-
nation with the scholars of the public schools, and if found inferior, might be trans-
ferred to a public school. A certificate of emancipation was granted when the obligatory
course had been fulfilled. The law contemplated that the instruction should be gratu-
tious, and in Geneva and the Valais it was gratuitous.
This law, besides the general features just described, went to a small degree for the purpose
of strengthening the democratic party against the clerical party. It provided that no relig-
ious society should be allowed to teach; that persons educated by the Jesuits should be
incapable of holding any office in church or state; it imposed a political oath upon the
schoolmaster; it prohibited children from being sent to a private school, except with the
satisfaction of the inspector and the school committee; and if sent, required that they should
come up for examination every half-year. At the same time it established an excellent
programme of primary instruction. At the elections of 1856 the clerical party regained
the ascendency in Freiburg; and in Jan., 1858, the council of state made a considerable
alteration in the school-law. It reduced the programme of primary instruction; it made
the clergyman a necessary member of the local school-committee, freed the teacher from
the necessity of taking an oath, and relaxed the obligation of attendance at the public
schools, giving parents liberty to educate their children at home or at private schools. In
other respects, the system, as already described, has been maintained in Freiburg; here
has been but little change in the other cantons.
The law as regards religious instruction seems to work with tolerable smoothness. In
Vaud, it appears that the laxity which prevails as to the requirement of a certificate
sometimes leads to the admission of unqualified persons as teachers; and in Vaud and
Neuchâtel, complaint is made of the incapacity of the school-committee to make up for
the want of professional inspection.
In the 4 cantons in which education is by law, compulsory, the school-attendance
is found to be no better than in Geneva, where it is not compulsory. In these cantons,
the law provides that parents not sending their children to school are to be warned; if
the warning be neglected, that they are to be summoned before the tribunals, which can
punish them by fine or imprisonment. But it appears that, in point of fact, the tribunals
are never resorted to; and that the authorities are careful not to insist upon more than
the people are willing and willing to comply with. In the Valais the school-year need
not last for more than 5 months. In Freiburg the vacation may last for 3 months; and
the inspector may exempt from attendance at school children who are sufficiently
advanced, and children whose labor their parents cannot do without. In Vaud, the local school-committee may grant to children above 12 years of age, whose labor is necessary to their parents, dispensations which in a great measure exempt them from attendance at school; the master may grant the scholar leave of absence for 2 days in the week; the president of the school-committee may grant him leave for a week at a time; the school-committee itself for a month at a time. It appears that in Vaud, the attendance at the schools had been steadily falling off from 1846, the date of the law, up to 1858; and the attendance of the children whose names were on the books was then reported to be by no means regular. New branches of industry which gave employment to children have been introduced into the canton; and the council of public instruction seems to have been compelled to sacrifice the law to the interests of families. The experiment of compulsory education cannot be said to have succeeded, because it has not really been made, in French Switzerland.

State Education in France.

At the head of the education of France is the minister of public instruction; he is advised and assisted by the imperial council of public instruction, a body the members of which are appointed by the crown for the period of a year. The minister, if he thinks fit, brings before the council for discussion projected laws and decrees on public education; he is bound to consult it respecting the programmes of study, methods, and books to be adopted in all classes of public schools. The minister has succeeded to the functions in respect of education which, under the first empire, were conferred upon the university of France; he is head of the university, the officials of which still perform a considerable part in the management of education, but do so under his control. As respects the higher and the professional education, the university is both a teaching and an examining body, granting degrees under conditions prescribed by the minister and council. The administration of the secondary instruction is committed to it, and it shares in the supervision of the primary instruction. It is composed of 18 academies, each of which comprehends several departments. These academies are so many local centers of the department of public instruction. At the head of each is a rector; the chief officials under him are called academy inspectors. The minister of public instruction is also rector of the academy of Paris.

The academy officials, under the control of the minister, have the superintendence of secondary instruction in the departments within the academy's jurisdiction; there is an inspector for each department. The instruction is minutely regulated, as to the quantity to be provided, as to the subjects to be comprehended in it, and as to its cost; it is the chief duty of the academy inspectors to see that the requirements with respect to it are complied with. The inspection is said to be highly efficient. The lycée is the principal seminary of secondary instruction; in general the chief town of every French department has its lycée. There is, besides, the communal college. Every town of considerable population has its communal college. The lycée is founded and maintained by the state, with aid from the department and the communes; the communal college is founded and maintained by the commune, with occasional aid from the state. The instruction given in the communal college and in the lycée is substantially the same in character; in the lycée it is more extensive. To the lycée there is usually attached a preparatory school for the younger boys. In both lycées and communal colleges there are boarders and day-scholars. French, Latin, Greek, and mathematics are the principal subjects of instruction; arithmetic, history, geography, modern languages, and the natural sciences are also taught. The course at the lycée lasts for six years, and qualifies for the degree of bachelor of letters. Religious instruction is given—to the Roman Catholic boys by chaplains attached to the school; to the Protestants, by a Protestant minister specially appointed to this duty; and the New Testament in Greek or Latin is read daily by every class. In the lycées, the average charge for day-scholars is from 110 francs (£4, 7s. 4d.) to 180 francs (£7, 8s. 4d.) a year; the charge for boarders from 200 francs (£93) to 900 francs (£393), according to their age and advancement.

In Paris, the charges are higher—from £93 to £393 a year for boarders, and from £19 to £412 a year for day-scholars; on the other hand, there is a lyceum where the charge is £38 a year. There are public scholarships (bourses) founded by the state, to be obtained by competition, the holders of which are relieved from all cost. The education given is in no respect much inferior—and in some respects it is superior—to that which is to be had at an enormous cost at the best English public schools; it is far superior to that which, at a far higher cost, is ordinarily given to children of the middle classes in England. A private secondary school cannot be opened without notice to the public authorities: they must be satisfied that the premises are suitable; and the director must have a certificate of probation—showing that he has served five years in a secondary school—and a certificate of competency obtained at the public examination for secondary teachers. The academy inspector inspects private secondary schools, but only to see that the pupils are properly lodged and fed, and that the teaching contains nothing contrary to morality and the laws. The minister may, however, dispense with the certificate of probation, and holy orders are accepted in lieu of the certificate of competency.

A law, dated June 21, 1865, founded a new course of study in secondary schools—a
special secondary instruction. The object of the special secondary instruction is declared to be to "found the sub-officers of industry;" instruction in living languages is substituted for the classical instruction of the secondary schools; the elements of science and its applications receive great attention—particularly regard being had to the teaching of agriculture and the sciences which bear upon it. The teaching, moreover, is intended to impart what may be called a sound French education. A normal school has been founded at Cluny for the preparation of masters for this special secondary instruction.

For primary instruction in France an excellent basis was laid by M. Guizot's law of 1833, of which, indeed, the more important provisions have been retained. Since the re-establishment of the French republic education has repeatedly been the subject of legislation; in the main, the provisions as to primary education are regulated by the laws passed between 1850 and 1867. Every commune must maintain an elementary school, either by itself or in combination with other communes; in founding and maintaining its schools it is to be aided, if necessary, by the department and by the state. It must have taxed itself specially for the schools three centimes per franc of rental before it can claim aid; the department must have taxed itself specially two centimes for the communal schools before the state is resorted to. Up to the present year a certain number of poor children—the number determined for each school by the prefect of the department—were admitted to the school gratuitously; for others a fee was charged, which was collected every month by the tax-gatherer. The state contributed whatever was necessary in addition to the communal and departmental taxation and the school-fees.

The law of the present year, however, provides that all children are to be admitted gratuitously whose parents would have difficulty in paying the school-fee; and that a commune whose taxation amounts to four centimes shall have the right of taxing the commune for an additional fee, if any, so arising being made up by the state. In the large towns the schools have long been gratuitous—the communes often taxing themselves for school-purposes beyond the amount required by law. Up to the year 1867 the law did not oblige the communes to maintain separate schools for girls, though a large proportion of them contributed towards the maintenance of such schools. The law of 1867 provides for the establishment of girls' schools; the cost of them—the communal and departmental taxation being in most places previously exhausted—will fall in a great measure upon the state.

Religious instruction is given in every school. In France, the Roman Catholic, the Protestant, and the Jewish forms of worship are subordinated by the state; and it is provided that, in communes where more than one of these is publicly professed, each form is to have its separate school. The departmental council, however, has power to authorize the union, in a common school, of children belonging to different communions. In such cases it is provided that ministers of each communion shall have free and equal access to the school, at separate times, to attend to the religious instruction of members of their own flock. To a school appropriated to one denomination, no child belonging to another is to be admitted, except at the express demand of his parent or guardian, signed in writing to the teacher. Denominational schools are now the rule, common schools the exception. Previously to 1850, under M. Guizot's law, common schools were the rule, but it was found that in them the religious instruction presented grave practical difficulties. All the religious bodies appear to be satisfied with the present system. The schools, though denominational, are communal schools; the denominations have not the management of them; and they are all subject to the same inspection.

The mayor and the minister of religion in each commune have the supervision and moral direction of the primary school; in practice they are strictly confined to matters connected with its morality. Cantonal delegates are appointed by the departmental council (the canton is a division larger than the commune) who inspect the primary schools of their canton; but they have no real authority over the schools; they are only allowed to make representations as to the state of the schools to the departmental council, or to the inspector. The departmental council has the chief part in the regulation of the primary schools; moreover, no private primary school can be opened without its permission; and if it refuse permission, there is no appeal. It is the prefect, however, who has the power of nominating, suspending, and dismissing public primary teachers. His authority is usually exercised upon the report of the academy inspector—the university official whose important functions, in respect of secondary instruction, have already been described. The academies have the charge of the normal schools of primary instruction, and the supervision of the primary schools as regards the methods of teaching and course of study. Under them are the primary inspectors, who report to the academy inspectors; above the latter, as regards primary instruction, there are four inspector-generals, attached to the different departments at Paris. It is the primary inspector who really superintends the instruction of the schools; his labors are unceasing; his inspection is a reality, for he is not required to give notice of his visits. The private primary schools are subject to his inspection, but only as regards the provision made for the bodily health and comfort of the pupils and the maintenance of morality. The subjects which must be taught in every primary school, in addition to moral and religious teaching, are reading, writing, arithmetic, the elements of French grammar, and the French system of weights and measures; there are other subjects which are facultative—which, in whole or in part, may be taught, that is, if the council of the
commune should so desire, and the departmental council give its consent. These facultative matters are the applications of arithmetic; the elements of history and of geography; the elements of physics and of natural history; elementary instruction in agriculture, the arts, and hygiene; surveying, leveling, drawing, singing, and gymnastics. For girls, there are superior primary schools which teach the facultative matters only; and in girls' schools instruction is usually given in needlework for about three hours a day.

For the preparation of male teachers, the law requires every department to maintain a normal school; in some cases, however, two departments are allowed to maintain one jointly: there are now 70 of these schools. There are separate normal schools for female teachers; of these, the number was recently 34; now that the law is about to add largely to the number of girls' schools, it will probably be increased. The members of the religious orders devoted to teaching, which perform a great part in primary education, are trained for their duties in the establishments of their respective orders. (Of these orders, the most important is that of the brethren of the Christian schools.) The instruction of the normal schools is meager; it scarcely exceeds the subjects of primary instruction; a considerable proportion of the students, indeed, acquire only an imperfect knowledge of the facilitative subjects. School-method is what, in the normal schools, it is deemed most important to teach. The examination for primary school-masters—which is conducted by a commission appointed by the departmental council—is limited to the subjects taught in the schools. There are two classes of certificates, according as the teacher passes in the obligatory subjects only, or in the whole or part of the facilitative subjects also. Every male teacher, public or private, is required to have the certificate of capacity granted after an examination; also, excepting in the case of religious persons, a certificate of morality. The law recognizes a certificate of stage, to be granted to assistants who have served as such for three years, as a substitute for the certificate of capacity, but this provision has been unpopular, and the qualification of stage is practically unknown. Female lay teachers require the certificate of capacity; female teachers of the religious orders are exempt from it. No person can be appointed a regular communal teacher unless he be twenty-four years old, and have served for three years since his twenty-first year as an assistant, or as a supplying teacher. The supplying teacher gets a lower salary, and may be employed in the poorer communes. The salaries are low even in the towns: in many of the country communes, the legal minimum are not exceeded: these are—for an ordinary communal teacher, £34 a year; for a female teacher, or a supplying teacher, £29 a year. The commune pays £8 a year, besides the school-fees; whatever is required to make up the legal minimum, the government supplies; and, since 1862, the government has, upon certain conditions, made slight allowances in addition to the minimum.

It is in secondary instruction that the education of France has a decided superiority over that of England. The primary instruction is scarcely equal to that given in English schools of the same grade. Mr. Matthew Arnold has reported that, in 1839, he found in French primary schools the writing fair, but scarcely so good as in English schools; the reading better, the arithmetic much better, than in English schools. Of history and geography, the pupils were far more ignorant than English school-children of the same age. The ministry of M. Durny, however, was an era of marked improvement; much more attention is given to the facultative matters now; especial attention to agriculture and the subjects connected with the daily life of the peasant. Mr. Arnold came to the conclusion that, even in the great towns there were no masses of children left altogether uneducated, that almost all passed at some time through the schools. Adult classes, taught in the evenings, have greatly increased in numbers of late years, and are now aied by the state.

In 1834—just after the passing of M. Guizot's law—the number of primary schools, public and private, was 10,316; in 1857 it was 63,100; in 1872 it was 70,180, of which 38,850 were boys' or mixed schools, 17,460 girls' schools, and 11,000 were free schools. In the primary schools alone there were, in 1872, 4,722,000 scholars—3,590,000 more than the number of scholars in 1829. In 1872, the year of the census, a careful inquiry was made into the condition of the French people with regard to primary education. Of the total population above the years of childhood, it was found that 30.77 per cent could neither read nor write, 10.94 could only read, and but 58.29 could do both. There was a most extraordinary difference between one department and another in this respect, the percentage of utterly illiterate persons ranging from 6.9 per cent in Doubs to 61.8 in Haute-Vienne; the most favorable figures indicating universally the north-eastern departments. In 1872 the state and the communes expended 87,000,000 francs on primary education alone. The item of public instruction stood at 49,311,000 in the budget of 1877. For the means of higher education in France, see University of France.

State Education in Prussia.

In all the Protestant states of Germany, the school-system in its main features is the same. The Prussian system—more celebrated, more extensive, more practical and thorough than the system of the minor states—always powerfully influencing these, and now likely to influence them more than ever, is that which must be selected for description. About this system, M. Cousin, by a strange confusion between it and a project of law—a mere scheme drawn up by the education minister, Von Altenstein, never even
proposed for legislation—spread misconceptions throughout Europe, which have scarcely yet been dispelled. It has been greatly changed, greatly improved since Cousin wrote in 1831; but it does not yet in symmetry and completeness approach to what he described.

In Prussia, there is a minister of public worship and instruction; but the officials who under him carry on the government of education are the officials of the department of the interior. At the head of the government in each province is a president; over each of the departments into which the province is divided there is a prefect (bezirk); each of these officers is assisted by a council, of which one section, called schulkollegium, forms a separate council for deliberating upon the local school affairs. One member of the school council, called a provincial school-councilor, is associated with the president for administrative purposes; the prefect has attached to him two departmental school-councilors, one Protestant, one Catholic, to advise with him, and to administer the school-affairs of their respective communions. There is practically a division made of educational affairs between the officials of the province and those of the department. The provincial school-councilor takes the charge of secondary education within the province; the departmental school-councilors the charge of the primary schools of the department.

Over each of the circles into which the department is divided is an office, termed a landrath, who reports to the prefect of the departments. With the landrath, in the management of primary schools, is associated the superintendent, the church dignitary of the circle. The superintendent is ex-officio inspector of the primary schools within the district. The parish clergyman is ex-officio local inspector of primary schools within his parish. There is also for the school or schools of each parish a board of managers, the composition of which varies in different provinces. The clergyman is always a member of the board; he is usually its chairman. In country places, the whole powers of the board are often left in his hands.

In the “exterior” affairs of the school—passing school-accounts, visitation of school-premises, control of the school estates, adjustment of the school-rate, etc.—the landrath is associated with the superintendent. Its “interior” affairs, all that concerns its teaching and discipline, are subject to the established regulations, under the superintendent’s control; but, in practice, they are more under the influence of the departmental school-counselor. The superintendent, however, is required to visit the school, and to watch over the conduct of the local inspector, and he reports annually to the government of the department. The local inspector’s province is the interior affairs of the school. He is expected to visit the schools diligently, and to be active in the supervision of them. The religious teaching of the children is almost entirely done by him, being his duty to prepare the children in administrative work, which comes at the end of the school-period. To qualify them for the duty of school-inspector, the candidates of the clergy are required to sit for six weeks as auditors at a normal school, and to have attended a course of pädagogik at the university. Nevertheless, it appears that many clergymen are very ill fitted for this work, and that their powers of interference are often exercised in ways annoying to the master, and detrimental to the school. The “exterior” affairs of the school of a parish belong to the board of managers.

This board is usually composed of representatives (1) of the patrons, if any, of the school; (2) of the parochial clergy; (3) of the municipal body; (4) of the householders. It has a stated meeting once a quarter; it meets whenever it is summoned by the chairman. It manages the revenue and expenditure of the school, in respect of which it is responsible to the landrath; it is the trustee of the school-buildings and property. It is its duty to see that the regular school-hours are kept; that no unauthorized holidays are given; to it application must be made for dispensations for periods exceeding a week. Its members should be present at all examinations and other public solemnities of the school.

In the large towns there are school-delegacies appointed by the magistrat, whose powers are more extensive, and are in practice the greater, because in the large towns the pastors pay little attention to the schools. The school-delegacies have control over the higher as well as the primary schools which their constituents maintain; two paid members—school-delegates—who must be members of the magistrat, exercise the greater part of their authority. Under the delegacy, for every school there is a school-board, consisting of the clergyman and two lay members, whom the delegacy appoints. The delegacy itself is accountable to the magistrat, and both are subordinate to the provincial council.

Every commune is bound to find school-room and teachers for all the children of school age belonging to it. The amount of the teacher’s stipend is in every case fixed by the departmental government; there is no legal minimum; the salaries are usually very low. Some parishes possess endowments, but in general, the cost of maintaining the schools is defrayed by means of (1) school-fees; (2) a local rate; (3) a grant from the national treasury. As a rule, this is levied by the landrath, and pay well for a school, even as the state grants aid only after the strictest proof of the incapacity of the commune, the weight of the burden falls upon the local rate. The maintenance of the schools ranks with the first charges upon the local purse. The teacher is appointed by the departmental council; in a few towns, however, a certain power of choice is allowed to the municipal authorities—they may select one from a number of candidates presented to them by the government.

School-attendance is by law compulsory for eight years; the school age beginning at the completion of the fifth year. But in most parts of Prussia, children, though allowed, are not compelled to attend till the completion of their sixth year. The school-period

National.
National.

The times were before teach them, say, communicate provisional lost, 50 natural some Prussia second; music, cates tory-law strict moral rank, some clergyman Grammar for to—has no effect, a statement is sent to the police office; the parent is fined a small sum for each day of the child's absence since the last admonition; and the fine can be levied by execution, enforced by imprisonment, or taken out in parish labor. It seems that very few children escape registration; but the regularity of the attendance—in general it is very regular—varies considerably in different districts; the execution of the law being strict or otherwise according to the temper of the people, their circumstances, and the vigilance of the school authorities. There are no statistics by which the success of the law can be exactly tested. In some of the larger towns the demand for child-labor and the growth of pauperism are adding to the difficulty of enforcing it. Prussia has a factory-law requiring that every child employed in a factory shall attend school for three hours a day, and this law is strictly enforced.

Teachers of every class, public and private, have to pass two examinations. Certificates are of three degrees of merit. The heads of examination are music, the German language, the art of school-keeping, geography of Prussia, arithmetic and geometry, knowledge of natural objects, writing, drawing, singing, and the theory of music, organ. After the first examination the candidate is eligible as an assistant or provisional master; he must serve in this capacity for three years before taking the second; he must pass the second within five years. The second examination is the same subjects; but now most weight is given to the art of school-keeping. Of the subjects taught in primary schools the principal is religion; the others are reading, writing, arithmetic, singing, and the elements of drawing. Incidentally, the teacher may communicate information about natural phenomena; about geography, beginning with that of the locality, and the history of Prussia. The teaching was much more ambitious before 1854, before 1854, also, the Prussian schools, now limited to a meager programme, were universities on a small scale, aiming at the mental training of their students, rather than at fitting them to teach elementary schools. The change is often ascribed, both in Prussia and out of it, to political motives, having been made by a party unfriendly to popular education; but eminent educationists defend and approve it. The schools, they say, are now attempting as much as can be thoroughly done in the time allotted for primary education, and are doing it thoroughly; while the showy teaching of former times, with its endeavor to develop the faculties, and to communicate knowledge, neglected the indispensable elementary instruction, and, as regarded the greater number of the scholars, was in no respect successful. The normal school training; it is said, now fits the teacher for his duties and his position in life; formerly it rather unfitness him for them, while fitting him perhaps for something better. It is, however, admittedly a defect in the Prussian system that it offers to the humble classes no opportunity of carrying their education beyond the point at which the elementary schools leave it. In some of the towns there are improvement institutes, where young persons are taught in the evenings or on Sundays; but they attempt little, are badly organized, and are neglected by the school administrations. It should be stated that the town schools often teach somewhat more than is taught in country places—more geography, history, and natural knowledge—but this, though permitted, is not encouraged by the authorities. Grammar is entirely excluded from primary instruction. The only part of the teaching which is less than excellent is the writing; it has been stated that upwards of 50 per cent of the recruits are unable to write—the art, never perfectly mastered, being lost, it must be supposed, through want of practice.

As regards religious instruction, the rule is that the primary school is denominational—segregated. The school, apart, that is, for children of each of the religious bodies; the clergyman, who has the charge of the school is the clergyman of the body to which it is appropriated. Besides the "evangelical establishment," in which Lutherans and Calvinists are combined, there are the Roman Catholics and the Jews to be provided for; of other sectaries, there are not 10,000 in all Prussia. The Lutherans and Cavinists are combined in the school as in the church. Dissenters are allowed to withdraw their children from the religious instruction, and have it given by their own pastor. Any commune may establish a mixed school, if it so desire, and if the authorities permit; but, in practice, mixed schools are only to be found where it would be very inconvenient to establish a school for each body. In mixed schools the teacher is chosen proportionately from each of the two great religious bodies; if there be only one teacher, it is, in some districts at least, customary that he should be alternately a Protestant and a Catholic. The same system is in force for higher education; but the results have been generally unsatisfactory, leading to attempts, or suspected attempts, at proselytism, and to parish squabbling. It has been abandoned, not so much from the wish of the government, as
in deference to the feelings of the people, and to the demands of the Roman Catholic hierarchy. But the denominational system is more in accord with the part which the state assigns to religion in the school. The school, it is said, should be the organ of the church for training children to church-membership; school and church are expected between them to form the child into a man contented with his position in life. Religious teaching must be given by the master for an hour every day. In the Protestant schools the master teaches the Lutheran catechism to Lutheran children; the Heidelberg catechism to the Reformed children. Scripture history is also taught; and by means, from an inscribed collection, have to be committed to memory. The master is not allowed to expand the catechism; his duty is to see that the children learn it and understand the words in which it is expressed. It is the clergyman who explains its doctrines to the older children in preparing them for confirmation.

Any one may open a private school of any class in Prussia who can obtain a license for the purpose from the government; but in a city it must be shown that the district in which the school is to be placed is insufficiently supplied with schools; and every private teacher must have passed the two examinations. Private schools are subject at all times to the inspection of the school-councilor, and are bound strictly to follow the regulations established for private schools. The larger towns in Prussia are not yet adequately supplied with public primary schools; private primary schools are therefore common in such places: in Berlin they educate nearly half the children who are in primary schools.

Of the secondary and higher education in Prussia, a brief and general notice must suffice. It has already been stated that the superintendence of the secondary schools is undertaken by the school-councilor of the province; it is independent of ecclesiastical control. The larger communes and the towns are required to maintain middle schools, giving instruction of a higher order than is given in the elementary schools, a sound German education, and preparing boys for the gymnasium. These must be provided to the satisfaction of the authorities, according to the wants of the population. They are maintained, like the primary schools, by school-fees, local taxation, and these fail, the state treasury. Some of the larger towns maintain also secondary schools of a higher class; these are of two kinds—the real-school, and the gymnasium or grammar-school. In such towns, as stated already, the local management rests with the school-delegacy. There is, besides, a considerable number of real-schools and gymnasium which are entirely in the hands of the government. None of the real-schools take boarders; very few of the gymnasium do. The gymnasium is a classical school preparing for the universities.

In the real-school, mathematics, scientific studies, and modern languages are substituted for the classics, and the instruction is designed to prepare the pupils, as far as possible, for the pursuits of life. The real schools grant certificates to their pupils. The royal real-schools and the gymnasium (other than those maintained by the large towns) are under the management of the provincial school-councilor. Some of the older of those gymnasium have endowments, but the money necessary for their support is contributed by the state. Appointments to the schools are made by the school-councilor; he appoints the teachers, or nominates the feet out of which local authorities have to choose, in all the secondary schools. Teachers for all the schools have to pass two examinations. There are boards of examiners, appointed by the provincial government, which conduct the examinations; these boards also examine the students of the gymnasium, to test their fitness for the university. The university in Prussia is a teaching (or rather a lecturing), as well as an examining body, and grants degrees for the universities, and, consequently, the degree for the university. There are seven universities within the territory held by Prussia before the war of 1866; in two of these—Breslau and Bonn—there is a Roman Catholic as well as a Protestant institute of theology. The university affairs are administered by a commissioner appointed by the crown; all their regulations are prescribed, and all the appointments in them made by the state.

State Education in the United States.

In the United States, the education of the people is out of the sphere of the central government; it ranks among the domestic affairs of the several states, and it is chiefly in the northern states—those from which, before the late war, slavery was excluded—that systematic attempts have been made to promote it. The central government has, however, in more than one instance endeavored to assist education in the states, by providing for it endowments. In the states which contain waste lands, it puts aside, in every newly-surveyed township of six miles square, one sq.m, for the support of schools within the township. The state becomes trustee of this land, or of the price obtained for it, which is usually called the township-fund, and pays over the yearly income to the township when it has been settled. The central government, about 1836, had accumulated in its treasury a considerable balance, the surplus of its income over its expenditure during several years: this it appropriated pro rata among the states, reserving the right to reclaim it. This right has not been, and is not likely to be exercised; and in most of the Northern states, the income of the "United States deposit-fund" is applied to the support of education. Since 1864, by what is called the "agricultural college act," the central government has made a liberal offer of allotments of land to the states upon certain conditions, for the endowment of one or more institutions in every state, in which—whatever the other instruction may be—special attention shall be given to those
branches of learning related to agriculture and the mechanic arts. Several states are preparing to avail themselves of this offer.

Every one of the northern states has its common schools. Before the war, Kentucky, Missouri, and Louisiana had each some kind of school-system; at various points throughout the south, particular towns had established schools, always after the model set in the northern states. The new state of Western Virginia has passed a school law since the conclusion of the war. In the northern states, besides the endowments above described—both of which are possessed by most of the states—every state possesses a school-fund arising from various sources—sale of lands, taxation, penalties, and forfeitures—which is usually vested either in the state legislature or in a board of education. In one or two of the states, the income of this fund is considerable, but in general it is small. It is usually, but not in all the states, applied solely to the support of public schools, or of the normal schools which help to provide them with teachers. Apart from the influence exercised by means of this fund, the state usually promotes public instruction only by its legislation, by which it requires or enables local bodies to make certain provision for the education of children within their jurisdiction. Everywhere, the law leaves much, and usually the practice leaves everything, to the local bodies; and these come short of, or exceed the legal requirements according to the local interest in education and ability to pay for it. It is through the interest of the municipalities in education that very ample provision is made in the towns; it is through the force of example, and in deference to educational experience, that a certain uniformity of system prevails. There is a close approach to uniformity both in the law and in the practice of the several states; and a description of the system of one state will be approximately true of that of other states. The Massachusetts system is fittest to be selected for description, as being the oldest, the most celebrated, that which on our side of the Atlantic is most identified with the common schools, and perhaps on the whole the most successful. Some of the principal variations from it will be noted.

In 1642—20 years after the landing of the Mayflower—the Massachusetts colonists passed a law requiring every citizen, under a penalty of 20s., to teach his children and apprentices, or have them taught, to read perfectly the English language. Five years later, they passed another law, requiring, under penalty, every township containing 50 householders to appoint a teacher to teach their children to read and write; every township containing 100 householders to maintain a grammar school capable of fitting youths for the university. The present law is different, if not less liberally conceived. The change was made by numerous steps, and was probably forced on by the circumstances of the community. The law, as it now stands in the revised statutes of the state, provides that in every township the inhabitants shall provide for at least six months in the year a sufficient number of schools for all the children of the township. The teachers are to be of competent ability and of good morals, and they are to teach orthography, reading, writing, English grammar, geography, arithmetic, the history of the United States, and good behavior. Other subjects—algebra, vocal music, drawing, physiology, and hygiene—are to be taught or not at the discretion of the local committee. Every township may, and every township containing 300 householders must, also maintain for ten months in the year a school which shall give instruction in bookkeeping, surveying, geometry, natural philosophy, chemistry, botany, the civil polity of Massachusetts and of the United States, and the Latin language. And in every township containing 4,000 inhabitants, the teacher must be competent to instruct in the Greek and French languages, in astronomy, geology, rhetoric, logic, intellectual and moral sciences, and political economy. Moreover, any township may establish schools for children over 15 years of age, determining the instruction to be given, and appropriate money for their support. The compulsory part of the law is supported by penalties, but it is said that there would be difficulty in enforcing it; at any rate, they are not enforced. It is also provided that every child between 8 and 14 must be sent to school for at least 13 weeks in a year; the penalty for breach of this provision is $20, but the idea of enforcing it seems never to have been entertained; its existence even is not generally known. The law does not permit school fees, or, as they are called in America, rates, but there seems to be no fund arising from waste lands in Massachusetts; and the township raises the necessary funds by a tax upon property— the personal property of the inhabitants and the capitalized value of their real property situated within the township. The amount of the rate is by the law left wholly undetermined; it is determined by the householders at their annual meeting. The state endeavors to influence the townships to make a liberal provision by means of the school fund, a share of which is given to every township which has made its returns to the board of education, and has spent not less than at the rate of $1 ¼ per head for all the children of the township. The school-fund contribution is very small—less than 25 cents for every child; but it is said to have an excellent influence upon the rural townships. No doubt, the publication of the returns made to the board of education tends to spur on the backward districts.

The management and control of all the public schools of a township are placed in the hands of a school-committee, consisting of any number divisible by three; the members of this committee hold office for three years, and one-third of them are elected annually at the annual meeting of the township. The committee have the supervision of the schools; and it is among their duties to see that no book calculated to favor the tenets of
any particular sect of Christians shall be used in the schools, and to require the daily reading of some portion of the Bible in the common English version. Any township by its public meeting, or a city by its city-council, may require the committee to appoint a paid superintendent of schools; when this is not done, the members of the committee receive a small allowance for the time during which they are engaged upon the school-affairs. But, moreover, any township may, at a meeting called for the purpose, resolve to divide itself into districts for the support of its schools. If this be done, the township names for each district a "prudential committee," consisting either of one or of three persons, resident within the district, which is charged with providing and keeping in repair the school-house, at the expense of the district, and, if the township so determines, with the duty of selecting and contracting with the teachers. The district determines the amount to be raised by it for the building or repair or furnishing of its school; this is collected by the township collector, and handed over to the district-committee. The school-committee retains its functions of management, except so far as they have been made over to the districts; and hence, there is a double management of the schools, which is found to be attended with inconveniences. The division into districts, too, is said to have led to an unnecessary multiplication of schools in country places: people scheme to have the township so divided that there may be a school in their neighborhood—there are, therefore, more schools than are needed, and more than can be maintained in efficiency. The school-committee—in cities, the school-superintendent—examines the teacher before his appointment, and grants him a certificate, which remains in force for a certain time. There are three classes of certificate—one valid for six months, another for twelve, a third for two years. The common schools of a township are open to all children residing therein, and none are to be excluded on any account of race, color, or religious opinions; and it has been held that a child unlawfully excluded may recover damages in an action of tort.

In New York, in Pennsylvania, and in most of the western states, large municipal powers are possessed by the county, and the county shares with the township the management of school-affairs. New York has a state superintendent, whose power over the schools is considerable. In that state, it is the school-commissioner of the "assembly district" in which the township lies that divides the township into school-districts; and it is the district which determines the school-tax: the township is almost completely ignored. In New York, Ohio, and Illinois, it is by county officials that teachers are examined and certificated. In New York, Rhode Island, and Connecticut, "rate-bills"—that is, school-fees—are allowed, and are usually levied. Several states besides Massachusetts make school-attendance compulsory: in most of the states, there appears to be a provision against "truant;" it appears that attempts are not made to enforce the law except occasionally, in the case of homeless, wandering children, who are liable, in lieu of a fine, to be sent to reformatory schools. It has been calculated that in the city of New York (pop. 940,000) there are about 100,000 children who do not go to school—though in no city is there a better or ampler provision of common schools.

As might be expected, the school-laws work badly in country districts. The householders are disposed to be satisfied with any kind of school, provided it be cheap, and within easy reach of them; and the multiplication of schools by the district-system, makes it almost unavoidable that an insufficient sum should be spent upon each school. The teachers—a vast majority of whom are women—being wretchedly paid, are badly qualified; they are constantly changing; scarcely any intent to make teaching their occupation for life. Few of them have been trained for their work—the normal schools which exist being utterly inadequate to supply the demand for teachers; and the examination by a rural school-committee affords but a slender guarantee of competency. The teacher is usually "bounced round" among the farmers of the district, and is said to be treated by them with much observance; but his income—putting a money-value upon the board—has been estimated at an average of about 50$ a month, and that only during the time that the school is open. In 1864, in 84 townships of Massachusetts—more than a fourth of all the townships in the state—the schools were kept open for less than the statutory period of six months. The teaching is said to be wonderfully good, considering the scanty pay given; but where the vacations last for more than six months, and the teacher is changed almost every term, thorough and systematic instruction is scarcely possible. It is in the towns that the working of the school-law has been creditable and successful. Through the high public spirit of the municipal bodies, and the great importance attached to education, the support of the common schools is in general most liberally provided for.

In the towns, there is usually a superintendent of schools, by whom, under and in co-operation with the general and district school-committees, the schools are inspected, and the character of the instruction determined; by him the examination of the teachers also is conducted. Of the schools, there are four classes—primary, intermediate, grammar, and high-schools or academies. Children usually enter the primary school about 5 or 6; the grammar-school between 8 and 9; the high-school between 12 and 13 years of age. They are not promoted from one class of school to another without undergoing an examination; the intermediate schools, where they exist, are intended for those who are too old to be at the primary school, and too backward to enter the grammar-school. To be admitted to a grammar-school, a child must be able to read at first sight easy prose, to spell
common words of not more than three syllables, and to have acquired a slight knowledge of arithmetic. For admission to the high-school, the usual requirements are ability to read correctly and fluently, an acquaintance with the simple rules of arithmetic, and some knowledge of geography and grammar. From these tests may be inferred the average proficiency expected to be attained by children leaving the primary and the grammar-school respectively. In the grammar-schools of Boston, the programme of studies consists of spelling, reading, writing, arithmetic with book-keeping, geography, English grammar, the history of the United States, natural philosophy, drawing, and vocal music: this is nearly the usual programme; but in New York and one or two other states a little more is attempted. Between the high-schools or academies in the various states, there are considerable differences. In the city of New York, for example, the Free academy has pretensions to the rank of a university, and grants degrees in arts and science (bachelor of arts, bachelor of science, master of arts) to students who have completed with credit the curriculum of five years. But, in general, the high-schools are schools of secondary instruction, intended to prepare youths for the universities—instruction being given in the classical languages, mathematics, the sciences, history, and the English language and English literature. The usual curriculum is one of four years; and the students are not required to study all the subjects taught in the school. At Boston, where boys are admitted to the Latin high-school at 10 years of age, the curriculum lasts for six years. There are high-schools for girls as well as for boys, the programme of instruction being the same in both. At Boston, the curriculum at the girls' high-school lasts for three years; and pupils at admission must be between 15 and 19 years of age. Boston possesses, besides its Latin high-school and its girls' high-school, an English high-school, said to be admirably planned and conducted. The instruction in it closely resembles that given in the real-schools of Germany, including French and German, and various sciences, with their application; being intended to enable boys to complete a sound English education, and to prepare themselves for commercial life. Great complaints are submitted everywhere made—Boston seems to be exceptional in this respect—of the irregularity of the attendance at the primary schools. It is estimated that in most states not much more than half of the children pass from these to the grammar-schools; but a trifling proportion of the grammar-school pupils enter the high-schools, and of these, only a small fraction persist to the end of the curriculum. All high-schools grant certificates of graduation to pupils who have credibly gone through the course of study. The study of the classics does not, even in the most pretentious institutions of this class, seem to be carried very far, much more attention being given to mathematics and natural science. In Boston—in many respects the most favorable example that could be taken—there were, in 1884, 32,514 children of school-age—between 5 and 15; of these, 28,990 were in school, the average attendance being 24,617. The number enrolled at the three high-schools was only 725, and the average attendance 491. The number of students who complete the five years' curriculum of the New York Free academy seldom exceeds fifty. Among the wealthy, there is said to be a growing disinclination to make use of the common-schools; their children are usually sent to private academies. The only serious opposition to the non-religious character of the common schools comes from the Roman Catholic clergy; but it is stated that there is a growing feeling upon this subject among some of the other religious bodies. In many of the New York schools, in which the majority of the children are Roman Catholic, clerical influence, insufficient to impress upon the education the religious character which it would approve, has obtained, with the tacit assent of the school-authorities, the disuse of the daily Bible reading which the law prescribes.

The primary and grammar schools are most frequently mixed schools—that is, they admit boys and girls; in the teaching, however, the sexes are kept apart. The teachers in primary and grammar schools, even in the towns, are usually women; but in Boston the principal of a grammar-school is always of the other sex. The schools are in towns, always graded—divided, that is, into classes composed of those who are at the same stage; each grade forms a separate department of the school, and is taught by a separate master. The usual number of pupils allotted to a teacher is in the primary schools about 50; in the grammar-schools about 35. This system of grading is a cheap system, because it enables a teacher to take charge of a large number of pupils; but it is said to lead to a want of thoroughness in the instruction, the teaching being addressed to the class rather than to the individual members of it. Want of thoroughness seems, indeed, the besetting sin of American teaching, which aims too much at communicatively knowledge, not sufficiently at developing capacities. In the primary and grammar schools, the education costs from 55s. to 68s. per head; in the high-schools, from 25 to 410 per head.

Statistics of National Education.

The proportion of children attending school—i. e., enrolled in school-registers—to the whole population of the countries under-mentioned may be approximately stated as follows: England, 1 in 7.7; Scotland, 1 in 6.5; Prussia, 1 in 6.27; France, 1 in 9; Holland, 1 in 8.11; Belgium, 1 in 11; northern states of the American union, 1 in 4.5; Switzerland, 1 in 7; the minor Protestant states of Germany, 1 in 6.7. These figures, however, must not be taken as indicating the comparative diffusion of education in the

U. K. X.—19
countries named: nor are they to be relied on as indicating, with anything like exactness, the comparative proportions of children actually attending school; for the proportion of the children enrolled which on the average is in actual attendance, varies in different countries. It should also be borne in mind that averages conceal the condition of the worst parts of a country—in Scotland, for instance, where the school attendance varies from 1 in 4 of the population in the best districts to 1 in 15, 1 in 20, and even 1 in 30 in the worst.

See the reports of the assistant-commissioners appointed to inquire into the state of popular education in England, vol. iv., being vol. xxi. part iv. sess. 1861; the second report of the Scottish educational commissioners, 1867; the statistical society's quarterly journal for March, 1867; Horace Mann on education in European countries; Fraser's report on American (U. S. and Canada) schools; Cousin on German and Dutch education; M. Block's abstract of public documents relating to education in France; Histoire et instruction du Peuple, par Pierre Tempels (Brussels, 1865); Statistische Nachrichten über das Elementar Schulwesen, an official return, which gives a complete survey of elementary education in Prussia to the end of 1864; Congrès International de Bienfaisance de Londres, Session de 1862; and Rapport et Discussion sur l'Instruction Obligatoire.

Since the preceding account was written, the claims of national education have been more fully recognized, and, with less opposition than might have been expected, a national system has been established in England and Scotland. The elementary education act for England, 1870, enacts that every district in which the existing schools are found deficient shall have a popularly elected school-board, to manage its rate-supported schools, levy school rates, appoint teachers, etc. Elementary schools are to be supported, and the expenses of school boards paid, out of funds called school-funds. The local rate is the nucleus of each school-fund; for every school there is likely to be entitled to an annual grant from parliament not exceeding the income of the school from other sources, and varying in amount according to the number of pupils and their proficiency as tested by different standards of examination. Schools are to be open at all times to government inspection. Religious instruction, if given at all—and this is left to each board to decide—is to be given at fixed times other than the ordinary school-hours, when no child is compelled to attend. It is further left to the discretion of school-boards to make education compulsory—The Scotch education act, 1872, differs materially from the English act on three points only; first, by providing that a school-board, under the Scotch education department, is to be elected in every parish and burgh; secondly, by making it illegal for parents to omit educating their children between 5 and 13 in reading, writing, and arithmetic; and thirdly, by comprehending higher-class schools. Otherwise the acts are much alike. Every school is to be open to children of all denominations, and religious instruction is only to be given before or after ordinary school-hours. Provided they conform to the conscience clause, school-boards may make any provision they please for religious instruction. School-boards are enjoined to relieve the teachers of higher-class schools, so far as may be, from elementary work.

NATIONAL EDUCATION (ante). See Common Schools.

NATIONAL GUARD, an organization for local defense, differing from the British militia and volunteers, in being at the disposal of the municipalities, not of the crown. Italy, Greece, and other nations have maintained this civic force; but the country whence it derives historic fame is France. The French national guard was instituted in Paris in 1759, when the government had an army of 30,000 at the gates. The municipality armed 48,000 men, and their example was followed by the chief towns of France. These corps obtained the name of national guard and assumed the famous tricolor as their ensign. In 1793, 30,000 of the Paris national guards attacked the Tuileries, and were repulsed by Napoleon Bonaparte with 6,000 regular troops. In 1830 they were reorganized under the command of Lafayette, their original chief; and between 1818 and 1851 a law was passed by which all males above 20 not otherwise employed under government were included in the national guard. After the coup d'état in December, 1851, they were reduced to the condition of an armed police. In the war of 1870-71 they showed some signs of vitality in sympathy with the commune, but effected nothing for France. After the fall of the commune they were disbanded.

NATIONAL GUARD (ante), a body of militia composed principally of the bourgeoisie, first formed by the committee of safety in 1759, and mustering at one time 300,000 men under the command of Lafayette. Napoleon dissolved them in 1795, and reorganized them in 1814. They were again dissolved in 1827, by Charles X., were reorganized in 1830, deserted Louis Philippe in 1848, were reorganized in 1852, and took part in the Franco-Prussian war and the insurrection of the commune. The same term is applied to the state militia of New York and New Jersey.

NATIONAL HYMNS are popular airs which are peculiar to and characteristic of a particular nation. It is a singular fact that the composers of national hymns are seldom known. The Germans call their national music volk's musik, a designation which is very appropriate, as a people collectively may not improperly be considered as the actual composer of its national tunes. A short melody extemporized by some one in a moment of patriotic emotion, is often taken up by others and traditionally preserved. In the course of time it generally undergoes modifications, until it has attained those conditions
which insure it a general acceptance. This fully explains what W. Grimm means in his facetious saying, "A national song composes itself" (Eig. Volkslied dichtet sich selbst), for the attempts of celebrated musicians to invent a tune with universal and permanent popularity have been successful in a few instances only. Among the most popular European national hymns, is God save the King, but the authorship of the tune has not hitherto been satisfactorily ascertained. In Prussia it is called Heil Dir im Sieger Kranz, and in the United States the melody is sung with the words "My country 'tis of thee," etc. Although there is no satisfactory evidence of its having been in existence before the reign of George II., there are several tunes known of an earlier date in some degree resembling it. Dr. Bull's tune, discovered in an old manuscript dated 1619, certainly bears a remarkable resemblance to the present God save the Queen, but with none of these melodies have the words God save the King, or similar words, been found. The Austrian national hymn, Gott erbatte [Frantz] den Kaiser, is a composition by Joseph Haydn. Having during his visit to England witnessed the effect of God save the King, on public occasions, Haydn resolved after his return to Vienna, to present his country with a similar composition. Baron Swieten and count Saurau procured the poetry for him, and the hymn was sung for the first time on the birthday of the emperor Franz, Feb. 12, 1797. The poetry was written by L. Leopold Haschka. The Russian hymn dates from the year 1830, when the emperor Nicholas ordered it to be performed in concerts and presentations on the stage. Its composer was Alexis Lwoff, and the air appears to have been suggested by the Sicilian Mariner's Hymn, which is also a favorite melody of the gondoliers in Venice. The poetry of the patriotic song of the Dunes, König Christian (singet jeder Macht, was written by Ewald, and the music is by a German composer, Johann Hartmann. The French national hymn, the Marseillaise, dates from the year 1793. It was composed by Rouget de l'Isle during the French revolution. The national hymn of the Germans, Die Wacht am Rhein, came into great popularity during the Franco-German war of 1870. Was ist der Deutschen Vaterland was written by Ernst Moritz Arndt, a German patriot, during the wars of Napoleon I. There have been many attempts to manufacture national songs in the United States, but the great national hymn of America will probably be a spontaneous production. The Star-Spangled Banner was written by F. S. Key, in 1814, and the words were adapted by F. Durang to an old French air, long known in England as Anacreon in Heaven, and in America as Adams and Liberty. It grew in favor in the loyal states during the rebellion, and was played continually by all military and orchestral bands. But as a patriotic song for the people at large it is almost useless, as the range of the air, an octave and a half, places it out of the compass of ordinary voices. Yankee Doodle has the claim of long association, and will probably always retain a certain degree of favor. Its words are mere childish burlesque, and it is reported to have been a popular tune in England during the commonwealth. Some state that its doggerel words originated at that time, Oliver Cromwell being designated as Yankee Doodle. Others state that it was the tune originally set to the old English song Lulita Locket lost her Pocket, and that the present words were written by a British sergeant in Boston in 1775. Hail Columbia was written by Joseph Hopkinson in 1798, and was set to the music of the President's March, which was composed by one Phylas or Fayles, a German leader of orchestra in New York. Columbia the Gem of the Ocean, and Harrison Millard's Vera America have also attained considerable popularity.

NATIONAL PARKS, a term applied to certain territory in the United States, set aside by act of congress and specifically exempted from sale, being reserved, by reason of picturesque character and general natural features, as common to the entire people; except for settlement or private use. Up to the present time (1881) two tracts of land have thus been appropriated—the Yellowstone valley and the Yellowstone region; the former of which was made a national park by act of congress passed June 30, 1864, and ordered to include the Mariposa Big Tree grove; the Yellowstone park was set aside by act approved Mar. 1, 1872.—The wonders of the Yellowstone region were first made known to the world through the report of a government reconnaissance, or exploration of the Yellowstone river and the surrounding country, made by officers of the U.S. corps of engineers, under the orders of lieut. gen. Sheridan, in 1871. This region, long known as the Great Divide, is comprised in the territories of Montana and Wyoming, being the geographical center of North America. The area covered by the reservation measures 3,578 sq. miles. Generally speaking, it lies between 100° and 110° w. long., and in 44° or 45° n. lat., the general elevation being about 6,000 ft. above the level of the sea, though mountain ranges on every side rise to a height of 10,000 to 12,000 feet. Four routes lead from Yellowstone National park to Grand Prairie, to fort Ellis, thence 30 m. to the Yellowstone river; 2, by way of the upper Missouri; 3, from the Canadas and the great lakes to Duluth, and thence by the Northern Pacific railroad, to fort Ellis; and, 4, from Walla-Walla, on the west. The most convenient and practicable route has hitherto been that from Corinne to Virginia City, Montana; thence to fort Ellis, crossing the Madison river, one of the head-waters of the Missouri; and to the Gallatin valley, which is about 40 m. in length and 10 to 15 broad, the finest agricultural land in Montana; at the upper end of which is Bozeman, and 3 m. beyond, fort Ellis. From this point the trail leads to a Crow agency, about 30 m. dis-
tant; and thence by a course nearly due s., following that of the Yellowstone river, to the great falls of the Yellowstone. The whole of this route, after reaching the river, offers some of the most impressive and sublime scenery in the world. Picturesque masses of rock, tall columns of basalt, and a landscape generally volcanic in character, present the most prominent features of the trail; chief among which is the "Devil's Slide," an extraordinary vertical rock formation, projecting a thousand feet into the air. Proceeding up the valley, Gardner's river, or Warm Stream creek, is met, as it enters the valley and joins the Yellowstone 15 m. from the middle cañon. Here begins the hot springs district, with the largest spring in the country, consisting of a basin 40 ft. long by 25 wide, through three openings, in which great quantities of carbonic acid gas are discharged. In this spring, which offers water of different degrees of temperature, in smaller basins and terraces, are found the most fantastic deposits of stalactites and stalagmites; while the basins are gracefully curved and scalloped, and vary in color from a rich blood red, to light yellow, white, and green. About this point, the "low divide" is crossed between the valley of Gardner's river and that of the Yellowstone, and the precipitous entrance to the great cañon is reached, so gloomy and forbidding in aspect that it is named the "Devil's Den." Through this narrow gorge the river rushes with great velocity, until it shoots over the abrupt descent of a fall of about 150 ft., and, after a series of rapids and cascades, finally leaves the great cañon with a single leap of 350 ft., after which its course lies over a rolling prairie for several miles. The great cañon has never been explored, but the height of its sides is known to be more than 2,000 feet. A new hot spring region is now reached, remarkable for its "mud geysers," and particularly for a mud volcano, having a crater 25 ft. in width and 30 ft. in depth, and in a constant state of effusion. One of the geysers having a basin 60 ft. in diameter, spouts at regular intervals of six hours. Eight m. from this geyser is Yellowstone lake, more than 7,000 ft. above the sea-level, 30 m. in length and 15 m. in breadth. Here the faulting of the basin and the valley is seen in every direction, for more than 300 miles. Almost in contact with this remarkable body of water is a chain of hot springs; fish abound in the lake, game of all kinds is found in the surrounding forests, and there are facilities for boating, and rude accommodations for the tourist. Striking westward, the traveler now journeys toward the head-waters of the Madison river. The country, though impregnated with volcanic characteristics, is here diversified by dense tracts of forest; and about 10 m. from the Yellowstone a new system of hot springs is reached, the whole district presenting the appearance of a vast linoleum in active combustion. Shortly after reaching the crest of the divide between the Yellowstone and the Madison, a valley is entered in which the springs are strongly impregnated with sulphur. In what is known as the Firehole valley—that of the Firehole river, the main eastern fork of the Madison—are large numbers of beautiful springs. But the object of greatest interest to the tourist is the great geyser basin, which is entered from the north, following the course of the Madison river. The geysers are all named, the first seen being two which are very active, placed one on each side of the river, and known as the "Sentinels." Next is the "Well" geyser, which has a crater formed like a well, and which spouts to a height of 80 or 90 feet. An extraordinary formation, 8 ft. high and 60 in circumference, is called the "Grotto;" it is hollowed into arches, and plays to the height of 60 ft. several times in every 24 hours. The "Giant" geyser is considered one of the most remarkable in the group. It has a crater 5 ft. in diameter, and its highest point is 15 ft. above the mouth on which it stands. It throws a column of water the size of the opening, to the measured height of 130 ft. continuing each active period for an hour and a half. From this system of geysers, a journey of about 12 m. reaches "Castle" geyser, which is situated on a platform of deposit, measuring 100 ft. in length and 70 in breadth. From the center of this platform rises a chimney 12 ft. high, 120 ft. in diameter at the base, and 60 ft. at the top, with a three-foot aperture. This monster geyser, when in operation, sends a column of water to a height of 250 ft., the movement being not continuous, but pulsating, at the rate of about 70 throbs to the minute, the time of activity being about an hour. At the head of the valley stands the geyser known as "Old Faithful," so called because it plays with great regularity every three-quarters of an hour, throwing a stream 100 to 150 ft. in height. From the mouth of this geyser can be seen the best presentment of the basin. The entire valley is drained of its hot water by the Firehole river, which takes it into the Madison. The geysers visible from this point are severally named the "Bee-hive," the "Giantess," "Grand," "Young Faithful," "Fan," "Riverside," "Saw-mill," "Turbian," etc. The Firehole river is itself one of the most remarkable features of this region. Its bed and banks, entirely composed of hot-spring deposit, are honeycombed and scooped out by geyser springs and pools, varying between minute vents not bigger than a quill and great tanks of boiling water. The course of the river is very straight, and resembles that of a canal through a country of linekils covered with slag-heaps and refuse of old smelting-works. The borders of the river are also cut by a little intermittent and winding creek, and dotted in some sections by small basins, hot water pools, warm pools, boiling springs, and the remains of ancient geysers. The Yellowstone region has been only visited by tourists, and the therapeutic qualities of its springs have not been analyzed. The writer of the government report said of the country in question: "No other locality, I think, can be found which combines so many attractions, both of climate and scenery." The act of congress by which the Yellowstone
country was reserved as a national park, stated that it was "reserved and withdrawn from settlement, occupancy, or sale, under the laws of the United States, and dedicated and set apart as a public park or pleasing ground, for the benefit and enjoyment of the people," while by the same act it was placed under the exclusive control of the secretary of the interior. The park is 65 m. n. and s. by 55 m. e. and west. During the summer months the atmosphere is pure and invigorating, with an entire absence of storms. The number of springs is from 5,000 to 10,000, and there are at least 50 geysers. The temperature of the springs ranges between 160° and 200°.

The Yosemite valley was granted by congress to the state of California, conditionally on the district being forever set aside as a place of public resort and recreation. It is in Mariposa co., California, about 155 m. from San Francisco, nearly in the center of the state. It is nearly level, and is 6 m. long, and varying by one-half a mile and a mile in width; and its perpendicular depth below the surrounding level is about one mile, although it is elevated above the sea level almost 4,000 feet. Its walls are nearly vertical, and through it winds the Merced river, its general direction being n.e. by e., and s.w. by w., nearly at right angles with the general direction of the mountain ranges. The valley is accessible by stage and saddle-horse from points on the Central Pacific railroad, about 90 m. distant, but only in summer: in winter it can only be reached on snow shoes. There are hotels for the accommodation of tourists, and these are comfortable and well supplied. Numerous objects of interest occur in proceeding up the valley, the first being the Bridal Veil fall, which is formed by the precipitous leap of a creek of the same name over a descent of 650 ft., to a slope below, from which point 250 ft. of cascades extend to the valley, the entire fall being 900 ft. Cathedral rock, a massive granite formation, 2,660 ft. in height, is met a little above the fall; and a short distance beyond this, the "Spires," single columns of granite, 500 ft. in height, stand out from the main walls of the valley. Sentinel rock is 3,043 ft. high, its termination being a slender obelisk 1000 ft. in height. Sentinel dome and the Virgin's Tears fall are the next important features; the latter being a cataract falling more than 1000 feet. El Capitan and the Three Brothers are monster masses of rock; and, above the latter, is the great Yosemite fall, which has first a vertical descent of 1500 ft., then a series of cascades falling 629 ft., and a final plunge of 400 ft.—the whole appearing to the observer to be a continuous fall, whose effect is grand and imposing in the extreme. During Aug. and Sept., the Yosemite and Bridal Veil falls nearly disappear, the best time for seeing them being in May, June, or July, before the creeks which form them have been filled and inundated. Everywhere the rocks of the valley occur at different points; while the general effect is a combination of the sublime and beautiful in nature, not known to exist elsewhere to a similar extent.

About 16 m.s. of the Yosemite valley are the Mariposa groves of "big trees," one of a number of groups or collections of the sequoia gigantea, only found in California; and the sequoia sempervirens, or red wood. Three of these groves are in Mariposa co., and include 134 trees more than 15 ft. in diameter, and 300 of smaller size. In all the groups there are trees from 275 to 375 ft. in height, and 25 to 55 ft. in diameter, well proportioned; the age of some that have been cut down have been estimated, by the usual methods, at from 2,000 to 2,500 years. The Yosemite valley was unknown to white men until 1851, and was first visited by tourists four years later.

NATIVE, a term mostly applied to metals, and employed to designate substances, as minerals, which are most of them more abundantly obtained from other minerals by chemical processes. Thus silver found pure, or nearly so, is called native silver, whilst most of the silver in use is procured from ores in which it exists variously combined.

NATROLITE, soda mesotype, feather zeolite, oprenstein, radiolite, Permaumnite, a hydrous silicate of the zeolite section, containing silica, soda, and alumina, with about nine per cent of water, and usually oxide of iron, crystallizes in the triclinic system; crystals usually slender and interlacing, divergent, or stellate; also fibrous and massive. Habit 3 to 5: sp. gravity 2.17 to 2.24. Luster vitreous, sometimes pearly; color white, grayish, and yellowish; transparent; translucent. The following is an analysis of crystals from Auvergne: silica 47.76; alumina 25.88; soda 16.21; water 9.31. The following were the constituents of iron natrolite: silica 46.54; alumina 18.94; peroxide of iron 7.49; soda 14.04; water 9.37; iron 2.40; manganese 0.55. In North America natrolite occurs in Nova Scotia in trap rock; at Cheshire, Conn.; at Copper falls, lake Superior, in crystals associated with native copper. Natrolite is also found at Bergen hill, N. J.

NATRC, or TRONA, an impure sesquicarbonate of soda (2NaO.HO.3CO2 + 3Aq), which always contains sulphate of soda and chloride of soda. It is obtained from the margins of lakes in Egypt, Siberia, Thibet, etc., and from the borders of the Black and Caspian seas.

NATRON LAKES, Natron was one of the substances employed by the ancient Egyptians in embalming mummies. They called it hemorrh, and, together with the lakes from whence it was derived, it is mentioned in texts of the twelfth dynasty, circa 1800 n.c. These lakes, eight in number, are in the vicinity of Zakeek, a village west of the Damietta branch of the Nile. They are below the level of the sea, and the natron is
obtained by evaporation. The locality is also renowned for four monasteries, Deyr Suriana, St. Maiarius, Amba Bishoi, Deyr Baramos, from whose libraries of Arabic, Coptic, and Syriac MSS. the national collections have been enriched. In the time of St. Pachomius 5,000 anchorites dwelt here: they at present number about 300.

**NATTERJACK.** See Toad.

**NATURAN ISLANDS,** Thir, lie to the n.w. of Borneo, between 2° 28' and 4° 36' n. lat., and 107° 57' and 108° 15' e. longitude. They are densely wooded and mountainous, Ramay, on great Natuna, rising to a height of 3,500 feet. The largest of the islands is about 600 sq. miles. Pop. of the whole about 13,000, who grow rice, maize, sago, cocoaanuts, etc., and exchange the produce of their fishings, their sago and cocoa-nut oil, for rice, iron, and cottons, at the European settlements on the strait of Malacca.

**NATURAL, in music, a note belonging to the diatonic scale of C, and neither elevated by a sharp nor depressed by a flat. When a note has been so elevated or depressed, the natural sign prefixed to it on its recurrence restores it to its place on the scale. When music is written on a key with a signature of sharps or flats, it is the office of the natural sign to counteract the signature as regards the note to which it is prefixed.

**NATURAL BRIDGE,** one of the chief natural curiosities in the United States, ranking in interest next, perhaps, to Niagara falls and the Mammoth cave. It is situated in Rockbridge co., Va., 115 m. w. of Richmond, and 160 m. s.w. of Washington. The bridge spans a deep chasm, through which a small stream flows, and is formed by an immense limestone stratum fashioned into an arch 215 ft. high. Its length is 93 ft. and the thickness of the crown of the arch is about 40 feet. The average width of the arch is 80 feet. A public road passes across it from which there is a beautiful view, not only of the long chasm where great forest trees tower up from below but also of the Blue Ridge mountains.—In Walker co., Alabama, and in California also there are other natural bridges, but none that rival this one. The one in Alabama is about 70 ft. high and spans 120 ft.; and the largest of those in California is across a small creek emptying into the Hay fork of Trinity river; is 3,000 ft. wide and has an arch 20 ft. high by 80 ft. across. It has been suggested that these bridges are the remains of great caverns.

**NATURAL HISTORY,** in the widest sense, includes all natural science, and has the whole of creation for its subject. In this sense the term was employed by the philosophers of antiquity. But it is now limited to those branches of science which relate to the crust of the earth and its productions. Of these, geology and mineralogy have for their subject inorganic portions of creation; botany and zoology, the various branches of which are often pursued as separate sciences, with physiology, have for their subject organized creatures. Natural history takes cognizance of the productions of nature, and of their relations to each other, with all the changes on the face of the earth, and all the phenomena of life, both animal and vegetable. It derives assistance from other sciences, particularly chemistry and natural philosophy; and some of the branches of chemistry may also be regarded as branches of natural history. When man himself is considered as a subject of scientific study, psychology must be added to the branches of natural history, but in the term as commonly employed this can scarcely be said to be included.

In every department of natural history, classification is of the utmost importance, and scarcely less important is a scientific nomenclature suited to the classification. The subjects of study are so incommensurably numerous that an arrangement of them in well-defined groups is necessary to any considerable attainment in the knowledge of them; and it is only by systems of classification which arrange smaller groups in larger, and these in larger and larger again, that natural history has been brought to its present state. The very division of natural history into different sciences is a result of such a classification, and implies a recognition of the largest and highest groups. It is not always in the establishment of these groups that the greatest difficulty is experienced. The primary distinction of all the subjects of natural history into organized and unorganized, or into those having life and those not having life, presents itself very readily to every mind. And equally natural and necessary is the distinction of organized beings into plants and animals, however difficult it has been found to draw the precise limit between the lowest of plants and the lowest of animals. Another distinction readily presents itself to the student of living beings in the kinds which retain the same characters from one generation to another. But here arises one of the most important of all the questions of natural history, what a species is, and how it differs from a variety. For this we refer to the article SPECIES. But much difference of opinion as there is on this point, the common and long-prevalent notion may be assumed, as suitable enough for guidance in all that relates to classification, that those are distinct species which cannot by any change of circumstances—or, let it be said, by any ordinary change of circumstances, and within any moderate period of time—be so modified as to be transmuted one into another, whilst those are only varieties of which the modification and transmutation can be thus effected. Thus,
in botany, *Brassica oleracea* is a species, of which kale, cabbage, cauliflower, broccoli, Brussels sprouts, etc., are varieties. Species, grouped together, according to their natural affinities, form genera; but a genus does not necessarily consist of more species than one; for, whilst some contain hundreds of species, others, apparently very distinct, contain only one as yet known to naturalists. The distinctions by which genera are separated are of course arbitrary, and are admitted to be so by those who deny that the distinctions between species are arbitrary, or that there is any uncertainty about them; but what arises from the imperfection of our knowledge; for, at present, it must be admitted on all hands, that the uncertainty is in innumerable instances very great, what are species and what are varieties. The great object, however, in the formation of genera is that they shall be accordant with the facts of nature; and so in regard to the larger or higher groups which are composed of associated genera, as tribes, families, orders, classes, etc. But in all this, the great difficulty is that affinities exist on many sides; and it is great, if anything, to be gratified by the success of classification, rather than as if they radiated from a common center; whilst otherwise viewed, the same groups might seem to radiate very differently from another common center. A natural system is one framed with the utmost possible regard to all these facts; an artificial system fixes on one class of facts and proceeds upon it, in disregard of all others. See Botany. In the inorganic departments of nature a species is of course something different from what it is in the organic. But classification still proceeds on the recognition of facts in nature itself, which it is sought to exhibit in the groups that are formed. See Mineralogy.

The nomenclature of natural history, in so far as it relates to organic beings, continues essentially as it was established by Linnaeus. See Genus. The names have in many cases been changed, but not the mode of nomenclature.

**Naturalism** is the name given in philosophy to those systems which profess to account for the phenomena of nature, by what they call the necessary action of unintelligent and inherent forces. Such, for example, was the doctrine of Lucretius, Leneippus, and Epicurus. It leads also to various forms of theological speculation and belief which deny the agency of a personal God in the production, preservation, and government of the physical, intellectual, and moral universe. In this aspect, therefore, naturalism is opposed to theism.

**Naturalization**, the act of placing an alien in the position, or investing him with the rights, of a natural-born citizen. The present arrangements with reference to naturalization, by which the old rule that British allegiance is indelible, has been changed, are embodied in the naturalization act (1870), 33 Vict. c. 14, and the naturalization oath act (1870), 3 & 4 Vict. c. 103. By the former of these statutes it is provided that an alien who has resided in the United Kingdom for a term of not less than five years, or has been in the service of the crown for a term of not less than five years, and intends, when naturalized, either to reside in the United Kingdom or to serve under the crown, may apply to one of her majesty's principal secretaries of state for a certificate of naturalization. The applicant is bound to adduce such evidence of his residence, or service, and intention to reside, or serve, as shall satisfy the secretary of state, who may, with or without reason assigned, give or withhold a certificate. No appeal lies from his decision, but his certificate takes no effect until the applicant has taken the oath of allegiance. An alien, to whom a certificate of naturalization has been granted, is entitled to all political and other rights, powers, and privileges; and subject to all obligations to which a natural-born subject is entitled or subject in the United Kingdom, with this qualification, that he, within the limits of the foreign state of which he was previously a subject, is not deemed a British subject, unless he has ceased to be a subject of the foreign state by the laws thereof, or by a treaty to that effect. Such a certificate may be granted to any person with respect to whose British nationality a doubt exists; and a grant of such special certificate for the purpose of quieting doubts shall not be deemed an admission that the person to whom it was granted was not previously a British subject. Aliens previously naturalized may, on application, obtain certificates. A British subject who has become an alien, in pursuance of this act (see Alien), may apply for a certificate of readmission to British nationality on the same conditions as an alien by birth. The secretary of state has, in this case, the same discretion; and an oath of allegiance is likewise required. The privilege of readmission, like that of admission to British nationality, requires that the recipient shall have ceased to be a subject of the foreign state. In the colonies the powers of the secretary of state are conferred on the governor. By the oaths' naturalization act, 33 and 34 Vict. c. 132, any person making or subscribing a false declaration is declared to be guilty of a misdemeanor.

In France, "la grande naturalization" confers political privileges; "la petite naturalization," gives all the private rights of a French citizen, and it has been doubted whether even public rights are not included in it. In 1867 the term of residence was reduced from ten years to three. A subject of France loses his native character by naturalization in a foreign country, or acceptance of office abroad without permission of the state, or even by establishing himself permanently out of his country. He may recover his rights by renunciation of his foreign office or domicile.

In Prussia the higher administrative authorities can naturalize any stranger who satis-

Naturalization. Naturalized.
forever all allegiance to any foreign prince, potentate, state, or sovereignty; and, by
name, that particular prince, state, or sovereignty, of which he is at that time a subject
or citizen. The certificate of naturalization, which is the legal evidence of such a declara-
tion as aforesaid, must be made out by the clerk, signed and sealed and given to the applicant as evidence of the declaration of intention. Five years’ residence in the country, and one year in the state where the
application is made, are necessary; by residence is meant permanent abode, but it is not
affected by temporary absence on business or pleasure. The court must also be satisfied
that the person applying is of good character and well disposed to the public welfare
and the principles of the constitution. If the alien have hitherto possessed any heredi-
tary title or order of nobility, he must forever renounce it. As to evidence, that of resi-
dence must rest on other proof than the applicant’s oath, but a single witness is taken on
this point, and on others the alien’s oath is generally deemed sufficient. The depositions,
certificate of declaration of intention, and the final order of admission, compose the
record of the case, and are put on file. A certificate of naturalization is made out, signed
and sealed by the court clerk and is given to the alien as evidence of his citizenship.
The record is conclusive and cannot be contradicted or overthrown, except by
proof of perjury; or other fraud in its procuration. Severe punishment by fine and impris-
onnement is provided for the taking of any false oath or affirmation in connection with the
proceedings; for any false personation either by applicant or witness; for counterfeiting
or imitating any instrument, paper, or proceeding used in the case or authorized by the
naturalization laws; for selling or disposing any such oath, certificate or notice, as
genuine, or for falsely representing one’s self as a citizen of the United States with-
out having been duly admitted to citizenship. Aliens who are subject to a country
at war with the United States at the time of application cannot be naturalized while the
war continues. In the early days it was several times held that the wife of an alien who
had not herself acquired the status of a citizen, if originally alien; but it was long
since decided by the supreme court that the citizenship of the wife should follow the
naturalization of the husband, and that it makes no difference whether the marriage is
contracted before or after the citizenship of the husband is secured. The right of
expatriation, as it is called, that is of freedom to throw off the natural allegiance and
acquire a new allegiance to another government, is now generally recognized by the
nations of Europe and America, though not as a matter of inherent right but rather of
permission from the authorities, and as a matter of public policy to prevent disagreeable
international complication. The English act of 1870 provides both for the naturalization
of aliens, after five years’ residence and application to the secretary of state, and also
that any British subject who shall voluntarily become naturalized in any foreign coun-
try shall from that time on be regarded as an alien and no longer a British subject.
A treaty was entered into in the same year between Great Britain and our country, provid-
ing that aliens who have complied with the conditions of admission and have been fully
naturalized should be recognized as such by the country of their birth; but the original
allegiance may be recovered by much the same process. Treaties were also made by the
United States, in 1868, with Prussia, Bavaria, the grand duchy of Baden, Württemberg,
grand duchy of Hesse, Belgium, and Mexico; in 1869 with Sweden and Norway; in 1870
with the Austro-Hungarian empire, and in 1872 with Ecuador and Denmark. These
treaties have the same general stipulations, stating a period of residence, usually five
years, after which naturalization is permissible and to be recognized,reserving to the
country the original allegiance, the right to punish for crime committed, or to compel
the execution of obligations entered into, before the change of domicile, and entering into
mutual obligations to recognize the rights of each other. The question on which there is
the greatest likelihood of disagreement under existing laws, arises where an alien comes
to this country, becomes duly naturalized and then returns. Is he then liable to undergo
military service or otherwise recognize the allegiance of the state of his birth? Some
European nations hold that such a transaction is on its face evidence of an intention to
escape the natural obligations, but the policy of our government has always been to pro-
protect its adopted citizens where the naturalization is not tainted by fraud.

**NATURALIZED.** In the language of botanists and zoologists, these plants and ani-
imals are said to be naturalized in any country, which, having been introduced into it by
man, have established themselves so as to exist without his care. A plant or animal is
never said to be naturalized so long as it exists merely in a state of cultivation or domes-
tication, but is so when it becomes truly wild, and, unaided, competes successfully for a
place among those which are indigenous to the country. Thus, the horse is not natural-
ized in Britain, or in most of the countries in which it is at present highly valued; but both
the horse and the ox may be said to be naturalized in South America. Many of the
plants now most characteristic of southern Europe are sometimes said to have been
originally introduced from the east; and some that are abundant in many parts of
Britain were, in all probability, brought from the continent of Europe. Some of these
almost elude their foreign origin by growing chiefly near ruins, or in places which have
long been the seats of human habitation. Many plants now naturalized in Britain
appear to have been originally brought for medicinal use, although now disregarded. In
many cases, however, naturalization has taken place without any attempt having ever
been made by man to introduce the plant, even for cultivation; and thus many Euro-
existence, edition, that must creatures? springs cerns. It assumptions held, lence, of uncertain of enforced nature, proof watch. In nature, productiveness. not desirable. what mollusk recently rivers another; springs natural DESIGN. England. naturalization, man. An aclimatization society has recently been formed in London, which has for its object the naturalizing, rather than what can be effected by the gradual change of animals and vegetables, and desirable. It is unquestionable that much may be done by naturalization of animals, not only to render rural scenes more attractive, but also to increase their economical productiveness. Perhaps nothing of this kind has received so little of the attention due to its importance as the naturalization of fishes. See Pisciculture.

NATURAL OBLIGATION, in law, means an obligation which is supposed to be prescribed by the law of nature, as the obligation of a parent to maintain his child. In England such an obligation is not recognized by the common law, and therefore it was necessary in the poor-law statutes to punish by a penalty parents who, being able, refused or declined to maintain their children. In Scotland the natural obligation of a parent to maintain his child is, however, recognized by the common law, though it is also enforced by the poor-law statute.

NATURAL PHILOSOPHY is a term frequently employed in Great Britain to designate that branch of physical science which has for its subject those properties and phenomena of bodies which are unaccompanied by any essential change in the bodies themselves. It thus includes the various sciences which are classed under physics (q. v.) in the limited sense of that term.

NATURAL THEOLOGY is the name given to that branch of moral science which concerns itself with the evidences for the existence of God, drawn from an inquiry into the constitution of the universe. It is believed by the majority of philosophical thinkers that these evidences warrant the belief in a Being of infinite power, wisdom, benevolence, and justice. There are, however, philosophers of great eminence who deny that there is such a thing as natural theology, who say that nature, at the best, gives forth an uncertain sound regarding the existence of a Supreme Being, and that a logical demonstration of such existence is impossible, and has always broken down. This view is held, for example, by theologians like David Hume, and the recent Scoto-Oxonian school of metaphysicians, of whom the principal representative is dean Mansel. The standard English work on the subject has long been Paley's Natural Theology (Lond. 1802; new edition by lord Brontehaim and sir Charles Bell, 1836). The Bridgewater and Burnett Treatises are also contributions to this branch of science.

NATURAL THEOLOGY (arch.), the name applied to the knowledge concerning the existence and attributes of God, furnished by the organized universe. This knowledge springs from the answers to two questions: 1. Is this complicated universe the work of a personal creator, or a result of impersonal force? 2. If of a personal creator, what does it, as his work, show concerning his character, attributes, and relations to his creatures? The answers to these questions depend on the assumptions that every change must be effected by some adequate cause, and that design proves the existence of a designer, whose attributes and character are indicated in his work. The basis for these assumptions is found, by the best thinkers, in the intuitive beliefs of the human mind. While any instance and degree of design prove the existence of a designer, the sum total of all instances and all degrees must be taken, in order to a full knowledge of the designers; and if, in all the instances, unity of design be manifested, then the existence of one designer, adequate to all the work, is proved. The investigation, therefore, requires the examination of all orders of objects and creatures, of all degrees of complexity and completeness in the properties, qualities, constitutions, and relations, physical, mental, and moral, which they display. The examination may be practicable only in part, and only as to results; but in proportion as it can be completely made and can be extended also to the means and processes by which the design has been carried into effect, the proof of high qualities in the designer will be increased. The proof of design in Paley's often cited instance of a watch, picked up in crossing a heath, cannot be set aside by raising questions concerning the length of time employed, or the instruments used in its construction; and while the slightest inspection of it may furnish proof of design, the proof is strengthened by the display of design of superior part and skillful examination of its complicated mechanism. If machinery that will make many watches be examined, the degree of design will be proportionally greater; and if a watch could be made to throw off other watches as a part of its work, instead of the proof of design being abrogated, it would be marvelously increased. Some persons, indeed, claiming to be philosophers, seek to limit all investigation to the phenomena of nature, denying or disregarding efficient and final causes as either not existing or not proved. They say, "Our reflecting reason is the sole cause of all the apparent design which exists and which is nothing but the combination of natural materials and forces."
But, to this assertion it is sufficient to reply that it fails to account (1) for the existence of the natural materials and forces; (2) for the combination of them in the production of our results; (3) for the existence of the reason of man, which is one of many causes of reflection, and (4) that it does not show how reason can be the cause of a design—or of anything else—which is only apparent, not real. The history of mankind shows that there has at all times existed, in the mind, some idea of God, or of gods, or of some supernatural beings, to be sought, worshiped, or feared. Some, indeed, have asserted that the most degraded tribes have no such idea, and that the deaf and dumb also are destitute of it until they are instructed. But to this it is answered that while, in the lowest degradation, the light of the idea may be nearly or quite extinguished, enough of dark superstition remains to show that the light once shone; as, in an extinguished or dimly burning lamp, the very blackness of the wick proves the previous existence of a brighter flame. And, as to the deaf and dumb, granting the facts alleged, it cannot be certainly maintained that they have no idea, but, in their case, education, cannot express it in language; or, we, in our imperfect intercourse with them, cannot draw it from their minds. Some have regarded the idea of God as innate in the human mind, from the fact that the belief in his existence has been so general in all ages of the world. But this theory is now held, if at all, only in the modified form that in the development of the mind the idea of God is certainly reached through the study of nature and of man.

NATURE-PRINTING. This is a process by which engravings or plates answering thereto are produced by taking impressions of the objects themselves, and printing from them. There is some dispute as to the original inventor of this art; Denmark claims it for a native of Copenhagen, Peter Kyle, a goldsmith, who died about 1833, leaving the MS. description of his invention in the archives of the royal collection of engravings in that capital. It is, however, admitted that no use was made of his invention. In 1833, Alois Auer, director of the state printing establishment of the Austrian empire, published his process, and also some very beautiful works illustrated by this art. About the same time, in England, Mr. G. W. Atkin made known his discovery of an exactly similar process, and showed some very beautiful plates of feathers, ferns, etc. But whatever other claims may be advanced, it is certain that Alois Auer holds undisputed right to the title of original inventor and practical applier of the invention. The process is very simple, as practiced by Auer; but it cannot be applied to any objects except those with tolerably flat surfaces, such as dried and pressed plants, embroidery and lace, and a very few animal productions. The object is placed between a plate of copper and another of lead, both worked smooth, and polished; they are drawn through a pair of rollers, under considerable pressure—M. Auer says 40 to 50 tons; then, when the plates are separated, it is found that a most beautiful and perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted; but as it is too soft to resist the action of the press for practical purposes, a fac-simile of it is obtained in copper by the electrolysis process, which is used as the printing-plate. The best practical use to which nature-printing has yet been applied is the multiplication of patterns of lace and other figured surfaces, either in textile materials or metals, for trade purposes. Lace-prints especially are very nearly like the originals and have cost less, but the most beautiful work is more; hence the cutting up of valuable pieces of lace for patterns has been saved. Henry Bradbury, of the then existing firm of Bradbury & Evans, London, made nature-printing his special study, and produced the exquisite works, Nature-printed Forns, and Nature-printed Sea-Weeds, in 2 vols. each (London: Bradbury & Evans).

NAUHEIM, a t. in the duchy of Hesse-Darmstadt, Germany, n. of Frankfort; pop. 2,500. Its mineral springs attract many visitors annually. The waters, both as an external and internal application, are highly valued as a remedy for diseases of the bowels and cutaneous affections. Mineral springs abound in the vicinity also, and their waters, with those of Nauheim, are extensively exported for use in other parts of Germany. Salt-works had long existed at Nauheim, but the baths were not opened till 1834. A fountain, opened by a shock of earthquake in 1846, produces some 75,000 quintals of salt per year, besides furnishing a supply of water for the bath-houses. Gambling, which was formerly extensively practiced, has been abolished.

NAUMACHIA, a Greek word, signifying literally a naval battle, afterwards, among the Romans, a spectacle which consisted in the imitation of a naval battle. Julius Caesar was the first to introduce a naumachia in Rome, 46 B.C., causing a portion of the Campus Martius to be dug to form a lake, on which the "spectacle" took off. Augustus made an artificial lake (stagnum) near the Tiber for the same purpose, which was afterwards frequently used, and the Colosseum exhibited a splendid one on lake Fucinus. Nero, Domitian, and others were likewise fond of such amusements. The combats were termed naumachiaris; they were for the most part either captives or condemned criminals; and the rival fleets took their names from the famous maritime nations of antiquity: Tyrians and Egyptians, Rhodians and Sicilians, Persians and Athenians, Corcyreans and Corinthians, Athenians and Syracusans. The magnificence of these spectacles may be estimated from the fact that in the one exhibited on lake Fucinus 19,000 men were engaged. These naumachiae were not sham-fights, any more than ordinary gladiatorial combats. Both sides fought on in real earnest for dear life.
until one was utterly overpowered; and, as a rule, multitudes were "butchered to make a Roman holiday."

NAUMANN, Emil, b. Berlin, 1828; son of Moritz Ernst Adolf. He studied music under Mendelssohn, and in 1818 brought out his first composition of importance, an oratorio called Christ, the Messenger of Peace. In 1852 he published a study of German church music, under the title of The Transformation of Protestant Church Music. About the same time he became director of church music at Berlin. He has since written, besides many compositions in sacred music, a number of operas, of which The Witch of the Mill and Judith deserve mention, and a cantata on the Destruction of Jerusalem. His work on the Introduction of Psalmody into the Evangelical Church appeared in 1856, and his Music in the History of Civilization in 1870.

NAUMANN, Karl Friedrich, 1797-1874; b. Germany; educated at the Freiberg school of mines, and at the universities of Jena and Leipzig. In 1821 he made a journey to Norway for scientific purposes, and the results of his observations were published in his Contributions to the Knowledge of Norway, 2 vols., 1824. Two years later he became professor of crystallography at Freiberg, and in 1835 he was transferred to the chair of geology and the same institution. In 1842 he was called to the chair of geology and mineralogical research at Leipzig. The most important of his works on mineralogy and geology are: Elements of Crystallography, 1811; Elements of Mineralogy, which ran through many editions; and Manuel of Geology. He became privy councillor of mines in 1866.

NAUMBURG, a t. of Prussian Saxony, in the government of Merseburg, situated 17 m. s.s.w. of the town of that name, on the Saale, in the midst of a striking amphitheater of vine-clad hills. Besides its cathedral—a noble Gothic structure, completed in 1249, with two choirs, and containing many beautiful sculptures—there are several other churches. The manufactures are cotton and woolen fabrics, leather, and chemical products. Wine is grown in the vicinity in considerable quantity—11,000 gallons yearly. During the thirty years' war, and in the campaigns of 1806 and 1813, Naumburg, in which the Russian magistrates were lodged, was a place of great importance. Five annual fairs are held here. Pop. '75, 16,327.

NAUPACTUS. See Lepanto, ante.

NAUPLIA, a small fortified t. and seaport in the Morea, Greece, at the northern extremity of the gulf of Argos or Nauplia, and 7 m. s.e. of the town of Argos. It is laid out in the manner of a European town. Its roadstead is one of the best in Greece. In the 18th century of St. Theodore, Cape d'Istria was assassinated in 1381. Nauplia is of high antiquity. At an early period it was the port and arsenal of Argos. In the 18th c. it was occupied by the Venetians, and was taken by the Turks in 1540. From 1824 to 1833 it was the capital of Greece, and had a population of upwards of 12,000; but on the removal of the court to Athens it fell into decay. Pop. about 4,000.

NAUSEA is a distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or debility, a small and often irregular pulse, a pale, cold, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a direct symptom of disease or disorder of the stomach, but sometimes it is a very important indirect symptom of disease at some part at a distance from the stomach—as, for example, the brain or the kidney. The nausea, which is so troublesome to pregnant women is due to the irritation excited by the enlarged uterus being reflected by nervous agency to the stomach.

NAUSETTS. See MASSACHUSETTS INDIANS.

NAUSHON. See ELIZABETH ISLANDS.

NAU TE, CAU PONES, ETC. These words are the commencement of an edict in Roman law, which made shipmasters, innkeepers, and stablers liable for the safety of the goods brought into the ship, inn, or stable. The same doctrine is adopted by the common law of England and Scotland, subject to variations produced by the carriers' act, and railway and canal traffic act, so far as regards carriers and railway and canal companies.

NAUTICAL ALMANAC, a work projected for the special behoof of astronomers and navigators. See ALMANAC. It is chiefly valuable to the latter class from its containing tables of the "true distances,"—i.e., distances of the moon from a few (5 to 7) of the more prominent stars, given for every three hours throughout the year—by which at the present day longitudes (see LATITUDE AND LONGITUDE) are most conveniently and accurately determined. To the astronomer the Nautical Almanac furnishes a great mass of important data; it gives the position of the moon in right ascension and declination for every hour, and the sun's latitude and longitude for every day in the year; it shews the obliquity of the ecliptic, the sun's and moon's parallaxes, aberration, etc., at different times; it supplies the necessary data for the determination of the real or apparent size, position, and motion of the planets and their satellites; it fixes accurately the places of about 150 fixed stars, and gives full details concerning eclipses, occultations, transits, and other celestial phenomena occurring during the year. It is generally issued four years in advance for the sake of mariners going on long voyages.
NAUTILUS genus of *tetrabranchiate cephalopoda* (q.v.), extremely interesting as the existing representatives of an order of mollusks now reduced to a very few species, but of which the fossil remains attest the great abundance in former geological periods. The species of this genus are found only in the seas of warm climates. One or more of them must have been known to Aristotle, as appears from his description, which, however, is not minute. Yet it is but recently that they came under the observation of modern naturalists; and they were very imperfectly known, till a specimen, obtained by Dr. Bennett in a bay of the New Hebrides in 1829, was submitted to the examination of prof. Owen, and became the subject of a valuable memoir by him. The shell, indeed, has long been common enough in collections, being plentifully found, entire or in fragments, on many tropical shores; but from the shell alone little could be learned concerning the animal to which it belonged. The shell is spiral, the spire not at all elevated, and its spiral wall is strengthened with the heavy calcareous spines, or teeth, which furnish the shells of many species of small but internally it is cameralized, or divided into chambers, by transverse curved partitions of shelly matter. In a very young state this structure does not exist; but as the animal increases in size it deserts its first habitation, which then becomes an empty chamber, and so proceeds from one to another still larger, occupying the outermost only, but retaining a connection with all by means of a membranous tube (siphuncle) which passes through the center of each partition. The use of this connection is not known; but the most probable supposition is that the animal is enabled, by throwing air or some kind of gas into the empty chambers of the shell, or by exhausting them of air, to change the total weight, so that it may rise or sink in the water at pleasure. It commonly inhabits the bottom of the sea, where it creeps about, probably like the gastropods, by means of a large muscular disk with which the head is furnished; but it sometimes rises to the surface, and is then seen floating there. Dr. Bennett states that the specimen which he fortunately captured attracted his attention, when thus floating, as an object resembling a dead tortoise-shell cat. The story of its spreading a sail is as fabulous as the similar story regarding the argonaut. The head and arms can be protruded from the shell, and can also be completely retracted within it. There are numerous arms attached to the head, 19 in the best-known species; there are also numerous other tentacles; but none of these organs are furnished with suckers, and they are feebly in comparison with the corresponding organs of many of the higher or dibranchiate cephalopods. The mouth is of the parrot's-bill form, as in the other cephalopods; but the mandibles are not entirely composed of horny matter, their extremities being calcareous and of a hardness apparently adapted for breaking shells. Their edges are also notched, and show an adaptation for crushing rather than for cutting. The tongue is large. The gizzard is muscular. The food appears to consist, at least in part, of crustaceans.

Only three species of nautilis are known, of which the best known and apparently the most abundant is the PEARLY NAUTILUS (*N. pompilius*), which is found in the Indian and the Pacific oceans. Its shell is beautifully maceous within; and is externally porcelain-like, white, and streaked with reddish chestnut. The shell, being large, thick, and strong, is used for a variety of purposes by the natives of the East Indies and South Sea islands; it is also made into ornaments of various kinds in China and elsewhere. The animal is eaten by the Fijians and other South Sea islanders, and is much esteemed as an article of food. The Fijians capture it by means of a basket-trap, somewhat like those used for catching lobsters, baited with boiled crayfish. The name *Paper Nautilus* has sometimes been given to the argonaut (q.v.).

Fossil Nautilus—About 150 species of fossil shells have been referred to this genus. They occur in all the strata from the upper silurian to the most recent deposits. Numerous forms, however, which exhibit very wide differences, have been incongruously associated under this generic name. The paleozoic nautili are so remarkable that they must certainly be referred to one or more separate genera; some of the carboniferous species have a square back, and the whorls either compact or open in the center, while the last chamber is more or less dismembered from the shell; and the Devonian clymenia has angular sutures and an internal siphuncle. Until a careful revision of this section of the cephalopoda is made it will be better to consider the species as belonging to the family *nautilidae*, and not to the genus *nautilus*.

NAUTILUS PROPELLER one of the oldest known among many names given to a mode of propelling steam-vessels by means of a horizontal wheel within board, instead of a paddle or a screw on the outside. *Hydraulic* propeller has latterly come more into use. Engineers thought of this mode of propulsion generations ago, and patents have been taken out for inventions relating to it by Tooood, Hayes, Rumsey, Linaker, Hall, and others; but the most successful attempts to realize it have been those of Mr. Ruthven. He constructed a small boat, 9 ft. long, in 1839 (tried on the Union canal), and a vessel, 40 ft. long, in 1844 (tried on the Firth), to test the principle; each was worked by a small steam-engine, and provided with the hydraulic apparatus. In 1840 Mr. Ruthven made improvements in the apparatus, and introduced the spireless vessel, 30 ft. long, tried upon the Thames. In 1854 he placed a boat in the great exhibition. In 1855 a vessel on this principle, called the *Albert*, was built in Prussia by M. Sydel, the machinery being supplied by Mr. Ruthven. She plied on the Oder as a passenger-steamer for many
years, and illustrated favorably some of the characteristic features of the Nautilus system. The term of Mr. Ruthven's patent expired, however, before the invention had worked its way into use in England; and the privy council, in 1863, gave a further term of ten years. He afterwards began building a vessel to be called the Nautilus; while the admiralty authorized the commencement of the gun-vessel Waterwitch, both to be worked on the Ruthven principle.

The Nautilus was first tried on the Thames in April, 1866. It is fitted with two steam engines, of 10 (nominal) horse-power each, with cylinders of 17 in. diameter, and 2 ft. stroke. Water is admitted through apertures in the bottom of the vessel into a water-tight iron case or compartment. In this case is placed a horizontal so-called turbine-wheel, 7 ft. in diameter, acted on from a vertical shaft connected with the steam-cylinders. The wheel is divided into compartments by plates or radii of peculiar curvature, and is placed below the water-line of the vessel, so as to be always immersed. Two pipes extend to the wheel-case, one to either side of the vessel, where they emerge nearly at right angles to the turbines, each 4 ft. in diameter, placed outside the vessel at right angles to the pipes: insomuch that each wheel is to be regarded as pointing ahead and another pointing astern. A valve is fitted to each pipe, at its junction with the nozzles, to open the passage to one nozzle and close it against the other; and the movement both of the starboard and the port valves can be governed from a raised deck built over the engine-house. The wheel-case is always full, or nearly full, of water, which enters through the apertures in the bottom of the vessel. When the wheel is made to rotate horizontally by the steam-engines, water is drawn in through the hollow axis, and expelled at the periphery by centrifugal force; it can only find an outlet through the two pipes, and then through the nozzles which terminate them. Supposing the nozzles pointing astern to be open, and those pointing ahead to be closed, the vessel is propelled forward by the resistance of the water of the river or sea to that rushing out of the pipes; when the forward nozzles are open, and the hinder ones closed, the vessel is propelled backward, or driven astern. The steering is done by opening and commanding both valves, can close the fore-nozzles, and open the aft, which makes the vessel go ahead; he can open the fore and close the aft, which makes her go astern; he can open one fore-nozzle, and close the other, which makes her turn. The exit of the water from the nozzles is a little above sea-level, a plan found to be better than actually immersing them. In one of the trial trips of the Nautilus, with strong wind and tide urging her on, and going at full speed, she was stopped dead in less than 10 seconds, and in about a quarter of her length, by simply reversing the valves.

The performance of the Nautilus was satisfactory enough to lead the admiral to expedite the finishing of the Waterwitch, an iron-clad gun-vessel of 778 tons and 160 horse-power. The wheel is rotated by an engine having three separate cylinders each 38½ in. diameter by 3 ft. 6 in. stroke. The vessel was built at the Thames iron-works, and engined by Messrs. J. & W. Dudgeon of Blackwall. Its turbine-wheel is 14 ft. diameter; it rotates (at full engine-power) 39 times per minute. The brass discharge-nozzles, which measure 24 in. by 1½ ft., are continued along the outside of the vessel 8 ft. on each side of the center; the lower lips of the discharge-nozzles are 8 in. below water-line, the remainder of the aperture being above water. The Waterwitch is flat-bottomed and double-ended, i.e., she has a rudder at each end, so that she can steer equally well when going ahead or astern. Her total cost was £60,000, of which no less than £13,600 was for the engines.

As regards her speed and the efficiency of her machinery, the Waterwitch did not do all that was expected of her; she was neither more nor less successful than her sister ships, the Viper and Viper, and they all three belonged to the slowest class of gun-boats. All her machinery was much more expensive than that of the others, nothing has as yet been done in the way of adding to the number of hydraulic engines in the navy. They possess many advantages in regard to maneuvering the ship, but these are to a great extent also possessed by twin-screw engines, which can be made at less cost; while some of the advantages originally claimed for them, such as freedom from slip, have not been realized in actual work. In such exceptional vessels as those of the Viper class, a fair comparison of the merits of the hydraulic propeller with those in common use cannot be made. The net result of the experiments hitherto made is, that while the addition of one additional part to the machinery between the engines and the actual propellers (which in this case are the columns of water) is open to grave objections; still with a "turbine" less faulty in design, and under more favorable circumstances, the hydraulic propeller may be found useful in men-of-war. The Waterwitch, as well as her non-hydraulic sister ships, now ranks among the "coefficients" of the navy, having been pronounced useless for purposes of modern warfare.

Nauvoo, a t, in Illinois, on the e. bank of the Mississippi river, 229 m. above St. Louis. It was built by the Mormons in 1810, and in 1846 contained a population of 15,600. Its principal feature was a great temple of polished marble, original in style, and imposing in appearance. After the murder of Joseph Smith, the Mormon prophet (see Mormons), and the expulsion of his followers, the temple was afterward bought and occupied by a French socialist community, under the leadership of M. Calvet. This experiment having proved, like others, a failure, the once famous city has been reduced to an inconsiderable village.
NAVAJOS, a tribe of Indians belonging to the family of Shoshones and Apaches, and occupying a reservation in n.w. New Mexico and n. e. Arizona, comprising nearly 3,500 square miles. They were formerly hostiles, but were subdued by the U. S. troops, and are at present peaceable and industrious. They number nearly 10,000, and possess 130,000 sheep and goats, and 10,000 horses. A specialty with this tribe is the manufacture of the Navajo blankets, which are valued for their warmth and durability.

NAVALE ACADEMY, U. S. See United States Naval Academy.

NAVAL ARCHITECTURE. See Ship-building.

NAVAL CADETS are the youths training for service as naval officers. Every admiral on hoisting his flag may nominate 2, every capit. 1 cadet. The boy must be between 12 and 13½ years old. He is examined at the royal naval college at Greenwich, and if he passes, is sent for 2 years to the Britannia training-ship, at Dartmouth. At the end of that time, if he has progressed satisfactorily, he is put into a sea-going ship, and becomes a midshipman at once if he has gained a first-class certificate.

NAVAL CROWN, in heraldry, a rim of gold round which are placed alternatelyprows of galleys and square sails. The device is said to have originated with the Roman emperor Claudius, who, after the conquest of Britain, instituted it as a reward for maritime services. He who first boarded the enemy's ship, and was the occasion of its being captured, was entitled to a naval crown. A naval crown supporting the crest in place of a wreath, occurs in various grants of arms in the early part of the present century, and the naval heroes of Great Britain are generally crowned with it. Vincent, bestowed on him after his victory over the Spanish fleet in 1797, is issuing out of a naval crown or, enwrapped by a wreath of laurel vert, a demi-pegasus argent maned and hooved of the first and winged azure, charged in the wing with a fleur-de-lis or.

NAVAL RESERVE, Royal, is a sort of militia, auxiliary to the royal navy. It is a force held in high esteem by naval men; and is considered an extremely valuable reserve of trained men ready to man the fleet in case of emergency. The force was instituted in 1590, under the act 22 and 23 Vict. c. 41. That act authorizes the engagement of 30,000 men, each for a period of 5 years, and provides that each shall be trained, for 28 days in every year, to the use of arms and naval tactics, either in her majesty's ships or on shore. In case of national emergency these men can, by royal proclamation, be called out for service in the navy in any part of the world, for periods not exceeding 5 years. While training and while called out for actual service, the men receive the same wages as corresponding ratings in the royal navy; in addition, they each receive, as retaining fee, a sum of £5 for every year in which the regulated training has been completed. For actual service, after 2 years — whether of uninterrupted service, or at broken intervals — the volunteer becomes entitled to twopence extra per diem. The man can terminate his engagement at the end of 5 years, unless on actual service, when the queen may require him to complete 5 years of such service before discharging him. During the continuance of his engagement, he must not embark on voyages which shall entail a longer absence from the United Kingdom than 6 months, unless with special permission of the admiralty. The periods of training are made as far as practicable to suit the sailor's convenience; he may break the 28 days into shorter periods, none being less than 7 days. He is drilled as near as practicable to his own home, the drilling being intrusted to the officers of the coast-guard. While drilling, if on board a queen's ship, he has the regulation victuals; if billeted on shore, while training for great-gun exercise in batteries, he is allowed 1s. 4d. a day for victuals. It is optional with the volunteer to renew his engagement on time to time, as the respective periods of 5 years expire; and at about the age of 45 he becomes entitled to a pension of £12 or upwards for the rest of his life, subject to the usual obligation of service in certain circumstances in the navy, which all pensioners are under. This pension may be commuted, if desired, into one of less amount, to last until the death of the longest liver of the volunteer and his wife.

To be eligible for the royal naval reserve, a man must be a British subject, under 35 years of age, in good health, and, within the preceding 10 years, must have served at least 5 years at sea, of which 1 year shall have been as able seaman. Soldiers, militia-men, and coast volunteers are ineligible, and subject to a penalty if they join; but a member of the last force may obtain his discharge therefrom for the purpose of joining the naval reserve. Penalties are enacted in case men fail to attend; and failure after proper notice to come up for actual service is held equivalent to desertion. While training or on duty, the men are liable to all the punishments, as they are entitled to all the rights and privileges of regular seamen. The men considered most desirable are (1) those having fixed residences, and personally known to the shipping master or his deputies; and (2) men having regular employment in the coasting trade, or in vessels the business of which brings them back to the same ports at frequent and known intervals. In 1880, about 20,000 men belonged to the naval reserve, and were in a state of great efficiency.

In 1881 the system of the reserve was extended — by the act 24 and 25 Vict. c. 129 — to officers of the merchant-service, certificated masters and mates being respectively granted commissions in the naval reserve as lieutenants and sub-lieutenants. The holders are required to train for 28 days annually on board her majesty's ships, and are liable to be called out
for actual service when required. When training, or on actual service, lieutenants receive 10s., and sub-lieutenants, 7s. per day, with all the privileges, pensions for wounds, pensions to widows, uniforms, etc., of naval officers of corresponding rank. The number of these officers allowed by regulation is 130 lieutenants, and 270 sub-lieutenants; of these, in 1874, commissions had been granted to 117 lieutenants, 79 sub-lieutenants, and 2 engineers. The total cost of the naval reserve, officers and men, for the year 1876-77, was estimated at £240,109.

NAVAL SIGNALS. Communication between vessels by flags or smoke by day, by lights at night, has always been in practice; as well as a kind of arbitrary code for signaling, etc., etc., when beating through a passage, by the movements of a single flag. The modern systems are by different colored flags by day, and by lanterns or blue-lights at night. The electric light is destined to become of great utility in this line, but whether the flash-light, now extensively used by the English armies, can be used on ship-board, remains to be seen. The signals are numbered, and, in the navy, the signal-book is always bound in lead, and is thrown over on surrender; the admiralty service requiring some fifty flags. The merchant service needs fewer combinations; the present code, that of the British board of trade, introduced just before our last war, needing eighteen flags, covering 20,000 signals, which may represent 70,000 numbers. From the book the number is read off, then the word or sentence opposite, and combinations are made if necessary to complete the communication.

NAVAL TACTICS. Modern naval tactics, as embodying a series of rules for maneuvering to the best advantage, corresponding to what is known on land as "la grande guerre," may be said to date only from the time of Crowell's admiral, Blake. Little change from then till the war of 1812 took place in the general principles of attack, with the single exception of the introduction of reliable mortars, but at that date the invention of the breech sight altered the conditions of the problems as regards range. The new fire can be changed from the center; the modern naval gun, since when evolutions under steam form the subject of greatest consequence. Armor and projectiles are constantly opposed, nor is it likely that either can long hold the balance, until the introduction of some extraneous factor, like torpedoes exploded by electricity, shall definitely change the efforts of seamen and constructors to a new direction. Our late war proved that heavy ordnance might be silenced by the successive attack of unarmored vessels; and admiral Teghoff, at the battle of Lissa, sunk, with wooden ships, the finest iron-clads of that day. In a squadron consisting of eight or more vessels, moving in line, or a column in echelon—that is in column, say, from n. to s., but each vessel heading n.w. movements are executed much on the principles of army tactics—by division, half-division, or single vessels. Thus, from line into column, upon right, left, or center; double column, wheels, changing of front, right about, by either flank, in echelon, and at various distances. Foxhall A. Parker (Squad. Tact. under Steam, New York, 1844), then a commander, proposed, as the necessary signals were not in the code, a series of flags for maneuver and change of direction, counting from the right by quarter points. Nos. 1 to 32 indicated points of the compass, and from 33 to 116 orders for movements.

Navan, a market t. of Meath county, Ireland, situated at the junction of the Boyne and Blackwater, 28 m. n.w. of Dublin, with which city it is connected by two railways. Pop. 71, 4,104, of whom 3,856 were Catholics. 293 Episcopalians. Prot. 1. There is a Collegiate Church. Navan is one of the most ancient boroughs in Ireland, and returned two members to the Irish parliament. It possesses considerable inland trade, a flax-mill, several flour-mills, and two paper-mills, besides a tannery, a brewery, and two distilleries. There are also an endowed school, a Roman Catholic seminary (one of the first opened in Ireland after the repeal of the penal law), and four national schools, containing (1871) 1,304 pupils, of whom 699 were boys, and 605 girls. The two girls' schools are attached to the Roman Catholic convent. Several interesting remains, both Celtic and Norman-English, are found in Navan and the vicinity.

Navaria (Navarino), or Neo-Castro, a sea-port and citadel on the s.w. coast of the Morea in Greece, contains only 2,000 inhabitants, but is of importance from its position, commanding the entrance of the bay of Navarino, at the southern extremity of which it is situated. On the island of Spagna or Sphacteria, which closes the bay's mouth, was formerly situated Pyrus Messeniare, the town of Nestor, in a spot where now stands old Navarino or Palaeoecaston. The bay of Navarino was the scene of a great sea-fight between the Athenians under Clean, and the Spartans (425 B.C.), in which the latter were defeated; and on Oct. 29, 1827, it saw the annihilation of the Turkish and Egyptian navies by the combined British, French, and Russian fleets under Sir Edward Codrington.

Navarre, a province and formerly a kingdom of Spain, is bounded on the n. by France, on the s. and e. by Aragon, and on the w. by the Biscay; and is situated in 43° 20' to 43° 15' n. lat., and 6° 50' to 2° 30' w. long. Area about 4,000 sq. miles. Pop. 70, 318,687. The country is mountainous, being bounded and traversed by the Pyrenees, spurs of which occupy almost the whole of the province in its northern and eastern parts. The highest peaks are Alloviscar, Ata, Alcorunz, and Rufa. Navarre is watered by the Bidasson, the Anzo, and by the Ebro, together with its tributaries, the Ega and Aragon, on the level shores of which corn, wine, and oil of good quality are
produced. Some of the valleys which intersect the mountain-ranges, as those of Roncesvalles, Lescon, Bastan, and Roncal, have a fruitful soil, and yield good crops; but in the mountain districts, husbandry is impracticable, and the inhabitants nearly all follow the chase, as much from necessity as inclination; and while a large number of the Navarrese are soldiers, a still larger proportion are smugglers—the proximity of the province to France, and the dangerous character of the almost inaccessible mountain-passes which alone connect the two countries, holding out many inducements and facilities in the way of smuggling. The mountain forests still harbor bears, wolves, wildcats, goats, deer, and an abundance of game of every other kind. Iron and salt are the chief mineral products of the district, but these are obtained in sufficient quantities to be exported. The people of Navarre are a hardy, brave, and hospitable race, loyal to the sovereign, attentive observers of the forms of their religion, and, except in the matter of smuggling, honest and moral; but they are passionate and distrustful, prone to anger, and keen in avenging an insult, real or imaginary. Although not industrious, the people follow a few branches of industry, and manufacture glass, leather, soap, chocolate, etc., of good quality.

The Navarrese, with few exceptions, are members of the church of Rome, to whose tenets they cling with superstitious devotion. They have always intermarried chiefly among their own compatriots, and are a nearly pure Basque race. In the mountainous districts, Basque is still spoken, but in the plains, the modern Castilian form of Spanish is rapidly supplanting the ancient language of the country. The chief town is Pamplona (q.v.).

The territory known from an early period of Spanish history under the name of Navarre was occupied in ancient times by the Vascones, who were subdued by the Goths in the 5th century. After having become gradually amalgamated with their conquerors, the people continued to enjoy a species of turbulent independence under military leaders until the 8th c., when they were almost annihilated by the hordes of Arabs who were rapidly spreading their dominion to all parts of the peninsula. The Gothic Vascones of Navarre, who had been converted to Christianity, offered a gallant resistance to their infidel invaders, and although repeatedly beaten, they were not wholly subdued. The remnant which escaped the sword of their Moslem enemies took refuge in the fastnesses of the mountains, and choosing a knight of their number, Garcia Ximenes, as their leader or king, they sallied forth, and by their gallant resistance, compelled the Arabs to leave them in the enjoyment of an independence greater than that of the neighboring states. On the extinction of the race of Ximenes, in the middle of the 9th c., the Navarrese elected as their king Inigo Sanchez, count of Biscarre, in whose family the succession remained till the marriage of Philip the fair with queen Joanna I. of Navarre; and the accession of the former to the throne of France in 1285, rendered Navarre an appanage of the crown of France. It continued a part of that kingdom during the successive reigns of Louis X., Philip V., and Charles the fair, but on the death of this last in 1328, France fell to the family of Valois, and the daughter of Louis X., the rightful heir, succeeded to Navarre as Joanna II. The events of the kingdom present no features of interest during the next hundred years. The marriage of Blanche, daughter of Charles III. of Navarre, with John II. of Aragon, in 1442, did not produce an annexation of Navarre to Aragon, as John suffered his wife to rule her own kingdom as she pleased, and even after her death and his subsequent re-marriage, he resigned the government entirely to his son by Blanche. This son, known as Charles, prince of Viana, having attempted to remain neutral in his father's quarrels with Castile, John expelled him and his elder sister Blanche, who sided with him, from Navarre, and conferred the kingdom on Leonora countess de Foix, his younger daughter, by Blanche, whose misrule completed the disorganization which these family quarrels had commenced. Her son, Francis, called Pehbns, from his beauty, succeeded in 1479, and his sister Catharine in 1483. Ferdinand and Isabella sought to marry the young queen to their son and heir, the prince of Asturias, but her mother, a French princess, married her to Jean d'Albret. Ferdinand, however, was not willing to let the prize escape him, and on some slight pretext he seized Navarre in 1512. After this act of spoliation, there remained nothing of ancient Navarre beyond a small territory on the northern side of the Pyrenees, which was subsequently united to the crown of France by Henri IV. of Bourbon, king of Navarre, whose mother, Jeanne d'Albret, was grand-daughter of queen Catharine; and hence the history of Navarre ends with his accession to the French throne in 1589. The Navarrese were, however, permitted to retain many of their ancient privileges; after their incorporation with the other domains of the Spanish crown, until the reign of queen Isabella II., when the active aid which they furnished to the pretender, Don Carlos, in the rebellion of 1834-39, led to the abrogation of their fueros, or national assemblies, and to the amalgamation of their nationality with that of the kingdom at large. In the later Carlist struggle of 1872-76, Navarre was again a principal seat of the war, the inhabitants being stimulated in their assistance of the representative of the claims and title of Don Carlos by his promise of restoring their fueros.

NAVARRETE, DOMINGO FERNANDEZ DE, 1610-89; b. Spain; was educated at Valadolid as a Dominican, and in 1647 went on a mission to the Philippine islands, where he soon became professor of theology in the college of Manila. A few years later, however,
he went to China and busied himself in the interior of the country, studying the people and their language until he was persecuted and thrown into prison in Canton. As soon as he escaped and arrived in Europe he visited Rome, and complained to the pope of the work of the Jesuits in China, accusing them of accommodating their religion to the superstition of the natives. He then returned to Spain and published a large work on the History, Politics, Ethics, and Religion of the Chinese Monarchy, shortly after which he received the appointment of archbishop of San Domingo in the West Indies, where he passed the remainder of his life.

**NAVARRETE, Martino Fernandez de, 1765-1844; b. Spain; entered the Spanish navy in 1780, was present at the attack on Gibraltar in 1782, and afterwards served against the Moors and Algerines. Ill health, however, forced him to retire from the service for some years which he spent in collecting documents respecting the history of Spanish maritime discovery, labors that resulted in 1825 in the publication of the first and second volumes of a work by him entitled *Colección de los Viajes y Descubrimientos que hicieron por mar los Españoles desde fines del Siglo XV.*, which was pronounced by Humboldt to be "one of the most important historical monuments of modern times." In 1830 the third volume appeared; and eight years later, the fourth and fifth volumes. But before the sixth and seventh were completed the author died. He was the author of several other lesser works, and a distinguished member of the Spanish academy.

**NAVARRO, a co. in n.e. Texas, on the Trinity river; 1840 sq.m.; pop. 80, 21,705 —5,394 colored. The surface is undulating with a large proportion of prairie. The chief productions are corn, cotton, and sweet potatoes. Cattle and pork are raised. It is drained by Chambers and Richland creeks, and is on the Houston and Texas Central railroad. Co. seat, Corsicana.**

**NAVE.** See Church.

**NAVESINK (or NEVESINK) HIGHLANDS, a chain of hills that form a bold headland along the coast of New Jersey on the border of Monmouth county. To ships approaching New York, they are important landmarks and located on them are two first-class light-houses 53 ft. high, both of which show fixed white lights. Though the neighboring region is a beautiful one and only 20 m. from New York, it remains primitive and only sparsely inhabited.**

**NAVEW (Fr. navette), a garden vegetable much cultivated in France and other parts of the continent of Europe, although little used in Britain. It is by some botanists regarded as a cultivated variety of Brassica napus, or rape (q.v.), whilst others refer it to *Brassica oleracea*, sometimes called wild navew, the species which is also supposed to be the original of the Swedish turnip (q.v.). The part used is the swollen root, which is rather like a carrot in shape. Its color is white. Its flavor is much stronger than that of the turnip. It succeeds best in a dry light soil. The seed is sown in spring, and the plants thinned out to 5 in. apart.**

**NAVEZ, François Joseph, 1787-1869; b. Belgium; studied art in Brussels and Ghent; and in Paris was a pupil of the great painter David. After finishing his studies he resided in Brussels till his death, and became director of the fine arts academy. His works almost all represent biblical scenes such as: "The Prophet Samuel," "The Ascension of the Virgin," "Hagar in the Desert," and "Meeting of Isaac and Rebecca."**

**NAVIGULA (Lat. a little ship), a genus of *Dictumnaeae* (q.v.), receiving its name from the resemblance of its form to that of a boat. Some of the species are very common.**

**NAVIGULAR DISEASE, in the horse, consists in strain of the strong flexor tendon of the foot, at the point within the hollow of the fetlock, where it passes over the navicular bone. It is most common amongst the lighter sorts of horses, and especially where they have upright pasterns, out-turned toes, and early severe work on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, wasting of the muscles of the shoulder, and projecting or "pointing" of the affected limb whilst standing. When early noticed, and in horses with well-formed legs, it is often curable; but when of several weeks standing, it leads to so much inflammation and destruction of the tendon and adjoining parts, that soundness and fitness for fast work are again impossible. Rest should at once be given, the shoe removed, the toe shortened, and the foot placed in a large, soft, hot poultice, changed every few hours. Laxative medicine and bran mashes should be ordered, and a soft bed made with old short litter. After a few days, and when the heat and tenderness abate, cold applications should supersede the hot; and, after another week, a blister may be applied round the coronet, and the animal placed for two months in a good yard or in a grass field, if the ground be soft and moist; or, if sufficiently strong, at slow farm-work on soft land. Division of the nerve going to the foot removes sensation, and consequently lameness; and hence is useful in relieving animals intended for breeding purposes or for slow work. The operation, however, is not to be recommended where fast work is required; for the animal, insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse.**
NAVIES, ANCIENT AND MEDIEVAL. The ancient method of naval warfare consisted in great part, in the driving of **beaked** vessels against each other; and therefore skill and dexterity in maneuvering, so as to strike the enemy at the greatest disadvantage, were of the utmost importance. The victory thus usually reigned with the best sailor. This mode of conflict has been attempted to be revived at the present time, and vessels called "steam-runners" are specially constructed for this species of conflict. The earliest powers having efficient fleets appear to have been the Phenicians, Carthaginians, Persians, and Greeks; the Greeks had fleets as early as the beginning of the 6th b.c.—the first sea-fight on record being that between the Corinthians and their colonists of Corea, 664 B.C. The earliest great battle in which tactics appear to have distinctly been opposed to superior force, and with success, was that of Salamis (480 B.C.), where Themistocles taking advantage of the superior weight of the Persian fleet in such a manner that their line of battle but little exceeded in length the line of the much inferior Athenian fleet. The Peloponnesian war, where "Greek met Greek," tended much to develop the art of naval warfare. But the destruction of the Athenian marine power in the Sullan expedition of 144 B.C., left Carthage mistress of the Mediterranean. The Roman power, however, gradually asserted itself, and after two centuries, became omnipotent by the destruction of Carthage. For several following centuries, the only sea-fights were occasioned by the civil wars of the Romans. Towards the close of the empire, the system of fighting with pointed prows had been discontinued in favor of that which had always co-existed—viz., the running alongside, and boarding by armed men, with whom each vessel was overladen. Onagers, ballista, etc., were ultimately carried in the ships, and used as artillery; but they were little relied upon, and it was usual, after a discharge of arrows and javelins, to come to close quarters. A sea-fight was therefore a hand-to-hand struggle on a floating base, in which the vanquished were almost certainly drowned or slain.

The northern invaders of the empire, and subsequently the Moors, seem to have introduced swift-sailing galleys, warring in small squadrons and singly, and ravaging all civilized coasts for plunder and slaves. This—the break-up of the empire—was the era of piracy, when every nation, which had more to win than lose by freebooting, sent out its cruisers. Foremost for daring and seamanship were the Norsemen, who penetrated in every direction from the Bosphorus to Newfoundland. Combination being the only security against these marauders, the medieval navies gradually sprang up; the most conspicuous being—in the Mediterranean, those of Venice, Genoa, Pisa, Aragon; on the Atlantic seaboard, England and France. In the Mediterranean, Venice, after a long struggle, with the Genoese, and subsequently with the Turks, became the great naval power. The Aragonese fleet gradually developed into the Spanish navy, which, by the epoch of Columbus, had a rival in that of Portugal. Many struggles left, in the 16th and 17th centuries, the principal naval power in the hands of the English, French, Dutch, Spaniards, and Portuguese. The present state of these and other existing navies will be briefly given under NAVIES, MODERN.

NAVIES, MODERN. Dating the modern navies of the world from the 16th century, we find the British navy rising from insignificance by the destruction of the Spanish armada in 1588; a blow from which Spain never recovered, and which the Dutch, whose naval force had acquired tremendous strength in their struggle for independence, increased the weight of, by their triumph in 1607, in the bay of Gibraltar. At this time there was no decisive superiority of the fleet of England over that of France; but each was inferior to the Dutch navy. The commonwealth and reign of Charles II. were signalized by the struggle for mastery between the English and Dutch; when victory, after many alternations, finally sided with the former. Through the 18th century, the English and French were the principal fleets; but Louis XVI. gave a decided superiority to the navy of France; and at the period of the American war, the naval power of England was seriously threatened. Spain, Holland, and Russia (now for the first time a naval power) had meanwhile acquired considerable fleets; and the "armed neutrality," to which the northern powers gave their adherence rendered the British position most critical. However, the slowly roused energy of her government, the invisible courage of her seamen, and the genius of her admirals brought Britain through all her trials. Camperdown broke the Dutch power; many battles weakened the French navy; and at Trafalgar in 1805, it, with the Spanish power, was swept from the ocean. The United States had in the meantime augmented their fleets, and in the war of 1812-14 maintained a glorious struggle. During the American war of secession many gun-boats, "monitors," and iron-clads of all classes were created; but chiefly adapted for river and coast service. The growth, in recent times, of the British navy will be found under NAVY, BRITISH. The Emperor Napoleon III. greatly enlarged and improved the French navy, yet in the war of 1870-71 it had no opportunity of proving its effectiveness.

The contest between the attack and defense which has been going on for some time appears to have attained its limits in the 100-ton guns of the Italian navy, and the 24-inch armor-plate of the British; and a new departure seems already to have been taken which points in the direction of steel plates and speed, and a more special adaptation of ships for particular services. The torpedo system has introduced a new element into naval warfare, particularly in harbors, rivers, and inland waters, which can hardly be
said to be yet fully developed (see Torpedo); and the catastrophes of the Vanguard of the British navy, and the Grosser Kurfürst of the German, have pointed out dangers connected with the steam system that had not been calculated upon.

The following table gives a fair estimate of the comparative strength of the chief navies of the world. Comparison by the number of guns is of little account now; that of armored steamers and horse-power is more to the point:

**CHIEF NAVIES OF THE WORLD, 1877.**

NAVIES, MODERN (ante). See United States Navy.

NAVIGATION, ART OF. We shall give a few indications of the manner of conducting the course of a ship at sea, referring to the various headings, such as SEXTANT, LATITUDE AND LONGITUDE, GREAT-CIRCLE SAILING, etc., for the more scientific explanation of the operations in use for determining position.

A vessel having completed her loading, she is steered out of port by a pilot, who lays his course by the **ranges** with which local familiarity has made him acquainted. Arrived off soundings, or at a point where his local knowledge is no more to be relied on, he leaves the vessel to the captain, who then assumes all responsibility. While off the coast the captain steers by his **chart** and by the **leeward**, assisted by **landmarks** and **ranges** by day, and by **lights** at night. It is his duty, without waiting for foggy weather, nor for any doubt of his situation, to keep the lead going, and a careful watch, while on soundings. When, finally, he is about to lose sight of the coast, he determines a last position, called the **point of departure**, which serves as the base of his reckoning. The problems involved in a long voyage are many, some intricate, but position is always ascertainable, either by observations or dead reckoning. Two things must be known, speed and direction. The first is found by the **log**, whose unit, the **knot**, predicates the number of nautical miles, 1851.155 meters, traversed per hour. The second is indicated by the **compass**, from which is read the angle, known as the course, between the magnetic meridian and the axis of the keel. But to reduce this to the true course with reference to the terrestrial meridian, the magnetic variation must be known and applied. The log is not an accurate instrument, nor is it possible, in a sailing vessel, to throw it as often as slight changes in the rate of motion occur; besides, it seldom happens that the course of a vessel is exactly that read from the compass, for decomposing into two forces the normal line of action of the wind on the sails, there results a certain side-push, forming an angle with the keel, and resulting in a falling-off from the true course known as **drift**. Allowance must also be made for the influence of local, tidal, or ocean currents, the force of which, even where not known by experience nor laid down on the chart, must be carefully judged, and anxiously watched for. The amount of drift is ascertained from the **wake**, either by a back-sight of the compass, or by means of a quadrant and eye-pieces, and can be always combined with the magnetic variation to obtain the true course. Then make allowance for the **set** of the current, the effect on a course of given length and direction of the known speed and trend of the stream.

When, as is necessary every day, it is desired to follow a **rhumb-line**, the course is deduced by making allowance inversely for variation, drift, and set. This course the captain lays down, and the officer of the deck continually over-sees the steersman, so that, granting this course continually kept, the path of the vessel successively intersects each meridian at the same angle, called the **angle of rhumb**, and this line, a curve of plane flexure, is the **loxodromic line**. But for the course to sail directly from point of departure to destination is almost impossible, whether from buffeting winds, intervening coasts, or adverse currents, the best that can be done then is to substitute a series of loxodromic curves, as little removed from the true course as possible, to make as few and as advantageous stretches as possible, and to take advantage of known currents and

* The horse-power and guns of the armored steamers only are given. The number of men includes the royal naval reserve.
favorable winds to substitute for a short but questionable passage a more circuitous but quicker route. The log must always be thrown whenever wind, sails, or course may change; the course and the speed are noted, say every half-hour, on a tally, and at the end of each watch the course is transferred to the log-book. Finally, every day at noon, or oftener as advisable, the reckoning is cast up, and the position of the vessel marked on the chart, taking as point of departure the last calculated position. The future course is deduced from this. All navigation by reckoning should be checked at least once a day, and as often and in as many different ways as can be accomplished by observations, repeated if possible, and the mean taken.

NAVIGATION, Freedom of, in the open or high seas has been fully established for nearly a century, and such efforts as have been made in the past to claim exclusive jurisdiction were founded rather on national pride or arrogance than on reasonable principles or considerations of commercial value. The most pretentious claims which have been made were those of Spain and Portugal in the 15th c. based on bulls of popes Nicholas V. and Alexander VI., giving Portugal control over the African seas, and dividing between the two the sovereignty of the Pacific. Of course Protestant nations paid no attention to these claims. The true principles of sovereignty in regard to seas, bays, etc., were first laid down by Grothus in his Mare Liberum, 1608, but, notwithstanding, his countrymen the Dutch for a long time opposed the right of the Spaniards to trade with the Philippines via the cape of Good Hope. In 1635 Selden published Mare Clausum, an attempt to refute Grothus and defend the claims of the English to sovereignty over the seas about the United Kingdom as far as to the coasts of other nations. His argument was weak, being based entirely on alleged precedents. The latest serious claim of the kind was that of Russia, which formerly asserted dominion over the Pacific n. of 51° n. lat. on the ground that no other state possessed territory bordering thereon. This was withdrawn in treaties with the United States and Great Britain in 1824-25. But while the open sea is free to all, inland seas are subject to the jurisdiction of the country in which they are situated; and where, as in the Black sea, two nations border on an inland sea, and in the case of gulfs or straits, questions of some difficulty have arisen. It is conceded that marine jurisdiction extends a short way from the coast, a marine league being the generally accepted limit; so also, gulfs and bays belong to the countries owning the promontories between which they lie. But this doctrine must not be carried too far, and the idea suggested by chancellor Kent in the early part of this century, that sovereignty might be in future claimed over the waters inclosed by lines drawn from cape Cod to cape Ann, Nantucket to Montauk Point, thence to the Delaware capes and from the extremity of Florida to the Mississippi (before Texas was annexed), is now considered untenable, as is also the proposition that the line of the gulf stream should bound the sovereignty of the United States. For purposes connected with the laws of revenue and commerce, four leagues are allowed. As to narrow seas, gulfs, and straits, there has existed from time immemorial a claim on the part of England to sovereignty over the English and St. George's channels, the Irish sea and the North channel, and theoretically it may still exist; but long since the only exceptions have been for requiring certain honors to be paid to the British flag, and even this custom has fallen into disuse. Over the Baltic sea Denmark long exercised a rather despotic rule, based partly on the natural position of the sea, partly on precedent, and partly on the cost of maintaining light-houses and signals. Heavy tolls were laid on foreign vessels, and caused the war with the Netherlands in the 17th century. In 1837 the powers agreed to pay Denmark a round sum as compensation for the renunciation of her alleged sovereignty, and the United States paid nearly $400,000 as its share. The questions in regard to the Black sea have had great prominence in the European and Turkish complications of this century. Previous to 1829 Turkey claimed the sole sovereignty. At that date Russia and her allies were admitted to the right of navigation. In 1841 it was agreed that vessels of war should not enter the Bosphorus or Dardanelles; while by the treaty of 1856 the Black sea was made neutral, ships of war still being prohibited from entrance, though Russia and Turkey were to allow the passage of war vessels for repairing or conveying supplies and provisions. By the Berlin congress of 1878 tends to confirm and strengthen the neutrality of this inland sea. Navigation of rivers has also given rise to questions of international interest, and there has been a constantly increasing freedom and enlargement of the privileges allowed by the country controlling the mouth and lower course to the countries lying above.

NAVIGATION, History of. In its widest sense, this subject is divisible into three sections—the history of the progressive improvement in the construction of ships, the history of the growth of naval powers, and the history of the gradual spread and increase of the science of navigation. Although these three sections are to some extent interwoven, the present article will be limited to a consideration of the last, the first two being sufficiently described under Ship-Building and Navies.

The first use of ships, as distinguished from boats, appears to have been by the early Egyptians, who are believed to have reached the western coast of India, besides navigating the Mediterranean. Little, however, is known of their prowess on the waves, and, whatever it may have been, they were soon eclipsed by the citizens of Tyre, who, to
make amends for the unproductiveness of their strip of territory, laid the seas under tribute, and made their city the great emporium of eastern and European trade. They spread their merchant fleets throughout the Mediterranean, navigated Solomon's squadrons to the Persian gulf and Indian ocean, and planted colonies everywhere. Principal among these colonies was Carthage, which soon outshone the parent state in its maritime daring. The Carthaginian fleets passed the pillars of Hercules, and, with no better guide than the stars, are believed to have spread northward to the British isles, and southward for some distance along the w. coast of Africa. From the 6th to the 4th centuries B.C., the Greek states gradually developed the art of navigation, and at the time of the Peloponnesian war, the Athenians appear to have been skillful tacticians, capable of concerted maneuvers. The Greeks, however, were rather warlike than commercial in their undertakings. In 431 B.C., Athens, already weakened by losing a considerable part of her commerce to Alexandria, which, having an admirable harbor, became the center of trade for the ancient world, and far surpassed in the magnitude of its marine transactions any city which had yet existed. Rome next wrested from Carthage its naval power, and took its vast trade into the hands of the Italian sailors. After the battle of Actium, Egypt became a Roman province, and Augustus was master of the enormous commerce both of the Roman and the Alexandrian merchants. During all this period, the size of the vessels had been continually increasing, but probably the form was that of the galley, still common in the Mediterranean, though a more clumsy craft than the sail. Satirs were known, and some knowledge was evinced even of beating up against a foul wind; but oars were the great motive-power; speed was not thought of, a voyage from the Levant to Italy being the work of a season; and so little confidence had the sailors in the safety of their ships that many of them preferred the sea to the lander from the stern, that it was customary to haul the vessels up on-shore when weather was in. During the empire, no great progress seems to have been made, except in the size of the vessels; but regular fleets were maintained, both in the Mediterranean and on the coast of Gaul, for the protection of commerce. Meanwhile the barbarian nations of the north were advancing in quite a different school. The Saxon, Jutish, and Norse prows began to roam the ocean in every direction; in small vessels they trusted more to the winds than to oars, and, sailing singly, gradually acquired that hardihood and daring which ultimately rendered them masters of the sea. The Britons were no mean seamen, and when Carthage restored the purple in their island, he was able, for several years, by his fleets alone to maintain his independence against all the power of Rome.

The art of navigation became almost extinct in the Mediterranean with the fall of the empire, but the barbarous conquerors soon perceived its value, and revived its practice with the addition of new inventions suggested by their own energy. The islanders of Venice, the Genoese, and the Pisans, were the carriers of that great inland sea. Their merchants traded to the farthest Indies, and their markets became the exchanges for the produce of the world. Vast fleets of merchant galleys from these flourishing republics dared the storm, while their constant rivalries gave occasion for the growth of naval tactics. Such a commerce tempted piracy, and the Moorish corsairs penetrated everywhere on both sides of the straits of Gibraltar in quest of prey; evincing not less skill and nautical acumen than savage fury and inhuman cruelty. But the Atlantic powers, taught in stormy seas, were rearing a naval might that should outstrip all other pretenders. The Norsemen extended their voyages to Iceland, Greenland, and Newfound-land, while they first ravaged and then colonized the coasts of Britain, France, and Italy. The sea had no terrors for these hardy rovers; their exploits are imperishably recorded in the Icelandic sagas, and in the numerous islands and promontories to which they have given names.

Early in the 15th c. the introduction of the mariner's compass rendered the seaman independent of sun and stars—an incalculable gain, as was soon shown in the ocean-voyages of Columbus, Cabot, and others. In 1482 Columbus rendered navigation more secure by the discovery of the variation of the compass. Between that and 1514 the "cross staff" began to be used; a rude instrument for ascertaining the angle between the moon and a fixed star, with the consequent longitude. Early in the 16th c., tables of declination and ascension became common. In 1537 Nuñez (Nonius), a Portuguese, invented various methods of computing the rhumb-lines and sailing on the great circle. In 1515 the two first treatises on systematic navigation appeared in Spain, one by Pedro de Medina, the other by Martin Cortes. These works were speedily translated into French, Dutch, English, etc., and for many years served as the text-books of practical navigation. Towards the end of the century, Bourne in England, and Stevin in Holland, improved the astronomical portion of the art, while the introduction of time-pieces and the log (q.v.) rendered the computation of distance more easy.

It would be tedious to enumerate the successive improvements by which the science of navigation has been brought to its present high perfection; but as conspicuous points in the history of the art, the following stand out: The invention of Mercator's chart in 1569; the formation by Wright of tables of meridional parts, 1507; Davis's quadrant, about 1600; the application of logarithms to nautical calculations, 1620, by Edmund Gunter; the introduction of middle-latitude sailing in 1623; the measure of a degree on the meridian, by Richard Norwood, in 1631. Hadley's quadrant, a century later, rendered observations easier and more accurate; while Harrison's chronometers (1764),
rendered the computation of longitude a matter of comparatively small difficulty. Wright, Bond, and Norwood were the authors of scientific navigation, and their science is now made available in practice by means of the Nautical Almanac, published annually by the British admiralty. The more important points of the science of navigation are noticed under such heads as DEAD-RECKONING, LATITUDE AND LONGITUDE, GREAT-CIRCLE SAILING, SAILINGS, etc.

NAVIGATION, INLAND. See Appendix.

NAVIGATION, LAWS AS TO. By law of nature and of nations, the navigation of the open sea is free to all the world. The open sea means all the main seas and oceans beyond 3 m. from land. The sea within 3 m. from land is called the territorial sea, and each state has a kind of property in such sea, and has a right to regulate the use thereof. Hence, it was natural that in early times, before the laws of commerce were properly understood, each state should endeavor to exclude foreigners from that part of the sea so as to secure to its own subjects the benefits of the carriage of goods in ships, which has always been an increasing source of wealth. In England, however, as in most countries, the first care seems to have been bestowed on the navy, as the great means of defending the realm against enemies, and trading-ships came to be first subject to statutory regulation only as being in some way ancillary to the interests of the navy. The laws of Oleron were the first code of maritime laws which obtained notice as well as general acceptance in Europe, in the time of Edward I., and the authorship of those laws is claimed by Selden and Blackstone for Edward I., though the point is disputed by the French writers. By a statute of Richard II., in order to augment the navy of England, it was ordained that none of the lieges should ship any merchandise out of the realm except in native ships, though the statute was soon varied and seldom followed. At length, in 1650, an act was passed with a view to stop the gainful trade of the Dutch. It prohibited all ships of foreign nations from trading with any English plantation without a license from the council of state. In 1651 the prohibition was extended to the money trade, no goods were suffered to be imported into England or any of its dependencies in any other than English bottoms, or in the ships of that European nation of which the merchandise was the genuine growth or manufacture. At the restoration, these enactments were repealed and continued by the navigation act (12 Chas. II. c. 18), with the further addition, that the master and three-fourths of the mariners should also be British subjects. The object of this act was to encourage British shipping, and was long believed to be wise and salutary. Adam Smith, however, had the sagacity to see that the act was not favorable to foreign commerce or to opulence, and it was only on the ground that defense was more important than opulence, that he said it was "perhaps the wisest of all the commercial regulations of England." In 1826 the statute 4 Geo. IV. c. 41 repealed the navigation act, and established a new system of regulations, which were further varied by subsequent statutes, till, under the influence of the free-trade doctrines, new statutes were passed, which reversed the ancient policy. By the law, as now altered, foreign vessels are allowed free commercial intercourse and equality with the ships of this country and its dependencies, except as regards the coasting trade of the British possessions in Asia, Africa, and America, for the coasting trade of the United Kingdom is now entirely thrown open to all comers. The advantages of equality and free trade are, however, so far qualified, that in the case of the eastern nations which do not concede to British ships like privileges, prohibitions and restrictions may be imposed by order in council.

As regards those laws of navigation which affect the property and management of ships, a complete code of regulations is contained in the merchant shipping acts, which are 17 and 18 Vict. c. 104, 18 and 19 Vict. c. 91, 29 and 30 Vict. c. 63, 34 and 35 Vict. c. 110, 36 and 37 Vict. c. 85. 1. As to ownership, registration, and transfer of merchantships. No ship is deemed a British ship unless she belong wholly to natural born subjects, denizens, naturalized persons, or bodies corporate, having a place of business in the United Kingdom or some British possession. Every British ship, with a few exceptions as to old ships and small vessels, must be registered, otherwise, it is not entitled to the protection of the British flag. The commissioners of customs indicate at what port in the United Kingdom ships may be registered by their officers, and when registered, the ship is held to belong to that port. The name of the ship and its owners must be stated; and as regards joint-ownership, a ship is capable only of being subdivided into 64 shares, and not more than 32 owners shall own one ship. These registered owners are deemed the legal owners, and so long as the register is unchanged the ship is held still to belong to them. The only way of transferring the property is by bill of sale under seal; or if a mortgage is made, it must be made in a particular form, and duly registered, and the priority of title as between several mortgages is regulated by the date of the entry in the register. 2. As regards the laws concerning merchant seamen, there is established in every such seaport a superintendent, whose business it is to afford facilities for engaging seamen, by keeping registers of seamen and superintending the making and discharging of contracts. No person is allowed to be employed in a foreign-going ship as master, or as first, or second, or only mate, or in a home-trade passenger-ship as master, or first or only mate, unless he has a certificate of competency or a certificate of service, issued by the board of trade only to those who are deemed entitled
therto. The master of every ship above 80 tons burden shall enter into an agreement, of a certain form, with every seaman he carries from the United Kingdom, and in which the names of the seamen, wages, provisions, capacity of service, etc., are set forth. The seamen are not to lose their wages though no freight is earned, or the ship lost. The men are also to have a berth of a certain size, and the ship to be supplied with medicines, log-book, etc. In order to secure general information, every master of a foreign-going ship is bound, within 48 hours after arriving at the final port of destination in the United Kingdom, to report his ship. Unsavoury or overloaded ships may be surveyed by the board of trade, and detained. 3. As regards the liability of ship-owners for loss or damage, it is provided by statute, that no owner of a sea-going ship shall be liable to make good any loss or damage occurring without his actual fault or privity, to goods or things on board, by reason of fire on board the ship; or to any gold, silver, diamonds, watches, jewels, or precious stones on board, by reason of robbery or embezzlement, unless the true nature and value of such articles have been inserted in the bill of lading. And in cases where loss to goods occurs without his actual fault or privity, the owner shall not be liable in damages to an aggregate amount exceeding £8 per ton of the ship's tonnage. In case of loss of life or personal injury caused by mismanagement of the ship, but without the actual fault or privity of the owners, they shall not be liable beyond £15 per ton. In case of accidents, whereby a large number of persons have been killed or injured, and to prevent a multiplicity of actions, the sheriff of the county is to impanel a jury, and inquire into the question of liability. If the owners are found liable, then £30 is to be assessed as the damages for each case of death or personal injury. In case of death, such sum is to be paid to the husband, wife, parent, or child of the deceased. If any person consider this is not sufficient damages, then, on returning such sum, he may commence an action; but unless he recover double that sum, he must pay costs. See also Pilots and Light-houses.

NAVIGATION LAWS (ante). In regard to United States laws of navigation affecting the property in and management of ships, see SHIPping LAW or. Only the regulation of congress in regard to the motions of ships coming near each other in such a way as to make a collision possible will be here considered. These regulations, which will be carried into effect in the courts of the United States, are also enforced in most commercial countries; and have taken the place of the general rules of the maritime law. They are the same which were adopted by France and Great Britain in 1863, and have since been agreed to by the United States and Canada, the chief continental commercial powers, Brazil, and the South American republics. Every steamship under sail and not under steam is to be considered a sailing-ship, and every steam-ship under steam, whether under sail or not, is to be considered a ship under steam. Every steam vessel under way must carry at the foremost head a white light; on the port side a red light; on the starboard side a green light; and both the green and red side-lights are to be fitted with inboard screens so as to keep the lights from being seen across the bow. Steamships towing other ships must carry two bright white lights vertically beside their side-lights to prevent them from being confounded with other steamships. Sailing-ships under way, or being towed, carry the same lights as steamships, with the exception of mast-head lights. Both steamships and sailing-vessels, when at anchor in roadsteads, shall exhibit a white light. Sailing pilot-vessels carry a white light at the mast-head, and show a flare-up light every 15 minutes. In case of a fog signals are to be sounded at least every 5 minutes. Steamships and sailing-vessels not under way sound a bell. Steamships under way and sailing-vessels not under steam are not required to sound a bell when they come near enough to a ship to make collision probable must stop and reverse. If two ships under steam are crossing each other, the ship which has the other on her starboard side must keep out of the other's way. If two sailing-ships meet end on so as to hazard collision the helms of both shall be put to port; and so with steamships. A vessel overtaking another must keep out of the latter's way. If two sailing-ships cross each other with the wind on different sides the one with the wind on the port side must keep out of the way of the one with the wind on the starboard side; but if they have the wind on the same side, or one has the wind aft, the one to windward must keep out of way of the one to leeward.

NAVIGATION, Ocean Steam. See Steam Navigation.

NAVIGA TORS or SAMAON ISLANDS, a group of nine islands, with some islets, in the Pacific ocean, lying n. of the Friendly islands, in lat. 13° 30' to 14° 30' s., and long. 168° to 173° w. The four principal islands of the group are Maua, Tutuila, Upolu, and Savaii. Of these, Savaii, 40 m. in length by 20 m. broad, and having a population of 20,000, is the largest. Area of the group estimated at 2,650 sq. m.; pop. about 56,000. With the exception of one (Rose island), the Navigators' islands are all of volcanic origin. For the most part they are lofty, and broken and rugged in appearance, rising in some cases to upwards of 2,500 ft. in height, and covered with the richest vegetation. The soil, formed chiefly by the decomposition of volcanic rock, is rich, and the climate is moist. The forests, which include the bread-fruit, the coconut, banana, and palm trees, are remarkably thick. The orange, lemon, tanna (from which a kind of sago is made), coffee, sweet-potatoes, pine-apples, yams, nutmeg, wild sugar-cane, and many other important plants, grow luxuriantly. Until recently, when swine, horned-cattle, and
horses were introduced, there were no traces among these islands of any native mammal, except a species of bat. The natives are well-formed (especially the males),1 ingenious, and affectionate. The women, who superintend the indoor work and manufacture mats, are held in high respect. There are English and American mission-stations on the islands, as well as several Roman Catholic establishments, and many of the natives have embraced Christianity. The government is in the hands of the hereditary chiefs. In 1875 Col. Steinberger, from the United States, established himself as (virtually) dictator of the Navigators' islands; but was removed by the commander of a British war-vessel in 1876. Trade is carried on with Sydney.

NAVY, BRITISH. Owing to the insular position of Great Britain her navy has long been considered a matter of vital importance, and is the service in which every inhabitant takes a peculiar pride. In considering the history of the British navy it is convenient to divide the subject into matériel and personnel. The latter had no distinct organization till the time of Henry VIII.; but of the former, we recognize in the earliest times the germ of subsequent glories. Carausius, a Roman general, who had thrown off his dependence on the empire, maintained himself in England for several years by his fleet, with which he prevented the imperial forces from reaching the island. The Saxons brought maritime prowess with them to the British shores, but appear soon to have lost it amid the rich provinces in which they settled. Some organization for the defense of the coast was, however, maintained; and Alfred the great availed himself of it to repulse the Danes: he at the same time raised the efficiency of his navy by increasing the size of his galleys, some being built which were capable of rowing as well as of rowing. Under his successors the number of vessels increased, and both Edward and Athelstan fought many naval battles with the Danes. Edgar aspired to be lord of all the northern seas, and had from three to five thousand galleys, divided into three fleets on the western, southern, and eastern coasts respectively; but the size of most of these ships was very insignificant, and the greater part were probably mere row-boats. Ethelred II. formed a sort of naval militia, enabling that every owner of 310 hides of land should build and furnish one vessel for the service of his country.

William the conqueror established the Cinque ports, with important privileges, in return for which they were bound to have at the service of the crown for 15 days in any emergency 52 ships carrying 24 men each. Richard I. took 100 large ships and 50 galleys to Palestine. John claimed the sovereignty of the seas, and required all foreigners to strike to the English flag; a pretension which brought on some bloody battles, but which England proudly upheld in all dangers. (This honor was formally yielded by the Dutch in 1673, and the French in 1704; and, although not now exacted in its fullness, the remembrance of the right survives in requiring foreign vessels to salute first.) In the same king's reign a great naval engagement with the French took place (1293) in mid-channel, when 250 French vessels were captured. The Edwards and the Henries maintained the glory of the British flag; Edward III., in person, with the Black Prince, at the battle of Sluys, in 1340, defeated a greatly superior French fleet, with 40,000 men on board. Henry V. had "grete shippes, carrakes, barges, and ballyngers;" and at one time collected vessels enough to transport 25,000 men into Normandy. Henry VII. was the first monarch who maintained a fleet during peace; he built the Great Harry, which was the earliest war-vessel of any size, and which was burned at Woolwich in 1555.

To Henry VIII., however, belongs the honor of having laid the foundation of the British navy as a distinct service. Besides building several large vessels, of which the Henry Grace de Dieu, of 72 guns, 500 men, and probably about 1000 tons, was the most considerable, he constructed a permanent personnel, defining the pay of admirals, vice-admirals, captains, and seamen. He also established royal dockyards at Deptford, Woolwich, and Portsmouth; and for the government of the whole service instituted an admiralty and navy-board, the latter being the forerunner of the present Trinity board. When this king died he left 50 ships of various sizes manned by about 8,000 hands.

Under Edward VI. the navy fell off, but was sufficiently important in the succeeding reign for the English admiral to exact the salute to his flag from Philip II. with a larger Spanish fleet when the latter was on his way to espouse queen Mary. Elizabeth had the struggle with the Spanish armada to try her navy, and left 42 ships, of 17,000 tons in all, and 8,346 men—15 of her ships being upwards of 600 tons. From this period the tonnage of the ships steadily increased. Under James I. and Charles I. Mr. Phineas Pett, m.a., the first scientific naval architect, remodeled the navy, abolishing the lofty forecastles and poops, which had made earlier ships resemble Chinese junks. In 1610 he laid down the Prince Royal, a two-decker, carrying 64 large guns; and in 1637 from Woolwich he launched the celebrated Sovereign of the Seas, the first three-decker, and certainly the largest ship hitherto constructed on modern principles. She was 232 feet in length, of 1637 tons, and carried at first 130 pieces of cannon; but being found unwieldy, was cut down, and then proved an excellent ship. She was burned in 1656.

Prince Rupert's devotion to the crown was bad for the navy, for he carried off 25 large ships; and Cromwell, on acceding to power, had but 14 two-deckers. His energy, however, soon wrought a change, and in five years he had 150 ships, of which a third were of the line; his crews amounted to 20,000 men. During the protectorate, Peter
Naxos.
Neagle.

Pett, son of Phineas, built the Constant Warwick, the earliest British frigate, from a French design and pattern. Cromwell first laid navy estimates before parliament, and obtained £400,000 a year for the service. The duke of York, afterwards James II., assisted by the indefatigable Mr. Samuel Pepys, did much for the navy, establishing the system of Admiralty government much on its present footing. In his time, sir Anthony Neagle improved the model of ships of war, again after a French design. James left, in 1683, 108 ships of the line, and 53 other vessels; the total tonnage of the navy, 101,892 tons; the armament, 5,630 guns; and the personnel, 22,000 men. William III., sedulously augmented the force, foreseeing its importance to his adopted country. When he died, there were 272 ships of 150,020 tons, when the annual charge for the navy had risen to £1,956,915. George II. paid much attention to his fleets, and greatly augmented the size of the ships; he left, in 1760, 412 ships of 321,104 tons. By 1782 the navy had risen to 617 sail of 500,000 tons; and by 1802 to 700 sail, of which 148 were of the line. In 1813 there were 1000 ships (256 of the line), measuring about 500,000 tons, and carrying 146,000 seamen and marines, at an annual charge of about £18,000,000. Since the peace in 1815 the number of vessels has been greatly diminished, although their power has vastly increased.

The progressive augmentation of size in vessels may be judged from the increase in first-rates. In 1667 the largest vessel was from 1500 to 1600 tons; by 1720, 1800 had been reached; by 1745, 2,000 tons; 1780, 2,200 tons; 1795, 2,350 tons; 1800, 2,500 tons; 1805, 2,616 tons; 1853, 4,000 tons. From 1841 a gradual substitution of steam for sailing vessels began, which was not completed, however, till 1859. Since 1860 another reconstruction has taken effect, armored-plated frigates, impervious to ordinary shot, armed either as broadside vessels or in turrets, being substituted for timber vessels. At the same time three and two deckers have ceased to be employed, enormous frigates and turret-ships replacing them of a tonnage far exceeding the largest three-deckers of former times; they mount fewer guns, but those they carry are of stupendous caliber, and are still rifled here. The Northumberland, one of the largest frigates of this new class, is of 6,621 tons, 1350 horse-power, and 38 large guns, while the Boucanier carries 4 great guns in turrets of the most massive armor. The Indefatigable (turret-ship) carries four 81-tion guns, and is supposed to be the most powerful war-ship in the world.

On April 1, 1874, the effective vessels of the navy were as follows: 33 armor-plated frigates (3 building); 14 turret vessels (3 building), 8 armored-plated corvettes, and 2 sloops; 3 floating-batteries; 3 armored gunboats; 37 ships of the line (10 without steam); 43 frigates (7 without steam); 42 corvettes (7 building, 5 without steam); 40 sloops (3 building, 4 without steam); 43 gun-vessels; 69 smaller steamers (10 building); 71 gunboats; with 17 transports, 6 yachts, and 5 schooners; giving a total of 424 vessels. At the end of 1877 there were in all 249 ships in commission, exclusive of Indian troop-ships. The personnel of the navy amounted in 1877 to 60,000 men including 14,000 marines, but excluding artillerymen and laborers in dockyards; the armament being about 5,000 guns, mostly of heavy caliber. The annual charge for 1874-75 was estimated at £10,179,485, which may be thus broadly subdivided (in 1878-79 it was £11,653,991):

Information on the various points of detail connected with the navy, will be found under the respective heads, as Admiral, Captain, Half-Pay, Ship-Building, Signals, etc.

NAXOS, the largest, most beautiful, and most fertile of the Cyclades, is situated in the Ægean, midway between the coasts of Greece and Asia Minor. Extreme length, about 15 miles; breadth, about 15.000 feet. Shore about 12,000. The shores are steep, and the island is traversed by a ridge of mountains, which rise in the highest summit, Dia, upwards of 3,000 feet. The plains and valleys are well watered; the principal products and articles of export are wine, corn, oil, cotton, fruits, and emery. The wine of Naxos (the best variety of which is still called in the islands of the Ægean, Eukynthwvino) was famous in ancient as it is in modern times, and on this account the island was celebrated in the legend of Dionysius, and especially in those relating to Ariadne. Among its antiquities are a curious Heleneic tower, and an unfinished colossal figure, 34 ft. long, still lying in an ancient marble quarry in the north of the island, and always called by the natives a figure of Apollo. It was ravaged by the Persians, 490 b.c., and after the conquest of Constantinople by the Latins, became the seat of a dukedom, founded by the Venetians. It now forms a portion of the kingdom of Greece (q.v.). Naxos, the capital, with a popu-
lation of about 5,000, is situated on the n.w. coast, contains 16 Greek and 4 Catholic churches, and 3 convents, and is the seat of a Greek and a Latin Bishop.

NAYLOR, JAMES, about 1616-60; b. in Yorkshire, England, of humble parentage. In 1641 he became an adherent of the parliament, and served for about 8 years under Fairfax and Lambert, rising to the rank of quartermaster. The fanatical religious movements of the time seem to have completely overthrown his judgment; he was first a Presbyterian, then an Independent, and in 1651 was led by George Fox to become a Quaker. His ignorant exhortations and frenzied ravings soon caused the main body of Quakers to disown him, but he found a few deluded people who regarded him as an inspired prophet, and followed him from place to place. He suffered and perhaps encouraged these disciples to regard him as a forerunner of Christ, and when he was released from imprisonment at Exeter in 1656, they spread their garments in his path in imitation of the Savior's entrance into Jerusalem. Naylor was at once arrested on charges of blasphemy, tried before parliament, and sentenced to stand in the pillory for two hours, to be whipped at the cart's-tail from Palace-yard to the exchange, the letter B to be branded on his forehead, and his tongue to be bored by a red-hot iron. After this he was to be taken to Bristol, whipped through that town, and then to be imprisoned for two years. The whole punishment was inflicted. Naylor recanted his errors, and was again received by the society of Quakers. A collection of his writings was published in 1716, and his Memoirs in 1719 and reprinted in 1830.

NAZAREANS. See Christians of St. John.

NAZARENE (Gr. Nazarenos and Nazarinos, an "inhabitant of Nazareth"), was used by the Jews as one of the designations of our Lord, and afterward became a common appellation of the early Christians in Judaea. Although, originally, it is but a local appellation, there can be no doubt that as Nazareth was but a second-rate city of the despised province of Galilee, it was eventually applied to our Lord and his followers as a name of contempt (John xviii. 5, 7; Acts xxiv. 5). For the Judaizing sect called Nazarenes, see ERONITES.

NAZARETH, a small t. or v. of Palestine, anciently in the district of Galilee, and in the territory of the tribe of Zebulun, 21 m. s.e. of Acre. It lies in a hilly tract of country, and is built partly on the sides of some rocky ridges, partly in some of the ravines by which they are seamed. It is celebrated as the scene of the Annunciation, and the place where the Savior spent the greater part of his life in obscure labor. Pop., according to Dr. Robinson, 3,130, of whom 1040 are Greeks, 520 Greek Catholics, 480 Latin, 400 Maronites, and 600 Mohammedans. Porter thinks 4,000 a moderate estimate. In the earliest ages of Christianity, Nazareth was quite overlooked by the church. It did not contain a single Christian resident before the time of Constantine, and the first Christian pilgrimage to it took place in the 6th century. The principal building is the Latin convent, reared, according to pious tradition, on the spot where the angel announced to the Virgin the birth of her Savior; but the Greeks have also erected, in another part of Nazareth, a church named in honor of the Virgin. Beside these rival edifices the traveler is shown a Latin chapel, affirmed to be built over the "workshop of Joseph," also the chapel of "the Table of Christ" (Mensa Christi), a vaulted chamber containing the veritable table at which our Lord and his disciples used to eat; the synagogue out of which he was thrust by his townsman; and "the Mount of Precipitation," down which he narrowly escaped being cast headlong. The women of the village have been long famous for their beauty.

NAZARITES (from Heb. nazar, to separate), denoted among the Jews those persons, male or female, who had consecrated themselves to God by certain acts of abstinence, which marked them off, or "separated them," from the rest of the community. In particular, they were prohibited from using wine or strong drink of any kind, grapes, whether moist or dry, or from shaving their heads. The law in regard to Nazarites is laid down in the book of Numbers (vi. 1-21). The only examples of the class recorded in Scripture are Samson, Samuel, and John the Baptist, who were devoted from birth to that condition, though the law appears to contemplate temporary and voluntary, rather than perpetual Nazaritishship.

NEA, Lough, the largest lake of the British islands, is situated in the province of Ulster, Ireland, and is surrounded by the counties of Armagh, Tyrone, Londonderry, Antrim, and Down. It is 16 m. (English) in length, and 11 m. in breadth, contains 98,255 acres, is 130 ft. in greatest depth, and is 48 ft. above sea level at low water. It receives the waters of numerous streams, of which the principal are the Upper Bann, the Blackwater, the Moyola, and the Main; and its surplus waters are carried off northward to the north channel by the Lower Bann. Communication by means of canals subsists between the lough and Belfast, Newry, and the Tyrone coal-field. In some portions of the lough the waters show remarkable petrifying qualities, and petrified wood found in its waters is manufactured into houses. The southern shores of the lough are low and marshy, and dreary in appearance. It is well stocked with fish, and its shores are frequented by the swan, heron, bittern, teal, and other water-fowl.

NEAGLE, John, 1799-1865; b. Mass.; began the study of painting as a coachmaker's apprentice, residing in Philadelphia, and at the age of 19 took his first sketches from
life. In 1829 he married the daughter of the painter, Thomas Sully. In 1828 his picture "Patrick Lyon, the Blacksmith" brought him some distinction. He painted the portraits, among other celebrities, of Washington, now in Independence Hall, Philadelphia; Gilbert Stuart, Mrs. Wood as Amina, Mathew Carey, Henry Clay, Dr. Chapman, and commodore Barron.

NEAL, ALICE BRADLEY. See HAVEN.

NEAL, DANIEL, a dissenting minister and author, was b. in London, Dec. 14, 1678. He was educated first at Merchant Taylor's school, and afterwards at Utrecht and Leyden, in Holland, and in 1706 succeeded Dr. Singleton as pastor of a congregation in his native city. Neal's first work was a History of New England (1720), which met with a very honorable reception in America. Two years afterwards he published a tract entitled A Narrative of the Method and Success of Inoculating the Small-pox in New England by Mr. Benjamin Colman, which excited considerable attention; but the production on which his reputation rests is his History of the Puritans (4 vols. 1732-38), a work of great labor, and invaluable as a collection of facts and characteristics both to churchmen and dissenters, though, of course, written in the interest of the latter. It involved its author in several controversies, which failing health rendered it impossible for him to prosecute. Neal died at Bath, April 4, 1743.

NEAL, JOHN, an American author and poet, of Scottish descent, was b. at Falmouth, now Portland, Maine, Aug. 25, 1793. His parents belonged to the society of Friends, of which he was a member until disowned, at the age of 25, because he failed to live up to the rule of "living peaceably with all men." With the scanty education of a New England common school, he became a shop-boy at the age of 12; but learned and then taught penmanship and drawing. At the age of 21 he entered a haberdashery trade, first in Boston and then in New York; and a year after became a wholesale jobber in this business at Baltimore, in partnership with another American literary and pulpit celebrity, John Pierpoint. They failed in 1816, and Neal turned his attention to the study of law. With the energy which acquired for him the sobriquet of "Jehu O'Caract," alluded to his poem The Battle of Niagara, he went through the usual seven years' law-course in one, besides studying several languages, and writing for a subsistence. In 1817 he published Keep Cool, a novel; the next year a volume of poems; in 1819 Otho, a five-act tragedy; and in 1823 four novels—Twenty-six, Logan, Randolph, and Errata. These impetuous works were each written in from 27 to 39 days. In 1824 he came to England, where he became a contributor to Blackwood's and other magazines and reviews, and enjoyed the friendship and hospitality of Jeremy Bentham. On his return to America he settled in his native town, practiced law, wrote, edited newspapers, gave lectures, and occupied his leisure hours in teaching boxing, fencing, and gymnastics. Among his numerous works are Brother Jonathan; Bicchel Dyer; Bentham's Morals and Legislation; Authorship; Down-casters, etc. After a long silence, devoted to professional business, he published, in 1854, One Word More, and in 1859, True Womanhood. The latter work, though a novel, embodies the more serious religious convictions of his later years. In 1857 appeared his Wandering Recollections of a Somewhat Busy Life. Neal's voluminous writings, with all their glaring faults of taste and incompetence, are full of genius, fire, and nationality.

NEAL, JOSEPH CLAY, 1807-48; b. N. H. He settled in Philadelphia, where in 1851 he became editor of The Pennsylvanian, a democratic journal. In 1844 he founded the Saturday Gazette, which had a large circulation. His best-known book, Charcoal Sketches; or, Scenes in a Metropolis, enjoyed a considerable degree of popularity and was republished in London. He wrote also Peter Piddly and Other Oddities, and a second series of Charcoal Sketches.

NEALE, JOHN MASON, 1818-66; b. London. After graduating from Trinity college, Cambridge, he took orders in the Church of England. In 1846 he became incumbent of Crawley and warden of Sackville college, East Grinstead. On nine occasions between 1843 and 1861 he gained the Seatonian prize for an English sacred poem. His published writings on theological and ecclesiastical subjects amounted to no less than seventy volumes, of which the best known are: The History of the Holy Eastern Church; the Patriarchate of Alexandria; Methodist Premises; History of the so-called Jesuit Church of Holland; Essays on Liturgy and Church History; Medieval Hymns from the Latin, and Hymns of the Eastern Church. He issued, also, a revised edition of Bunyan's Pilgrim's Progress for the use of children, which, on account of his notes, was the cause of considerable controversy. He was distinguished as a champion of the ritualistic party in the English church, and as the founder of the Anglican sisterhood of St. Margaret, East Grinstead.

NEALE, ROLLIN HEIER, D.D., 1808-79; b. Conn.; educated at Columbian college, and in 1838 called to the pastorate of the First Baptist church in Boston, of which he was pastor for over 50 years. He published The Incarnation; The Burning Bush; Religious Liberty, and Holding forth the Word of Life.

NEANDER, JOHANN AUGUST WILHELM, by far the greatest of ecclesiastical historians, was born at Göttingen, Jan. 16, 1789, of Jewish parentage. His name prior to baptism was David Mendel. By the mother's side, he was related to the eminent phil-
osopher and philanthropist Mendelssohn (q.v.). He received his early education at the Johanneum in Hamburg, and had for companions, Varnhagen von Ense, Chamisso the poet, Wilhelm Neumann, Noeld, and Sieveking. Already the abstract, lofty, and pure genius of Neander was beginning to show itself. Photo and Plutarch were his favorite classics as a boy; and he was profoundly stirred by Schleiermacher's famous Discourses on Religion (1799). Finally, in 1806, he publicly denounced Judaism, and was baptized, adopting, in allusion to the religious change which he had experienced, the name of Neander (Gr. λεχος, new; ανερ, a man), and taking his Christian names from several of his friends. His sisters and brothers, and later his mother also, followed his example. He now proceeded to Halle, where he studied theology with wonderful ardor and success under Schleiermacher, and concluded his academic course at his native town of Göttingen, where Planck was then in the zenith of his reputation as a church historian. In 1811 he took up his residence at Heidelberg university as a privat-dozent; in 1812 he was appointed there extraordinary professor of theology; and in the following year was called to the newly established university of Berlin as professor of church history. Here he labored till his death, July 14, 1850. Neander enjoyed immense celebrity as a lecturer. Students flocked to him not only from all parts of Germany, but from the most distant Protestant countries. Many Roman Catholics, even, were among his auditors, and it is said that there is hardly a great preacher in Germany who is not more or less penetrated with his ideas. His character, religiously considered, is of so noble a Christian type that it calls for special notice. Ardent and profoundly devotional, sympathetic, glad-hearted, profusely benevolent, and without a shadow of selfishness resting on his soul, he inspired universal reverence, and was himself, by the mild and attractive sanctity of his life, a more powerful argument on behalf of Christianity than even his writings themselves. Perhaps no professor was ever so much loved by his students as Neander. He used to give the poorer ones tickets to his lectures, and to supply them with clothes and money. The greater portion of what he made by his books, he bestowed upon missionary, Bible, and other societies, and upon hospitals. As a Christian scholar and thinker, he ranks among the first names in modern times, and is believed to have contributed more than any other single individual to the overthrow, on the one side, of that anti-historical rationalism, and on the other of that dead Lutheran formalism, from both of which the religious life of Germany had so long suffered. To the delineation of the development of historical Christianity, he brings one of the broadest, one of the most sagacious (in regard to religious matters), one of the most impartial yet generous and sympathetic intellects. His conception of church history, as the record added 1839: Impressions of Christian thought and life, and the history of the great events of the religious life of the world are the means of his sympathy with all of these, and his extraordinary erudition, he elicits, in his Kirchengeschichte, the varied phenomena of a strictly Christian nature, have placed him far above any of his predecessors. Neander's works, in the order of time, are: Uber den Kaiser Julianus und seinen Zeitzeiter (Leip. 1812); Der Heil. Bernhard, und sein Zeitzeiter (Berl. 1813); Genetische Entwickelung der vorromischen Gotischen Systeme (Berl. 1818); Der Heil. Cryasostomus und die Kirche des Ostens, in dessen Zeitzeiter (2 vols. Berl. 1821-22; 3d ed. 1849); Denkwürdigkeiten aus der Geschichte des Christenthums und des Christlichen Lebens (3 vols. Berl. 1822; 3d ed. 1845-46); Antiquostia, Geist des Tertulianus und Einleitung in dessen Schriften (Berl. 1826); Allgemeine Geschichte der Christlichen Religion und Kirche (6 vols. Hamb. 1825-53); Geschichte der Pflanzung und Lehre der Kirche durch die Apostel (2 vols. Hamb. 1832-53; 4th ed. 1847); Das Leben Jesu Geschichtlich nach seinem geschichtlichen Zusammenhang (in 3 vols. 1837; 5th ed. 1853); Historische Abhandlungen, published by Jacob (Berl. 1851); Geschichte der Christlichen Dogme, also published by Jacob (1856). The majority of these works, including the most important, have been translated into English, and form more than a dozen volumes of Bohn's "Standard Library."
iron and tin plates, and fine bricks are extensively exported, stones are quarried, and coal and culm are raised. The trade of the port has largely increased within late years. Pop. 71, 10,690.

NEB-NEB, or Neb-ner, the dried pods of Acacia Nilotica, one of the species of Acacia (q.v.) which yield gum-arabic, and a native of Africa. These pods are much used in Egypt for tanning, and have been imported into Britain.

NEBO, the name of a well-known deity of the Babylonians and Assyrians. He presided over learning and letters. He is called the "far-hearing," "he who possesses intelligence," "he who teaches or instructs." He generally has the distinguished titles of "Lord of lords," "Holder of the scepter of power," etc. Hence Layard thinks the name is derived from the Egyptian Neb, Lord. The wedge or arrow-head—the essential element of cuneiform writing—was his emblem. His character corresponds with that of the Egyptian Thoth, the Greek Hermes, and the Latin Mercury. A statue of Nebo was set up by Pul, the Assyrian monarch, at Calah (Nimrud), which is now in the British museum. Nebo early held a prominent place in Babylonia, and from a remote age a great temple was dedicated to him at Borsippa, the modern Birs Nimrud, and that ancient town was especially under his protection. He was the tutelar god of the most distinguished Babylonian kings, of whose names the word Nebo or Nabo forms a part, as Nebuchadnezzar, Nebuzaradan, and some mentioned in classical writers, as Nebuchadnezzar. Astronomically, Nebo is identified with the planet nearest the sun. Nebuchadnezzar rebuilt his temple at Borsippa, where his worship was continued to the 3d or 4th c. after Christ.

NEBRASKA, or Platte, a river of Nebraska, rises in the Rocky mountains, lat. 42° 30' n., long. 109° w., and flowing easterly 600 m. through the entire territory, watering its great valley, falls into the Missouri.

NEBRASKA, one of the United States of America, lying in lat. 40° to 43° n., and long. 95° to 105° w.; bounded on the w. by Wyoming, and n. by Dakota, being partly separated from the latter by the Missouri river and its branch the Niobrara; e. by Iowa and Missouri, from which it is separated by the Missouri river; s. by Kansas and Colorado. This state is about 425 m. from east to west, and from 138 to 208 from north to south, and has an area estimated at 75,995 sq. miles. Originally, when this state was a territory, it extended from the Missouri river to the Rocky mountains, and from lat. 40° to the boundary of what was, at the time, British America. The chief towns are Omaha city, the starting point of the Union Pacific railway, Nebraska City, and Lincoln, the capital. Nebraska is a vast plain rising gradually towards the Rocky mountains, with immense prairies, the haunts of vast herds of buffalo, and with fertile and well-timbered river-bottoms. The chief rivers are the Missouri on its eastern, and the Niobrara, partly on the northern boundary, the Platte or Nebraska, and the Republican fork of the Kansas, and their branches. The Platte valley, running through the whole center of the territory, is broad and fertile. There are quarries of sandstone, a soft limestone which hardens on exposure, and a thin tuff of coal. In the mountainous western region are mines of gold, silver, copper, and cinnaabar. Between the fertile lands of the eastern and central portion and the mountains is a great desert valley of 30 by 90 m., 300 ft. deep, full of rocky pinnacles, and rich in fossil remains. The climate is dry and salubrious, with an abundance of clear sunny days. The country produces wheat, maize, hemp, tobacco, and fruits in abundance, while the rolling prairies afford unequaled pasturage. The Omahas, Pawnees, Otoes, Sioux, and other wild tribes hunt over the unoccupied territories, but the immigration is progressing rapidly. Erected as a territory in 1854, it had, in 1860, a population, exclusive of Indians, of 28,836; and in 1870, with the same exclusion, it was 122,117. Nebraska became a state in 1867. See Nebraska, by Edwin A. Curley (Lond. 1875).

NEBRASKA (ante), was originally a portion of the Louisiana territory ceded to the United States by France in 1803, and it formed successively a part of the Louisiana and Missouri territories until 1854. During the winter of that year Stephen A. Douglas succeeded, amid much political excitement, in having congress pass what was widely known as his Kansas-Nebraska bill, which resulted in the establishment of Nebraska as a territory. It included a part of Dakota and Montana, Wyoming, and the e. portion of Colorado at that time; but in 1861 and 1863 it was reduced to its present limits. Up to the summer of 1854 it had had no civilized residents except the soldiers sent to keep the Indian tribes in order, the missionaries, and the fur traders; and until the construction of the Pacific railroad the population increased very slowly. The principal growth has been since its admission to the union as a state, and during the past ten years it increased at a rapid rate. The pop. in '80, was 452,432—355,042 of American birth; 2,627 colored. Nebraska has also within the past few years begun to take a prominent place as an agricultural and stock-raising state. The soil in the eastern part of the state is deep and fertile, and the whole region s. of the Platte river and e. of the 99th meridian is a rich black vegetable mold from two to ten ft. deep, slightly impregnated with lime, free from stones or gravel, and easily plowed to any depth required. The agricultural region embraces about 30,000 sq. m., extending 150 m. w. of the Missouri, and in the valley of the Platte 500 miles. Wheat, corn, barley, oats, sorghum, flax, hemp, and all
vegetables may be raised; and below lat. 42° the common small fruits grow in abundance. The grazing regions consist of about 23,000,000 acres, and is generally well watered. The wild grasses, of which 150 species have been classified, yield on the bottom and table lands from 1½ to 3 tons an acre and are very nutritious. Large numbers of cattle are brought from Texas and Kansas to be fattened on the grasses of Nebraska preparatory to sale; and the cattle drives which pass through the state are a growing source of material prosperity. The drive of 1879 from Texas and the southern ranges is reckoned at 250,000 head, and that from Montana and Oregon at 100,000. Formerly Kansas was the northern limit of the drive; but the great rendezvous of cattle drovers, which used to be at Abilene on the Kansas Pacific road, is now to be found at Ogallala on the Union Pacific road in Nebraska, which point it is believed, will soon become the greatest stock thoroughfare on the continent. Up to June, 1879, 29,651,200 acres had been surveyed, and the number of acres of improved farm land in 1870 was nearly 700,000; number of farms, 12,301, of which 787 contained less than 10 acres each, 1,541 from 10 to 20, 5,096 from 20 to 50, 3,379, from 50 to 100, 1,487 from 100 to 500, and 11 from 500 to 1000. Their cash value was estimated to be $30,242,150; and the value of the farming implements and machinery to be $1,549,716. The estimated value of all farm productions was $89,601,742. Chief among these productions were: spring wheat, 2,109,701 bush.; winter wheat, 15,755 bush.; rye, 13,532; Indian corn, 4,739,710; oats, 1,477,562; barley, 216,481; buckwheat, 3,471; peas and beans, 3,353; Irish potatos, 759,981; sweet potatos, 702; grass seed, 153; flax seed, 404; tobacco, 5,958 lbs.; wool, 14,635; butter, 1,539,563; cheese, 46,142; hogs, 100,000, honey, 29,147; sorghum, 77,593 bushels; wheat, 1,897,405 bushels; there were 20,511 horses; 2,632 mules and asses; 29,930 milch cows; 5,931 working oxen; 45,057 other cattle; 22,725 sheep; and 59,449 swine. The greatest obstacle that the farmers have to contend against, is the visitations of grasshoppers or locusts, and Nebraska seems to be more subject to devastations of this kind than most of the other western states. Active measures, however, have been taken to exterminate these insects, the legislature in 1879 having authorized road supervisors throughout the state to order out all voters in their respective precincts to do twelve days' work each in killing grasshoppers, for which each person will be paid $2 a day in county warrants. The climate is mild and dry, but drought rarely damages the crops, for the soil is such that it withstands extremes and prolonged heat. The mean temperature during the winter months ranges from 22° to 30°; that of the spring from 47° to 49°; of the summer from 70° to 72°, and of the autumn from 49° to 51°. The heat of the summer is tempered by the prairie winds, and the nights are usually cool. The greatest amount of rain falls in May and June. A weather-record, kept from 1863 to '69 at Nebraska City, gives the mean annual rainfall as 30.36 in., of which 20.87 in. fell between the first of April and the first of October, and only 9.49 in. between these dates reversed.

Metals and minerals have not yet been found to any extent in Nebraska. Coal has been discovered here and there, ranging in layers from 5 to 22 in., but it has not so far yielded sufficient quantities for the home demand. Prof. Hayden believes that this deposit is the western margin of the great coal-basin of Missouri and Iowa, and that the coal is so much thinned out by pressure from above that it will not prove profitable to mine to any extent. Building-limestone has also been discovered, and is in daily use for the erection of dwellings, together with a dark, yellowish, gray sand-tone, and a dark freestone. Clay, for the manufacture of brick, is easily obtained, and in the central and western parts of the state there are extensive and valuable deposits of such clays as will make bricks of the purest and best kind. Gravel, slate, and sandstone are also found in the state, which is declared to be the purest and best in the world. Smelting works have been in successful operation at Omaha since 1871, and in the year 1873 they turned out in fine silver and gold about $1,100,000, and during the following year they refined and separated 7,000 tons of base bullion, and smelted 2,000 tons of ore. The value of the gold and silver produced was $1,350,000; the quantity of lead shipped 6,500 tons, valued at $800,000, making a total of the value of products of this establishment $2,150,000. Though the manufacturing industry of the state is in its infancy, there are already car-works, foundries, distilleries, gas-works, breweries, flouring mills, broad factories, pork packers, soap-works, pickle factories, carriage, wagon, and implement factories in prosperous existence. Altogether there were, in 1870, 570 manufacturing establishments, employing 2,063 operatives and $2,109,963 capital, using $2,902,074 of raw material, and producing annually goods valued at $3,758,513. For the year 1875 this amount is reported to have been about three times larger, and nearly every industry since has continued to give promise of much prosperity. Nebraska necessarily has only a domestic commerce. Except that portion of the state's productions and manufactures that are shipped on the Missouri river, all are transported over the railroads. The actual amount of this trade has never yet been accurately estimated, but in 1874 more than 1,500,000 bushels of grain were sent to the market by a railroad, from which an idea at least may be formed of the magnitude of the state's relations to the general commerce of the country. In 1874 there were 10 national banks in operation in the state, with a paid-in capital of $1,025,000 and an outstanding circulation of $865,000; 7 state banks, with an aggregate capital of $857,000; 1 savings bank; and 23 private banking-houses. The number of railroads in operation was 10, with 1120 m. of track. These were the Atchison and Nebraska, the Brownville and Fort Kearney,
the Burlington and Missouri River, the Omaha and Southwestern, the Midland Pacific, the Omaha and Northwestern, the St. Joseph and Denver City, the Sionx City and Pacific, the Tremont, Elkhorn, and Missouri Valley, and the Union Pacific. The assessed value of these roads at that date was $11,183,114; and their cost and equipment, according to the reports of the various companies, was $53,737,833. The Union Pacific traverses the entire state from e. to w.; the Burlington and Missouri has direct through-connection between Kearney, the capital Nebraska, and Chicago; the Midland Pacific places the eastern part of the state in communication with St. Louis; and the St. Joseph and Denver in the s., the Omaha and Northwestern in the n., together with connecting roads to the eastward and elsewhere, afford Nebraska excellent facilities for moving her produce and for carriage traffic generally.

In 1878 the state had no indebtedness except $50,000, in 10 per cent 10-year bonds, issued for the relief of grasshopper sufferers in 1875, and $549,267.35 in $8 cent fund bonds, issued April, 1877, providing for the outstanding warrants and other indebtedness, making a total of $599,367.35. The assessed value of all taxable property during the year 1879 was $74,389,533.97, an increase of $3,677,957.07 over the previous year. The rate of taxation was 6.57 mills on each dollar, and the amount collected for the fiscal period of two years was as follows: General fund, $517,977.82; sinking fund, $120,240.38; common school fund, $145,333.27; university fund, $80,314.29. The disbursements for all purposes during the same period were $1,772,209.99, and there was a balance in the treasury in Nov., 1878, of $146,181.09. The total valuation of the state, as reported by the state board of equalization in 1874, was $81,218,813. The lands held by private owners and subject to taxation amounted to 11,000,579 acres, the assessed value being $43,044,800; town lots, $9,941,809; money used in merchandise, $2,448,235; in manufactures, $552,410; stocks and shares, $979,455; money and credits, $1,578,329; household furniture, $343,762. The horses, cattle, and other live-stock were valued at $77,081,044. The railroad property was valued at $111,183,114; and the telegraph, of which the Western Union company owned 737 m., and the Great Western company 126 m., at $61,553. The property of corporations is taxed in the same manner as that of individuals.

Religious interests of the state have been for many years watchfully managed. The school lands donated by the government comprise about 2,700,000 acres for schools in general, and 400,000 acres for the erection and maintenance of a state university at Lincoln. Out of the sale and lease of these lands and a general tax of two mills, together with the money received from fines, licenses, and a dog tax, the schools are supported, the apportionment being made by a state superintendent among the counties according to the number of children between the ages of 5 and 20 years. In 1874 there were 2,215 school districts, containing 73,991 children, of whom 47,718 attended school. The total number of school buildings was 1516, of which 1345 were stone, brick, or frame, and 171 log, sod, or dug-outs. Their value was estimated at about $1,546,480. The number of male teachers employed was 1252; of female, 1483. The average monthly wages of the first was $57.98; of the second, $92.12. The total receipts for school purposes from all sources were $988,740.20; and the total expenditures, $1,604,957.08. There are graded schools in 12 towns, and high schools in every town. At Peru there is also a state normal school, with 10 instructors, and an average attendance of about 200 pupils.

The university was opened in 1871, and comprises 6 departments: (1) a college of arts of the liberal sciences; (2) sciences; (3) law; (4) medicine; (5) practical science, mechanics, and civil engineering; (6) fine arts. The number of its professors in 1874 was 8, and the number of students in attendance was 114. Besides these institutions there are two colleges under denominational control, Nebraska college (Protestant Episcopal), at Nebraska City, and Doane college (Congregational), at Crete. The former was chartered in 1868, has 10 professors, and grounds and buildings valued at $23,000; the latter was organized in 1873, has 4 professors, and ground and buildings worth $50,000. Of the libraries throughout the state, the census of 1870 reported 390, containing 147,040 volumes, of which 219, with about 95,000 volumes, were private, and 171, with 51,955 volumes, were public. The number of newspapers and periodicals published in 1880 was about 77. Of these there were daily, 62 weekly, 1 semi-monthly, and 4 monthly. The total value of church property was $1,514; church buildings, 379; church property, $665,150. The leading denominations were Baptist, 90; Disciples, 15; Congregational, 65; Protestant Episcopal, 28; Evangelical Association, 10; Lutheran, 30; Methodist, 91; Presbyterian, 78; Roman Catholic, 18; Unitarian, 3; United Brethren in Christ, 84; Universalist, 1.

The constitution of Nebraska provides that every male person of the age of 21 years and upwards, who is a citizen of the United States or has declared his intention 30 days previous to an election to become a citizen, and who is neither insane, an idiot, nor an unpardoned felon, shall be entitled to vote, provided he has resided in the state six months. The executive department consists of a governor, lieutenant-governor, secretary of state, auditor of public accounts, treasurer, superintendent of public instruction, and commissioner of public lands and buildings, who are elected every two years. In 1880 the house of representatives consisted of 84 members, and the senate of 30. The judicial power is vested in a supreme court of three judges, elected for six years; six district courts, with one judge for each, elected for four years; and county courts, each presided over by one
judge, whose term of office is two years. Justice of the peace and police magistrates are appointed to try minor cases. Under the apportionment of 1872 the state is entitled to only one representative in Congress. Its electoral votes have been cast as follows: 1868, Grant and Colfax, 3; 1872, Grant and Wilson, 3; 1876, Hayes and Wheeler, 3; 1880, Garfield and Arthur, 3.

NEBRASKA CITY, the co-seat of Otoe co., Neb., on the w. bank of the Missouri river, 44 m. s. of Omaha, capital Nebraska railroad; pop. 70, 6,650. It has a courthouse, churchs, schools, banks, 2 daily and 3 weekly newspapers, the academy of the Annunciation, under Catholic control, and Nebraska college, under Episcopal control. There are flour mills, machine shops, foundries, etc.

NEBUCHADNEZ ZAR. See BABYLON.

NEBULE, a name given to indistinct patches of light in the heavens, supposed to proceed from aggregations of rarely-distributed matter belonging to distant worlds in the course of formation. By the gradual improvement of telescopes in power and distinctness, these nebule have, one after another, become resolved into clusters of distinct stars, and it is now generally supposed that such a resolution of all nebule which have been observed is only limited by the power of the telescope. It is probable that the group of stars with which our system is immediately surrounded, and which forms to our eyes the galaxy which stirs the firmament, would, if looked upon from the immeasurable distances at which the so-called nebule are situated, itself assume the appearance of such a nebula; and that in the intervals there exist spaces as void of starry worlds as these are comparatively full of them. See STARS. Some nebule are of a round form presenting a gradual condensation towards the center; others consist of one star surrounded by a nebulous haze; while a third class present just the same appearance as various nebulae seen from the red stellar system. These and other phenomena suggested to Laplace the idea, afterwards developed into a theory, and known as the nebular hypothesis, that these nebulae were systems in process of formation: the first stage presenting an agglomeration of nebulous matter of uniform density, which, in the second stage, showed a tendency to gradual condensation towards the center; and, finally, the nebulous matter round the now-formed center of the system, separated itself into distinct portions, each portion becoming condensed into a planet. The same opinion regarding the formation of planets from nebule was put forward by sir William Herschel in 1811; but the subsequent discoveries made by lord Rosse, were supposed to expose a fallacy in this theory. That wonderful instrument, the spectroscope, has, however, recently reinstated the nebular theory, by showing that among these appearances there are real nebule devoid of solid or liquid matter, and consisting of masses of glowing gas—apparently nitrogen and hydrogen.

NEBULE (n. 2). The earliest mention of nebule is that of the Arabian astronomer Sulî, who, in the 10th c. described the Magellanic clouds and the nebula in Andromeda. Ptolemy had made a catalogue of "cloudy stars," but the objects he mentioned are easily resolvable in modern telescopes. The most famous nebule ever visible to the naked eye, was the only one discovered before the invention of the telescope, although a few others are now known which are faintly visible. In 1655 Huyghens discovered the great nebula in the constellation Orion, publishing an account of it along with the discovery of the rings of Saturn in 1639. In 1714 Halley described six nebule. In 1755 La Caille sent a list of 42 nebule which he had discovered at the cape of Good Hope, to the academy of sciences at Paris. Messiers published a list in 1783 and 1784, containing an account of 103 nebule, the greatest number described by one observer before the observations of sir William Herschel, who, in 1781, with a five-foot reflector of his own construction began his investigation of the heavens, his first performance being the discovery of Uranus. By the use of this and other telescopes he was enabled in 1786 to communicate to the royal society a catalogue of 1000 new nebule and clusters; in 1787 a second catalogue of another 1000, and in 1820 a third, containing 300 more. Sir John Herschel, between 1825 and 1830 reviewed a portion of his father's work, adding a list of 500 nebule and clusters of his own discovery, making in all a list of 2,303 nebule and clusters in the northern hemisphere, which he sent to the royal society. In 1833 he took his instruments to the cape of Good Hope, the result of which was a catalogue of 1708 nebule and clusters in the southern heavens. The whole number of nebule and clusters now known is over 5,000. The most complete catalogue is that of sir John Herschel, published in 1864, which contains all that were accessible to him up to 1863. The number there recorded is 3,079. The nebule have presented a subject about which there has always been doubt, in regard to their position as well as constitution. After many of them had been resolved into starry clusters it was thought they were all galaxies similar to our own solar system, and sir William Herschel adopted this view in regard to certain nebule which he supposed were external to our stellar system, but afterwards in developing his nebular hypothesis, he found it difficult to distinguish between the external nebule and those which are generally thought to be parts of our own sidereal system. Proctor expresses the opinion "that our sidereal system extends far beyond the limits which have ordinarily been assigned to it, and that there are no nebule which can be regarded as external to it." Herschel concluded that there were nebule which are not resolvable into stars, and that they consisted of gaseous matter. The forms of nebule

are various, and they change in appearance with different powers of the telescope. The spiral nebulae, which were first made known by Lord Rosse are examples of this kind, their spiral form having previously not been suspected. Some planetary nebulae resemble planets, and when viewed with telescopes of high power present a complicated appearance. These have the appearance of a ring and are called annular nebulae; there is a beautiful example in the constellation Lyra in which a central mass is surrounded by a ring. Some are in pairs, like double stars. Small nebulae generally have the appearance of a bright nucleus surrounded by a veil; some of them are called stellar nebulae. Others are very irregular, and have long slinky arms. Those in Orion and Andromeda are examples, as also the great nebula in Argo which was carefully described by Sir John Herschel in his Cape observations. Those nebulae which are resolvable into stars give spectra which resemble the spectra of stars, while those which are obtained from the light of unresolvable nebulae give a spectrum of three, sometimes four, bright lines, one of which corresponds to a line in the spectrum of hydrogen, and another to a line in that of nitrogen. The planetary nebulae also give similar gaseous spectra. Of 70 nebulae examined by Huggins about one-third gave gaseous spectra. The nebular hypothesis in regard to the formation of the universe, although previously proposed by Swedenborg, Buffon, and Kant, was first systematized by Herschel and Laplace, and has been since modified. Laplace's earlier ideas were embraced in a consideration as to the manner of the formation of our solar system. He conceived that a mass of highly-heated vaporous matter occupied a space larger than the orbit of the farthest planet. In consequence of molecular and gravitating forces it acquired rotation, by which it threw off rings of matter which afterwards broke up into planets and their satellites. Herschel's theory caused a modification of Laplace's who adopted the idea that primordial nebulous matter still existed which was being formed into nebule and clusters. The general idea now entertained is that this primordial matter has accomplished the work of world formation by the action of gravity aided by molecular forces. It is assumed by some that on physical principles primordial matter widely distributed through space would pass through the following changes: Gravitation would cause the mass to contract, and become more dense; this would be followed by atomic repulsion, which acting against gravitation would produce heat. After a certain degree of condensation had taken place molecular combination would result, which would again cause a great evolution of heat; this would be followed by radiation and precipitation of binary atoms as flocculi floating in the rarer medium: these flocculi will tend to move toward a common center, but as the mass is irregular the motion will really be to one side of the center. This will result in a spiral movement. Mutual attraction will produce groups of flocculi, moving around local centers of gravity. There will be here and there detached portions which will not concole with the larger internal masses, but will slowly follow without overtaking them, thus accounting for the formation of comets. Many dynamic principles are involved in such motions and changes of matter which have received the attention of scientists, of which may be mentioned the investigation of molecular vortices by Rankine, and of vortex rings by Helmholtz and Thomson, and the preservation and disruption of revolving rings by Maxwell, Peirce, and Hind in memoirs on the rings of Saturn, that although grand and instructive views have been obtained of the regions of space, the brilliant investigations of science have as yet afforded no positive knowledge of its infinite depths, or of its genesis.

NEBULY, one of the partition lines in heraldry, which runs out and ia in a form sup posed to represent the uneven edges of clouds.

NECESSITY. This word occurs in connection with two different philosophical subjects, namely, the freedom of the will (see FRE-WILL), and the nature of our belief in fundamental truths, such as the axioms of mathematics. It is alleged by some philosophers that the truths held by us as most certain are the result of experience, and that the degree of certainty is but a measure of the universality of the experience. Others contend that such first principles as the axioms of mathematics are not only true, but necessarily true. Such necessity, it is argued, cannot come from more experience, and therefore must be independent of any infinite number of necessary truths; is only another name for the theory of instinctive or intuitive truth.

Necessity is a word too vague in its signification to serve as a leading term in philosophy. There are several meanings attaching to it which should be clearly set forth before entering on the discussion of such questions as those above mentioned.

1. Necessity, in the first place, means that one fact or statement is implied in another. Thus, if we say that all the apostles were Jews, it follows necessarily that Peter was a Jew; this is not a new fact, but merely a reassertion of a portion of the same fact. We are not at liberty to affirm a thing in one form, and then deny the same thing when expressed in a different form. If we say this room is hot, it is repeating the assertion in another way, to say that it is not cold. These truths follow by necessary inference. Hence the general axiom of the syllogism, that what is true of a whole class must be true of that part. To say a thing is true in this sense. In affirming such a truth, we merely declare that we shall be consistent, and that when we have affirmed a proposition in company with other propositions, we are prepared to affirm it when taken apart from the others. This kind of necessity is sometimes called logical necessity, and sometimes
mathematical necessity. We might call it deductive necessity, or necessity by implication.

2. A second meaning is inductive certainty; or the certainty that arises from a well-grounded experience. That lead will sink in water; that animals need food and air in order to live; that warmth promotes vegetation—are truths that we call necessary, in the sense of being so certain that we may always count upon them. We presume with the highest confidence, that an unsupported body will fall to the ground, not because the fact of falling is implied in the fact of matter, but because nature has uniformly conjoined the two facts. We can speak even of moral necessity, by which we mean only uniform sequence and consequent certainty. When we declare that children, whose education has been neglected, must fall into evil courses, we declare what experience has shown us will happen in relation to the human mind.

3. When necessity means inductive implication, nor inductive certainty, it refers us to a peculiar test supposed to apply to the truths in dispute—namely, the inconceivableness of their opposite. It is said that, not only can we not believe in the opposite of the axiom, that "the sums of equals are equal," but we cannot even conceive, imagine, or picture to ourselves the opposite of it. This impossibility of conceiving the contradiction of any statement, is regarded by many as a peculiarly cogent circumstance in its favor. It distinguishes the axiomatic first principles from the truths of inductive science, these having, it is said, an inferior order of certainty. To this it may be replied, however, that men's power of conceiving is so much affected by their education and habits, that many things, whose opposites were at one time inconceivable, have since been found to be false. For example, the notion that men could live at the antipodes was once reckoned inconceivable, and we now know it to be a fact. An unvarying association will often produce a disability to conceive anything different.

In commencing a discussion as to the necessary character of any truth, the disputants should agree beforehand which of the three meanings they intend. In the controversy on the mathematical axioms, maintained between Dr. Whewell on the one hand, and Sir John Herschel and Mr. J. S. Mill on the other, the third meaning is more particularly involved. The doctrine of inconceivability, as the test of truth, has been put forward by Mr. Herbert Spencer, under the title of the universal postulate (Principles of Psychology, Part I).

NECHES, a river of Texas, rises in the central eastern portion of the state, and flows s. by e., 200 m., into Sabine bay, where its waters, with those of the Sabine river, find their way, by Sabine pass, into the gulf of Mexico.

NECHO, PHARAOH NECHO, or NEKU, an Egyptian king, son and successor, according to Herodotus, of Psammeticus, and contemporary of Josiah king of Judah. Sacred and profane writers relate his successful wars in Syria. Soon after his accession to the throne he prepared large fleets on the Mediterranean and Red seas, and sent some expert Phenician sailors to explore the coasts of Africa. They are said to have circumnavigated Africa, by which its peninsular form was ascertained, more than 2,000 years before Vasco de Gama doubled the cape of Good Hope. He attempted also to reopen the canal connecting the Red sea with the Nile. To check the power of the Assyrians, he collected a large army at the beginning of his reign, B.C. 610, and entered Palestine with the view of besieging Carcenisih in the Euphrates. But Josiah resented his passage through his territory, and, though Necho sent messengers that invaded him by the plains of Megiddo, about 40 m. n. of Jerusalem, Josiah's forces were routed with great slaughter. He himself was wounded with an arrow, and his attendants, removing him from his chariot, conveyed him to Jerusalem, where he died. Necho proceeded on his march to the Euphrates. Three months after the capture of Carcenisih and the defeat of the Chaldeans, he learned that Jehoiakim, a younger son of Josiah, had usurped the throne of his father. Necho deposed him, condemned the land to a yearly tribute, and carried him prisoner to Jerusalem. He then sent Eliakim king, changing his name to Jehoiakim, took the silver and gold which had been levied from the Jewish nation, and returned to Egypt with Jehoiakim. Four years afterwards he again marched into Syria against the Babylonians, but Nebuchadnezzar completely routed his army, and, advancing through Palestine, took from Necho all the Egyptian possessions from the Euphrates to the southern extremity of Syria. Nebuchadnezzar deposed Jehoiakim, who had succeeded his father, and carried the warriors and treasures to Babylon. Necho died soon after, having reigned, according to Herodotus, 16 years. He was of the Sæte 36th dynasty, of which Manetho makes him either the fifth ruler of the sixth. Herodotus calls him Necho. He was succeeded by Psammeticus II.

NECKAR, one of the largest tributaries of the Rhine, and the principal river of Württemberg, rises near to the source of the Danube, on the eastern declivity of the Black forest, and close to the village of Schweningen. It has a winding course of 240 m., first n.e. to its junction with the Pils, then n. to its junction with the Jaxt, and finally n.w. to Mannheim, where it joins the Rhine. The principal places on its banks are Tübingen, Heilbronn, Heidelberg, and Mannheim. Its course, leading first through a deep and narrow dale, leads afterwards through a succession of wide and fertile tracts, inclosed by soft vine-clad hills. The scenery of its banks is, in general, very beautiful, and in many places highly romantic. From Cannstadt, about midway in its course, the Neckar is
Navigable; steamers ply regularly to Heidelberg. Good wines are grown on its banks. Chief affluents, on the left, the Enz; on the right, the Fls Rums, the Kocher, and the Jaxt.

NECKER, Jacques, a famous financier and minister of France, was b, Sept. 30, 1732, at Geneva, where his father, a native of Brandenburg, but of Anglo-Irish descent, was professor of German law. He became a banker in Paris and acquired a large fortune during the seven years' war. After retiring from business he became the representative of his native city at the French court; and also acquired a high but not exactly a solid reputation by his publications on political economy and finance, particularly his *Essai sur la Legislation et le Commerce de Grains* (Par. 1775). In this essay he appears as the opponent of the wise Turgot's liberal measures in regard to the traffic in grain, and claims for the state the right of fixing its price, and if it thinks it necessary, of prohibiting its exportation. On the removal of Turgot from office in June, 1776, Necker was called to assist in financial affairs, and after the brief administration of Churchy he was made general director of finances in June, 1777. Necker could not conceal his chagrin. This was his weak point. He had all the vanity, egotism, and love of show that mark his brilliant but superficial daughter. Nevertheless he succeeded not only in meeting the exigencies of the American war, but in restoring to some degree of order the general financial affairs of the country, though mainly by the perilous expedient of borrowing, which he was enabled to do to an almost unlimited extent, owing to the confidence reposeid in his financial dexterity. Some years he borrowed as much as 490,000,000 of francs. His Protestantism, however, and some retrenchments which he made in the royal household, with his publication on the financial affairs of France (*Compte Rendu*), which produced an immense sensation, made him an object of great dislike to the queen and court, and on May 12, 1781, he was suddenly dismissed. He retired to Geneva, where he was visited, from motives of sympathy and respect, by the highest personages in the realm, the prince of Condé, the dukes of Orleans and Chartres, the prince of Conde, the duke of Luxembourg, maréchal de Richelieu, the archbishop of Paris, etc., but he could not get a single which he published on the financial management of the reckless and ignorant Calonne. In the financial and political crisis, however, which followed upon the financial administration of Loménie de Brienne, Louis XVI. found himself under the necessity of calling Necker in Nov., 1788, to the office of comptroller-general of finances and minister of state. Necker recommended the calling of the states-general, and thereby acquired the greatest popularity. He failed, however, in the difficulties which ensued, having no capacity for political affairs in other than their mere financial aspects. When the court, on June 23, 1789, determined upon nullifying the resolution of the third estate, Necker hesitated, and the king therefore dismissed him on July 11, and required him to leave the French dominions immediately. He obeyed, but the disturbances of July 12, 13, and 14 (on the last of which days the Bastille was taken) were the result of his dismissal, and the king was under the necessity of recalling him. He now allied himself with Mirabeau and other ministers for the introduction of a constitution like that of Britain, with two chambers or houses of parliament; but this caused a great diminution of his popularity, and he was unable to contend in debate with Mirabeau and other great leaders of the national assembly. On the rejection by the assembly of his scheme of a loan, and the adoption instead of it of Mirabeau's scheme of assignats, he resigned his office in Sept., 1790, and retired to his estate of Coppet, near Geneva, where he died, April 9, 1801. Besides the works already mentioned he published several on political and religious subjects, particularly a work on the French revolution (4 vols. Par. 1790), which has been frequently reprinted. His daughter was the celebrated madame de Staël.

NECKER, Susanne Curchod de Nasse, 1739-94: b. canton Bern, Switzerland. Her father, the pastor of Nyon, gave her an excellent education, but opposed her union with Gibbon, the historian, with whom she was inlovete. In 1764 she was married to Jacques Necker, the finance minister of Louis XVI. Her house in Paris became the resort of Buffon, Diderot, D'Alembert, and most of the celebrities of the time, whose influence she used to further her husband's political advancement. Her principal literary works are *Réflexions sur le Décorum, Memoire sur l'Establishement des Hospices*, a treatise upon hasty interments, and five volumes of miscellanies, published by her husband after her death. She founded a hospital in Paris which bears her name. Her life was written in 1829 by Auguste de Staël-Holstein.

NECK-MOLDING. A molding at the junction of the capital and shaft of a column. The plain space between the astragal of the shaft and the moldings of the cap of the Roman Doric order is called the neck.

NECROMANCY (Gr. nekros, dead, and maesteia, divination), a mode of divination by the conjuring up of the dead to question them concerning the future. It originated in the east, and in times of the most remote antiquity. It is condemned in the Old Testament; and the story of the witch of Endor affords a remarkable illustration of it, which has not a little perplexed interpreters of Scripture. The eleventh book of Homer's *Odyssey* bears the title of *Nekromanteia*, and in it the shade of Tiresias is represented as brought up and consulted by Ulysses. In most parts of Greece necromancy was
practiced by priests or consecrated persons in the temples; in Thessaly it was the pro-
fession of a distinct class of persons called psychagogoi ("evokers of spirits"). The
practice of it in that country was ultimately connected with many horrid rites, in
which human blood, half-burned portions of bodies from funeral piles, the immature fetus cut
out of the womb, etc., were employed, and sometimes human beings were slain that
their spirits might be consulted ere they finally passed into the lower world. The
establishment of Christianity under Constantine caused necromancy to be placed under the
ban of the church. There are evident traces of necromancy in some of the older Norse
and Teutonic poems. The mediaeval belief in the evocation of spirits belongs rather to
sorcery than to necromancy. See Peucer's Commentarius de Proutulis Dictationum
Generibus (Zerbst, 1591).

NECROMANCY (ante). See SPIRITUALISM, ante.

NECROPHILISM, an unnatural and revolting love or appetite for the dead which has
manifested itself in various ways. Consorting or living with the dead has been observed
as a characteristic of melancholia. Individuals have inhabited grave-yards, preferring
the proximity and association of corpses with which they had no tie, to the cheerfulness
and comforts of home; and there is recorded one notorious case in which a gentleman,
although on bad terms with his wife while alive, carried her body with him through
India, scandalizing the natives and outraging the feelings of all by placing the coffin
under his bed. This hideous tendency may enter into certain developments of cannibal-
ism where the feast is celebrated in memory of a departed friend, rather than in triumph
over a slain foe. It is affirmed that there were anthropophagous epidemics in 1436 and
1500; and the history of vampirism connects that delusion with the moral perversion
now described. Patients in asylums, especially in continental asylums, are still often
encountered who bemoan the crime of having devoured the dead and violated channel-
houses. The most extraordinary exhibition of necrophilism is where individuals, not in
fancy but in reality, have exhumed corpses to see them, to kiss them, to carry them
away to their own homes, or to mutilate and tear them to pieces. It is worthy of notice
that, so far as such cases have been observed in this country, they have been confined
to communities living in remote places, of rude and unenlightened character, and cher-
ishing the superstitions of ages and states of society with which they have no other
connection, and of which they have almost lost the recollection.—Ambro, Medico-
Psychologiques, t. viii. p. 472.

NECROPOLIS, a Greek term, meaning the city of the dead, and applied to the cem-
eteries in the vicinity of ancient cities. It occurs in classical antiquity only as applied
to a suburb of Alexandria, lying to the w. of that city, having many shops and gardens
and places suitable for the reception of the dead. The corpses were received and
embalmed in it. Here Cleopatra, the last of the Ptolemies, applied the asp to her breast
to avoid the ignominy of being led in triumph by Augustus. The site of the necropolis
of ancient Alexandria seems to have been where are now the catacombs, consisting of
galleries and tombs hollowed out of the soft calcareous stone of which the city is built,
and lying at the extremity of the city. The term necropolis is now, however, used in
a much more extended sense, and applied to all the cemeteries of the ancient world.
These consisted either of tombs, constructed in the shape of houses and temples, and
arranged in streets, like a city of the dead; or else of chambers hollowed in the rock,
and ornamented with façades to imitate houses and temples. Such cemeteries are to be
distinguished from the cemitério, or subterranean chambers of the Romans, in which
their terms were deposited; or the rows of tombs along the Via Appia; or the cemeteries
of the Christians, whose bodies were deposited in the ground. The most remarkable
necropoleis are that of Thebes in Egypt, situated at a place called Gournah, on the left
bank of the Nile, capable of holding 3,000 persons, and which it is calculated must at
least have contained 5,000 mummies; those of El-Kab or Elleithyia; of Beni-Hassan, or
the Speos Artemidos; and of Madfun or Abydos; of Siwa or the oasis of Ammon. See
OASIS. In Africa the necropolis of Cyrene is also extensive; and those of Vulci, Corneto,
Tarquinii, and Capua are distinguished for their painted tombs (see Tombs), and the
numerous vases and other objects of ancient art which have been exhumed from them.
Large necropoleis have also been found in Lycia, Sicily, and elsewhere.

Strabo, xviii. pp. 795-799; Plutarch, vit Anton: Le Dro: Journal des Savans, 1828,
p. 103; Dennis, Cities and Cemeteries of Etruria, i. 412, i. 276-393.

NECROSIS (Gr. nekrós, dead) is a term employed to denote the death or mortification
of bone, but often restricted to the cases in which the shaft of a long bone dies, either
directly from injury or from violent inflammation, and is inclosed by a layer of new
bone; the death of a thin superficial layer, which is not inclosed in a shell of new bone,
being usually termed exfoliation.

The bones of the lower extremity—the femur and tibia—are those which are most fre-
quently affected by necrosis. The lower jaw is, however, extremely often affected by it
in persons engaged in making lucifer-matches, the disease being set up by the perni-
cious action of the vapor of phosphorus. The dead bone, known as the aequusrum, gene-
 rally consists of the circumference of the shaft only, and not of the interior, and the
inside of the dead portion presents a rough appearance, as it worm-eaten. If the mem-
brane investing the bone (the periosteum) remain healthy, it deposits lymph, which
Nectar.

Neef.

Suddenly ossifies, forming a shell of healthy bone, which completely invests the dead position.

The essential point in the treatment is the removal of the sequestrum, which is too purely a surgical operation to be described in these pages.

NECTAR, the name given by Homer, Hesiod, Pindar, and the Greek poets generally, and by the Romans, to the beverage of the gods, their food being called ambrosia (q.v.). But Suppho and Alcman make nectar the food of the gods, and ambrosia their drink. Homer describes nectar as resembling red wine, and represents its continued use as causing immortality. By the later poets nectar and ambrosia are represented as of most delicious odor; and sprinkling with nectar, or anointing with ambrosia, is spoken of as conferring perpetual youth, and they are assumed as the symbols of everything most delightful to the taste.

NECTARINE. See Peach.

NECTARY, in botany, an organ in the flowers of many phanerogamous plants, devoted either to the secretion or the reception of honey. Of the former kind are nectariferous glands, scales, and pores; of the latter, tubes, cavities, etc. But the term was for a long time very vaguely employed by botanists, and seemed to be found convenient for the designation of any part of a flower for which no other name was known. Thus amongst the parts called nectaries by the older botanists may be found those now called disk (q.v.), and that which bears the name of corona (q.v.).

NEDJED, or NEJD. See Wahabis, ante.

NEEDFIRE (Ger. needfeuer; allied to Sw. gnida, to rub; Eng. knead), fire obtained by the friction of wood upon wood, or the friction of a rope on a stake of wood, to which a wide-spread superstition assigns peculiar virtues. With varieties of detail, the practice of raising needfire in cases of calamity, particularly of disease among cattle, has been found to exist among most nations of the Indo-European race. It has been supposed effectual to defeat the sorcery to which the disease is assigned. When the incantation is taking place, all the fires in the neighborhood must be extinguished, and they have all to be rekindled from the sacred spark. In various parts of the Scottish highlands the raising of needfire was practiced not long ago, and it is perhaps still had recourse to in some very remote localities. The sacrifice of a heifer was thought necessary to insure its efficiency. The ways of obtaining fire from wood have been various; one is by an apparatus which has been called the "fire-churn," a cylinder turning on a pivot, and furnished with spokes, by means of which it is made to revolve very rapidly, and fire is generated by the friction. Fire struck from metal has been supposed not to possess the same virtue, and in some instances the persons who performed the ceremony were required to divest themselves of any metal which might be about them. In its origin the fire-churn was considered a model of the apparatus by which the fires of heaven were daily rekindled. It is still in daily use in the temples of the Hindus. The same superstition was doubtless the origin of the story of Prometheus (q.v.). See Grimm's Deutsche Mythologie; Supplement to Jamieson's Scottish Dictionary.

NEEDLE-GUN. See BREECH-LOADING ARMS AND NEEDLE-GUNS, ante.

NEEDLES are instruments of metal, or other material, for the purpose of carrying the thread in sewing, embroidery, knitting, netting, and other similar operations. They are generally made of metal, but bone, ivory, and wood are also used; for ordinary needlework, called sewing, they are made of fine steel, and are too well known to need description; for other kinds of work they are often much larger and differently formed, according to the requirements of the work to be done.

Needle-making is an important branch of industrial art, and it has of late years attained to extraordinary perfection. Small bars of steel, not thicker than a good-sized bristle, can be made perfectly round, pointed at one end with wonderful accuracy, pierced at the other end with an oval hole, the sides of which are so smoothly rounded that there is no friction upon the thread, and the whole of each instrument, not more than three inches long, is enamelled and sold at less than a shilling per hundred, notwithstanding that a large part of the operations required in their manufacture are manual. The first operation, after the wire has been selected and its thickness accurately gauged, is to cut it into eight-feet lengths; this is done by winding it in a coil of 16 ft. circumference, and then cutting this coil into exact halves with powerful cutting shears. The colling of the wire is so managed that there are 100 pieces in each half when cut; the bundles of 100 wires are again cut into the necessary lengths for two needles; and so well arranged are the cutting shears, that a man can easily cut enough for 1,000,000 needles in a day of 12 hours. The pieces cut from a coil, although now reduced to the length of two small needles, are nevertheless somewhat curved; they are therefore collected into bundles of about 6,000, and placed in two iron rings, which hold them loosely together; they are then slightly softened by firing, and are laid on an iron plate or bench, and are pressed with a small curved bar in two or three places, by which the operator manages to make them all perfectly straight. They are now taken to the grinder, who sits in front of his grindstone upon a seat which is hollow, and forms an air-shaft open towards the stone; through this a blast of air is forced when the wheel is in motion, which carries away from the grinder every particle of the sublimate dust from the needle
points and the stone. Before this humane invention, which has rendered the operation quite innocuous, the loss of life in this manufacture was more serious than in any other industrial occupation. The operator, with great tact, holds about 25 of the wires, by means of his thumb pressed against the inside of his fingers, the wires, which are held straight and applied to the grindstone, being dexterously turned round on the inside of the hand by means of the thumb, until they are ground sharp at one end; they are then reversed, and the other ends are similarly sharpened. They are next taken to the impressing machine, which in principle consists of a weight hanging to a block, which is raised by the hand and let fall at pleasure; the wires are placed in succession under this, so that the falling weight strikes each wire exactly in the middle, and there flattens it. The hardening of the flattened part by the blow is removed in the annealing oven, and the holes are next punched, two in each flattened portion. These are either done by hand-punched works by children, who acquire great nicety in the operation, or by a machine on the same principle as the impressing machine; this not only punches the two holes, but also forms a small cross-cut between them, which is otherwise made by a file. At this cross-cut the wire is broken in two, and may now be regarded as two rudely-formed needles, each having a flattened and pierced head. A number of these are now threaded (spitted) on a thin wire, and are placed in a vise, which holds them firm and straight, so that the workman can file the heads on the top and sides, so as to remove all the burried edge. The next process is oil tempering, for which they are made hot, and immersed in sufficient oil to cool them thoroughly; the oil is then burned off, an operation which renders the needles brittle. They are then weighed out into lots of about 500,000 each, and after being shaken so that they lie side by side, they are laid on to a special place of strong canvas, and a quantity of sand and emery-powder being mixed with these, they are corded up very securely into a long roll from 18 in. to 2 ft. in length. A number of these rolls or bundles are placed on a movable wooden slab, in the scoring machine, and over them is placed another heavily weighted slab. The action of the machine, of which these slabs form part, is to move them backward and forward in opposite directions, the bundles of needles acting as rollers, the pressure upon which works the inclosed needles, sand, etc., together, so that after 8 to 10 hours, which this operation occupies, instead of the blackened appearance they had when it commenced, they are white and slivery-looking. They are now removed to an exactly similar machine, where they are polished. Here they are separated from the sand and emery, and are removed to other canvas squares; and when mixed up with a paste of putty-powder and oil, are again corded up, and made into roll backward and forward under the weighted wooden slab. This process is repeated more or less, until the needles are completely removed from the canvas, and agitate them in a vessel with soft-soap and water, to remove the oil and putty-powder, and next to dry them in ash-wood saw-dust. They are now highly polished and well tempered, but not all of exactly the same length, nor are the eyes perfect; they are therefore passed to a person who, by nice management of a small gauge, sorts them very quickly into certain lengths (evening), and arranges them all in one direction (heading). They then pass on to be drilled, an operation requiring great nicety, as the small oval holes have to be so polished all round, as not to cause any friction on the thread in seizing with them; a clever workman will drill and polish the holes of 70,000 needles per week. The needle is now practically finished, but many minor operations are considered necessary to produce high-finish; these we purposely omit, to avoid complicating our description. It is, however, worthy of remark, that this little instrument, which costs so much labor for its formation, has by these operations acquired immense value. The wire of which the ordinarily-sized needles are made is so thin, that 51 lbs, go to form 74,000 needles. Of ordinary sized needles, 24 millions weigh 3 cwt., and are worth rather more than £290, although the steel wire of which they were made was only worth £14 at the commencement of the manufacture. English-made needles are the best in the world, and are chiefly made in Redditch and the neighborhoods, where, and in other parts of the county of Worcester, this manufacture employs a large number of persons.

NEEDLES. The, a cluster of five rocks on the w. point of the Isle of Wight, pyramidal in form: their tops are white, and of a chalky formation; their bases black; they are curiously streaked throughout with strata of black flint; a light-house has been placed on the outer one. They were probably caused by the waves beating against the sharp cliffs of the island, and their gradual washing away is attributable to the same cause. But three of the rocks are noticeable now, the tallest one, some 120 ft. in height, having fallen into the water in 1764.

NEEF or NEEPS, Pieter the Elder, 1570-1651; b. Antwerp. His numerous architectural paintings usually represent church interiors illuminated with the glow of torches or of candles. He was distinguished for his thorough knowledge of perspective by which he was able to give great effect to a small canvas. His treatment was delicate, refined, and extraordinarily clear; he understood the harmonious modulation of colors and the power of chiaroscuro, but he generally intrusted the painting of the figures introduced into his pictures to Teniers, Franks, Breughel, and Van Thulden. His works are to be found in the galleries of Dresden, Vienna, Paris, and Gotha. His son Pieter NEEF was also a painter, but had less talent. He was a pupil of the younger Steenwijk.
NEELE, Henry, 1798-1828; b. London; studied law while quite young, but gave up that profession, choosing rather to lead a literary life. He was a well-known poet and critic; and published Odes and other Poems, 1817, delivered Lectures on Shakespeare, 1819, and published Dramatic and Miscellaneous Poetry, 1823, and Romance of English History, in 3 vols., 1827. In the latter year he gave a lecture on English poetry of the period from Chaucer to Cowper, which were brought out in book-form after his death, styled Literary Romances. He committed suicide while temporarily insane. His poems won high praise.

NEELY, Henry Adams, D.D.; b. N. Y., 1830; graduated at Hobart college, 1849, and was tutor there until 1851. He became assistant rector in Calvary church (Pro-Episcopal), Utica, in 1852, and, in 1854, rector of Christ church, Rochester. He married Mary Delafeld in 1858, and returned to Hobart college as chaplain, 1862. He was appointed assistant to Trinity church, New York, and rector of Trinity chapel, two years later. In 1867 he was consecrated bishop of Maine.

NEEM-TREE. See Meliaceae.

NEEMUCH, or Nimach, a t. of India, in the territory of Gwalior (q. v.), near the n.w. border of Malwa, 320 m. s.w. from Delhi, on a slightly elevated ridge rising from a well-cultivated plain. It is 1476 ft. above the sea. The native population is only about 4,000; but Neemuch has acquired importance on account of a British cantonment established here in 1817. Prior to the sepoy mutiny of 1857-58, the officers' quarters comprised about 50 houses, but all, except one bungalow, were destroyed in 1857 by the mutineers, who massacred the Europeans, and kept possession of the fort for some time, till it was captured by brig. Stuart after a siege of fourteen days. The situation of Neemuch is regarded as one of the most healthy in India; the climate is agreeable, the nights cool even in the hot season, the winter seldom so cold as to make fires requisite, and frosts very rare.

NEENAIH, a village in Wimnecago co., Wis.; situated on the s. side of Fox river, near the outlet of lake Wimnecago; on the Milwaukee Northern, the Wisconsin Central, and the Chicago and Northwestern railroads, 90 m. n. b. w. of Milwaukee. Pop. of township, 3,123. Has a fine park, and good water power; is a favorite resort for summer travelers.

NEER, Arnoldus of, Amsterdam; sometimes called the "moonlight painter." His usual subjects are villages with fishermen's huts along the banks of canals. He is most successful in his moonlight pieces.

NEER WINDEN, a small village of Belgium, in the n.w. corner of the province of Liège, is celebrated in history for the great victory gained by the French under Luxembourg over the English under William I. (July 29, 1693); and also for the defeat of the French under Dumouriez by the allies under the prince of Coburg (March 18, 1793).

NEES VON ESSENBECK, Christian Gottfried Daniel, 1776-1838; b. Germany; educated at the Darmstadt gymnasium and the university of Jena. He studied medicine, after practicing which, for a short time, he was called to the chair of botany at the university of Erlangen. He was soon made president of the Leopoldine academy of naturalists, and professor of botany at Bonn, where he was one of the founders of a new botanical institution. In 1830 he accepted the posts of professor of botany and director of the botanic garden at Breslau. He took an active interest in the agitations which preceded the revolutionary movement of 1848, and was a prominent member of a Breslaw religious organization named the Kristkatholiken, and aiming at various charitable and humanitarian purposes. He lived at Berlin for a time in 1848, participating in the democratic agitation then at its height throughout Europe. Returning to Breslau, he established a "fraternity of workingmen," with the object of diffusing education among laborers, maintaining harmony between them and their employers, etc. This society excited the hostility of the government, which ordered him to desist his labors with it. A prosecution was soon instituted against him for living with a woman without having been divorced from his wife. Both, this prosecution and his deposition from the chair of botany in 1832, were supposed to be due to political motives, and the distrust felt by the government for his democratic principles and influence with the laboring classes. Deprived of his salary, he had to sell his library and his collection of botanical specimens. In spite of his reformatory activity, and his researches in regard to spiritualism, in which he was a believer, he found time to continue his botanical studies, and became one of the first botanists of Europe. In his Handbook of Botany, 1821, he developed the theory advanced by Goethe in his Metamorphosis of Plants, that all the parts of the flower are only variations of the leaf. This work had been preceded by his Fresh Water Algae, 1814; by System of Fungi and Sponges, 1816; and by Plant Substance, 1819, in which he was assisted by Rothe and Bischof. He published, in 1823, Genera et Species Asteroearum; in 1826, Systema Laurinianum; and in 1841, Fauna Africæ Antarctidelis Illustrations, Monographia. In 1852 appeared the first volume of his Universal System of Nature. He was a specialist on cryptogamous plants, and in this branch of botany his chief work is Natural History of the European Water-Liverwort, 1833-38.
NE EXEAT REGNO is the title of a writ issued by the court of chancery to prevent an individual leaving the kingdom, unless he gives security to abide a decree of that court. The writ was originally resorted to in cases of attempts against the safety of the state, but is now issued in cases where an equitable debt or demand is sought to be substantiated by a bill or proceeding in chancery. The writ is only granted where the party usually resides within the jurisdiction. It resembles the process which is known in the common-law courts as arresting and holding to bail, and in Scotland as arresting a person in mediataine postage.

NE EXEAT REPUBLICA, another name for the writ ne cred regno (q.v.), the word republican or state being substituted for kingdom. The writ is rarely used in the United States, and chiefly in cases involving a breach of trust or official administration.

NEFF, FELIX, 1798-1839; b. at Geneva, Switzerland. He received his early education from his widowed mother, who was distinguished for piety, and had occasional lessons from some pastor of his native canton. His favorite authors in youth were Plutarch and Rousseau, and he was fond of mathematics and natural history. At an early age he was placed with a Florist-gardener, and at 17 entered the army, that he might not longer be a burden to his poor mother. His excellent character and fidelity soon raised him to the rank of sergent. His strict religious principles and the purity of his life provoked the hostility of his associates, and he decided to leave the army. Being advised to enter the mini-try he resigned his commission in 1819, and offered himself as a catechist or parish missionary. "The first years of his missionary life were spent in the cantons of Geneva, Neuchâtel, Bern, and the Pays de Vaud. In 1821 he went to the destitute district of Grenoble in France, and afterward to Muns in Isère. Religious samples preventing his being ordained in the established church of Geneva, and his being a foreigner rendering it impossible to obtain ordination from the Protestant church of France, he went to England, and having been ordained in 1823 by the Congregationalists he returned to Muns, the scene of his former labors. But his heart was with the destitute on the mountains, and, turning away from those by whom he was greatly beloved, he went to the high Alps, and labored with great courage and zeal among the descendants of the Vaucols in the wild picturesque valleys of Queyras and Freyssinières. Here he preached, organized schools, dedicated churches, laboring incessantly among those lonely glens and dreary mountains. His pastoral work was performed in a poor Alpine district, comprising 17 isolated villages within a circuit of 80 miles. In one part of his parish the people were so degraded as to be scarcely removed from the condition of barbarians. As they needed education and were unable to pay a teacher, he became school-master as well as preacher. They became so much interested that they built a school-house, he directing the workmen and acting himself as architect and mason. Exhausted by these labors he visited the baths of Plombières, but returned to Geneva without permanent benefit. Companies of the poor people of the Alpine valleys made long journeys on foot through the snow to see their beloved dying pastor.

NEGAPATAM, a t. of British India, in the presidency of Madras, and district of Tanjore, 124 m. s.s.w. from Madras, on a small estuary of one of the many small southern mouths of the Bay of Bengal. The earliest shipping was, in former times, only coasting, but that carried on here, but has greatly declined in consequence of the cheapness of British goods. A chief branch of industry is the expression of oil from the cocoon-nut and from oil-seeds. There is a considerable trade with Ceylon. The harbor is suited only for small coasting-vessels; but measures are in progress for its improvement. Negapatam is a terminus of the Great Southern railway of India. It was the capital of the Dutch possessions in India, but was taken by the British in 1781.

NEGATIVE, in photography, is that kind of photographic picture in which the lights and shadows of the natural object are transposed; the high lights being black, and the deep shadows transparent, or nearly so. Negatives are taken on glass and paper by various processes, and should indicate with extreme delicacy, and in reverse order, the various gradations of light and shade which occur in a landscape or portrait. A negative differs from a positive inasmuch as in the latter case it is required to produce a deposit of pure metallic silver to be viewed by reflected light, while in the latter, density and transmitted light is the chief desideratum; accordingly inorganic reducing and retarding agents are employed in the development of a positive, while those of organic origin are used in the production of a negative. Adopting the colloidon process (which has almost completely replaced every other) as a type of the rest, the conditions best adapted for securing a good negative may be briefly indicated, leaving it to the reader to apply the principles involved to any process he may desire to practice.

The possession of a good lens and camera being taken for granted, and favorable conditions of well-directed light being secured, all that is necessary is to establish a proper and harmonious relation between the colloidon bath, developer, and time of exposure. A recently iodized colloidon will generally be tolerably neutral, in which case, if the developer be at all strong, and the weather warm, the bath should be decidedly acid, or fogging will be the result. Should the colloidon, however, be red with free iodine, a mere trace of acid in the bath will suffice, while the development may be much prolonged, even in warm weather, without fogging. If the simple fact
he borne in mind that the presence of acid, either in the bath collodion or developer, retards the reducing action of the developer, it will suffice to guide the operator in many difficulties. The value of a negative consists in the power it gives of multiplying positive proofs. See Positive Printing; also Photography.

NEGATIVE QUANTITIES are generally defined as quantities the opposite of “positive” or “numerical” quantities, and form the first and great point of difference between algebra as a separate science and arithmetic. In the oldest treatises on algebra they are recognized as distinct modifications of quantity, and existing apart from, and independent of, positive quantity. In later times, this opinion was vigorously combated by many mathematicians, among whom Vieta occupied a prominent place; but the more eminent analysts retained the old opinion. Newton and Euler distinctly assert the existence of negative quantities as quantities less than zero, and the latter supports his opinion by the well-known illustration of a man who has no property, and is £50 in debt, to whom £50 requires to be given in order that he may have nothing. After all, this discussion is little more than a verbal quibble, though interesting from the prominent position it for a long time held. It had its rise in the difficulty of satisfying the requirements of a constantly progressing science by the use of signs and forms retaining their original limited significance. It was soon felt that the limited interpretation must be given up; and accordingly an extension of signification was allowed to signs and modes of operation. \(+\) and \(-\), which were formerly considered as merely symbols of the arithmetical operations of addition and subtraction, were now considered as general cumulative symbols, the reverse of each other,” and could signify gain and loss, upward and downward, right and left, same and opposite, to and from, etc. Applying this reasoning to negative quantities, we obtain at once a true idea of a negative quantity: for if \(+4\) signifies 4 in, above a certain level, \(-4\) signifies 4 in, below that level, and therefore, though a positive quantity in itself (a negative being, strictly speaking, an impossible existence), it may be fairly considered to be less than zero, as it expresses a quantity less by 4 than 0 inches above the level. Keeping this idea in view it has been conventionally agreed to admit the existence of negative quantities as existing per se. The only errors which can flow from this arise from misinterpretation of results, for the four fundamental operations of addition, subtraction, multiplication, and division are unaffected by the extended interpretation of signs. The following is an illustration of the value of an extended interpretation of the negative sign, showing at the same time how much more general are the ideas conveyed by algebraic expressions than by ordinary language: If at the present time a father is 50 years, and his son 20 years old, when will the father be three times as old as his son? This problem when solved, gives \(-6\) as the number of years which must elapse before the father's age is three times the son's. Now, at first sight, this result appears to be absurd, but when we consider the terms of the problem, its explanation is easy. The question asked pointed to a number of years to come, and had the result turned out to be positive, such would have been the case, and the fact of its being negative directs us to look in a "contrary" direction, or backward to time past; and this is found to satisfy the problem as five years "ago" the father was 45 and his son 15.

Negative quantities arise out of the use of general symbols in subtraction, as in the formula \(a - b\), where we may afterward find that \(b\) is greater than \(a\). See Subtraction.

NEGAU'NEE, a village in Marquette co., Mich., 12 m. s.w. from Marquette on iron mountain; on the Chicago and Northwestern railroad, and at the junction with the Marquette, Houghton and Ontonagon railroad; pop. '74, 3,741. Teal lake, a beautiful sheet of water, is on the n. border. It has large iron mines in which a considerable capital is invested. It has blast furnaces, a nitro-glycerine factory, banks, public schools, churches, and weekly newspapers.

NEGLEY, James S., b. Penn., 1826; was a student at Western university; entered the Mexican war as a private, and at the outbreak of the rebellion enlisted within 8 days a brigade of volunteers for 5 months, and was appointed brig. gen. April 19, 1861; fought with the army of the Ohio in Alabama and Tennessee; was in command at Lavergne Oct. 7, 1862, where he defeated Anderson and Forrest, promoted to maj. gen., for his bravery at Stone river, Dec., 1862, and served in the Georgia campaign. In 1869 he was elected to congress from Pittsburg, at which city he resides.

NEGREGUE, in law, such want of due diligence and caution, though unaccompanied by injuries or criminal intent, as will give ground for a civil action for damages or will justify a criminal prosecution. The obligation to exercise caution may arise from a contract, express or implied, or from a rule or presumption of law; and the degree of care and caution which must be exercised varies greatly under different circumstances. The theoretical distinction between gross negligence and fraud or criminal intent is clear, but in practice it is often difficult to decide which exists in the particular circumstances. Where a contract is for any reason contrary to law, negligence in carrying out its provisions is, of course, no cause for action; and if an infant neglect to carry out a contract voidable on the score of infancy, he is not liable; though he may often be held for negligence amounting to a tort and altogether outside of contract obligations. If the negligence relate to contract, only a party to that contract can sue, whoever may be injured indirectly, while in torts it is the person receiving the actual injury who has a claim for
damages. It is not enough to constitute a valid claim that there has been a want of care; for, first, the negligent party may have been under no obligations to exercise care toward the person injured; thus, where a railway accident is brought about by the grossest negligence on the part of the company, if an individual passenger were injured who was obtaining his passage by fraud, he would have no claim, and, secondly, though the obligation might exist and negligence occur, yet it might be so slight compared with the nature of the transaction as to make it obviously unjust to hold the negligent party. Again, if the injured party has himself been negligent and has thus "contributed" to his own damage, he will have no action. This principle of "contributory negligence" is based upon public policy in part and in part upon the belief that a loss brought upon a plaintiff by his own act should not give him compensation. But it is not a good bar to an action to prove that, if the plaintiff had not done a certain act, he would not have been injured; the negligence, like that of the defendant, must have been actual, and care required of him by some legal or natural obligation. It is generally held that the burden of proof is on the defendant as to contributory negligence; that is, the plaintiff or injured party will be supposed to have acted with due care until the contrary is shown. The doctrine of contributory negligence presents many difficult questions on trial, not so much as to the law, as in determining the respective rights of the parties and the degree in which either was or both were negligent. By the common law, if death were occasioned by negligence, no action for damages could be had by the near relatives; but by an English statute and by similar enactments in most of the states of this country, suit may be brought by the administrator or executor in behalf of a husband or wife or next of kin, wherever death has been caused by negligence or wrongful act. Where the original injury has been increased by the willful act or negligence of the plaintiff, he cannot include the more remote damage in his claim. Thus, where physical injury is received and medical care is refused—the refusal resulting in permanent loss of health which would otherwise not have followed—there can be no claim for damages on that account. Every man is bound so to use his own property as not to injure another. Thus, the owner of animals which are vicious or have a contagious disease is bound to keep them under proper restraint; and the digger of a pit on his own land is liable if it is near an unguarded highway and unprotected. Professional men are bound to exercise a fair average skill in their profession. A superior is, in general, responsible for the negligence of an agent or employee when acting in the scope of his employment, but the servant is, in turn, liable to the master.

Most important decisions as to the degree of care required of railroad corporations may be seen in Redfield on Railroads. In general it may be said that extraordinary care is demanded of all public carriers. As to negligence by public officers in performing their official duties, see Office. Three degrees of care or diligence and corresponding degrees of negligence, are usually described, apportioned to the relative circumstances and responsibilities of the parties; where one is required to use but slight care and is responsible only for gross negligence; where he is required to use ordinary care and is liable for ordinary neglect; and where he is required to use very great care and is responsible for but slight neglect. This classification is applied especially to the subject of Bailment. Where the bailment is for the benefit of the bailor, but slight care is required of the bailee; where the benefit is mutual, as in cases of hiring, ordinary care is required; and where the bailee is the only one who benefits by the bailment, extraordinary diligence is required and the slightest negligence will give cause for action. The exceptions to the second statement are the bailments to common carriers and innkeepers where public policy requires that a very great degree of care should be exercised. Negligence, not coexistent with any criminal intent, may in certain cases constitute a crime. Thus, where the negligent act of one man results in the death of a second, the circumstances may make the first guilty of manslaughter. So where an officer of the law allows a prisoner to escape, not having been tempered with, but through mere carelessness, he is criminally guilty. The subject of negligence may be found treated in detail in Shearman on Negligence, Addison and Hilliard on Tort, Redfield on Railroad Law, and Bishop on Criminal Law.

NEGOTIABLE PAPER. See BILL OF EXCHANGE; EXCHANGE; ante.

NEGRELIS, alos von, 1799-1858; b. in the Tyrol; constructed the first Swiss railroad, from the German border to Zurich, also the first Austrian railroad, completed 1841; the Austrian Northern railroad secured him as chief inspector, which position he held till 1849, when he was appointed director of public works. In 1855 he assumed full charge of all Austrian railroads, from which position he was called, two years later, by the viceroy of Egypt, to superintend the cutting of the Suez canal, at which work he spent the last year of his life.

NEGritos, or Negri1los (Spanish, diminutive of negros), the name given by the Spaniards to certain negro-like tribes inhabiting the interior of some of the Philippine islands, and differing essentially both in features and manners from the Malay inhabitants of the Eastern archipelago. They bear a very strong resemblance to the negroes of Guinea, but are much smaller in size, averaging in height not more than 4 ft. 8 in., whence their appellation of Negritos, or little negroes. They are also called by the Spaniards Negritos del Monte, from their inhabiting the mountainous districts for the most part; and one of the islands where they are most numerous bears the name of
Isla de los Negros. These Negritos are also known by the names Acta, Aiga, Ita, Inapa, and Iloote, or Igorote. They are described as a short, small, but well-made and active people, the lower part of the face projecting like that of the African negroes, the hair either woolly or frizzled, and the complexion exceedingly dark, if not quite so black as that of the negroes. The Spaniards describe them as less black and less ugly than the negroes—Mama negros y menos fios. All writers concur in speaking of them as sunk in the lowest depths of savagery, wandering in the woods and mountains, without any fixed dwellings, and with only a strip of bark to cover their nakedness. They carry weapons the bow and arrow; and they live upon roots, wild fruits, and any sort of animals that they can surprise in their haunts or conquer in the chase. By the Malays they are despised and hated; and the buffalo-hunters in the woods, when they meet with them, do not scruple to shoot them down like wild beasts or game. "It has not come to my knowledge," says a Spanish writer, "that a family of these negroes ever took up their abode in a village. If the Mohammedan inhabitants make slaves of them, they will rather submit to be beaten to death than undergo any bodily fatigue; and it is impossible, either by force or persuasion, to bring them to labor." The same writer, an ecclesiast, speaks of them as gentle and inoffensive in their manners, whenever he himself came in contact with them; and although informed that some of them were cannibals, he was not inclined to believe the report. Dr. Carl Scherzer, the historian of the circumference of the Negritos, when at Manila, had an opportunity of seeing a Negrita girl, whom he thus describes: "This was a girl of about 12 or 14 years of age, of dwarf-like figure, with wooly hair, broad nostrils, but without the dark skin and wide everted lips which characterize the negro type. This pleasing looking, symmetrically-formed girl had been brought up in the house of a Spaniard, apparently with the pious object of rescuing her soul from heathenism. The poor little Negrita hardly understood her own mother tongue, besides a very little Tagal, so that we had considerable difficulty in understanding each other.

According to Spanish statements the Negritos are found only in five of the Philippine islands—namely, Luzon, Mindoro, Panay, Negros, and Mindanao—and are estimated at about 25,000 souls. Remnants of them exist, however, in the interior of some of the other islands in the Eastern archipelago; and they are scattered, also, though in small numbers, through certain islands of Polynesia. They are altogether an island people, and are hence treated by Pickering under the designation of Polynecian negroes. By Dr. Pickering they are treated of as a distinct race, resembling the Papuans, but differing from it in the diminutive stature, the general absence of a beard, the projecting of the lower part of the face or the inclined profile, and the exaggerated negro features. The hair, also, is more woolly than that of the Papuans, though far from equaling that of the negroes in knotty coarseness. By Latham the Negritos are classified under the subdivision of Oceanic Mongolide, C, which subdivision is further modified by him into the designation of "Amphinesians" and "Kelenonesians." The Negritos out of the Philippine islands are found for the most part in the islands embraced under the latter designation, as New Guinea, New Ireland, Solomon's Isles, Louisiade, New Caledonia, and Tasmania or Van Diemen's Land. Except in the last-mentioned island, however, the Negritos, strictly speaking—that is, the blackish people with woolly hair—do not preponderate over the other native tribes less strongly marked with negro features; while in Tasmania itself the race has almost entirely disappeared, amounting at present to not more than two or three dozen souls. Dr. Pickering is of opinion that the Negrito race "once occupied more space than it does at this time, and that it has in many instances preceded the dissemination of other races." We conclude with a description of a Negrito native of Erramango (the island where the missionary Williams was murdered), supplied to Dr. Pickering by Horatio Hales, his associate in the United States exploring expedition: "He was about 5 ft. high," says Mr. Hales, "slender and long limbed; he had close woolly hair, and retracted arched forehead, short and scanty eyebrows, and small snub nose, thick lips (especially the upper), a retracting chin, and that projection of the jaws and lower part of the face which is one of the distinctive characteristics of the negro race. . . . Placed in a crowd of African blacks, there was nothing about him by which he could have been distinguished from the rest." See Papuans and Polynesians.

NEGREO, Rio. See Rio Negro.

NEGROES (from the Spanish word negro, black; Lat. niger) is the name given to a considerable branch of the human family possessing certain physical characteristics, which distinguish it in a very marked degree from the other branches or varieties of mankind—more especially the so-called whites or Europeans. In Blumenbach's five-fold division of mankind the negroes occupy the first place under the variety Ethlapien, which likewise embraces the Kaffers, Hottentots, Australians, Afforins, and Oceanic negroes. In Latham's threefold division they are placed among the Abantilide, and form the primary subdivision of Negro Atlanticide in that author's classification; while in Pickering's eleven-fold division they occupy the last place in his enumeration of the races of mankind.

Both Pickering and Latham strongly protest against the common error of looking upon the term negro as synonymous with African. "It ought to be remembered," says the
former, "that the word negro is not a national appellation, but denotes the ideal type constituted by the assemblage of certain physical characteristics, which is exemplified in the natives of Guinea in western Africa, and in their descendants in America and the West Indies." And Latham in like manner observes: "No fact is more necessary to be remembered than the difference between the negro and African; a fact which is well verified by reference to the map. Here the true negro area—the area occupied by men of the black skin, thick lip, depressed nose, and woolly hair—is exceedingly small; as small in proportion to the rest of the continent as the area of the district of the stunted Hyperboreans is in Asia, or that of the Alps in Europe. Without going so far as to maintain that a dark complexion is the exception rather than the rule in Africa, it may safely be said that the line of the Arab, the Indian, and the Australian is the prevalent color. To realize this we may ask, What are the true negro districts? and what other than negro? To the former belong the valleys of the Senegal, the Gambia, the Niger, and the intermediate rivers of the coast, parts of Sudania, and parts about Senaar, Kordofan, and Darfur: to the latter the whole coast of the Mediterranean, the desert, the whole of the Kaffer and Hotentot areas s. of the line, Abyssinia, and the middle and lower Nile. This leaves but little for the typical negro." Bearing in mind this limitation of the primitive area of the negro, we shall next proceed to speak of his prominent physical characteristics.

The negro has a black skin, unctuous and soft; woolly hair; thick lips; the lower part of the face prognathic, or projecting like a muzzle; the skull long and narrow; and a low, retroussé forehead. The skull of the negro is remarkably solid and thick, so that in fighting they often butt against each other like rams, without much damage to either. This is caused by the fact that bone is less elastic in the negro than in other races. According to Camper's lateral admeasurement, the head of the negro shows an angle of 75°, while that of the European shows one of 80°, on which difference of 5°, as he considered, depends the superior beauty of the latter. There is not much dependence, however, to be placed on such a mode of admeasurement; and the same may be said of Blumenbach's vertical method. According to this, a considerable difference would appear to exist between the skull of the negro and that of the European. "But," says Dr. Prichard, "I have carefully examined the situation of the foramen magnum in many negro skulls; in all of them its position may be accurately described as being exactly behind the transverse line bisecting the antero-posterior diameter of the basis cranii. This is precisely the place which Owen has pointed out as the general position of the occipital hole in the human skull. In those negro skulls which have have the alveolar process very protruberant, the anterior half of the line being described, is lengthened in a slight degree by this circumstance. If allowance is made for it, no difference is perceptible. The difference is in all instances extremely slight; and it is equally perceptible in heads belonging to other races of men, if we examine crania which have prominent upper jaws. If a line is let fall from the summit of the head at right angles with the plane of the basis the occipital foramen will be found to be situated immediately behind it; and this is precisely the case in negro and in European heads." There is, in fact, neither in this respect—the conformation of the negro skull—nor in any other, solid ground for the opinion hazard by some writers, and supported either through ignorance or from interested motives by many persons—that the negro forms a connecting link between the higher order of apes and the rest of mankind. The difference is certainly considerable between the highest European and the typical negro, but the gulf between them both and the highest of the simiae is so nearly of the same width that the difference is scarcely measurable. Of course, selection, skin, muscles, and ligaments, and the general facial appearance of the negro, are not the only features that distinguish him in a great degree from the European, and seem to stamp him as a distinct variety of the human race. "In the negro," says Prichard, "the bones of the leg are bent forwards. Soothing and Lawrence have observed that the tibia and fibula in the negro are more convex in front than in Europeans; the calves of the legs are very high, so as to encroach upon the hams; the feet and hands, but particularly the former, are flat; and the os calcis, instead of being arched, is continued nearly in a straight line with the other bones of the foot, which is remarkably broad. As to the supposed excessive length of the fore-arm in the negro, a circumstance also dwelt upon as showing an approach to the anthropoid apes, facts are altogether against the statement; there being no greater difference than is observable in individuals of any other variety of mankind. In stature the negro is very much on par with the European, often reaching 6 ft., and rarely declining below five and a half. Into the discussion as to the cause of the blackness of the skin in the negro we have not space to enter. It is generally supposed to depend upon the greater amount of pigment cells in the rēte Malpighi, and in the greater number of cutaneous glands, as compared with the skin of Europeans. In the skin of the negro there is much oily matter, and he perspires profusely, which serves to keep him in health, while it diffuses a smell far from agreeable to bystanders whose olfactory nerves are at all sensitive. Of the hair of the negro, Dr. Prichard remarks: "I am convinced that the negro has hair properly so-called, and not wool. One difference between the hair of a negro and that of a European consists in the more curled and frizzled condition of the former. This, however, is only a difference in the degree of crispation, some European hair being likewise very crisp. Another difference is the greater quantity of coloring
matter or pigment in the hair of the negro. It is very probable that this quality is connected with the former, and is its cause, though we cannot determine in what manner one depends upon another; but as these properties vary simultaneously, and are in proportion one to another, we may infer that they do not depend upon independent causes.

The negroes, in their native state, comprise various independent tribes, which are thus classified and enumerated by Dr. Latham: 1. Western Negro Atlantide, embracing the Wolofs, Sereres, Serawelli, Mandingos, Felups, etc. ; Fantis, etc.; the Ghâ, the Whidah, Mahâ and Benin tribes, the Grebo, etc. 2. Central Negro Atlantide, embracing the Yarribâ, the Tapua, Hausaa, Fulaâs, Cumbri, Sungai, Kissûr, Bornî, etc.; Begharmi, Mandara, Mobba, Furrâus, Koldûngi. 3. Eastern Negro Atlantide, embracing the Shillûk, etc.; Qämamydl, Dakall, etc.; Tibbo, Gongus. This list might, of course, be still further enlarged by reference to the works of Barth, Livingstone, Speke, and other travelers, whose researches have been published since the appearance of Dr. Latham's *Varieties of Man*, in 1850.

While these several tribes have their distinctive peculiarities, they yet bear a strong general resemblance to each other, not only in their physical appearance, but in their intellectual capacities, moral instincts, customs, and manners. The negro intellect is generally acknowledged to be inferior not only to the European, but to that of many primitive races as not yet brought within the pale of civilization, while it is superior to that of the Australians, Bushmen, and Esquimaux. Some tribes are sunk in the lowest depths of barbarism, and are either ferocious savages, or stupid, sensual, and indolent. This is the case, for the most part, according to Prichard, where the exaggerated negro type is discernible, as among the Bulhoms, Papals, and other tribes on the coast of Western Guinea; also among the tribes near the slave coast, and in the bight of Benin, where the slave-trade has been carried on to the greatest extent. In other parts they show a capacity for practicing the arts of life. They are ingenious in the construction of their dwellings, they have some knowledge of the working of iron and other metals, they manufacture arms, dress and prepare the skins of animals, weave cloth, and fabricate numerous useful household instruments. Whether are they altogether deficient in a knowledge of the various arts and sciences. Their works of civilization are generally converted into worship; the national deities. They believe in good and evil spirits, and are perpetually practicing incantations to ward off the baneful influence of their spiritual enemies. Their religion, in fact, is one altogether of fear; and as this generally leads to cruelty, we find them for the most part indifferent to the sacrifice of human life. In some parts they even offer up human victims to propitiate their deities. They are cruel to their enemies and prisoners, and often shed blood for the mere savage delight they experience in seeing it flow from their victims. We need only allude to the inhuman customs, as they are called, of Dahomey, and the Yam and Adâi customs of the Ashantees, as described by Bowdich, in support of this statement.

This same indifference to human suffering, coupled with the passion of avarice, has doubtless been the mainspring of the slave-trade carried on during so many centuries between the negroes and European traders in the western coast of Africa. Begin by the Portuguese as early as 1505, the negro slave-trade was carried on by the English in 1641, and by the French in 1661, and subsequently by Charles V., legalized in England under Elizabeth, and eventually practiced by every maritime nation of Europe, this infamous trade flourished under the sanction of law as late as the year 1807, when it was happily abolished by act of parliament in Great Britain, and is now treated as piracy by almost every civilized nation. Even still, however, it is practiced by lawless men, notwithstanding the humane efforts of Great Britain, France, and the United States to suppress it; and the encouragement which it has given to the petty chieftains on the slave coast, and the country behind it, to enrich themselves at the expense of their fellow-countrymen, has contributed more than anything else to retard the progress of civilization in that part of Africa. "The region mentioned," says Prichard, "has been the great seat of the exportation of negro slaves, and the tribes on the coast have been reduced to the lowest state of physical and moral degradation by the calamities and vices attendant on that traffic. Throughout negro-land, and especially this part of it, the inhabitants of one district, in the interior, the dwellers on one mountain, are ever on the watch to seize the wives and children of the neighboring clans, and to sell them to strangers; many sell their own. Every reess, and almost every retired
corner of the land, has been the scene of hateful rapeine and slaughter, not to be excused or palliated by the spirit of warfare, but perpetrated in cold blood, and for the love of gain."

The custom of polygamy prevails among all the negro tribes, and where these are constituted into nations or kingdoms, as in Dahomey, the sovereign has often as many as two or three thousand wives, whom he occasionally disposes of as presents to his chief officers and favorites.

The languages of the various nations and tribes of negroes are very numerous. Vocabularies of nearly 200 languages have been brought from Africa by the rev. Dr. Koelle. "A slight examination of these vocabularies," says Mr. Edwin Norris, "seems to show that there are among the negro idioms a dozen or more classes of languages, differing from each other as much as the more remote Indo-Germanic languages do." To these negro idioms Dr. Krøpff has given the name of Negro-humidic languages. These may perhaps have affinities with some of the other African tongues, but not with any of the great well-defined families of languages. For further information upon this subject, we must content ourselves with referring to Dr. Prichard's Natural History of Man, and especially to a learned note by Mr. Edwin Norris, in vol. i. of that work, page 823.

Of the condition and prospects of the negroes in the various countries into which they have been imported during the prevalence of the slave-trade, we have severely room to speak. They are found in all the West India islands, to the number of about 3,000,000; in the United States, Brazil, Peru, and other parts of South America; also in the Cape de Verde islands, Arabia, Morocco, etc. In the British West India islands they were emancipated from slavery in 1834, and in those belonging to France in 1848. Indeed, slavery now exists nowhere in the West Indies, with the single exception of Cuba. In the United States the negroes amounted in 1870 to 4,880,000. Many of these were emancipated in the course of the late unhappy civil war, all the negroes of secession masters being declared emancipated by proclamation of president Lincoln and act of the federal congress; at the same time that indemnities were promised to such loyal states as of their own accord declared emancipation. Negro slavery in the United States has been utterly destroyed, and the great problem which used to exercise philanthropic minds has been solved—the negro having become a United States citizen at a fearful cost of blood and treasure to both their possessors and their liberators.

NEGRO EXODUS, the name applied to a remarkable migration of freedmen from the southern states of America, in the beginning of 1879, and through that and the succeeding year. On April 7 in the year named, a memorial reached Washington, signed by many of the most influential citizens of St. Louis, Mo., including ex-senators and ex-representatives in congress, the mayor of the city, an ex-minister to Liberia, and others without distinction of party, setting forth the following facts: That during the two weeks preceding April 7 there had arrived by steamboat at St. Louis, having come up the Mississippi river, chiefly from the states of Louisiana and Mississippi, as many as 2,000 negroes, including men and women, old and young, with many of their children, that this multitude expressed an eager desire to reach Kansas; and without exception, so far as could be learned, refused all overtures or inducements to return south, even if their passage back was paid for them. That the condition of the great majority of them was that of absolute poverty; they being clothed for the most part in thin and ragged garments, and supported during their stay in St. Louis partly by public but mostly by private charity. The older ones in this migration had been formerly slaves in the south: all related the same story as to the causes of their departure from their homes—great privation and want from excessive rent exacted for land; murder of their colored neighbors; and personal violence threatened against themselves. The memorial was accompanied by affidavits given by the negroes, relating instances of political and other assassinations, and other cases of personal violence and outrage. This migration continued to flow steadily northward, and the colored people already living in Missouri and Kansas were embarrassed by the necessity imposed upon them of affording assistance to the emigrants, in which they were comparatively little aided by the white population of the north, although earnest calls by the press and by public speakers were made in all directions. By the middle of April it was publicly alleged that certain counties in Mississippi, and some river parishes in Louisiana, were being depopulated, so far as the negroes were concerned; also from interior points numbers had fled to St. Louis by rail. It appeared, on investigation, that this movement had been a matter of discussion among the negroes of the gulf states during several years, but the simultaneous character of the migration was not explicable on any general theory. Nor was the reason for selecting Kansas as the concluding point made clear. The climate of that state was so severe in the early spring that great suffering occurred among those who reached it; but neither this fact, nor the stories of hardships and dangers which were industriously circulated by these interested in opposing the movement, appeared to have the slightest effect in retarding it. It was alleged that local associations had been formed in the southern states for the purpose of encouraging migration northward. There was, however, no evidence of any united action by such associations. It was alleged, also, that the movement had been devised and executed partly in the interest of certain Kansas land speculators, and
partly by railroad companies. Mass meetings of colored people were held in New Orleans, Vicksburg, and other southern cities, during the spring of 1879, for the purpose of encouraging the negro migration; while meetings of planters and others employing negro labor were convened, at which the dissatisfied negroes were invited to state their grievances, with a view to redress, if practicable. A colored convention assembled at Nashville, Tenn., on May 7, at which delegates were present from Alabama, Arkansas, Georgia, Indiana, Illinois, Louisiana, Mississippi, Missouri, Nebraska, Ohio, Oregon, Pennsylvania, South Carolina, and Tennessee. The whole subject of the condition of the negro race in the south since the act of emancipation was considered in a report which was offered and adopted, and a plan to improve this condition was submitted. The following resolution was adopted: "Resolved, That it is the sense of this conference that the colored people should emigrate to those states and territories where they can enjoy all the rights which are guaranteed by the laws and constitution of the United States, and enforced by the executive departments of such states and territories; and we ask of the United States an appropriation of $500,000, to aid in the removal of our people from the South." By Aug. 1, more than 7,000 needy colored refugees had arrived in Kansas from the southern states, and the flow continued steadily during the summer. Public attention was diverted from it, however, and as an occasion for popular excitement it gradually died out. During 1880 but little was heard of the exodus, though the migration continued—not to Kansas alone, but to the older and more thickly settled states, and in bands of fewer numbers, thus avoiding notice.

NEGRO MINSTRELSY, a species of singing which originated among the negro slaves of the United States, and is now popular at public entertainments. The sentiment of the earlier of these negro melodies was of the most simple kind, the words mostly broken English, and the harmonies confined chiefly to two chords—the tonic and dominant. How the airs were composed has been a matter of curious inquiry. Some of them are believed to be broken down and otherwise altered old psalm-tunes, which had been caught up by the more musical of the negro race. In some instances, the singing of the melodies is accompanied with grotesque gestures; the effect being to give the idea of good-nature and love of fun in the dark-skinned minstrels. Negro melodies may be said to have had a most marked influence on Mr. D. Rice, who, first in New York, in 1831, and afterward in London, created a sensation by his singing of "Jim Crow." Other songs followed, such as "Jimalong Jokey and Buffalo Gals" and from less to more, there was created a very characteristic national music, if the Americans will allow us to call it so. Becoming extensively popular, and addressed to fashionable audiences, this negro minstrelsy now comprehends a large variety of songs, with airs of a pleasing kind, the whole much in advance of the original negro compositions. For these improvements, the world is indebted, among others, to Mr. E. P. Christy, who began as conductor of a band of minstrels at Buffalo in 1842, and who established himself in New York in 1846. At first his troupe were called the "Virginia Minstrels," but afterwards they were known as the "Christy Minstrels." Mr. Christy's great success in this species of entertainment brought other leaders and troupes into the field. In most cases, the members of the negro minstrel troupes are only negroes in name, with faces and hands blackened for the purpose. See Christy's Minstrels' New Songs, with Music, edited by J. Wade; and other similar collections.

NEGROPONT. See EUBEA.

NEGROS, Isla de. See PHILIPPINE ISLANDS.

NEGUNDO, a genus of trees of the natural order aceraceae (see MAPLE), differing from the maples chiefly in the disecous flowers, being destitute of petals, and in the pinnate ash-like leaves. The common Neogundo or ash-leaved maple, is a native of North America, and now not infrequent in Britain as an ornamental tree.

NEGUS, a compound of either port or sherry wine and hot water sweetened with sugar and flavored with lemon-peel and spices. It is a favorite beverage in England, and derives its name from a col. Negus, who claimed to be the inventor.

NEHEMIAH, son of Hachaliah, probably of royal descent, is first mentioned in the Bible as cup-bearer to Artaxerxes Longinmanns in his palace at Shushan about 444 B.C. Having learned the sad fate of the returned colonists in Jerusalem, he prevailed upon the king to send him to his brethren there with full powers "to seek their welfare." For twelve years (444-432), he was untiringly engaged as "governor" in works for their safety from within and without; refortifying the city walls, notwithstanding the hindrances and dangers that beset him on all sides; inducing people from the country to take up their permanent abode in the city, thus promoting its prosperity; and finally, settling the controversy respecting the sacrifice of the Passover, and especially the question of the observance of the law in the hearts of the rough immigrants. He then returned to Persia, trusting to the new vitality which his reforms had, as he thought, infused into the Jewish commonwealth. But not long afterwards—within a period which it is extremely difficult now to fix—he had again to obtain leave from the king, for the purpose of abolishing the many abuses that had crept in during his brief absence from Jerusalem. His energies now were chiefly directed against the foreign elements mixed up with the people, both privately and publicly. He enforced the rigorous observance of feast and
Negro, Neighbrerry.

Sabuth, and rearranged the temple service in accordance with its primeval purity, procuring at the same time the means for its proper support by inducing the people to offer the titles as of old. His second stay at Jerusalem seems to have lasted between ten and fifteen years; but the dates, as gathered from circumstantial evidence only, are exceedingly vague. He seems to have lived to an old age, but the place and year of his death are unknown. What was the part he took in the formation and reedition of the biblical canon, cannot be investigated in this place. But there can hardly be a doubt that, among the reformatory works undertaken by him, the collection, and perhaps the edition of some of the books of the Old Testament must be included.

The book known under his name (in 13 chapters) is believed only partly his own work. Recent investigation ascribes to him only the first six chapters, part of the seventh, and the last chapter and half; the rest being a compilation by other hands. Its style and character are very simple, free from anything supernatural or prophetic. Its language resembles much that of Chronicles and Ezra, and is replete with Aramaisms and other foreign, partly Persian words. Originally considered a mere continuation of the Book of Ezra, it was, by the Greeks and Latins at first called "The Second Book of Ezra." Gradually, however, it assumed its present independent position in the canon after Ezra. It is supposed to have been written or compiled towards the end of Nehemiah's life.

NEHEMIAH, BOOK or, the latest of the historical books of the Old Testament, was in some ancient Greek and Latin versions called the second book of Ezra or Esdras. This may be accounted for by the intimate official relations between Ezra and Nehemiah, and by the similarity of the circumstances in which they acted and wrote. Without the title, "The words of Nehemiah"—prefixed to the book in modern Hebrew Bibles, and retained in the English version—its first words, "And it came to pass," might appear like a continuation of Ezra. The two books, however, contain internal marks of independence in the books, and there is no more reason to doubt that Nehemiah wrote the one than that Ezra wrote the other. Some, indeed, to prove the difference of authorship, say that Nehemiah exhibits an egotism in speaking of his own actions from which Ezra is free. But to this it is replied that Ezra, in chapters viii. and ix., adopts the same style in speaking of himself in the first person which Nehemiah at greater length employs; and that both authors were led by the time and circumstances to write in a similar way.

While Nehemiah was doubtless the author of the book, he evidently compiled part of it from historical sources: chapter vii. 6-53, was, as he says, copied from a register which is found also in Ezra ii. The second part, chapters viii. x., is said to be marked by a Levitical bias, different from the rest of the book, and by the use of the third person instead of the first in speaking of Nehemiah. Hence, some critics have ascribed these chapters to Ezra or some unknown writer. But critical scholars generally consider these views without force. The third part, chapters xi.-xiii., is acknowledged by all to be chiefly, if not altogether, Nehemiah's work.

The book records: Nehemiah's sorrow over the desolations of Jerusalem and his prayer to God for the opportunity to rebuild it; the permission granted him by the king to undertake the work; his arrival at the city and survey of the ruins, followed by the rebuilding of the walls; the opposition of the Jews' enemies, and the plans by which their efforts were defeated; the complaint of the people against the oppression of the nobles, and the redress of the evil; the crafty plot of their enemies, and its defeat by Nehemiah's straightforward boldness; the record of the families that returned first from Babylon, followed by an account of the offerings made by the rich and poor towards the work; the reading of the law by Ezra the scribe, accompanied with a joyful celebration of the feast of tabernacles; the mourning, fasting, and repentance of the people, expressed by a full confession of sin and by a solemn covenant sealed by princes, priests, and Levites, and confirmed with an oath by the whole multitude of the people, to observe the law, sanctify the Sabbath, sustain the services of the temple, and bring in all the tithe; the selection by lot of a tenth of the people to dwell in Jerusalem, and the distribution of the rest through the other cities of the land; the registry of the Levites and Levites, and the gathering of the latter from all parts of the land to dwell in Jerusalem; the dedication of the wall of Jerusalem, accompanied with the offering of large sacrifices and the utterance of great joy which was heard afar off; the admission of heathen strangers into the temple during Nehemiah's absence in Persia, and their summary expulsion after his return; his enforcement of the broken covenant to pay the tithe, to sanctify the Sabbath day, and to refrain from marriages with the heathen around them.

NEILIG, Victor, b. Paris, 1830. His instructors in painting were Abel de Pujol, and Cogniet. After residing some time in Havana, Cuba, he removed to New York, where he gained a reputation by his pictures representing the romance and poetry of American history. In 1860 he was elected a member of the national academy of design. Among his best-known works are "Gertrude of Wyoming," "Hiawatha and Minne-baha," and "Pocahontas."

NEILGHERRY (properly NILGHIR) HILLS (Skr. nila, blue, and gir, mountain), a remarkable group of mountains in the s. of Hindustan, entirely isolated, with the exception of a precipitous granite ridge, 15 m. in width, which connects it with the high table.

U. K. X.—30
land of Maisalur on the north. Lat. 11° 10' to 11° 35 n., long. 76° 30' to 77° 10'. The shape of the group is that of a triangle, of which one side faces the district of Mahabar on the west. Greatest length, about 40 m.; average breadth, about 15 miles. The base of the mountains is covered by a dense and unhealthy forest, swarming with wild animals, among which are the elephant and tiger; but in the higher regions of the hills wood is comparatively scanty. The surface of the group is undulating, rising, in the peak of Dodabatta, near the center, to the height of 8,760 ft., the greatest height, as yet ascertained, in India s. of the Himalayas. The hills for the most part consist of granite, covered often to the depth of upwards of 10 ft. by a richly productive black soil. There are several morasses yielding peat, which is used for fuel. The higher lands form a fine open grass country, covered with the vegetation of the temperate zone, and inhabited by a most remarkable tribe, the Todas or Tortures (herds-men). This tribe numbers only about 2,000 persons. The men are tall and handsome, with Roman noses, fine teeth, and large expressive eyes; the women are singularly beautiful. Their religion is theis-m; they have no idols. Owing to their great elevation the Neillgherry hills have a delightfully cool climate, and are much resorted to on this account by invalided Europeans. The principal station, and the only place on the hills that deserves the name of a town, is Unkamad, situated in the center of the hills, at an elevation of 7,300 ft., above sea level. Its climate is cold and damp during the monsoon; at other times it is intensely dry, and the mean annual temperature is 58°.

NEILGHERY NETTLE, Girardinia Lochonolitii, a plant of the natural order urceae, nearly allied to the true nettles, and possessing in a high degree the stinging power which is common to that order. It is frequent on all the higher ranges of the Neillgherry hills. The bark yields a valuable fiber, which the natives obtain by first boiling the whole plant to destroy its stinging properties, and then peeling the stalks. The fiber is of great delicacy and strength, and is worth £200 a ton in England. The cultivation of the plant is therefore thought likely to be remunerative.—Markham's Travels.

NEILL, Thomas H., b. Penn., 1825: educated at West Point, and after graduating in 1847 was assigned to the infantry. At the outbreak of the rebellion he organized the 23d Penn. Vols., and commanded the regiment in the peninsular campaign of 1862. The same year he was brevetted brig. gen., and at Frederick'sburg, Mary Heights, and Gettysburg commanded a brigade of the 6th corps. In 1864 he was made maj. with brevet rank of maj. gen. for gallant conduct at the siege of Petersburg and battle of Winchester. Since the end of the war he has been promoted to the rank of lieut-col., has been engaged in the Indian warfare, and in 1875 was made commandant of West Point.

NEIRA. See Moluccas.

NEISÉ, a t. of Prussian Silesia, and a fortress of the second rank, is situated in a broad valley on the Nisze, an affluent of the Oder, 30 m. s.w. of Oppeln. It consists of the town proper on the right bank, of the Friedrich's town, and of the Preussen fort on the left bank. It contains two great squares, has eight Catholic and two Evangelical churches, a hospital, theater, etc. It carries on manufactures of arms, chemical products, and manufactures of paper. Its inhabitants are chiefly German and Polish. The population in 1871 was 19,376. Neisé, formerly the chief town of a principality of the same name, and the residence of a prince-bishop, has frequently been the scene of conflict.

NEJIN', an ancient t. of Little Russia, in the government of Tchermonof, on the Oster, an affluent of the Donieper, about 80 m. n.e. of Kiev. It fell into the hands of the Lithuanians in 1320, and of the Poles in 1386, but was annexed to Russia in 1654. Nejin is an industrious town of (1867) 20,516 inhabitants, many of whom are descendants of Greek immigrants who settled here in the reign of Catherine II. The principal branch of industry is the cultivation of tobacco. Great quantities of leaf tobacco are sent hence to St. Petersburg, Riga, and Mittau. The chief institutions are 2 monasteries, 25 churches, and a lyceum.

NÉLATON, Auguste, 1807-73; b. Paris; studied with Dupuytren, graduated in medicine in 1836, practiced surgery in several hospitals, and was adjutant professor of the faculty of Paris from 1839 to 1851, and professor of clinical surgery till 1867; became a senator in 1868, was member of the academy, and surgeon to Napoleon III.; made several improvements in surgery, one of which was for the extraction of stone of the bladder. A probe, having an unpolished porcelain knob at its end, much used in military surgery for reaching or lead bullets, is called Nélaton's probe. In conjunction with Velpun he published Rapport sur la Progres de la Chirurgie in 1867; but his principal work is Elements de Pathologie Chirurgicale, in 5 vols. 2d ed., 1867-70.

NELIGHT, a co. in central Nebraska, drained by the Loup fork of the Platte river; 576 sq. miles. Its surface is adapted to stock-raising, but is very little cultivated.

NELLORE, a t. of British India, capital of a district of the same name, in the presidency of Madras, situated on an elevation on the right bank of the northern Pennar, 20 m., from its mouth, and 35 m. n.w. from Madras, a town irregularly built, and the population in some places much crowded; but there are some good streets. The abundant supply of water contributes to the health of the town. Nellore was formerly an important fortress. It is a curious circumstance that, in the end of last century, a pot filled
with Roman gold coins and medals—chiefly of Trajan, Adrian, and Faustina—was found under the ruins of a small Hindu temple at Nellore. Pop. 71, 29,932.

NELSON, a co. in central Kentucky, traversed by the Southern and the Louisville and Nashville railroads; drained by Salt river. Pop. 14,864—3,918 colored. The woods are slightly kingly and large, covered with forests, the soil fertile, good lime-stone being found in several parts. The principal products are lumber, grain, wool, and live stock. It has numerous saw-mills, 3 flour-mills, and 8 distilleries. Co. seat, Bardstown.

NELSON, a co. in central Virginia, extending from the Blue ridge on the n.w. to the James river on the s.e., and drained by the Tye and Rock rivers and Rockfish creeks; crossed by the Washington City, Virginia Midland and Great Southern, and the Atlantic, Mississippi and Ohio railroads; and intersected by a canal leading to Richmond: 340 sq.m.; pop. '80, 16,535—7,512 colored. The soil is fertile, and the surface undulating, in some parts being covered with extensive forests. Wheat, Indian corn, oats, and tobacco are the leading products. Co. seat, Lovingston.

NELSON, the capital of a province of the same name, in New Zealand, is situated at the n. end of South island, at the mouth of the Matiai, a small river, and at the head of a large bay called Blind bay. The situation is very beautiful, on a flat, hemmed in by rugged hills and amidst almost tropical luxuriance. The harbor, however, only admits vessels of 500 tons at high water, and this circumstance has much retarded the progress both of the town and the settlement. The center of the town is a hill rising 40 ft. above the surrounding streets, and laid out as a square with an Episcopal church in its center. Nelson is the seat of a bishop. The city was founded in 1841. Pop. '71, 5,534; with suburbs (1877) about 10,000. Three newspapers are published here. The manufactures of the town comprise cloth and leather.

NELSON, DAVID, 1793-1854; b. Tenn.: graduated at Washington college, Va.; studied medicine in Danville, Ky., and in the Philadelphia medical school; returned to Kentucky at the age of 19, intending to practice his profession, but the war of 1812 having commenced, he joined a Kentucky regiment as a surgeon, and went to Canada. Returning he came near losing his life from hunger and fatigue, but was found and saved by his relative, col. Allen. He resumed his medical practice at Jonesborough, his native town. Religiously educated, he had early made a profession of religion, but while in the army he became an infidel. He soon, however, became convinced of the truth of the Bible, and determined to enter the ministry. He was licensed to preach in April, 1825. He preached three years in Tennessee, and published also at Rogersville the Calvinistic Magazine. In 1828 he succeeded his brother Samuel as pastor of the Presbyterian church in Danville, Ky. In 1830 he removed to Missouri and established Marion college, near Palmyra, of which he was the first president. Earnestly advocating the cause of emancipation he found it expedient to leave Missouri, and in 1836 he removed to Illinois, where he established at Oakland, near Quincy, a school for the education of young men for the ministry. He exhausted his pecuniary means and the institution failed. In 1838 he published a work of great interest—\textit{Catechism and Code of Inoffendibles}—which had an extensive circulation and passed through several editions in America and England. He wrote a work entitled \textit{Wealth and Honor}, but the manuscript was lost in passing from his hands. He wrote articles on missions, baptis-m, etc., for the New York Observer and other public journals.

NELSON, HORATIO, the greatest of Britain's admirals, was b. on Sept. 29, 1758, at Burrough Thorpe, Norfolk, of which place his father, Edmund Nelson, was rector. His mother's maiden name was Suckling, and through her he could claim a collateral kinship with the celebrated sir Robert Walpole. As a child he was feeble and sickly; and throughout life his small, frail, and attenuated frame seemed to consort but poorly with the daring and impetuous spirit which "stirred and lifted him to high attempts." At the age of 13 he entered the royal navy, commencing his career in the \textit{Repsoneous}, 64 guns, commanded by his uncle, capt. Suckling. Then, even more than now, promotion in the first stages of the profession was determined by admiration interest; and fortunately for him and for England, his uncle, shortly afterward becoming comptroller of the navy, was able to facilitate his rise. His promotion was nearly as rapid as it could be, and before he was quite 21 he had attained the rank of post-captain, which fairly opened the way for him to the higher honors of the service. Up to this time no opportunity had been afforded him of achieving any marked distinction, but to all who were brought into contact with him he had already approved himself a bold and capable officer. Henceforward, for some years, he was nearly constantly employed in a variety of harassing services; and in all, his conduct was such that in no long time he had made for himself a brilliant reputation. His growing fame was as yet, however, chiefly confined to professional circles, no very signal exploit having brought his name prominently before the public. But with the advent of the war with revolutionary France the time had come when he was to "flame amazement" on the world by a series of noble deeds, in the latter of which all other naval glory looks pale. In his obscure years, he seems to have been cheered under what pained him as unmerited neglect by that presence of a grand destiny, which has so often preceded to a career of exceptional splendor. Thus, on one
occasion, he writes: "They have not done me justice. But never mind. One day I'll have a gazette of my own." And subsequently the same confidence is expressed with something like the depth of a religious conviction: "One day or other I will have a long gazette to myself. I feel that such an opportunity will be given me. I cannot, if I am in the field of glory, be kept out of sight; wherever there is anything to be done, there Providence is sure to direct my steps." In 1793 appointed to the <i>A discontent</i>, 64 guns, he took a distinguished part, among other services, in the sieges of Bastia and Calvi, in Corsica, losing an eye at the last of these; and in the celebrated action of Sir John Jervis off Cape St. Vincent with the Spanish fleet, to a maneuver of extreme and masterly daring, executed by Nelson in defiance of orders, that officer was mainly indebted for the splendid success obtained, and the peage with which it was rewarded. Though in the interval an expedition which he commanded against Teneriffe had failed disastrously, with loss to himself of his right arm in the assault, it was on all hands admitted that everything was done on the occasion which skill and valor in their highest combination could effect, and Nelson on his return to England in 1797, was received with general acclamation. He was invested with the order of the bath, and a pension of £1000 a year was voted to him. Being next year intrusted with a fleet, he signalized this his first independent command of any magnitude by the stupendous victory of the Nile, memorable in naval annals as the complete annihilation of an enemy on record. See Anoukian, Finding the French fleet—to which his own was considerably inferior in force—skillfully moored so as to defy ordinary attack, he adopted the novel expedient of doubling on the enemy's ships, and was rewarded with success the most consummate. Of the French line of battle, two ships only escaped to be afterward captured; and it was considered that solely a wound in the head, which in the heat of the action prostrated Nelson, did even these owe their temporary safety. Honors were now from all quarters showered upon him; and in particular the gratitude and enthusiasm of his countrymen were signified by the title bestowed on him of baron Nelson of the Nile, and a grant of £2000 a year for his own life, and the lives of his two immediate successors. For his services immediately subsequent, in effecting the expulsion of the French from Naples, the Neapolitan king rewarded him with the dukedom of Bronte and a domain of £3000 a year. These last honors, however, were in one sense dearly purchased. The single suspension of a fleet on his side, the slight regard of his rivals to his command in Naples, and of certain questionable acts into which by these he was led. The only flaw in his private character was his infatuated attachment to lady Hamilton, the wife of the English ambassador, a woman of questionable antecedents, but perilous fascination, with whom he was here thrown in contact. The influence which she now obtained over him, she continued to the end to exercise. Early in life he had married, and married happily. If to the charms of an impure adventuress he sacrificed, on his return to England, the wife to whom before he had been tenderly devoted, it is not necessary to indulge in comment. Let us compassionately the one cruel frailty of a man in all else and in his proper nature, as gentle and generous as he was brave. His next magnificent exploit was the battle of Copenhagen in 1801, in which, after a struggle of terrible severity, he shattered the naval power of Denmark, and along with it the dreaded coalition against England of the three northern kingdoms. Never were the danger and danger worse than when Nelson was brilliantly displayed than on this most trying occasion. In the moral courage to accept responsibility at all hazards, no man ever surpassed him. In the heat of the battle, his chief, sir Hyde Parker, in deadly anxiety as to the issue of what at a distance seemed to be a hopeless conflict, signaled him to discontinue action. "Damn the signal!" said Nelson, when this was reported to him. "<i>Keep mine for closer battle flying</i>. That's the way I answer such signals. Nail mine to the mast." And with the certainty of professional discretion and ruin staring him in the face in case of failure, he worked out his grand triumph. Had Nelson's services here ceased, his fame would still have been assured as the greatest of England's naval heroes. But a crowning glory awaited him. In the earlier part of 1805, glowing with fierce ardor and impatience, he had chased half round the world a French fleet of nearly double the force of his own, scared by the very terror of his name; and on the memorable Oct. 21 of that year, the desire of his life, the battle of Trafalgar, in the Bay of Teneriffe, Nelson having afloat the navies of France and Spain amusing to meet him in frank conflict. Of the glorious consummation which followed we need not speak in detail. Ere night, the power of France upon the seas was annihilated, and her threatened invasion of England had become an abortive dream. But Nelson was no more. He died as such men wish to die, amid the thunders of his mightiest victory. The character of Nelson was, for a man of his greatness, unusually simple and transparent. A more absolute singleness of aim and aspiration than his is difficult even to conceive of. Literally on fire with that ardor and passion of enthusiasm without some tincture of which scarce any man perhaps has ever yet achieved distinction, he was driven by it imperiously in one direction. The greatest of sailors—he was a sailor and little else. Of his genius for command it would be idle at large to speak. In coolness, foresight, promptitude, instant intuitive decision, and a daring, which, even when it seemed at times to touch temerity, was yet regulated throughout by the nicest calculation of reason, he has perhaps never been quite equaled on the element. His nature
was most noble and humane. His heart was as soft as a woman’s, and overflowed with all liberal generosities. He had but to be known to be beloved; and of the tender chirality of his relations with his gallant brethren in arms it is touching to read.

NELSON, SAMUEL, M.A., 1792-1873; b. N. Y.; educated at Middlebury college, and admitted to the bar in 1817. He was a presidential elector for New York in 1820, and a circuit judge 1823-31. In 1844 he was appointed an associate justice of the state supreme court, which office he retained till 1872. He was a member of the N. Y. constitutional convention in 1846, and of the joint high commission for the settlement of the Alabama claims in 1871.

NELSON, THOMAS, 1728-89; b. Va.; son of William Nelson, president of the Virginia colonial council. He was educated at Trinity college, Cambridge, England. Returning to this country in 1761, he took up his residence at Yorktown on the family estates. In the disputes with Great Britain he warmly advocated the colonial cause, both privately and in the house of burgesses. He served in the first provincial convention of 1774, and in the second of 1775. In the latter year he became col. of the 2d Va. regiment, but resigned in 1776 upon his election to the constitutional convention. In this body he introduced a resolution instructing the Va. congressional delegation to bring before congress proposals for a declaration of independence. He was elected to congress in time to sign the declaration, but resigned in May, 1777, on account of ill-health. In August of the same year, when a British squadron under admiral Howe was off the Virginia coast, he became commander-in-chief of the state troops, and soon after, at the call of congress, led a cavalry battalion to Philadelphia. After the alarm occasioned by the approach of Howe had subsided, he returned to the legislature, where he resisted the proposed confiscation of British property, maintaining that it was unjust to make private persons suffer for public wrongs. Early in 1779 he was again a member of congress, and was again forced by ill-health to resign. In May the same year, he organized the state militia, for protection against a British foraging and plundering expedition then invading Virginia. In 1780, when congress had asked for contributions to pay for the expenses of the French contingent, Virginia attempted to raise a loan of $2,000,000. In the depreciated condition of the public credit, there was little hope of negotiating that sum, but a large amount was advanced by Nelson, who made himself personally responsible. He also paid two Virginia regiments, which had refused to go south till the Virginia assembly had arranged their pay. In 1781 he succeeded Jefferson as governor. The British were embroiling the state, and Nelson opposed them with what militia he could muster. He was forced to exercise extra legal powers, but his acts were afterward sanctioned by the legislature. In command of the state militia at the siege of Yorktown, he ordered the bombardment of his own house, the most valuable in the town. He was already financially embarrassed by his loans to the government, and in his last days his property was sold to pay his debts. He resigned in Nov., 1781.

NELSON, WILLIAM, 1825-62; b. Ky.; brother of Thomas Henry, minister to Chili 1861-66; joined the navy in 1840, and in 1847 commanded a battery in the fleet which bombarded Vera Cruz, keeping up a continuous cannonade and seconding the movements of the army under Scott, resulting in the capture of the city and fort. He served in the Mediterranean and south Pacific, and in 1854 was promoted to master, in 1855 to lieut. In 1858, when the slave ship Echo was required to discharge her cargo of negroes into the keeping of the Niagara, for the purpose of restoring them to African soil, he was ordered to the latter vessel. In 1861 he was on ordnance duty at Washington, and at the outbreak of the rebellion he was placed in command of the gun-boats on the Ohio, with the rank of lieut. commander. Soon after, he left the navy, and entering the military service, was ordered to Kentucky. He there established recruiting stations, and organized camp "Dick Robinson," near Danville, and a similar rendezvous at Washington, in Mason county. He was promoted to brig. gen. Sept. 1861. At the battle of Shiloh, April, 1862, he commanded the 2d division under gen. Buell, whose forces united with gen. Grant's were attacked by the confederate gen. Beauregard. He was wounded at the battle of Richmond, Ky. In 1862, when Louis ville was threatened with an attack of the Confederates under gen. Bragg, he commanded the union forces, ordered earthworks to be constructed, pressing private citizens into the service, and defending the position until the arrival of gen. Buell with the army. In 1862 he was commissioned maj. gen. of volunteers, and in September was fatally shot at the Galt house, Louisville, by the union gen. Jefferson C. Davis of Indiana, in a personal quarrel.

NELSON, WOLFRED, 1792-1863; b. Montreal; son of an English officer; in 1811 he began the practice of medicine in St. Denis. In the war with the United States, 1812, he served as surgeon. He was chosen representative of Sorel in the Canadian parliament of 1827. In the revolution of 1837 he was prominent, and was in command at the victory obtained by the insurgents at St. Denis, on the Richelieu river, but was captured and sent to Bermuda as an exile. In the next year he settled at Plattsburg, N. Y., and in 1845 returned to Montreal, a general amnesty having been declared. He was again elected to parliament from his former district in 1844 and 1845, and in 1851 was made inspector of prisons, a position which he held for several years. He served as mayor of
Montreal two terms and was at the head of the Lower Canada college of physicians and surgeons.

NELSON RIVER, British North America, rising in the n. extremity of Lake Winnipee in the North-West territory, a branch of the Saskatchewan, after passing through a number of lakes runs n.e. into Hudson's bay, where it is sometimes called Katcha- \n
It is deep, wide, and swift, and in its course makes many abrupt turns, and has many rapids and falls that render it almost un navigable. That part of the area e. of the lake of the Woods and lake Winnipee, is a rough country with a soil of Laurentian formation except for 100 m. of the river's course through the Silurian plain of Hudson's bay. In the former region one-quarter is arable land, about one-half is too cold for cultivation, and about 70,000 sq. m. of timber constitute the remainder. The area of its basin is 392,000 sq. miles. West of lake Winnipee it traverses a fertile country adapted to wheat culture. Its length to the head of the south fork of the Saskatchewan is 1792 m., and at its mouth is York, a town and fort, one of the principal trading posts of the Hudson's bay co. company.

NELUMBO, Nelumbium, a genus of aquatic plants similar to water-lilies, and often included under that name, as well as by some botanists in the natural order Nymphaeaceae (q.v.); although by others constituted into a distinct order, Nelumbiaceae, differing in the want of albumen in the seed, and in the distinct carpels, which are one-seeded, and buried in the cavities of a large fleshy receptacle; which eventually becomes a broad hard bed, full of holes, with the large seeds half buried in them. The flowers and leaves are very large, and those of the genus Nelumbo are few, which are found in the warm parts of Asia, in the n. of Africa, and in North America. They are all distinguished by the beauty of their flowers. N. speciosum is the Egyptian Bean of Pythagoras, the lotus (q.v.) of the Hindus, held sacred by them and by the people of Thibet. It is also much esteemed and cultivated in China, and elsewhere in the e., for its seeds, roots, leaf-stalks, and flower-stalks, all of which are eaten. It has been used as food by the Egyptians from remote antiquity. The seeds are in size and shape like acorns, with a taste more delicate that that of almonds. The root contains much starch, and Oichoe arracoor is said to be obtained from it. Slices of it are often served up at table in China. Great quantities are pickled with salt and vinegar, and eaten with rice. The powdered root makes excellent soup with water or milk. The flowers are generally rose-colored, seldom white. The ancient Egyptian mode of sowing this plant, by inclosing each seed in a ball of clay and throwing it into the water, is practiced in the present day in India—V. ligustica is a North American species, extending almost as far north as Philadelphia; with yellow flowers. The seeds are sought after by children and by Indians, and the farnaceous roots are agreeable when boiled.

NEMAH, a co. in n.e. Kansas, having the state line of Nebraska for its n. boundary, drained by the Nemaha and Delaware rivers and by Vermillion creek; 730 sq. m.; pop. '80, 12,463—10,727 of American birth, 55 colored. It is intersected in the s. by the central branch of the Union Pacific railroad and centrally by the St. Joseph and Denver City railroad. Its surface is somewhat hilly and its soil is very fertile, producing large crops of wheat, corn, oats, potatoes, and dairy products. It is a fine country for stock-raising, and its rivers furnish excellent water-power. Its mineral products are limestone, much used for building-purposes, sandstone, coal, and gypsum. It has for that section a good supply of timber, appearing along the streams, and on the bluffs, in groves of oak, hickory, walnut, and cotton-wood. Co. seat, Seneca Court House.

NEMAH, a co. in s.e. Nebraska, having the Missouri river for its e. boundary separating it from Missouri; intersected by the Nebraska railroad in the s. and centrally by the Brownville to Aurora branch; 430 sq. m.; pop. '80, 10,451—9,256 of American birth. Its surface is hilly and drained by the Little Nemaha river, Muddy creek, and other small streams. A large proportion is prairie land with groves of ash, elm, cotton-wood, and hickory, which grow along the river bottoms where the soil is fertile, having a limestone foundation, and producing the staple products of the western states. It is eminently fitted for stock-raising. Limestone, found in abundance, is used for building-purposes, and coal is mined. Co. seat, Brownville.

NEMATELIA (derived from the Gr. words nemia a thread, and helmin, an intestinal worm), is the term given by recent zoologists to a large and important class of the subdivision versus of the articulate. The worms belonging to this class are of a more or less elongated cylindrical form. Their skin is thick and strong, and is usually wrinkled in such a manner as to give them an annulated appearance, which, however, disappears if the animal is placed in water. The nervous system in the higher forms (as the ascidian) consists of two lateral ganglia at the anterior extremity, which are united by a slender nervous ring, and from which two lateral nervous trunks proceed to the posterior part of the body; while in the lower forms no distinct nervous system can be recognized. No special organs of the senses are met with; but a general sense of touch is probably present. The digestive organs are extremely simple. In one order (the acanthocephal; no trace of an intestinal canal can be detected; in another order (the gordiacea), there is a mouth, but no anus; while the higher forms are provided with mouth, intestinal canal, and anus. In the higher forms, a kind of vascular system is developed in the skin, in
the shape of canals, in which the nutrient fluid is propelled by the movements of the body. No distinct respiratory organs can be detected; but in some genera there are glands whose object is not clearly known. These worms are unisexual; but the males are comparatively rarely found, and are always smaller than the females. With the exception of two families—the <i>acrodea</i> and <i>aegullatidae</i>, or paste and vinegar eels—all the animals of this class are parasitic; indeed, Carus, in his <i>Handbuch der Zoologie</i> (1863), vol. ii. p. 498, goes so far as to say that “probably all the nematela live as parasites, either during their whole lives or during certain stages of their existence.”

The nematelima are sometimes termed <i>pinniciormus</i>, just as the platelmia (tape-worms, flukes, etc.) are called <i>flat-parasites</i>. Most commonly, however, the term round-worm is restricted to the <i>aeredia tuberculoides</i>, the most common of the human entozoa.

This class is divisible into three very distinct orders—viz.; the <i>aenarchochephalia</i>, which are destitute of an intestinal canal; the <i>gordiacea</i>, which possess an intestinal canal, but no anus; and the <i>nematoidea</i>, which possess a perfect intestinal canal, provided with two orifices.

**NEMATOLEA** constitute the highest order of the nematelima, and indeed of intestinal worms generally, inasmuch as they present a distinct nervous-system, a complete intestine provided with mouth and anus, and distinct sexual organs. The history of their development is not fully known; but there is no reason to believe that these animals undergo any remarkable metamorphoses, although some perforate the intestinal walls, and become encysted in parenchymatous organs. The great majority of the nematelidae are parasitic. The nematolea are divided by Carus into twelve families, all the members of which are known only in a parasitic state of existence, excepting certain genera of the first and second family.

Although the intestinal canal is the most common residence of these worms, some, as <i>bischna spiralis</i>, are found chiefly in the muscles; others, as <i>flaria megistina</i>, in the subcutaneous cellular tissue, and others in the kidneys, lungs, etc. See Entozoa. For further information regarding these worms, the reader is referred to Eberth's <i>Untersuchungen uber Nematoden</i> (1863).

**NEMEA,** anciently the name of a deep and well-watered valley of Argolis, in the Peloponnesus, between Cleone and Phlius. It lies n. and s., and is from 2 to 3 m. long, and more than half a mile broad. It possessed a sacred grove, with a magnificent temple of Zeus, and was celebrated for the games called the <i>Nemcon games</i>, which took place four times in two Olympiads in an adjacent woody valley. This was one of the great national festivals of the Greeks, and, according to one legend, was founded by the seven princes who were combined against Theseus: according to another, by Hercules after his victory over the Nemean lion. The games consisted partly of exercises of bodily skill and strength—such as chariot-racing, quoit-throwing, wrestling, running in armor, horse-racing, boxing, throwing the spear, and archery, and partly of musical and poetical competitions. The prize was originally a crown of olive twigs, afterwards of parsley. We have eleven odes by Pindar in honor of victors in the Nemean games.

**NEMERTES,** a genus of marine <i>anamaria</i>, the type of a family, <i>nemertidae</i>, remarkable for the prodigious length which some of the species attain, which, in their most extended state, is 30 or 40 feet. But the animal which stretches itself out to this length, is capable of suddenly contracting itself to 3 or 4 feet. The structure is similar to that of leeches, but there is no sucker. These annelids feed upon mollusks by sucking them out of their shells. They generally lurk in the mud or sand of the sea-coast, and are sometimes drawn up with the nets or lines of fishermen. They twine themselves into knots and coils, apparently inextensible, but without any real entanglement. The life history of the <i>nemertidae</i> is curious. The embryo has at first a ciliated, non-contractile, oval body; from which there issues a small actively contractile worm, leaving behind it the oval worm, and this worm grows to the size already mentioned. The larval state, however, exhibits a cleft with raised edges, which becomes the mouth of the perfect animal.

**NEMESIAXUS.** MARCUS AURELIUS OLYMPICUS, b. about the middle of the 3d c., probably in Africa. He wrote four epistles, and a poem on hunting.

**NEMESIS,** according to Hesiod, the daughter of Night, was originally the personification of the moral feeling of right and a just fear of criminal actions—in other words, of the conscience. Afterwards, when an enlarged experience convinced men that a divine will would find room for its activity amid the little occurrences of human life, Nemesis came to be regarded as the power who constantly preserves or restores the moral equilibrium of earthly affairs, preventing mortals from reaching that excessive prosperity which would lead them to forget the reverence due to the immortal gods, or visiting them with wholesome calamities in the midst of their happiness. Hence originated the latest and loftiest conception of Nemesis, as the being to whom was intrusted the execution of the decrees of a strict retributive providence—the awful and mysterious avenger of wrong, who punishes and humbles guilty-doers in particular. Nemesis was thus regarded as allied to Ate (q.v.) and the Enmenides (q.v.). She was sometimes called Adrastea and Rhannusia, the latter designation being derived from Rhamnus, a village of Attica, where she had a temple. She was represented in the olden times as a young virgin, resembling Venus; in later times, as clothed with the tunic and pep-
lus, sometimes with swords in her hands and a wheel at her foot, a griffin also having his right paw upon the wheel: sometimes in a chariot drawn by griffins. Nemesis is a frequent figure on coins and gems.

NEMESIS, b. Syria about the middle of the 4th c.; bishop of Emessa in the reign of Theodosius the great, though the time is uncertain, and little is known about his life. He left a treatise in Greek on The Nature of Man, which treats of the soul and body. The observations and theories of Nemesis on the latter subject show considerable ingenuity and learning. His description of the glands, nerves, and spleen show him to have been thoroughly acquainted with the physiological learning of his time; and, in regard to the motion of the pulse and the object of the bile, have given rise to the supposition that he was acquainted with the circulation of the blood and the functions of the bile and liver. While it is dilated, it draws with force the thinner part of the blood from the next veins.” The soul was considered by Nemesis as formed of two parts: the rational part, composed of will, memory, and thought; and the irrational part, consisting of the passions and desires. He believed in the Platonic teaching as to the pre-existence of the soul.

NEMI, a lake in Italy, having on its margin a temple of Diana famous among antiquities. It was called Scipuium Diana, mirror of Diana, and is now known as Lago di Nemi. It is 17 m. s.e. of Rome. The ancient estimate of the distance from the temple to La Ricerca (their Aricia), a city of Latium, is 3 m.; and the place was celebrated throughout Italy on account of its sacred temple, grove and lake, and given the surname of Nemoralis. The n.e. margin is the site of the ancient town of Nemus now occupied by the village of Nemi overlooked by a feudal castle. It is less than 6 m. in circumference, lying between lake Albano and the town of Velletri, on the Appian Way, in the midst of steep high hills, embowered in trees, once peopled with votaries of Diana. It fills the crater of an extinct volcano and has no known outlet except a passage made by the ancients which still serves its original purpose. It is a favorite resort for tourists and artists.

NEMOURS, Louis Charles Philippe Raphael d'Orléans, Duc de, b. Paris 1814; 2nd son of Louis Philippe. In 1831 he was elected king of the Belgians, but declined, as he did a subsequent offer of the throne of Greece. He served in the two Belgian campaigns, and in Algeria, and was made het general. After the death of his elder brother, the duc d'Orléans, a bill was passed conferring the regency upon the duc de Nemours; but it was not sanctioned by public opinion, and he left France in 1848, and did not return till 1850. He married in 1840 Victoire-Antoinette, duchess of Saxe-Coburg, by whom he has 2 sons and 2 daughters.

NEAGH, a market t. of Tipperary co., Ireland, distant 95 m. s.w. from Dublin; pop. 71, 3,696, of whom the Roman Catholics were twelve times as many as the Protestants of the Episcopalian church, and there were fifty or sixty Protestants of other denominations. Neagh is the assize town of the North Riding of Tipperary, and is a place of more than ordinary pretensions in its public buildings. The ancient keep, called Neagh Round, is a striking object, and the court-house, jail, barrack, and union workhouse are imposing edifices. There is a free school, and three national schools. Among the not very numerous articles manufactured at Neagh, are woolens, tobacco, soap, and candles. It is, however, a place of very considerable inland trade.

NENA SAHIB. See Nana Sahib, ante.

NENNIUS, a monk of Bangor, in Wales, who is believed to have lived early in the 9th century. Others, but without authority, place him in the early part of the 7th century. He calls himself, in his history, a Briton, and not a Saxon, and a pupil of bishop Edbodus, or Elvogus. He is known only from the history of Britain ascribed to him, Historia Brittonum, or Euyelogia Britonnae. The work begins with a mythical genealogy of Brut, grandson of Jeneas, and first king of Britain. After a description of the Pictish emigration to n. Britain, and the Scottish settlement of Ireland, and a brief account of the Roman conquest and rule in Britain, the author says at the beginning that the work was compiled “from the annals of the Romans, and the chronicles of the fathers, from the writings of the Scots and Angilt, and the traditions of our ancestors.” His book is confused and often untrustworthy. Its chief value is the collection of legends contained in it, such as those of king Arthur and Merlin. It is in dispute, indeed, if Nennius ever lived, and if the history which bears his name be not a later forgery. The name of Nennius was not connected with it till the 13th century. The manucript contains many interpolations, the work of a copyist who admits that he omitted portions of the work of Nennius, and added passages of his own.

NEOLOGY, a term signifying new doctrine or new statement, and first used in Germany about the middle of the 18th c. to denote the new statement of Christian doctrine and new explanations of biblical facts which, in their developments, became widely known as rationalism. The Neologists at first, professing to regard Christianity as an inestimable blessing to men and the Scriptures as the rule of faith, proceeded to explain
the doctrines of the former and the facts of the latter according to what they called the increasing intelligence supplied by education and culture. Without affirming that anything in the Bible was false, they asserted that many things in it had been misunderstood. Without assailing the historical character of the miracles they attributed them entirely to natural powers and means. Beginning with explaining away the less important facts, they gradually applied the same process to the most vital doctrines. Thus, students of the Bible and of theology, as well as congregations and the people generally, were prepared for the absolute "rationalism" which denies a special divine revelation in the Bible. See Rationalism.

Neoplatonists, the name given to an illustrious succession of ancient philosophers who claim to have found their doctrines and speculations on those of Plato. Strictly speaking, however, the Platonic philosophy—that is, in its original and genuine form—expired with Plato's immediate disciples, Speusippus and Xenocrates. Arcesilus (q.v.), the founder of the new academy, and at a later period Carneades (q.v.), introduced and diffused a skeptical Probabilism, which gradually destroyed that earnest and reverent spirit of intellectual inquiry so characteristic of the great pupil of Socrates. The course of political events in the ancient world also largely assisted in bringing about the same result. The triumphs of the Roman power had been accomplished at the expense of national liberties, and had issued in a general deterioration of moral character, both in the east and the west. Public men, especially, sought, above all things, material gratifications, and came to look upon philosophy itself as only a more exquisite kind of luxury. It was quite natural, therefore, that skepticism and eclecticism should become the prevalent forms of philosophy. Besides, the speculations of the older philosophers were felt to be unsatisfactory. When men began to review the long succession of contradictory or divergent systems that had prevailed since the time of Thales the Miletian, in the gray dawn of Greek history, a suspicion appears to have sprung up that reality, certainty, truth, was either not attainable, or could only be attained by selecting something from every system. Moreover, the immensely extended intercourse of nations, itself a result of Roman conquest, had brought into the closest proximity a crowd of conflicting opinions, beliefs, and practices, which could not help occasionally undergoing a confused amalgamation, and in this way presented to view a practical eclecticism, less refined and philosophical indeed than the speculative systems of the day, but not essentially different from them. This tendency to amalgamation showed itself most promi-
nently in Alexandria. Placed at the junction of two continents, Asia and Africa, and close to the most cultivated and intellectual regions of Europe, that celebrated city naturally became a focus for the chief religious and philosophic of the ancient world. Here, the east and the west, Greek culture and oriental enthusiasm, met and mingled; and here, too, Christianity sought a home, and strove to quell, by the liberality of its sympathies, the myriad discords of paganism. "Greek skepticism," says Mr. Lewes, "Judaism, Platonism, Christianity—all had their interpreters within a small distance of the temple of Serapis." It is not wonderful, therefore, that a philosophy, which so distinctly combines the peculiar mental characteristics of the east and the west, as that pro-
mulgated by the Neoplatonists, should have originated in Alexandria. Yet, at the same time, it is but right to notice, as does M. Matter in his Histoire de l'Ecole d'Alexandrie, that it soon ceased to have any local connection with the city. Its most illustrious represen-
tatives were neither natives of Alexandria, nor members of the famous museum, and they had their schools elsewhere—the Romans, at the Seleucid school in Antioch.

It is not easy to say with whom Neoplatonism commenced. Scholars differ as to how much should be included under that term. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy, 1st, of Philo-Judaens and of Numanitists the Syrian; 2d, of the Chris-
tian fathers (Clemens Alexandrinus, Origen, etc.); 3d, of the gnostics; and 4th, of Ammon-
iius Saccas and his successors. Others, again, would exclude the second of these (though the Alexandrian divines frequently Platonize); while a third party is disposed
to restrict the application of the term to the fourth. The last of these modes of regarding Neoplatonism is the one most current, and is perhaps the most convenient and definite: yet Bonitzerck, Tememann, Lewes, etc., agree in considering Philo Judaeus (q.v.) an Alexandrian Jew, and (in part) contemporary of Jesus Christ, as the first of the Neoplatonists—i.e. (to say, as the first who endeavored to unite the mysteries of oriental belief with the rational speculations of the Platonists. A similar conclusion was at least partially arrived at by the Christian fathers of Alexandria, partly from a predilection for the philosophy in which they had been reared, and partly from a desire to harmonize reason and faith, and to make their religion acceptable to thoughtful and educated pagans; hence, they too may, not without reason, be classed along with Philo, though their spirit and aim are distinctively and even strongly Christian. In gesticism, on the other hand, speaking generally, the lawless mysticism of the east predominated, and we see little either of the spirit or logick of Plato. They may, therefore, be dismissed from the category of Neoplatonists. Regarding Philo-Judaus and the Alexandrian divines, it must be noticed that they wrote and taught in the interests of their own religion, and had no idea of defending or propagating a heathen philosophy. It is this which strikingly distinguishes them from the school founded by Ammonius Saccas, and also from an independent group of pagan teachers and authors who likewise flourished in the first and second centuries after Christ, and whose main object was to popularize and diffuse the ethics and religio-philosophic system of Plato, by allegorically explaining the ancient mysteries of the popular belief in harmony with the ideas of their master, but, at the same time, blending with these many Pythagorean and Aristotelian notions. The best-known names of this group are Plutarch (q.v.) and Appuleius (q.v.). These men have a better claim to the title of Neoplatonists than any of the others. They adhered far more closely to their great master, and were, in fact—to the best of their ability—simply popular expounders of his philosophy. Living at a time when paganism was in a moribund condition, they sought to revive, purify, and elevate the faith in which their fathers had lived. Christianity, a young, vigorous, and hostile system, was rooting itself in the hearts of men deeper and deeper every day, and these disciples of Plato tenderly attached to their ancestral religion—felt that something must be done to preserve from going out the fires that were feebly burning on the altars of the ancient gods. However, these commentators and expositors of Plato were not remarkable for their philosophical power; a fresh stream of life was first poured into the old channels of Platonic speculation by Ammonius Saccas (q.v.) and Plotinus (q.v.), and it is this fact which gives the school which they established its best claim to the exclusive title of Neoplatonists. "In no species of grandeur was the Alexandrian school deficient," as M. Saisset justly observes: "genuis, power, and duration have consecrated it. Reanimating during an epoch of decline the fecundity of an aged civilization, it created a whole family of illustrious names. Plotinus, its real founder, resuscitated Plato; Proclus gave the world another Aristotle; and in the person of Julian the apostate, it became master of the world. For three centuries it was a formidable rival to the greatest power that ever appeared on earth—the power of Christianity; and if it succumbed in the struggle, it only fell with the civilization of which it had been the last rampart" (Lewes's *Bibl. Hist. Phil.*, p. 259). The essence of all the Alexandrian speculations, we have stated, consists in the blending of Platonic ideas with oriental mysticism; the peculiarity of the Neoplatonists, strictly so-called, lies simply in the novelty, audacity, and ingenuity of their reasonings. They aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the highest, and the way in which they endeavored to accomplish this was by assuming the existence of a capacity in man for passing beyond the limits of his personality, and acquiring an intuitive knowledge of the absolute, that—what is beyond and above the fluctuations and dualities of "opinion." This impersonal faculty is called *c'edasey*. By means of it, man—ceasing, however, it should be observed, to be individual man, i.e., himself—can identify himself with the absolute (or infinite). Plotinus, in fact, set out from the belief that "philosophy" (i.e., "absolute truth") is only possible through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. This intuitive grasp or "vision" of the absolute is not constant; we can neither force nor retain it by an effort of will; it springs from a divine inspiration and enthusiasm, higher and purer than that of poet or prophet, and is the choicest "gift of God."

The god of Plotinus and the other Alexandrians is a mystical trinity, in the exposition of which they display a dialectical subtlety that even the most ingenious of the schoolmen never reached. The divine nature contains within it three hypostases (substances); its basis, if we may so speak, is called unity, also poetically primitive light, etc. This unity is not itself any thing, but the principle of all things; it is absolute good, absolute perfection; and though utterly incapable of being conceived by the understanding, there is that in man that assures him that it—the incomprehensible, the ineffable, is. "It has neither quantity nor quality; neither reason nor soul; it exists neither in motion nor repose; neither in space nor time; it is not a numeric unity nor a point; . . . it is pure esse without accident; . . . it is exempt from all want or dependency, as well as from all thought or will; it is not a thinking being, but thought itself—the principle and cause of all things." To the skeptic this "primitive light," we are afraid, will not seem very luminous. From "unity," as the primordial source of all things, emanates "pure
intelligence" (now—the current of modern German metaphysics); its reflection and image, that by which it is intuitively apprehended; from pure intelligence, in turn, emanates the "soul of the world" (psyche tou pantos), whose creative activity produces the souls of men and animals, and "nature" and finally, from nature proceeds "matter," which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness. Unity, pure intelligence, and the worldsoul thus constitute the Plotinian triad, with which is connected, as we have seen, the doctrine of an eternal emanation, the necessity of which he endeavors to demonstrate by the most stringent logic. Human souls, whose source is the pure intelligence, are—by some mysterious fate—imprisoned here in perishable bodies, and the higher soul are ever striving to reassemble to their original home. So Plotinus, when in the agony of death, said calmly to his friends: "I am struggling to liberate the divinity within me."

The most distinguished pupil of Plotinus was Porphyry (q.v.), who mainly devoted himself to expounding and qualifying the philosophy of his master. In him we see, for the first time, the presence of a distinctively antichristian tendency. Neoplatonism, which can only be properly understood when we regard it as an attempt to place paganism on a philosophical basis—to make the Greek religion philosophical, and Greek philosophy religious—did not consciously set out as the antagonist of Christianity. Neither Ammonius Saccas nor Plotinus assailed the new faith; but as the latter continued to grow, and to attract many of the most powerful intellects of the age into its service, this latent antipathy began to show itself. "Porphyry wrote against it; Lamblichus (q.v.), the most noted of his pupils, died the same. The latter also introduced a religious or "magic" element into Neoplatonism, teaching, among other things, that certain mysterious practices and symbols exercised a supernatural influence over the divinities, and made them grant our desires. Magic is always popular, and it is therefore not wonderful that Lamblichus should have had numerous followers. Aedesius succeeded to his master's chair, and appears to have had also a considerable number of disciples. To the school of one of them the emperor Julian belonged, whose patronage for a moment shed a gleam of splendor over Neoplatonism, and seemed to promise it a universal victory. After a succession of able but not always consistent teachers, we reach Proclus (q.v.), the last great Neoplatonist, who belongs to the 5th c., a man of prodigious learning and of an enthusiastic temperament, in whom the pagan-religious, and consequently antichristian, tendency of the Neoplatonic philosophy culminated. His ontology was based on the Triad of Plotinus, but was considerably modified in detail; he exalted "faith" above "science" as a means of reaching the same. The latter also introduced the doctrine of the "all naturally laid great stress upon the ancient Chaldæan oracles, Orphic hymns, mysteries, etc., which he regarded as divine revelations, and of which he considered himself—as indeed, he was—the last great "interpreter." His hostility to the Christian religion was keen; in its success he saw only the triumph of a vulgar popular superstition over the refined and beautiful theories of philosophy; it was as if he beheld a horde of barbarians defacing the statues and records of the Pantheon. The disciples of Proclus were pretty numerous, but not remarkable for high talent. Perhaps the ablest of his successors was Damascius, in whose time the emperor Justinian, by an arbitrary decree, closed the schools of the heathen philosophers. "The victims," says Cousin (Cours d'Histoire de la Philosophie Moderne), "are the victims of fierce retaliation, and of an obstinate persecution, these poor Alexandrians, after having sought an asylum in their dear east, at the court of Chosroes, returned to Europe (553 A.D.), were dispersed over the face of the earth, and a part especially in the deserts of Egypt, without converted for them into a philosophical Thebais." See Fichte, De Philosophia Nova Platonica Origine (Berl. 1818); Boutroux, Philosophorum Alexandrinarum ac Neo-Platonicerum recessio Accretionaria (564, 581, 1821); Matter, Essai Historique sur l'École d'Alexandrie (2 vols. Par. 1826); Simon, Histoire de l'École d'Alexandrie (2 vols. Par. 1843); Barthélemy St. Hilaire, De l'École d'Alexandrie (Par. 1845); Lewes, Biographical History of Philosophy (1857); and Ueberweg's History of Philosophy (Translation, Hodder and Stoughton: 1872).

NEOSHO, a co. in s.e. Kansas; intersected by the Lawrence and Southwestern railroad, and by two branches of the Missouri, Kansas, and Texas; drained by the Neosho river, flowing from n.e. to s.w., dividing it into two equal parts; 576 sq.m.; pop. '80, 15,124—14,156 of American birth. By far the greater part of the surface is an undulating prairie; wheat is raised in large quantities; Indian corn, oats, and grass are also staples. Limestone and coal are found. Co. seat, Erle.

NEOSHO RIVER. rises in e. central Kansas, in Morris co., and after flowing about 450 m, in a generally s.e. direction, empties into the Arkansas near Fort Gibson. It passes through Morris, Lyon, Coffey, Allen, Neosho, and Labette counties, in Kansas, and then enters the Cherokee reservation in Indian territory, changing its direction to s.w. The country through which it passes is mostly prairie and good wheat land. Coal is found near its banks.

NEOZOIC (Gr. new life), a term introduced by Edward Forbes to include all the strata from the trias to the most recent deposits. They are generally divided into the two great groups of secondary and tertiary rocks. This division is, however, quite arbitrary—the chief point of difference depending on the occurrence in the tertiary deposits of species supposed to be the same as some still living. There is no palaeontological
NEPA AND NEPIDE. See Water-Scorpion.

NEPAUL, or Nepal, an independent kingdom of Hindustan, lying on the southern slope of the Himalayas, is bounded on the n. by Tibet, on the s. and w. by British India, and on the e. by Sikim, a protected state. Long. 80° 15' to 88° 13' east. It is 500 m. in length by about 100 m. in average breadth. Area, 56,745 sq. m.; pop. estimated (1875) at 3,000,000. The kingdom is separated from the plains of India by the long narrow strip of land, resembling an English down, but unhealthy, called the Terai, which extends along the whole southern border. North of this, and running parallel with it, is the great forest of Nepal, from 8 to 10 m. broad. North of this strip is a tract of hilly country, and above that are two tracts of greater elevation, the first of which may be called mountainous, while the second might appropriately be called alpine, if it did not comprise, among its mountains, peaks, which, like mount Everest and Dhaulagirii, attain almost twice the elevation of mountain Blanc. The principal rivers are the Karnali, the Gogra, the Rapti, the Gunthuk with its tributaries, and the Kosi. The climate, most unhealthy in the Terai, is healthy and pleasant in the hilly and mountainous districts, suggesting that of southern Europe. In the Valley of Nepal—the district surrounding the capital—there is a perpetual mist, which in the rains may be exchanged for the cold of Russia by ascending the slopes of the hills which enclose it. The soil is extremely rich and fruitful. Barley, millet, rice, maize, wheat, cotton, tobacco, sugar-cane, pine-apple, and various tropical fruits are cultivated. Gold has not been found, but iron and copper mines are worked. The inhabitants consist mainly of two tribes—the Ghurkas, whose chief occupation is war, and the Newars, who are principally artisans. The capital of the country is Kathmandu (q.v.).

Nepenthe, a name derived from two Greek words meaning absence of grief, and applied to a narcotic drug employed by the Egyptians. Homer relates that Helen of Troy acquired from them the art of compounding the potion. Diodorus Siculus states that the women of Thebes were acquainted with the secret method of preparing it. Poe refers to it as producing forgetfulness:

"Wretch!" I cried, "thy God hath bent thee—by these angels he hath sent thee Respite—respite and nepenthe, from thy memories Lenore!"

Quaff, O quaff this kind nepenthe, and forget this lost Lenore!"

—The Raven.

William Smith, author of Greek and Roman Antiquities, says of nepenthe, "Among the ancients, an Egyptian drug, which had an exhilarating effect, and which was supposed to obliterate all sorrow from the memory of those who partook of it—thought by many to have been opium."

Nepenthes, the only known genus of a natural order of exogenous plants called Nepenthaceae, consisting of herbaceous or half-shrubby plants with dioecious flowers, natives of swampy ground in India and China, chiefly remarkable for their leaves. Each leaf consists of a dilated foliaceous petiole, prolonged beyond its foliaceous part, as if it were the prolongation of the midrib of a leaf, and terminating in a pitcher (nepenthium), from which the name Pitcher Plant has been very generally given to the species of this order. The pitcher is terminated by a lid, which is regarded as the true blade of the leaf. The fluid found in these pitchers is a secretion of the plant itself. Insects often enter the pitcher, and are apparently there dissolved and absorbed; so that the nepenthes rank amongst the plants called "insectivorous" by Mr. Darwin. Pitcher plants (N. didifolia) are not uncommon in our hot-houses.

Nephele, (Gr. nephele), a cloud, from its appearance. A misislicate mineral, scapolite group, occurring in six or twelve-sided columnar, scaly crystals, with or without pyramids, white, transparent, instead glassy and greasy; when in masses, greenish, bluish-gray, brownish, or brick red. Angles: O A 1 = 135° 55': a = 0.839. Analysis (about), aluminum one-third, rather more silicon, rather less sodium, traces of carbon and potassium, with more hydrogen; atomic combination. Nephele occurs both in ancient and modern volcanic rocks, mostly in grains or glassy crystals, and in metamorphic rocks allied to granite and gneiss, mostly in stout crystals. The former is sommithe, the latter, eleotide. Eleotide occurs at Litchfield, Me., with cencinite; in the Okar mountains, Ark., with brookite and schorlomite; in a boulder, with sodalite, at Salem, Mass. The earliest name for nephele is sommithe. Decamethere, 1797, from the place where found on Vesuvius, then called fettstein by Werner, 1808, and eleotide (Gr. elation, oil), from its greasy look, by Klaproth. The name of Hajy, 1801, has survived, and is owing to its becoming cloudy when immersed in strong acid. It is also called nephelein, and nefelina. (Dana, sys. of mineralogy, 1880.)

Nephelium. See Litchi.

Nephrite, a mineral which is not unfrequently called jade (q.v.), and of which xene- stone (q.v.) is very generally considered a variety. It is composed of silica, magnesia, and lime; is compact, with a coarse splintery fracture, very tenacious, sometimes trans-
lucent, greyish to the touch, and of a green or greenish color. It is found in granite, gneiss, greenstone, etc., in many parts of the world. Very fine specimens are brought from Persia, Siberia, and China, and are known as oriental jade. The kind called Italian jade is olive green, and strikes fire with steel; that from China is whitish, and does not strike fire. Nephrite is used for ornaments. The Turks make it into handles for sabers and daggers.

Many imaginary virtues were once ascribed to it, such as the cure of epileptic fits and of nephritic (Gr. nephros, kidney) complaints; hence its name.

**NEPHRITIS** (Gr. nephros, kidney), inflammation of the kidneys (q.v.).

NEPL, a t. in Italy. 40 m. from Rome; pop. 2,382. It was of Etruscan origin, but came under Roman control in 400 B.C. Many interesting archaeological remains are found in the vicinity.

**NEPOMUC.** See John of Nepomuk.

**NEPOS, CORNELIUS,** a Roman historian, born in the 1st c. B.C., but the place and precise time of his birth are unknown. He was the friend of Cicero and Catullus. The only work of Nepos's which has survived (if indeed it be his), is a series of twenty-five generally brief biographies of warriors and statesmen, mostly Greeks. These biographies are distinguished by the purity of their Latinity, the conciseness of their style, and their admirable exhibition of character, but sufficient care has not been exercised in the examination of authorities, nor is the relative importance of things duly regarded. Until the middle of the 16th c., these biographies, on the strength of the titles given in the various MSS., were generally ascribed to Emilianus Probus, a writer who lived in the latter part of the 4th c.; but in 1669, an edition was put out by the famous Dionysius Lambinus, who pronounced the so-called Lives of Emilianus Probus to be in reality the lost work of Cornelius Nepos, De Viris Illustribus. His weightiest argument is drawn from the excellence of the Latin, and the chastity of the style, so unlike the corrupt and florid language of the decline. Many critics hold that these lives ought to be regarded as an abbreviation of the work of Nepos by Probus. This hypothesis is not without its difficulties, but it is perhaps the least objectionable of any. There are many editions, among which may be mentioned those of Van Staveren (Leyd. 1773), of Tzschupee (Gott. 1804), and of Breni (Zur. 1820); and the book is in general use as a school-book. It has been very frequently translated into English and other languages.

**NEPTUNE,** an ancient Italian god. It is doubtful whether he was originally a marine deity at all, for the old Italians were the very opposite of a maritime people, yet his name is doubtless connected with no, to swim; hence, at an earlier period, he may have borne another designation, after which was forgotten. With the Romans he became a maritime power, and had grown acquainted with Grecian mythology, they, in accordance with their usual practice, identified him with the Greek god whom he most resembled. This was Poseidon, also Poteidun (connected with potos, a drink, ponos, the sea, and potamos, a river). Poseidon appears in his most primitive mythological form as the god of water in general, or the fluid element. He was the son of Cronos (Saturn) and Rea, and a brother of Jupiter. On the partition of the universe amongst the sons of Cronos, he obtained the sea as his portion, in the depths of which he had his palace near Ægæ, in Euboea. Here also he kept his brazen-hoofed and golden-maned steeds, in a chariot drawn by which he rode over the waves, which grew calm at his approach, while the monsters of the deep, recognizing their lord, made sportive homage round his watery path. But he sometimes presented himself at the assembly of the gods on Olympus and in conjunction with Apollo, built the walls of Troy. In the Trojan war he sided with the Greeks; nevertheless, he subsequently showed himself Romantically to the great sea-wanderer Ulysses, who had blinded his son Polyphemus. He was also believed to have created the horse, and taught men its use. The symbol of his power was a trident, with which he raised and stilled storms, broke rocks, etc. According to Herodotus, the name and worship of Poseidon came to the Greeks from Libya. He was worshiped in all parts of Greece and southern Italy, especially in the seaport towns. The Isthmian games were held in his honor. Black and white bulls, boars, and rams were offered in sacrifice to him. Neptune was commonly represented with a trident, and with horses or dolphins, often along with Amphitrite, in a chariot drawn by dolphins, and surrounded by tritons and other sea-monsters. As befitted the fluctuating element over which he ruled, he is sometimes figured asleep or reposing, and sometimes in a state of violent agitation.

**NEPTUNE.** See Planets, u. t.

**NEPTUNIAN,** a term formerly applied to the geologists who maintained the aqueous as against the igneous theory of the origin of rocks.

**NERAC,** a t. in the s.w. part of Lot-et-Garonne, a French department; situated on the river Boise. 15 m. s.w. of Agen; pop. about 7,500. It is divided into two parts; the old town on the right bank, picturesque but in decay; joined by bridges to the new town on the left bank. Ruins of a temple, aqueduct, and baths, indicate that a Roman city once occupied the site, but no information in regard to it is extant. There are also remains of a monastery of about 1250 A.D.; in later times changed into a castle. Névacook the Calvinist side in the first part of the 17th c., but was overcome by the duke of
Mayenne in 1621. It has a large corn-market, and a good trade in flax, hemp, linen, wine and brandy.

**NERBUDAH**, a river of Hindustan, rises in the Vindhya mountains, at a height of from 3,000 to 4,000 ft. above sea-level, in lat. 22° 40' n., long. 81° 52' e. It flows w., past Jabalpur (190 m. from its source), where the great depression of the Vindhya mountains on the n., and the Satpura mountains on the s., known as the valley of the Nerbudah begins. The other principal towns on its banks are Hoshangabad, Burwan; and Barche. At Hoshangabad it is 900 yards wide, and from five to six feet in depth. At Barche it begins to expand into a wide estuary, and after flowing 30 m. further, it falls into the gulf of Cambay. Entire length about 800 m., of which 55 are navigable for ships of considerable size.

**NERCHINSK**, an important mining t. of Russia, eastern Siberia, in the trans-Baikal territory, on the Nercha, a tributary of the Shilika, in lat. 51° 38' n., long. 116° 35' e., 4,707 m. m. n. w. Petersburg. It was founded in 1683, and had, in 1857, 2,888 inhabitants. The district of which Nerchinsk is the center yields a good deal of gold yearly, together with large quantities of silver, lead, and iron, and precious stones. The only tin-mines in the empire are worked here. The soil in the vicinity is fertile, and the climate mild and agreeable.

**NEREIDS**, in mythology. See **Nereus; Nympha; nereis**.

**NERIAH**, a t. of British India, in the presidency of Bombay and district of Kaira, on the route from Baroda to Ahmedabad, 38 m. n. w. from Baroda, on a feeder of the Sabarmati. It is the chief town of an extensive and well-cultivated tract, which produces much tobacco, and contains many prosperous towns and villages. Pop. 71, 25,529.

**NEREIS**, a genus, and **Nereid**, a family of annelida, having a long, slender body, a distinct head, with tentacles and eyes; the whole body covered with tubercles, and the gills lobed and tufted. They are all marine, and generally hide under rocks or in the sand. They swim actively, by rapid and undulating flexions of the body, and by the aid of numerous oars arranged along the sides; each formed of a stout footstalk, numerous bristles, and a flap. The proboscis is thick, strong, and armed with two jaws.

**NERITES**, the name given to animals which have left their impress on the Silurian rocks, and which exhibit a form similar to the modern Nereids. They occur on the surface of the limy mud of fine shales, over which, when it was soft, the creature moved, leaving a long and tortuous trail, which is generally found to terminate in a more defined representation produced apparently by the body itself, although every trace of it has disappeared. See **Ichthyology**.

**Nereus**, in mythology, a sea-god, son of Pontos and Gê, and father, by Doris, of the Nereids. He had the gift of prophecy, and forewarned Paris of the destruction which the elopement of Helen would bring to Troy. Hereules, when seeking the golden apples of the Hesperides, was directed by the nymphs to the cave of Nereus, whom he found asleep. Nereus, on waking, transformed himself into a multitude of shapes, but was held fast by Hereules, whom he was obliged to instruct as to his quest.

**NERI, Philip d'**, a saint of the Roman Catholic church, and founder of the congregation of the oratory (q.v.), was b. of a distinguished family of Florence, July 21, 1515. His character, even in boyhood, foreshadowed the career of piety and benevolence to which he was destined, and he was commonly known among his youthful companions by the name of good Philip. On the death of his parents, he was adopted by a very wealthy uncle, with whom he lived for some time at San Germano, near Monte Cassino, and by whom he was recognized as his destined heir. But he relinquished all these prospects for a life of piety and charity, and having come to Rome in 1534, he there completed his philosophical and theological studies, and won the esteem and reverence of all by his extraordinary piety, and his benevolence and activity in every good work, whether of charity or of religion. Although he did not receive priest's orders till 1551, he had already been for years one of the most earnest and devoted in all the pious works of Rome for the instruction of the poor, the care of the sick, and the reclamation of the vicious; and in 1550, in union with several of his friends, he established a confraternity for the care of poor pilgrims visiting Rome, and other homeless persons, as well as of the sick generally, which still subsists, and which has numbered among its associates many of the most distinguished members of the Roman Catholic church. This confraternity, however, is chiefly noteworthy as having been the germ of the far more celebrated congregation of the oratory (q.v.), which was founded by St. Philip in concert with his friends Barconius and Targacio, both afterwards cardinals, Sabriti, and some others. Besides the general objects above indicated, and the spiritual duties designed for the personal sanctification of the members, the main object of this association was the moral instruction and religious training of the young and medicated, who were assembled in chapels or oratories, for prayer and for religious and moral instruction. As a further means of withdrawing youth from dangerous amusements, sacred musical entertainments (thence called by the name of oratorio) were held in the oratory, at first consisting solely of hymns, but afterwards partaking of the nature of sacred operas or dramas, except that they did not admit the scenic or dramatic accompaniments of these more secular compositions. Religious and literary lectures also formed part of his plan,
and it was in the lectures originally prepared for the oratory that, at the instance of Neri, the unselfish devotedness of his life, his unaffected piety, his genuine love of the poor, his kindly and cheerful disposition, and, perhaps, as much as any of the rest, a certain quaint humor, and a tinge of what may almost be called drollery which pervaded many of his sayings and doings, contributed to popularize his institute, and to engage the public favor for himself and his fellow-laborers. He himself enjoyed the reputation of sanctity and of miracles among his fellow-religious almost beyond any of the modern saints; and he may still be described as emphatically the popular saint of the Roman people. He lived to an extreme age in the full enjoyment of all his faculties, and in the active discharge to the last of all the charitable duties to which his life had been devoted. He died at the age of 80, May 26, 1595. He was canonized by Gregory XV. in 1622. His only literary remains are his Letters (Sto, Padua, 1751); the Constitutions of his congregation, printed in 1612; some short spiritual treatises, and a few sonnets, which are printed in the collection of Rime Onde. 

NE R I U M. See OLEANDER.

NE RO, Roman emperor from 54 A.D. to 68 A.D., was b. at Antium, on the coast of Latium, Dec. 15, 37 A.D., and was the son of Cn. Domitius Ahenobarbus and of Agrippina, the daughter of Germanicus Caesar, and sister of Caligula. His mother, becoming the wife of the emperor Claudius, Claudius adopted him (50 A.D.), and his name, originally L. Domitius Ahenobarbus, was changed to Nero Claudius Caesar Drusus Germanicus. After the death of Claudius (54 A.D.), the Pretorian guards, at the instigation of Agrippina Burhus, their prefect, declared him emperor, instead of Claudius's son Britannicus, and their choice was acknowledged both by the senate and the provinces. His reign began with the semblance of moderation and good promise, under the guidance of Burhus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be treacherously poisoned at the age of 14, because he dreaded him as a rival, and afterwards (69 A.D.) caused his own mother Agrippina (with whom he was lately on bad terms) to be assassinated, to please his mistress Poppea Sabina (the wife of his principal boon-companion Otho, afterwards emperor), in order to marry whom he also divorced and afterwards put to death his wife Octavia (aged 30), the sister of Britannicus. The low servility into which the Roman senate had sunk at this time, may be estimated from the fact that it actually issued an address congratulating the hateful matricide on the death of Agrippina. Nero himself, on the other hand, confessed that he was ever haunted by the ghost of his murdered mother. The affairs of the empire were at this time far from tranquil. In 61 A.D. an insurrection broke out in Britain under queen Boadicea, which was, however, suppressed by Suetonius Paulinus. The following year saw an unsuccessful war against the Parthians in Armenia. At home, matters were not much better. The emperor was lampooned in verse; the senate and priesthood, alike venal, were satirized by audacious malcontents; Burhus, a valuable friend, died; and even Seneca, though not a great moralist, out of his hands, would not collect it. He removed to Rome, and restored the great conflagration in Rome, by which two-thirds of the city were reduced to ashes. Nero himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance, reciting verses about the burning of Troy, but many scholars are doubtful whether he really had any hand in it. At all events he laid the blame on the Christians—that mysterious sect, who, like the Jews in the middle ages, were the cause of all otherwise inexplicable calamities, and persecuted them with great fury. Moreover, he rebuilt the city with great magnificence, and reared for himself on the Palatine hill a splendid palace, called, from the immense profusion of its golden ornaments, the Aurea Domus, or Golden House; and in order to provide for this expenditure, and for the gratification of the Roman populace by spectacles and distributions of corn, Italy and the provinces were unsparingly plundered. A conspiracy against him failed in the year 65. His friend Seneca, and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppea, by kicking her when she was pregnant. He then proposed to Antonia, the daughter of Claudius, but was refused, wherupon he caused the too fastidious lady to be put to death, and married Statilia Messalina, after killing her husband. He also executed or banished many persons highly distinguished for integrity and virtue. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer, and he received sycophantic applauds, not only in Italy, but in Greece, to which, upon invitation of the Greek cities, he made a visit in 67. But in 68, the Gallic and Spanish legions, and after them the Pretorian guards, rose against him to make Gaibba emperor, and Nero fled from Rome to the house of a freedman, Phaedon, about four miles distant. The senate, which had hitherto, under still less subservient, declared him an enemy of his country, and the tyrant ended his life by suicide, June 11, 68. One is sorry to learn that such a wretch had a taste for poetry, and was skilled in painting and modeling. 

NERVA, M. Cocceius, a Roman emperor, elected by the senate after the murder of Domitian, Sept. 18, 96. He was born 32 A.D., of a family belonging to Narnia, in
Nerve, Nervous.

480

Umbria, and twice held the honor of consulship, before his election to the dignity of emperor. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; but finding himself, upon account of his advanced age, not vigorous enough to repress the insolence of the Pretorian guards, he adopted M. Ulpius Trajanus, then at the head of the army of Germany, who succeeded him on his death, Jan. 27, 98. After his decease, he obtained an apotheosis.

Nerve. See Nervous System, ante.

Nerve Cell. See Histology.

Nervi, an ancient tribe in Belgica, n. of the Ambiani. In the time of Cesar, who first mentions them, they were a warlike people, who prohibited trade with their neighbors, forbade the introduction of luxuries, and attempted to make an alliance of the surrounding tribes against the Romans. Upon Cesar's advance into their territory they sent their children and old men and women to a place of safety in the marshy country near the sea, and stationed themselves in ambuscade along the banks of the river Sabis, now the Samue. When the Romans came up, and began to prepare their camp, they were suddenly attacked by a force of 60,000 men, and only the military skill of Cesar saved them from defeat. After a desperate contest the Nervi were put to flight. In 54 B.c., however, they joined the Eburones in an assault upon the camp of Quintus Cicero. They submitted to the Romans, 53 B.C. Their chief towns were Camaracum, now Cambray, and Bagacum, now Bavay.

Nervous Diseases of an Obscure Nature and Nervousness. Although the most important affections of the nervous system, as chorea, convulsions, epilepsy, hydrophobia, hypochondriasis, hysteria, neuralgia, paralysis, spasms, and tetanus, have been considered in special articles, there is an infinite variety of often evanescent) forms which the diseases of the nervous system assume, some of which we propose now to consider.

These nervous affections are almost solely confined to women, and most of them may be regarded as modified forms of hysteria. Simulated pregnancy, or, as the French physicians term it, Nervous pregnancy, is an affection of not very rare occurrence. The abdomen gradually enlarges, the catamenia are suppressed, and sickness, enlargement of the breasts, and the other symptoms of pregnancy, supervene (as far as they can be recognized by the non-professional observer), and it is only the non-appearance of the infant at the expected period that leads to a suspicion of the true nature of the case. The diagnosis of such a case is extremely difficult, and the most celebrated accoucheurs have been deceived. We commence with this extreme instance, as being singularly illustrative of the power which a perverted action of the nervous system may impress upon certain persons. The somewhat allied cases in which patients persist in fancying themselves pregnant in opposition to the opinion of their medical adviser (as the well-known case of queen Mary, so admirably drawn by Froude), are far more numerous. The intestines are often implicated in cases of a deranged condition of the nervous system. The excretion of gas from the intestinal mucous membrane is often much increased in the class of patients commonly called nervous. The rattling sounds produced by the movement of the gas—scientifically known as bombardment—are sometimes so loud as to prevent the patient from entering into society with comfort; and sometimes the mere fear of the occurrence of these sounds is sufficient to induce them. A depraved appetite, scientifically known as picottage, is a common symptom of deranged nervous system both in chlorotic young women, in whom the catamenial discharge is not well established, and in pregnant women. See Morbid Appetites. The not very rare cases of fasting women and girls belong to the same category. All these cases, however, ultimately undergo detection.

Dr. Parry and other physicians have described cases of morbid sensibility of the mucous membrane of the pharynx, in which the muscles of the larynx are called into violent action if the patient takes a sip of water or other fluid. Such cases so strongly simulate hydrophobia that they are described as hysterical hydrophobia.

Passing on to the special modifications which an abnormal state of the nervous system impinges on the organs of circulation, we have nervous palpitation of the heart, which may readily be distinguished from palpitation dependent on change of structure by due attention to symptoms. There is a peculiar form of abdominal pulsation, due solely to nervous influence, which may not very frequently be felt on pressing the hand on the patient's abdomen. It has in many cases been mistaken for neuritis.

The nervous symptoms implicating the respiratory organs are not only the most common of any, but are alarming and urgent, and may be readily mistaken for indications of serious inflammatory or organic disease. Nervous asthma, which is supposed to depend upon a spasmodic constriction of the bronchial tubes, is too well known to require comment. Women suffering from a deranged condition of the nervous system sometimes present symptoms of what may be termed nervous catarrh—such as copious flow of tears, free discharge from the nostrils, and constant sneezing. Such cases are often periodic. They may be treated with preparations of iron, and are sometimes at once checked by a pinch of snuff. There are various forms of cough due mainly to nervous irritation, the difference in the character of the cough probably depending on the spot which is the seat of irritation. Thus, we hear of spasmodic cough, which is often accompanied by much
straining and convulsive agitation, and somewhat resembles whooping-cough; **ringing** cough, accompanied by dyspnea and houiness, or loss of voice; **barking** cough, often arising from irritation of the ovaries, etc. Such coughs as these are aggravated by depleting measures, ordinary cough medicines, etc., and usually disappear under the use of tonics.

The nervous affections of the motor system are conveniently grouped by Dr. Laycock under three heads—(1) the first including those cases in which there is paralysis or spasm without distortion; (2) those in which distortion follows cessation of muscular equilibrium; and (3) paroxysmal affections. The best example of the first class is hysterical paralysis of the lower extremities, of which Sir Benjamin Brodie long ago wrote as follows: "I have known not a few, but very numerous, instances of young ladies being condemned to the horizontal posture, and even to the torture of caustic issues and setons, for several successive years, in whom air, and exercise, and cheerful occupations would probably have procured a cure in the course of a few months." A notice of such cases as these may be found in the article Hysteria. 

Paralysis of a lateral half of the body, or of one limb only, may also be merely a manifestation of hysteria. The second class is well illustrated by the following case, which is reported by Mr. Shaw. A young lady who had suffered from a train of symptoms indicative of a disturbed nervous system, had the ankle so turned round that she walked on one side of the foot. The knee was also bent outward, and the spine was becoming distorted. Sir Charles Bell, who saw her in consultation, regarded the case as one of willful deception, and in a year's time his diagnosis was confirmed by the establishment of the trace of lameness being apparent. Many of the joints—as the knee, hip, etc.—may be the seats of purely neuralgic symptoms, which so closely simulate organic disease of the cartilages, as to lead to the removal of the limb. Camichael, Brodie, and others have recorded cases in which this terrible mistake has been made by experienced surgeons. Spinal irritation, or spinal tenderness, is a mysterious affection, whose diagnostic value is not very definite, as it may arise from a large number of distinct conditions, as, for example, disease of some part of the spinal cord, uterine disease, chronic disease of the intestinal viscera, etc.

One of the most anomalous affections of the nervous system ever recorded is described by Mr. Holden in the St. Bartholomew's Hospital Reports, 1867, vol. iii., pp. 293-305. The patient was a bright-looking boy about 12, who, as he lay reading in bed, presented every appearance of perfect health: all that he complained of was what he called his "bump," which was about the size of a hen's egg, and lay on the right side of the neck, just above the shoulder. If the "bump" were touched, even most gently, the boy instantly lost all consciousness, and became deaf, dumb, and blind, while his body became arched like a bow, and was supported only by the back of the head and the heels, while his arms were rigidly extended. He might be pinched or pricked, but showed no sign of sensation. After remaining in this state for somewhat less than a minute, he drew a deep long breath, which was followed by a deep sigh. Instantly the spasm ceased, and the body fell, seemingly lifeless, on the bed. After two other similar sighs, which occurred in a few seconds, the boy awoke as if from profound sleep, and in a few minutes was none the worse for what he had gone through. Whenever the bump was touched—even when the boy was fast asleep—the same phenomena occurred. (It was found that, on touching the backbone in the dorsal region, the same series of events happened. By continuous gentle manipulation of the lump, the boy was kept unconscious for twenty minutes. Another and even more remarkable phase of the boy's affection was his crowning and barking fit, which took place every day at the same time, almost to a minute. See the reports above cited.

With this illustration, we close our remarks on what may be termed anomalous nervous affections. With regard to nervousness, which also stands at the head of this article, we may observe, that 'it is a word pertaining rather to the vocabulary of the patient (and pre-eminently of the female patient) than of the physician. It is usually understood to indicate a condition of which a restless mobility, with or without an undue excitability of the nerves of sensation, is the chief characteristic. For further information on this subject, the reader is referred to Dr. Laycock's various works, and to Romberg On Diseases of the Nervous System, 2 vols., translated by Dr. Sieveking.

**NERVOUS SYSTEM.** The is composed in all vertebrated animals of two distinct portions or systems—viz., the cerebro-spinal and sympathetic or ganglionic. The cerebro-spinal system includes the brain and spinal cord (which form the cerebro-spinal axis), and the cranial and spinal nerves. It was termed by Bichat the nervous system of animal life, and comprises all the nervous organs concerned in sensation, volition, and mental action.

The sympathetic system consists essentially of a chain of ganglia connected by nervous cords, extending from the cranial to the pelvis, along each side of the vertebral column, and from which nerves with large ganglionic masses proceed to the viscera and blood-vessels in the cavities of the chest, abdomen, and pelvis. It was termed by Bichat the nervous system of organic life, since it seems to regulate—almost or quite independently of the will—the due performance of the functions of the organs of respiration, circulation, and digestion.

U. K. X.—31
The essential parts of the cerebro-spinal axis are described in the articles Brain, Cerebrum, and Cerebellum, and Spinal Cord. The brain and spinal cord are covered and protected by three membranes or meninges, as they are frequently termed—viz., the dura mater, the arachnoid, and the pia mater. The dura mater is a strong fibrous membrane, which supplies the cranial bones with blood in early life, and adheres firmly to their inner surface. It is less closely attached to the bony walls of the spinal canal. Inside the cranium it gives off processes (such as the falx cerebri, tentorium cerebelli, and falx cerebelli) which divide and form different partitions of the brain; it gives a strong fibrous sheath to every nerve; and by splitting into two layers at certain points, it forms receptacles for venous blood, which are termed Sinuses (q.v.). The arachnoid (so-called from its being supposed to be as thin as a spider's web) is a serous membrane, and, like all serous membranes, is a closed sac, consisting of a parietal and visceral layer. The parietal layer adheres to the inner surface of the dura mater, to which it gives a smooth, polished appearance; while the visceral layer somewhat loosely invests the brain and spinal cord, from direct contact with which, however, it is separated by the intervention of the pia mater and some loose areolar tissue. In most regions there is an interval between the visceral layer of the arachnoid and the pia mater, which is called the sub-arachnoid cavity, and is filled during life by the cerebro-spinal fluid. This fluid, which varies in quantity from two to ten ounces, keeps the opposed surfaces of the arachnoid in close contact, and affords mechanical protection to the nervous centers which it surrounds, and guards them against external shocks. It is accumulated in considerable quantity at the base of the brain, where it serves for the protection of the large vessels and nerves situated there. In fracture of the base of the skull, the draining away of this fluid, often in very large quantity, through the external auditory meatus, is often one of the most significant symptoms. It is doubtless secreted by the pia mater, which is the immediate investing membrane of the brain and spinal cord. This membrane consists of minute blood-vessels, held together by an extremely fine areolar tissue. It dips down between the convolutions and fissures of the brain, and is prolonged into the interior, forming the e.dum intemposum and the choroid plexuses of the fourth ventricle. It is by means of this membrane that the blood-vessels are conveyed into the nervous substance.

We now proceed to notice the nerves connected with the cerebro-spinal center or axis. These are usually described in two classes—the spinal and the cranial or ependylic. The former class consists of all those which arise from the spinal cord, and emerge from the spinal canal through the inter-vertebral foramina; while the latter includes those which arise from some part of the cerebro-spinal center, and emerge through foramina in the cranium or skull.

The spinal nerves (exclusive of the spinal accessory nerve, which, from the fact that it emerges from the skull, is usually ranked among the cranial nerves) are thirty-one on either side, there being a pair for each pair of inter-vertebral foramina (whose formation is described in the article Vertebra and Verterbral Column), and for the foramina between the atlas (the first or highest vertebra) and the occipital bone at the base of the skull. Every spinal nerve arises from the cord by two roots, an anterior and a posterior, of which the latter is distinctly the larger. Each root passes out of the spinal canal by a distinct opening in the dura mater. Immediately after its emergence, a ganglion is seen on the posterior root, and in the anterior surface of this ganglion the anterior root lies imbedded. Just beyond the ganglion, but not at all previously, the nervous fibers of both roots intermingle, and a compound nerve results. The trunk thus formed separates immediately after it has passed through the inter-vertebral canal into two divisions—the anterior and posterior—each of which contains filaments from both roots, and possessing, as will be immediately shown, perfectly different functions. These divisions, of which the anterior is considerably the larger, proceed to the anterior and posterior parts of the body respectively, and are distributed to the skin and the muscles. The anterior branch communicates with the sympathetic nerve, as is shown in the figure. The mode of connexion of the roots of the nerves with the cord is noticed in the article Spinal Cord. These nerves are arranged in classes, according to the regions of the spine in which they originate, and we thus speak of eight cervical, twelve dorsal, five lumbar, and six sacral nerves on either side.

The discovery of the separate functions of the anterior and posterior roots of the spinal nerves, which has been characterized as the first important step towards a right understanding of the physiology of the nervous system, was made by our distinguished countryman sir Charles Bell, although there is reason to believe that Magendie, without any knowledge of Bell's experiments, arrived at similar conclusions at nearly the same time. The original experiments consisted in laying open the spinal canal in rabbits, and irritating or dividing the roots of the spinal nerves. It was observed that irritation of the anterior roots caused muscular movement, and that the posterior roots might be irritated without giving rise to any muscular action; while division of the posterior roots did not impair the voluntary power over the muscles. Hence it was inferred that the anterior roots were motor (or conveyed motive power to muscles), and the posterior roots not motor; but it was not fully determined what degree of sensibility remained in parts supplied from the divided roots. Numerous physiologists arrived at similar results to those of Bell; but the most conclusive experiments are those of Müller, who operated on
Nerves.

frog, in which, from the great width of the lower part of the spinal canal, the roots of the nerves can be exposed with great facility. In these experiments, it was found that irritation of the anterior root always excited muscular contraction, while no such effect followed irritation of the posterior root; that section of the anterior root caused paralysis (or loss of power) of motion, while section of the posterior root caused "paralysis of sensation; and that when the anterior roots of the nerves going to the lower extremity were cut on one side, and the posterior roots on the other, voluntary power without sensation remained in the latter, and sensation without voluntary motion in the former. The obvious conclusion to be derived from these experiments is, that the anterior root of each spinal nerve is motor, and the posterior sensitive. (In place of the terms sensitive and motor, the terms afferent and efferent are now frequently used. The functions of the nerves being to establish a communication between the nervous centers and the various parts of the body, and vice versa; an afferent nerve communicates the impressions upon the peripheral nervous ramifications to the centers, while an efferent nerve conducts the impulses of the nervous centers to the periphery.)

The cranial nerves, although twelve in number on either side, were arranged by Willis (Gerei Anatomie; et al. necossi Nervorum Descriptio et Usus, 1664), whose system is still generally adopted, in blue pairs, which, taken from before backwards in the order in which they are transmitted through the foramina at the base of the skull, stand as follows: 1st, olfactory; 2d, optic; 3d, motores ocularum; 4th, pathetic; 5th, traiical; 6th, abducens; 7th, portio dura or facial, portio mollis or auditory; 8th, glossozygyncal, par vagum or pneumogastric, spinal accessory; 9th, hypoglossal. They may be subdivided into three groups, according to their functions—viz., nerves of special sense—the olfactory (see Nose), optic (see Eye), and auditory (q.v.); nerves of motion, or efferent nerves—the motores ocularum, pathetic, abducens; facial, and hypoglossal; and compound nerves—the traiical, glossozygyncal, pneumogastric, and spinal accessory.

The reason why no nerve of taste is included in the above arrangement amongst the nerves of special sense will be subsequently seen; and we proceed briefly to notice the functions of the motor cranial nerves.

The 3d, 4th, and 6th pairs—the motores ocularum, pathetic, and abducens—together make up the apparatus by which the muscles of the orbit (the four recti, the superior and inferior oblique, and the levator palpabrae) are called into motion, and are sufficiently noticed in the article Eye.

The facial nerve, or the portio dura of the 7th pair, is divisible into three stages. The first stage is the intercranial, from its origin to its exit from the cranial cavity, in association with the portio mollis or auditory nerve (q.v.), at the internal auditory meatus. The second stage is contained in the aqueduct of Fallopius, a bony canal lying in the petrous portion of the temporal bone. In this stage it anastomizes with other nerves, and thus sensory fibers are introduced into it from the 5th pair and other sources, which make irritation of some of its branches to cause pain. The third stage commences with the emergence of the nerve through the stylo-mastoid foramen. The nerve now lies in the petrous portion of the temporal bone, and after giving off the posterior auricular nerve and a few smaller branches, finally divides into the temporal, facial, and cervical branches. This diverging distribution of the nervous branches over the face forms the pes anserinus of the older anatomists, from the supposed resemblance to the expanded foot of a goose. Careful dissection of this nerve shows that the great majority of its fibers are distributed to muscles, and if we except the muscles of mastication, which receive their motor power from the 3d division of the 5th pair, this may be regarded as the general motor nerve of the face. "The muscles which are supplied by the facial nerve are chiefly those upon which the aspect of the countenance and the balance of the features depend. The power of closing the eyelids depends upon this nerve, as it alone supplies the orbicularis palpebrarum; and likewise that of frowning, from its influence upon the corrugator supercilii. Anatomy indicates that this nerve is the motor nerve of the superficial muscles of the face, and of the deep-seated muscles within the ear. This conclusion is abundantly confirmed by comparative anatomy. For wherever the superficial muscles of the face are well developed, and the play of the features is active, this nerve is large. In monkeys it is especially so. That extremely mobile instrument, the elephant's trunk, is provided with a large branch of the facial as its motor nerve. In birds, on the other hand, it is very small."—Todd and Bowman, Physiological Anatomy and Physiology of Man, vol. ii. p. 107.

Before sir Charles Bell commenced his experiments on the functions of the nerves, it was believed that the facial was the nerve of sensibility of the face, and it was on several occasions divided with the view of relieving tic douloureux, of which it was supposed to be the seat. But the operation, of course, yielded no relief, and always inflicted a permanent injury, since it was succeeded by paralysis of the facial muscles, with total loss of expression, over the same features and over the closing of the eye, on the side on which the operation was performed.

The treatment of facial palsy, which is often, especially if it arises from cold, a very temporary affection, although usually a alarming one to the patient and his friends, is described in the article Paralysis.

The hypoglossal nerve (derived from the Greek words hypo, under, and glotta, the
tongue) escapes from the cavity of the skull by the anterior condyloid foramen, and passes outward and forward around the pharynx to the inferior surface of the tongue, where it breaks up into its terminal branches, which supply the muscular structure of that organ with motor power. This nerve communicates with the pneumogastric nerve, with the sympathetic (by branches derived from the superior cervical ganglion), and with the cervical plexus, soon after its emergence from the cranium; and subsequently, as it curves round the occipital artery, it gives off the long anastomosing branch known as the desc. max. n.ovi.

Experiments on living animals, comparative anatomy, and pathological investigations alike indicate that this is the motor nerve of the tongue. In cases of paralysis of this nerve the power of articulation is much injured or totally destroyed; and this is often one of the first symptoms which lead the physician to apprehend serious cerebral lesion.

We now proceed to the consideration of the compound nerves, beginning with the trifacial or fifth nerve. This nerve, as was first pointed out by Sir Charles Bell, presents a remarkable resemblance to the spinal nerves in its mode of origin; for it arises by two roots, one large and the other small, and on its larger root, as on the posterior and larger root of the spinal nerve, is a distinct ganglion; the two roots being quite distinct until after the formation of the ganglion, when the lesser one coalesces with the lowest branch, which emerges from the ganglion to form the inferior maxillary nerve. This ganglion, which is known as the gasserian ganglion, and which is formed upon the larger root of the nerve, lies upon the upper surface of the petrous portion of the temporal bone, and is of a somewhat triangular form, with its base directed forward and outward. From this base there proceed three nerves—viz., the ophthalmic, on the inside; the superior maxillary, in the middle; and the inferior maxillary, externally. The first two of these nerves consist exclusively of fibers from the ganglionic root, while the third—the inferior maxillary—is composed of fibers from both roots, and is, therefore, a compound nerve. From the mode of distribution, as well as from that of origin, it is inferred that the ophthalmic and superior maxillary are purely sensory, while the inferior maxillary is a motor and sensory nerve. Experiments on living animals confirm the inference, that the sensory fibers are derived from anatomical grounds. Division of the ophthalmic or of the superior maxillary nerve induces loss of sensibility without any serious impairment of muscular power; but when the inferior maxillary nerve, on either side, is divided, the power of mastication is destroyed on that side, and the sensibility of the tongue and of the lower part of the face on that side is lost.

The lingual or gustatory branch of the inferior maxillary is distributed to the mucous membrane and papillae at the fore part and sides of the tongue, where it acts both as a nerve of common sensibility and of taste. (The consideration of the respective parts which this nerve and the glossopharyngeal play in the sense of taste, is considered in the articles Tongue and Sense of Taste.)

The trigeminal nerve is the seat of the affection known as tic-douloureux, and described in the article Neuralgia. It is in the dental branches of this nerve that toothache is situated; and in the process of teething in young children, the irritation of these branches, consequent upon the pressure of the teeth, often gives rise to convulsions, by being conveyed through the nervous system by reflex action.

The glossopharyngeal nerve is principally an afferent or sensory nerve, but has a small motor root. It escapes from the cranium in association with the pneumogastric and spinal accessory nerves, through the same foramen as that through which the jugular vein emerges. It then descends by the side of the pharynx, and after anastomosing with the facial and pneumogastric nerves, and giving off a branch to the tympanum of the ear, terminates in branches to the mucous membrane of the base of the tongue, of the palate, tonsils, and pharynx, and in twigs to the diagastric and stylopharyngeal muscles; so that its distribution is almost entirely to sentient surfaces. From a careful examination of the investigations of Dr. John Reid and others regarding the functions of this nerve, Todd and Bowman arrive at the following conclusions: 1. "It is the sensitive of the mucous membrane of the fauces and of the root of the tongue, and in the latter situation it ministers to taste and touch, as well as common sensibility; and being the sensory nerve of the tonsil, it fully confirms the feeling of the palate, which may be so readily excited by stimulating the mucous membrane of this region." 2. "Such are its peripheral organization and central connections, that stimulation of any part of the mucous membrane in which it ramifies, excites instantly to contraction all the facial muscles supplied by the pneumogastric and the facial nerves; and the permanent irritation of its peripheral ramifications, as in the case of sore throat, will effect other muscles supplied by the facial nerve likewise. It is, therefore, an excitor of the movements necessary to pharyngeal deglutition."—Op. cit. vol. ii., p. 119.

The pneumogastric nerve, or par vagum, is distributed to so many important organs (the larynx, heart, lungs, stomach, etc.), and is of such great physiological importance, that a special article is devoted to its consideration.

The spinal accessory nerve is more remarkable for its peculiar course than in any other respect. It rises from the spinal cord at the level of the fifth or sixth cervical nerve, passes upwards between the anterior and posterior roots of the cervical nerves into the skull, and emerges from the cranial cavity with the two preceding nerves. It is chiefly distributed to the trapezius muscle.
In the above remarks on the cranial nerves, we have omitted all notice of their points of origin, as that subject is sufficiently noticed in the article Brain.

We shall now briefly notice the mode in which the extremities receive their nerves. These nerves are derived from the spinal nerves, through the intervention of what is termed in anatomy a plexus. Four or five nerves proceed from the spinal cord for a certain distance, without any communication with each other. They then divide, and from the conjunction of the adjacent branches new nerves result, which again subdivide and interchange fibers. From the net-work or plexus thus formed nerves emerge, each of which is composed of fibers derived from several of the original branches. The most important of these plexuses are found in the regions of the neck, the axilla, the loins, and the sacrum, and are known as the cervical, brachial, lumbar, and sacral plexuses.

The brachial plexus is formed by communication between the anterior roots of the

![Diagram](image_url)

1. the brachial plexus; 2 and 3, the anterior and posterior thoracic nerves; 4, the phrenic nerves going to the diaphragm; 7 and 9, the external and internal cutaneous nerves; 10, the origin of the median nerve (which receives its name from taking a course along the middle of the forearm to the palm of the hand); 12 and 13, branches of this nerve; 14, the point at which it passes under the angular ligament, and divides into its terminal branches, which are distributed to the hand and to all the fingers except the little finger and the outside of the ring finger, which are supplied by (15) the ulnar nerve, whose terminal branches are shown at 18; 19, the musculo-spiral nerve (the largest of the plexus); 23, 24, the radial nerve, one of the branches of the musculo-spiral.

![Diagram](image_url)

Fig. 2.—A diagram showing the lumbar and sacral plexuses, with the nerves of the lower extremity.

1, the first four lumbar nerves which, with the branch from the last dorsal, form the lumbar plexus; 2, the four upper sacral nerves, which, with the last lumbar, form the sacral plexus; 6, the anterior cruciate or femoral nerve; 7, 8, 9, 10, its branches; 11, its terminal branch, the long or internal saphenous; 13, the glutaeal nerve; 15, the lesser sciatic nerve; 16, the greater sciatic or obturator nerve (the largest nerve in the body), dividing at about the lower third of the thigh, into 17, the popliteal nerve, and 18, the peroneal nerve; 19, muscular branches of the popliteal, given off in the popliteal region of the knee; 20, the posterior tibial nerve, dividing, at 21, into the internal and external plantar nerves, which are distributed to the sides of the toes in precisely the same manner as the median and ulnar nerves are distributed to the fingers; 22, the external saphenous nerve; 23 and 24, the two terminal branches of the peroneal nerve; viz., the anterior tibial and the musculo-cutaneous nerves.

last four cervical nerves and the first dorsal nerve. These nerves are nearly equal in size, and their mode of distribution is sufficiently explained by the diagram. The branches emerging from this plexus supply the shoulder and the arm; and the names of the most important of these branches are given in the description attached to the figure.

The lumbar and sacral plexuses, with the nerves of the lower extremity, are shown in Fig. 2. The description attached to the diagram sufficiently explains the mode of formation and the distribution of the branches of these plexuses.

The general arrangement of the sympathetic system, or, as it is sometimes termed, the sympathetic nerve, has been already noticed at the beginning of this article. Its cephalic portion consists of four ganglia on either side—viz., (1) the cervical, or ganglion of the 1st, 2nd, or 3rd cervical; (2) the sphenopalatine, or Meckel's ganglion; (3) the oto, or Arnold's ganglion; and (4) the submaxillary ganglion. They are all closely connected with the branches of the trunical nerve. The cervical portion contains 3 ganglia, the dorsal 12, the lumbar 4, the sacral 5, and the coccygeal 1, which, instead of lying on the side of the vertebral column, is placed in front of the coccyx, and forms a point of convergence for the two ganglionated cords which run from the cervical to the sacral region parallel to one another. Each ganglion may be regarded as a distinct nervous center, from which branches pass off in various directions. In addition to the cords of communication
When we consider the nervous system, we find that it consists of two main parts: the visceral and the fibrous. The visceral part is responsible for the functions of the internal organs, such as the heart, lungs, and digestive system. These organs are supplied by a network of blood vessels and nerves, which are collectively known as the splanchnic nerves.

The splanchnic nerves originate from the spinal cord and travel to the organs they serve. They provide both motor and sensory functions, allowing the body to regul
Nervous.

gray matter lies in the central portion, and the fibrous or white matter is external to it; while in the ganglia the two structures are more or less uniformly associated.

From the observations which have been made in an earlier part of this article on the functions of individual nerves, it is sufficiently obvious that it is through the instrumentality of the nervous system that the mind influences the bodily organs, as when volition or emotion excites them to action; and that, conversely, impressions made on the organs of the body affect the mind, and excite mental perceptions through the same channel.

"In this way," to quote the words of Dr. Todd, "the nervous system becomes the main agent of what has been called the life of relation; for without some channel for the transmission of the mandates of the will to the organs of motion, or some provision for the reception of those impressions which external objects are capable of exciting, the mind, thus completely isolated, could hold no communion with the external world." The nature of the connection between the mind and nervous matter is, and must ever be, the deepest mystery in physiology, and one into which the human intellect can never hope to penetrate. There are, however, many actions of the body in the production of which the mind has no share. Of this kind are the nervous actions, which are associated with the functions of organic life, such as digestion, respiration, and circulation. Again, there is another class of actions for which two nerves (an afferent or excitor, and a motor) and a nervous center are necessary. These are the actions known as reflex or excitatory for the full investigation of which physiology is especially indebted to the labors of the late Marshall Hall. For example, the movement of the esophagus in propelling the food onwards to the stomach, is caused by the stimulus of the food acting on the excitor or afferent nerves, which, through the spinal cord, excites the motor or afferent nerves, and thus give rise to the necessary muscular action. When the edge of the eyelid is touched, the excitor nerve (a branch of the ophthalmic division of the fifth or trifacial nerve) conveys the impression of the stimulus to the nervous center, and the eye is at once closed by the motor influence, which is transmitted by a branch of the facial nerve to the orbicular muscle. In such cases as these—and they form a very numerous class—the mind takes no part. In some of them it is conscious of the application of the stimulus, as well as of the muscular act which follows; but even in these cases no effort of the will could modify or interrupt the sequence of the phenomena.

It has been already shown that the stimuli, by which the action of nerves is commonly excited, are of two kinds, mental and physical, and the change which these stimuli produce in a nerve develops the power known to physiologists as the nervosa, or nervous force. "The nervous force," says Dr. Sharpey, in his Address on Physiology in 1862, "has long been likened to electricity, but rather through a vague perception of analogy than from any rigorous comparison. It is true that electric force is developed in the nerves, and even exhibits modifications connected with different conditions of nervous action. Still, it must be borne in mind that the evolution of electricity is a common accompaniment of various processes involving chemical change, whether within the living body or in external nature: and the tendency of recent speculation is not towards the identification of the nerve force with electricity, but rather to suggest that the two still remain in the same way as electricity and other physical forces are related to each other—that is, as manifestations of a common force or energy, of which they, severally, are the special modifications.\" The velocity with which impressions are transmitted by the nerves has been recently made the subject of investigation, but it is doubtful how far the observations are to be depended on, in consequence of the various sources of fallacy by which such experiments are beset. According to Hirsch, the velocity is 34 meters, or about 112 ft. per second in man; while Helmholz fixes it at 190 ft. per second in the frog.

The description of the nervous system given in the foregoing pages is applicable, with slight modifications, to all the vertebrates; the main differences being in the degree of the development of the brain—a point which has been already noticed at the commencement of the article Brain. For a sufficient notice of the plan of the nervous system in the invertebrate animals, the reader is referred to the articles ARTICULATED ANIMALS, MOLLUSCA, and RADIATA. It is only in the lowest subdivision of the animal kingdom, the PROTOZOA, that no traces of a nervous system can be detected.

For further information on the subject of this article, the reader is referred to Dr. Carpenter's works on Human and Comparative Physiology, to Dr. Todd's article on "The Nervous System" in The Cyclopedia of Anatomy and Physiology, to Todd and Bowman's Physiological Anatomy and Physiology of Man, and to Funke's Lehrbuch der Physiologie.

NERVOUS SYSTEM (note). The nerve fibers have a great diversity of size; some of them found between the muscules are as much as 1 75 of an inch in diameter, having a tubular membrane, medullary contents, and an axial band. Other nerve fibers having the same structure are not more than 71 78 of an inch in diameter. Other fibers again are composed of an axial band and a medullary covering only; and still others have no other element than the axial band. The important element, and the one necessary to the conducting function, is the axis cylinder. In regard to the gelatious nerve fibers, or the fibers of Remak, which are found, as stated in the preceding article, chiefly in the sympathetic system, there is a difference of opinion. By some physiologists they are believed
to be connective tissue elements, not possessing the peculiar properties of nerves; but the predominant view is that they have peculiar nerve properties. These gelatinous fibers are particularly found in that portion of the sympathetic system connected with involuntary contraction of non-striated muscles, viz., in the gray filaments sent to these muscles, and not in the white filaments of the sympathetic, which are regarded as incapable of exciting motion. Microscopic investigation has shown that in the development of the embryo, the first formed nerve fibers are identical with the fibers of Remak, and that the new nerve elements which are formed in the reparations of injuries are also of this character. The gelatinous nerve fibers of the sympathetic system are of a flattened form, with smooth, sharp borders, having a grayish pale color, and containing, within a sheath, numerous fine granulations, and, at intervals, oval cells or nuclei of the same diameter as the caliber of the fibers, and composed of fine granular matter, without nuclei. The dimensions of these " nuclei" or cells are about $\frac{2}{3}$ of an inch in their short, and $\frac{4}{5}$ of an inch in their long diameter. The medullated nerve fibers, in passing into certain organs, such as the pacinian corpuscles (q.v.), the tactile corpuscles (see Touch), and some glandular structures, lose the tubular sheath and medullary investment of the axis cylinder, while nothing but the latter element composes the termination. It was formerly thought that the tubular elements also entered the pacinian corpuscle, but recent observations have led to other conclusions.

Nerve cells and their relations.—The cellular elements of the nervous system, which are regarded as the "generating elements" of nervous force, are composed of four kinds of cells—apolar, unipolar, bipolar, and multipolar; and these are of various sizes and of diverse appearance. The nerve cells are found to be composed principally of granular matter and having nuclei and nucleoli. They are always present in the gray matter of the sympathetic nerve, and have been found in the cerebro-spinal centers. It is not certain that unipolar cells exist in man, but they are not uncommon in the lower animals. Bipolar cells are found in the ganglia of the posterior roots of the spinal nerves, and also in ganglia of the sympathetic. Small cells, with three and sometimes four poles or connections, are found in the posterior horn of the gray matter of the spinal cord (q.v.), while large, irregularly shaped multipolar cells with numerous prolongations are found in the anterior horns of the gray matter. Some of the cells have ten or twelve poles, and have received the name of motor cells. The general anatomical elements are, however, in all these forms of cells essentially alike. Except the apolar and unipolar cells, they are of irregular shape, and have highly refracting granular contents. In adult animals there is usually but one nucleus, but the nerve cells of young animals often have multiple nucleoli. The general shape is generally single, but sometimes it is also multiply. The size of nerve cells varies, some being less than $\frac{3}{10}$ of an inch in diameter. The nuclei are not so variable in size, ranging from $\frac{1}{10}$ to $\frac{4}{5}$ of an inch. In examining these delicate organisms with the microscope it is usual to harden the tissues with chemical substances, such as chromic acid, and make very thin sections with a sharp knife; but, notwithstanding all the care that may be taken, the precise relations between the nerve cells and nerve fibers have not been satisfactorily determined. Some of the German physiologists, among them Max Schultze, have become satisfied that multipolar cells have one prolongation unlike the rest, which is continuous with the axis cylinder of the nerve fiber, the other prolongations being of a different character, and, although branching out to a considerable extent, not connected with the nerve fibers. In tracing a nerve fiber towards its origin in the white portion of a nerve center, it is observed to lose its sheath, and consist only of an axis cylinder and investing medullary substance; the white portion of the center being composed of these simply medullated, non-shedded fibers. When a fiber passes from these white portions into the gray substance it loses its medullary investment, and passes among the cells simply in the form of an axis cylinder; and although it is certain that many fibers are prolongations of the poles of the cells, it is not clearly made out that this is always the case.

Inhibition.—When an impulse is sent along a nerve to a nerve center, if the latter be in a quiescent or uncoupled state, it will transmit outwardly to an organ a reflex impulse. A nerve transmitting an impulse toward a center is called an afferent, while one which conveys an outward impression toward an organ, or toward the periphery, is called an efferent nerve. When, however, a nerve center is preoccupied, and an afferent impulse is sent to it, which would ordinarily be reflected along an efferent nerve, it is not so reflected, or only in a much diminished degree. This peculiar action of arresting a nervous current is called inhibition, and is constantly playing an important part in the distribution of nervous force to all the different parts of the complicated animal mechanism. For example, if the central end—the end toward the brain or to speak more definitely, toward the medulla oblongata (see Brain, a) of a divided pneumogastric nerve be stimulated when the respiratory center is engaged in its accustomed rhythmic action of sending out impulses of inspiration and expiration, one of two things will happen, viz.: either the respiratory movements will be slowed or stopped entirely, or they will be accelerated. One explanation of the difference of action is that the pneumogastric nerve contains among its afferent fibers two sets, which, on account of original structure or of their connections, will, in one case, stop impulses, while in the other they will be accelerated. The restraining or stopping set are called inhibitory, while the others are called accelerating fibers. It must be confessed, however, that this is simply
Nervous.

an "explanation." The most striking instance of inhibition is offered by the heart. If the pneumogastrics be divided in an animal while the heart is beating regularly, and the outer end of the divided nerve is stimulated for a short time with the interrupted (Farad) galvanic current, the heart will be almost instantly brought to a stand-still, and it will not resume its pulsations for some time. The beats, when they reappear, are at first feeble and infrequent, but soon reach the standard, or even go beyond it. The inhibitory action in this case has been estimated to be about 16 of a second. Other stimuli than the interrupted current may be employed, such as mechanical irritation and chemical stimuli. The action of atropine is remarkable. When injected into the blood, stimulation of the pneumogastric nerve with powerful galvanic currents will produce no inhibition. In order to understand this subject better it will be proper to say a few words about vaso-motor nerves. In mammals, if the cervical sympathetic nerve be divided, it will be found that the minute arteries of the head on the same side have become dilated, and that an increased amount of blood is circulating in them. If a rabbit be the subject of the experiment it will be seen that the whole ear of the side operated on will be much redder than natural. All the minute vessels, both arteries and veins, become greatly dilated and the temperature will rise more than one degree. Division of the sciatic nerve in the mammal causes a dilatation of the arteries of the leg and foot, and the temperature will rise several degrees. Division of one of the splanchic nerves (nerves arising from sympathetic ganglia in the thorax) produces dilatation of the blood vessels of the intestines and other abdominal viscera. If a nerve supplying a muscle is divided, there immediately follows a considerable increase of flow of blood from the muscle, showing that its blood vessels have become dilated. The act of dilation may be easily studied with the microscope in the frog. There are, indeed, in all parts of the body certain vascular areas, which have such a relation to certain nerves that they become dilated on division of one of the nerves. These nerves are ordinarily called vaso-motor nerves. It is not intended by this designation to indicate that they are vaso-motor in an exclusive sense, possessing essentially different properties or structure from other nerves, but that they are nerves which have a vaso-motor function, because they are distributed to organs where vaso-motor functions can be performed. It has been a matter of discussion as to whether the origin of the vaso-motor nerves is in the spinal cord or in the sympathetic system. From their being so usually traced to sympathetic ganglia it was supposed for a time that they had a sympathetic origin, but careful researches have demonstrated their origin in the cerebro-spinal centers. One remarkable fact in regard to the vaso-motor nerves is that, although a section of their fibers produces dilatation in the vessels supplied by these fibers, stimulation (paroxysms) produced with these vessels does not always restore their caliber by constriction; but dilation may be increased by irritation in some cases, while constriction is produced in others.

If an animal is placed under the influence of curariz (q.v.), and the central end of a divided sciatic nerve stimulated, an increase of blood-pressure will be observed, caused by the constriction of certain arteries, particularly those supplied by the splanchic nerves; and, in general, the stimulation of a nerve containing afferent fibers will produce increase of pressure in the blood vessels, thus affording a test for the presence of afferent fibers in any nerve. If the animal is placed under the influence of chloral instead of curariz, there will be a diminution of blood pressure instead of an increase on stimulation of an afferent nerve. These experiments suggest that the dilating or constricting results of stimulation depend upon the condition for the time being of the central nervous system, and this has led to the explanation of the two phenomena by means of the inhibitory system. This, however, seems to fail in these nerves, the irritation of the peripheral end of a divided nerve produces either dilation or constriction, according to circumstances. Therefore, it has been supposed that there are vaso-motor nerves which have a dilating, and others which have a constricting, function. An interesting example is afforded by the submaxillary gland, which is supplied with two nerves, one being distributed to the salivary duct and its branches, and the other to the blood vessels. No marked effect is produced by simple section of either nerve, but when they are stimulated remarkable results follow, the ducts of the gland becoming greatly dilated, while the arteries are in an equal degree contracted. A question as to whether there is a vaso-motor center has for some time been a subject of investigation, but no definite conclusions have been obtained. Experiments show that the medulla oblongata, which is the center of so many reflex actions, is also a center of a large number of reflex vaso-motor functions, but it is also found that various parts of the spinal cord are centers of reflex vaso-motor functions; and it is probable that vaso-motor action is connected with an arrangement of nerve fibers and centers similar to that of the general reflex system. Whether there are automatic vaso-motor centers, those in which impulses are generated independently of reflex action, has not been determined, but it is probable that there are, if we consider the effects of certain emotions, such as blushing and pallor.

The pneumogastric nerve (see Nervous System, ante) has the most remarkable course, the greatest number of connections, and the most varied functions of any of the cranial nerves. It arises in the medulla oblongata by a purely sensory root, but communicates with five motor nerves in its course, and is distributed extensively to muscular tissue both of the voluntary and involuntary kind, to striated muscles and to non-striated, whether belonging to blood vessels, intestinal walls, or glandular ducts. It presents two
ganglionic enlargements in its course—one at its exit from the cranial cavity by the jugular foramen, which is called the ganglion of the root; the other, a grayish enlargement, from half an inch to an inch in length, called the ganglion of the trunk. It is a plexiform structure, composed mainly of white and gray fibers and nerve cells. The most important communication, or addition, which the pneumaticastific receives is a branch from the spinal accessory, for it has been shown that the larynx is supplied by filaments derived from this branch. Other communications are received between the root and the ganglion of the trunk, the most important of which are from the superior cervical ganglion of the sympathetic. The filaments are short, and blend the sympathetic ganglion to the trunk of the nerve. Other filaments are received from other sympathetic ganglia, so that the pneumaticastific becomes a mixture of sympathetic and cerebro-spinal nerves.

What mysterious purpose is served by this mingling is not known; probably qualities are produced which are not inherent in any certain fibers, similar to those which are sometimes produced in galvan-o-electric machines by certain combinations of conductors and magnets, producing variations in intensity or in quantity, and also, perhaps, other qualities which are unknown. The most important branches of the sympathetic are: 1. aurieular; 2. pharyngeal; 3. superior laryngeal; 4. inferior laryngeal; 5. cardiae; 6. pulmonary; 7. esophageal; 8. abdominal. The plexus of the sympathetic are generally alike in their distribution in either side of the body, with the exception of the inferior laryngeal and abdominal branches. Passing by the differences in the former, it may be stated here that the left abdominal branch supplies innervation to the muscular walls and the mucous membrane of the stomach; numerous branches also supplying the liver, its course anastomosing with branches of the right abdominal and of the sympathetic. The right pneumaticastific, which is situated more posteriorly, sends a few filaments to the stomach, but is principally distributed to the liver, spleen, kidneys, supra-venal capsules, and the most important (difference) to the whole of the small intestine. Before the nerve pass to the intestines, however, there is a free interchange of fibers between the left and right abdominal branches.

NESHBA, a co. in e. Mississippi, intersected in the n. by the Pearl river; 573 sq. m.; pop. '89, 8,741—8,713 of American birth. Its surface is hilly, a large proportion covered with forests and uncultivated. The soil is fertile, and especially in the n. yields good crops of cotton, corn, wool, sweet potatoes, tobacco, and sorghum. Much attention is given to stock-raising, and large numbers of cattle, sheep, and swine are raised. Co. seat, Philadelphia Court-House.

NESS (identical with Eng. nöse, A.-S. nece, Ger. nase, Ice. nes, Lat. nasus, Fr. nez), a geographical termination, signifying promontory. Names in -ness abound among the Orkney and Shetland islands, and on the coast of Caithness; and they occur, though less frequently, along the e. coast of Great Britain, as far as Dungeness in Kent. As the corresponding Scandinavian termination -nose prevails in the names of promontories in Norway, Sweden, and Denmark (e.g., Lindesnes, in s. of Norway), the existence of names in-ness in Britain is held as an evidence of Scandinavian and Danish colonization.

Grisnez, on the n. coast of France, points to the same source.

NESS, a co. in central Kansas, drained by the North fork, the South fork, and Walnut creek, all affluents of the Arkansas river; 900 sq. m.; pop. '80, 3,722—3,422 of American birth. 2,156 colored. Its surface is mostly prairie land, furnishing good pasturage for cattle, horses, and sheep, and extensively raised. Its soil is productive, and it is thinly timbered. Co. seat, Ness Court-House.

NESS, Locr, a long narrow lake in Inverness-shire, Scotland, extends n.e. and s.w., and is 23 m. in length, and 14 m. in average breadth. Its n.e. extremity reaches a point 6 m. s.w. of the town of Inverness. It receives the Morriston, the Oich, the Foyers, and other streams, and its surplus waters are carried off to the Moray firth by the river Ness. It lies in the valley of Glenmore, and is inclosed by mountain masses averaging 1000 ft. in height; but the scenery on its banks is not strikingly picturesque. In many places it is about 130 fathoms in depth, and owing to the length of time which this immense body of water takes to cool down to the freezing point, ice never forms to any considerable extent.

NESSERODE, Karl. Rob., Count, one of the most eminent diplomats of modern times, was b. Dec. 14, 1780, at Lisbon, where his father, a descendant of an ancient noble family on the lower Rhine, was then Russian ambassador. He early devoted himself to a diplomatic career, gained in a high degree the esteem and confidence of the emperor Alexander, and in 1813 was one of the representatives of Russia in the important negotiations which took place between the powers who combined against France. In 1814 he accompanied the Russian emperor to France, and on Mar. 1 signed the treaty of the quadruple alliance at Chaumont. He was also one of those who concluded the treaty of Marmora, and the surrender of Paris. He continued to take a principal part in all the negotiations which ended in the peace of Paris; and was one of the most prominent and active of the plenipotentiaries in the congress of Vienna. He was one of the most active diplomats of the holy alliance, and accompanied the emperor Alexander to the congresses of Aix-la-Chapelle, Troppau, Laibach, and Verona. The emperor Nicholas reposed in him the same confidence, and under his
reign he conducted the Russian policy in the affairs of Greece and Turkey. Amidst the European convulsions of 1848 and 1849, Russia, under his guidance, refrained from interference, till opportunity occurred of dealing a deadly blow to the revolutionary cause in Hungary; and, at the same time, of bringing Austria very much under Russian influence. Being one of the chiefs of the German or moderate party in Russia, Nesselrode is supposed to have exerted himself strenuously to preserve peace with the western powers; and after the war had broken out in 1854, and the ill success of Russia was manifest, he undoubtedly strove for the re-establishment of peace, and for the assembling of a congress to settle all disputes. After the accession of Alexander II. he retired from the direction of foreign affairs, and was succeeded in that department by prince Alexander Gorchakov, but retained the dignity of chancellor of the empire, and a seat in the ministerial council. He died at St. Petersburg, Mar. 23, 1862.

NESSUS, in Greek mythology, a centaur who carried travelers over the river Evmus, and who insulted Deianeira, the wife of Hercules, and was killed by the latter. In revenge he told the priestess of the river to collect the blood from his wound and use it as a love philter, and when she afterwards poured it on Hercules's tuire, the poison communicated to the blood by the arrow dipped in the hydra's venom so tortured the hero that he sought death on a funeral pile. Hence the use of the word to denote a fatal present or that from which there is no escape, as "the Nessus-shirt of ridicule," (RÉNAI).

NEST-BUILDING APES. Reference was made, but with some hesitation, in the article GORILLA, to certain new species of apes of the same genus with the chimpanzee and gorilla, said to have been discovered by M. du Chaillu in western Africa. The complete vindication which has since taken place of that traveler's reputation as a truthful and trustworthy observer, makes it necessary to give some further notice of these now unquestioned discoveries, exceedingly remarkable on account of the habits of some of the animals. To protect themselves from the rain, they construct nests, or rather umbrellas, among the branches of the trees, of long branches and leaves laid one over the other very carefully and thickly, so as to be capable of shedding water. The branches are fastened to the tree in the middle of the structure by portions of the stems of twining shrubs, abundant in these forests. When the leaves dry, so that the structure no longer keeps out the rain, the owner builds another shelter; and Du Chaillu says this happens once in ten or fifteen days. The nest-building ape (tragulodes calvus, called nshiego mbouye by the natives) is nearly four feet in length. Du Chaillu supposes this ape to rest all night on a projecting branch under its nest or umbrella, with an arm round the stem of the tree for security. The nests are generally constructed about 15 or 20 ft. from the ground, and invariably on a tree which stands a little apart from others, and which has no limbs below the one in which the nest is placed, probably in order to insure safety from serpents and other animals. These apes inhabit the most lonely parts of the forests. The nests are never congregated together, so that this ape does not seem to be gregarious. It feeds on fruits.—Du Chaillu discovered a second species of nest-building ape on his second visit to the Ogbolai, very similar to the tragulodes calvus, but which constructs its nest in a somewhat different fashion. It is called n-shiego nkengo by the natives. It makes its nest or shelter at the height of about 30 or 35 ft. from the ground, by bending over and interweaving a number of the weaker boughs, the foliage of which forms its protection from rain.

NESTOR, according to ancient Grecian legend, the son of Neleus and Chloris, b. in the Messenian Pylos, escaped destruction when Hercules slew all his brothers, being then a dweller among the Geronians, with whom he was brought up. He married Enrydice, by whom he became the father of a numerous family. In his youth he was distinguished for valor in wars with the Arcadians, Eleians, and the centaurs, and in his advanced age for wisdom. Although he was an old man when the expedition against Troy was undertaken, he joined it with his Pylians in sixty ships. Homer makes him the great counselor of the Grecian chiefs, and exults his eloquence as superior even to that of Ulysses. His authority was even considered equal to that of the immortal gods. Nestor returned in safety to his own dominions after the fall of Troy, along with Menelaus and Diomedes, and continued for long to rule over the people of Pylos.

NESTOR, 1056-1114; b. Russia; entered a convent at Kiev in 1072. He wrote, in the old Slavic dialect, the chronicles of Russia, from about 850 to his own times.

NESTORIANS, a sect of the 5th c., so called from its founder Nestorius, under which head their distinctive doctrine, as well as their history up to the time of its condemnation, are sufficiently detailed. Of the later history it will be enough to say that, even after the council of Ephesus, Nestorianism prevailed in Assyria and Persia, chiefly through the influence of the well-known school of Edessa. Although vigorously repressed in the Roman empire, it was protected, and probably the more on that account, by the Persians, and ultimately was established by king Perozes as the national church, with a patriarch resident at Seleucia; its fundamental doctrine as laid down in the synod of Seleucia in 466, being the existence of two distinct persons as Christ, unde sexed by unity of the Holy Spirit, differentiated by the action of the Logos. Under the rule of the Persians, the Nestorians enjoyed considerable protection, and throughout the countries of the east their community extended itself. Of their condition in central Asia, during the medie-
val period, some account will be found under the head of Prester John. In the middle of the 12th c., their church reckoned no fewer than 90 bishops under regular metropolitan polities, together with 56 others, whose special dependencies are unknown; but in the destructive career of Tamerlane, they shared the common fate of all the representatives of the eastern civilization. In the 16th c. a great schism took place in this body, of which a portion renounced their distinctive doctrine, and placed themselves under the jurisdiction of the Roman pontiff, to whom, under the title of Chaldean Christians, they have since remained faithful. The others still maintain their old creed and their ancient organization. Their chief seat is in the mountain ranges of Kurdistan. They are at present a poor and Hellenic race, numbering about 140,000, and subject to a patriarch residing at Diz (who is always chosen from the same family, and takes invariably the name of Schamum, or Simon) and 18 bishops. All these are bound to observe celibacy, but marriage is permitted to the priests and inferior clergy. Their liturgical books recognize no confession in infanticide, but confession is infrequent, if not altogether disused. Marriage is dissolved by the sentence of the patriarch; communion is administered in both kinds; and although the language of the Liturgy plainly implies the belief of transubstantiation, yet, according to Layard, that doctrine is not popularly held among them. The facts are strict and of very long duration, amounting to very nearly one-half of the entire year. They pray for the dead, but are said to reject the notion of purgatory, and the only sacred image which they use or reverence is that of the cross. The Nestorians of Kurdistan, like the Christians of the Lebanon, have suffered much from time to time through the fanaticism of the wild tribes among whom they reside. In a massacre in 1543, and again in 1840, many fell victims, and even still they owe much of their security to the influence exercised in their favor by the foreign representatives at the Turkish and Persian courts.

There is another body of Nestorians who have existed in India from the period of the early migrations of the sect, and who are called by the name of Syrian Christians. Their chief seat is in Travancore, where they number about 100,000. Among both bodies of Nestorians, European missionaries, Catholic and Protestant, have of late years endeavored to effect an entrance. See Perkins's Residence of Eight Years in Persia among the Nestorian Christians (Andover, 1843); Anderson's Oriental Churches (1875); and Dean Stanley's History of the Eastern Church.

NESTORIANS (ante) claim to have existed as a sect prior to Nestorius, and date their conversion to the preaching of the apostle Thomas. They have also a tradition that they are descended from the patriarch Abraham, and hence are sometime called Chaldeans. It is admitted that they are the oldest of the oriental Christian sects. And though they have some superstitions and doctrinal errors, yet they retain many of the doctrines and authorized usages of the early church of Christ. Notwithstanding the deposition of Nestorius, his writings and those of Theodore of Mopsuestia were translated into Syriac, were circulated in Assyria and Persia; and made many converts. When emperor Theodosius II. expelled from his dominions all who refused to accept the Ephesian decision, Nestorianism was transferred to those countries where it had held its ground to the present day. In 455 was established the famous school of Edessa, and from it went many disciples of the new doctrine. Of these the most celebrated was Bursumas, bishop of Nisibis, who did much to propagate Nestorian views in Persia. He and Jannes, bishop of Ardashir, prevailed upon the Persian king Perozhe to expel those Christians who favored the decision of Ephesus, and establish the Nestorians as the national church for the Christians in Persia. Thus patronized by the state, they made Seleucia the seat of their patriarchate, which from that time to the present has been held by the patriarch of the Nestorians. They also established a theological seminary at Nisibis. So great were the zeal and success of Bursumas that the Nestorians now in Chaldaea, Persia, Assyria, and the adjacent countries, regard him as their founder. Mosheim says, "It appears from unquestionable documents still existing that there were numerous societies in all parts of Persia, in India, in Armenia, in Arabia, in Syria, and in other countries under the jurisdiction of the patriarch of Seleucia during the 6th century." Of the 7th c., he says, "The Christian religion was in this century diffused beyond its former bounds, both in the eastern and western countries. In the east the Nestorians, with incredible industry and perseverance, labored to propagate it from Persia, Syria, and India, among the barbarous and savage nations inhabiting the deserts and the remotest shores of Asia. In particular the vast empire of China was enlightened by their zeal and industry with the light of Christianity." Considering it necessary to express fully their views, a system of doctrine was adopted at a synod convened by the patriarch Bursumas in 496 at Seleucia. The characteristics of this were that in Christ there were two persons, the divine Logos, and the man Jesus; that these two hypostases had only one outward appearance; that the man whom men took for the Son of man took place at the moment of the Virgin's conception, and is never to be dissolved; that these two persons are united by no other connection than that of will and affection; that Christ on that account ought to be clearly distinguished from God; that Mary is to be called the mother of Christ, Christotokos, and not the mother of God, Theotokos. They asserted also that these tenets had not been derived from Nestorius, but had been held by the church from the beginning. Another peculiar opinion was that it was lawful for bishops and presbyters
The Nestorians. to marry. At the end of Caradus’s reign in the 6th c., a schism occurred among the Nestorians, which lasted 12 years, when two patriarchs, Nestes and Elisius, were elected by the opposing factions, each of whom appointed bishops from his own followers. After the death of Nestes in prison and the deposition of Elisius, the bishops elected Mar Aba I., or the great, a Magian convert, 536-552. He translated the liturgy of the Nestorians from the Grecian into Syriac, making the version now in use among the Nestorians. He was very active in restoring discipline in the church, and held a synod in 544 which declared that the patriarchs and bishops should themselves marry, a regulation ever since observed. He also ordered that while conforming to the Nicene creed, the system of Theodore of Mopsuestia should form the basis of biblical interpretation. Nestorianism was regarded with favor, or at least with toleration under the Saracens, Arabs, and Tartars, the successive masters of Persia. The Nestorians spread not only in Arabia, Syria, and Palestine, but under Mar Aba II., 742-752, a bishop was appointed for them in Egypt. He was subject to the see of Damascus: in later times they had a metropolis in Egypt. After Bagdad became the abode of the caliphs the patriarch also resided there in A.D. 782. The patriarch was called gyzelich, i.e. catholicos, and in the 13th c., he had 23 metropolitans under his supervision. A historian says: “The Nestorians had now become widely extended. They occupied almost to the exclusion of other Christian sects the region which forms the modern kingdom of Persia, in all parts of which they had churches. They were numerous in Armenia, Mesopotamia, and Arabia. They had churches in Syria and in the island of Cyprus. They had churches among the mountains of Malabar in India. They had numerous churches in the vast region of Tartary from the Caspian sea to mount Imaus, and beyond, through the greater part of what is now known as Chinese Tartary, and even in China itself.” Early in the 11th c. Unkh Khan, a Tartar prince on the northern borders of China, invited Nestorian missionaries among his people, and himself became the famous Prester John, Genghis Khan and several of his sons and grandsons, who conquered China and almost all Asia and a part of Europe, were connected with Prester John by marriage. Several of them had Christian wives, and one of them preserved himself a Christian. Under some of this dynasty central Asia was comparatively civilized and enlightened; and Christian travelers passed with safety from the banks of the Euphrates to Samarkand and Pekin. Some of the Chinese emperors favored Christianity and ordered the erection of numerous churches. Meanwhile the sword of Moslem fanaticism advancing eastward Bagdad fell before it, and all the country on the Euphrates, then Persia and the regions to the north. The Nestorian church was crushed, and its missions languished; and about the year 1400 Tamerlane swept like a whirlwind over the remains of Nestorian Christianity. The missions in China languished for want of support, and were weakened by controversies with missionaries from Rome; but some of the churches still existed, and in 1602 four bishops were sent to China. In 1551 a dispute arose among the Nestorians concerning the election of a patriarch. One party elected Bar Mama: the other, who chose Suhaka, placed themselves under the Roman pontificate, and called themselves Chaldean Christians. Suhaka was sent to Rome to be ordained, but on his return he was made prisoner in Aragon. Another was appointed in his place. In 1684 pope Innocent XI. appointed a patriarch, who resided in Diarbekir, and took the name of Joseph, which is retained by his successors. The number of Chaldean Christians is about 20,000, scattered from Dierbekir to the frontiers of Persia and from the borders of Tyari to Bagdad—a district which once contained a vast number of Nestorians. This portion of the Nestorians is governed by a patriarch and six bishops, who have lately been pensioned by the propagation. They have no independent existence, but are a section of the Roman church. They have no standard confession of faith. The patriarch of the other party is called Simeon, and resides in the mountains of Kurdistan. These are the two representatives of the primitive Nestorian church in Persia. The Syrian or Nestorian Christians of St. Thomas profess to be his disciples, and say that he preached the gospel in Malabar and other parts of India. However that may be, there is evidence that the Syrian or Nestorian churches in Malabar were founded as early as the 5th or 6th century. The first notices of this people in recent times are found in Portuguese histories. When they arrived in India in A.D. 1500, they found not only a Christian king, but many professing Christians, and more than 100 churches. The popes claiming universal spiritual supremacy endeavored to bring them into subjection, and directed the Portuguese to use all their power to convert them. In 1545 a Franciscan friar was sent out who opened schools to educate the youth in the doctrines of their church. The Syrian bishop, Mar Joseph, was taken a prisoner to Goa, and thence sent to Portugal. Mosheim says, “The finishing stroke was put to the violence and brutality of these attempts by Don Alexis de Menezes, archbishop of Goa, who at the close of the 16th century, calling the Jesuits to his assistance, compelled this unhappy people to embrace the religion of Rome, and to acknowledge the pope’s supreme jurisdiction.” The property of these, of these priests and churches must not be submitted to the pope, insisting, however, on retaining their language and liturgy. These are called the Syrio-Roman Christians. But those in the interior would not yield. After a brief show of submission they proclaimed war against the inquisition, hid their books,
fled to the mountains, and sought the protection of the native princes. These retain their ancient rites, liturgy, and ministry, and are called by their former name the Syrian Christians of Malabar. Little was known concerning them in Europe and America until Dr. Buchanan published his account of them in 1807. He found near Travancore the Syrian metropolitan and his clergy, and there were 55 churches. They used the liturgy of Antioch in the Syrian language. They had many old and valuable copies of the Scriptures, one of which, a Syrian manuscript of great antiquity they presented to him. He describes their doctrines as few in number, but agreeing in essential points with those of the church of England. The church missionary society subsequently had a mission among them, but without much success. The Syrio-Roman Christians are said to number about 100,000, the others 50,000.

In 1830 Messrs. Smith and Dwight, missionaries of the American board, visited the Nestorians of Persia. From their Researches we learn that they occupy a wild range of the Kurdistan mountains on the borders of Turkey and Persia. They are governed by meliks or kings chosen from their own people. Every melik or head of a small clan is perfectly independent, except as they yield a voluntary obedience to their patriarch, Mar Simon, who resides near Joolamier, and styles himself "patriarch of the East." The Turkish government has long sought to subdue them. They are very poor, and in the summer many descend to the plain of Oromiah at the foot of the Kurdish range, where now dwell a large body of Nestorians, numbering about 40,000. They are bold, generous, and kind. The patriarch professes only spiritual power, but among the mountaineers his word is law in all things. He seldom visits those of Oromiah. Under him are 18 bishops, 4 of whom reside in Oromiah. Celibacy is not required of the clergy, who generally are not united in a church, either in the common administration of the affairs of the church, or in teaching a few children. Some of them can scarcely read, but they have improved since the distribution freely among them of the Syriac Bible. Religion is very low. Lying, intemperance, profanity, and some other vices, are common. Sunday is a holiday. Roman Catholic agents seek to seduce the Nestorian Christians, and even the patriarchs, to submission to the pope. A Jesuit a few years ago offered the patriarch $10,000 if he would acknowledge the Roman supremacy. The Mohammedans also endeavor to proselyte. These poor people are greatly oppressed with taxes, and are, the victims of spoliation, and have no redress even in the courts. A Nestorian is not allowed a place in the bazaar, cannot engage in commerce, and in the mechanic arts cannot rise to a higher position than that of a mason or carpenter. In 1843 they rebelled and a general massacre took place. The Nestorians acknowledge the supreme authority of the Holy Scriptures, and hold that no doctrine or practice is essential to salvation, which cannot be proved from them. They have no priests or images in their churches. The only symbol among them is a plain Greek cross, which they highly venerate.

In efforts to reach pagan and Mohammedan people with Christian truth, it is often found that the remnants of ancient Christian churches existing among them, and sometimes in political subjection to them, have substituted the forms of religion for its reality, and are in almost as much need of enlightenment as those by whom they are overborne. It has seemed that the renewal of those churches in moral and spiritual life, would provide the best means of Christianizing the races with whom they are in contact. With these aims the rev. Mr. Perkins and his wife were sent in 1833 by the American board to Persia to begin mission work among the Nestorians. Dr. Grant and his wife joined them in 1835. The bishops and priests of the Nestorian church for the most part received the missionaries cordially, and encouraged their efforts for the reformation, admitting that their people had wandered far from the right way. They even in some instances put themselves under instruction, and prepared to co-operate with them, following their example in giving expositions of Scripture, which they had never ceased to consider the ultimate standard of truth. Mrs. Grant by her school awakened great interest in the education of women. Dr. Grant not only was highly useful as a physician and surgeon, but gained great influence for the truth through this means. A boarding school for girls under the care of Miss Fiddela Fisk and a high school for boys under that of professor Stoddard, where hundreds of young men and women have received Christian training, have been highly useful. The Mohammedans seeing what was undertaken for the Nestorians, said, "Are we to be passed by," and claimed a share in the generous labors of the missionaries. Eighteen ordained missionaries and their wives, 3 missionary physicians and the wives of two of them, and 1 male and 8 female assistant missionaries, have been employed in this work, and the success has been most gratifying. They had no printed Scriptures, now they have the Bible in both the ancient and vernacular. Spelling-books, geographies, arithmetics, and religious books, in all, 11,000 volumes have been distributed. 3 persons have been ordained. For wide and wide oral Christian instruction has been given. The benefit of spiritual religion is evinced in the daily life of many, and their example makes a most favorable impression. Seventy have become preachers of the gospel. The missionary spirit is growing, and several hundred dollars are contributed annually to carry the gospel to other peoples, the Nestorians themselves engaging in this work, and laboring among Moslems, Jews, Armenians, and Mahrians of Russia. One of these Nestorian preachers has gained among the latter 150 converts. Five are pastors of self-supporting churches. It was not the design.
of the American missionaries to interfere with the established church organizations, but there have been formed "reunions on the apostolic basis," which include 767 members.

NESTORIUS, a native of Germanicia, a city of northern Syria, in the patriarchate of Antioch, was probably a disciple of the celebrated Theodore of Mopsuestia; and having received priest's orders at Antioch, became so eminent for his fluency, if not eloquence, as a preacher, and for grave demeanor and exemplary life, that on occasion of a dispute about the election of a patriarch of Constantinople he was selected by the emperor, in 428 A.D., to fill the vacant see. Soon after his consecration a controversy arose as to the divine and human natures of our Lord, in which Nestorius took a leading part. One of the priests, who followed Nestorius to Constantinople, Anastasius, having in a sermon, which was by some ascribed to Nestorius himself, denied that the virgin Mary could be truly called the "mother of God," being only in truth the mother of the man Christ. Nestorius warmly defended Anastasius, espoused this view, and elaborated it into the theory which has since been known by his name, and which equivalently, if not in formal terms, exaggerated the distinction of two natures in our Lord into a distinction of two persons—the human person of Christ and the Divine Person of the Word. An animated controversy ensued, which extended from Constantinople to the other patriarchates, and drew from Cyril, patriarch of Alexandria, a formal condemnation of the doctrine of Nestorius in twelve anathemas, still preserved, and a similar condemnation, accompanied by a threat of deposition and excommunication, from Celestine, bishop of Rome, unless he would withdraw the obnoxious doctrine. Nestorius remaining firm in his opinions, a general council was convened at Ephesus in 431, at which Cyril took the most active and prominent part, and in which, notwithstanding the absence of the patriarch of Antioch and his bishops, Nestorius was condemned and deposed. Considerable opposition was offered to this judgment for a time, but ultimately Nestorius was confined in a monastery near Constantinople, whence, after four years, still persisting in his views, he was banished to the greater oasis in upper Egypt, and after several changes of his place of confinement, died in exile. The account given by Evagrius, that his death was caused by a disease in which his tongue was eaten by worms, rests, according to Evagrius himself, on a single and unnamed authority. The more probable narratives ascribe his death to the effects of a fall. The date of this event is uncertain. It was about 439, when Socrates wrote his history (Hist. Ecc. vii. 34), but there is little doubt that he was already dead in 450, when the Eutychian controversy first began to attract notice.

NESTS (Lat. nidus, Gael. neid; allied to Ger. nisten, Sax. nesten, Lat. nectere, to sew, bind, or tie) are the structures which animals prepare for the rearing of their young. They are very different, not only when the creatures which construct them belong to widely separated divisions of the animal kingdom, but often when the animals are of the same class, or even when they are nearly allied; and whilst some construct very simple nests, and those of others are very curious and elaborately framed, some make no nest at all. Among MAMMALS the only nest-builders are certain rodents, as mice, dormice, squirrels, etc. The structures of some of these are as artfully contrived and as beautiful as the nests of birds. It is among BIRDS that nest-making is most general; although there are not a few species which merely sempa a hole in the ground, and many sea-fowls lay their eggs on ledges of naked rock. The situations chosen by birds for their nests are very various, each species affording some particular kind of situation, as each species also exhibits a uniformity in choice of materials and in form and mode of structure; these particulars, however, being all liable to modification—within certain limits—according to circumstances. Some birds' nests consist merely of a few straws or leaves collected together; some of such materials as twigs, straws, moss, hair, etc., very nicely interwoven, and often with a lining finer than the frame-work; some, as those of swallows, are made of clay or other soft material, which hardens as it dries. Birds' nests are generally open at top, but some, as those of swallows, are so placed under a projection of rock or of a building as to be covered, and have the opening at the side; whilst others are vaulcted, and have the opening at the side. Some are situated in holes excavated in clayeY, loamy, or sandy banks. The nests of troglodytes, bats, weaver-birds, etc., are remarkable for the ingenious contrivance displayed in them; and a very singular nest is that of the tailor-bird, made by sewing together the edges of leaves. These are noticed in the articles on these birds. Many birds are as solitary as possible in their nidification: whilst others, as rooks and herons, congregate in large communities. —NO REPTILES are known to construct nests; their utmost approach to it being to make a hole for their eggs in sand, or in some other suitable situation. —The nests of Fishes have recently attracted much attention of naturalists. It is supposed that the ancients were acquainted with the nest-building instinct of some fishes; but it was unknown to modern naturalists till 1888, when Mr. Edwards discovered it in a species of stickleback (q.v.). It now gives interest to many a fresh-water aquarium. Not many fishes are yet known as nest-builders. Among them are gobies and the goramy. Many are known not to construct nests. The salmon and others exhibit an approach to the nest-building habit in making a place for their eggs in the sand or gravel which they choose for a spawning-bed. —Many Insects—a small proportion, however, of the whole number, and mostly
hymenoptera—construct nests, as bees, wasps, and ants. The nests of the social bees and wasps are also their ordinary habitations, but the nests of solitary bees are entirely devoted to their young. A few insects, not hymenopterous, as some weevils, may also be said to make nests; but among insects provision for the wants of the young is usually made in very different ways. Certain spiders, amongst which may be named the water-spider, construct nests.—The instinct of nest-making, connected as it is with the instinctive care for their young which the Creator has made so important a part of the nature of so many animals, is by no means an index either of that care or of the affection with which, in many cases, it is accompanied; and some of the animals which construct no nest are among those in which affection for their young is exhibited in the highest degree.—The nest-making instincts of animals seem to be a very essential part of their constitution; and even in the most perfect domestication are still retained and exhibited; although the accommodation to circumstances which is also manifested shows something—and that not inconsiderable—of reason.

NESTS. This subject is usually confined to the nests of birds, and most notices are based on The Architecture of Birds (Charles Knight, London, 1831), the original observations in which are by professor J. Reenie. The subjects of his treatment include ground-nesters, squatters, and miners; builders of domes, of umbrellas, of domes; masons; carpenters; platform-makers; basket-makers; weavers; tailors; felters; cementors. But if we look at these divisions from the point of scientific classification, it will immediately be seen that the shape, size, and locality of the nest of any given species depend on its capacities, which will appear in its beak, wings, and claws; and on its habits, which may have been modified by a thousand considerations of climate, of companionship, or imitation. General influences as to the practice of particular species may be best drawn by the following classification, based on Cuvier, but partly Reichenbach, partly Willoughby.

1. Robbers
   (a. Swoopers. Eagles, hawks, vultures.
   (b. Stealers. Owls, etc., etc.

2. Climbers
   (a. Porchers. Parrots, etc.
   (b. Roosters. Domestic fowl, partridge, etc.
   (c. Pinchers. Fly-catchers, warblers, etc.

3. Scratchers
   (b. Cricketers. Larks, linnets, rooks.
   (c. Tuckers. Hoopoes, humming-birds, etc.

4. Songsters
   (a. Runners. Ostrich, emu, etc.
   (b. Walkers. Bustards, plovers, etc.

5. Stalkers
   (a. Fishers. Herons, storks, cranes.
   (b. Dyers. Curlews, rail, woodcock, etc.
   (c. Scooters. Rails, creets, flamingoes, etc.

6. Swimmers
   (a. Divers. Anks, penguins, etc.
   (b. Roverers. Pelicans, gulls, cormorants, albatross, etc.
   (c. Waddlers. Swans, geese, ducks.

But the desire of birds to build nests corresponds to that of men to make houses, or beasts to construct lairs. They are a shelter for the young, or a refuge for the old; as with mammals, the higher the order of intelligence, the more protection is needed by the young, so that the young eagle must have its food torn up for the first few weeks, while the young ostrich scuttles out of the sand almost ready to take care of itself from birth. Nor do birds’ nests differ in shape, material, or adjustment from the works of insects, beasts, even crustaceans. The following is a summary of nest-builders, disregarding the minute divisions of the list of Reenie:

First. Burrowers.—First of mammals is the mole, so voracious, active, and fierce that if the creature had the size of one of the tropical ferre, it may be questioned whether any animal has existed which could conquer it. The burrow is most complex of all, and the nest separate from the house. Then come shrews and musk-rats, the fox, all the wensels and badgers, chip-squirrels and woodchucks, and the rabbit. All have a distinct nest within the hole, and generally means of escape by extra passages. Burrowing birds; The sand-martin, the kingfisher, puffins, jackdaws, and sheldrakes; the stormy petrel, like all fish-eating birds, living in the midst of filth and stench; woodpeckers, the starlings and the creeper; the toucan, large of beak but small of strength, unable to excavate its hole in the knot of a tree. Reptiles, tortoises, crocodiles, and snakes, with all the crab kind of crustaceans, and the whole horde of boring mollusks. Scorpions and spiders, who have tunnels, towers, and trap-doors; insects, beetles, including the curious mole-cricket and the ant-lion; and all the numberless insects that bore into every article not made of metal or stone.

Second. Hang-nests.—The beautiful little harvest-mouse, one of the smallest mammals in the world, builds a true pencele nest, round, and, curiously enough, without opening. So does the squirrel, when his summer nest (for he makes two) from the end of
some slender bough, but these are almost the only animals light and active enough to rival the birds in this peculiar industry. Hanging nests of all shapes—bottles, scoops, extinguishers; with holes, with concealed openings—being in enormous variety, to the tropical humming-birds, the orioles, the fly-catchers, and all the warblers. Among insects the best-known are the wasps; but many ants, the moths, and some spiders come into this category. There is one fish, but it seems wrong to include here the pulp of insects.

Passing to the creatures which build, rather than burrow or weave, we have: Building mammals. Two Australian species only and our own musk-rat; but the birds are very numerous. The oven-bird, the blackbird, and the song-thrush, martins of all kinds, swallows of all kinds, the curious birds of Australia which hatch their eggs in mounds of rotting leaves and twigs; the titmouse, wrens, the eastern lyre and boyer birds. Among insects we have white ants and mud-building wasps. But a whole class of buildings may be separated and called sub-aquatic. Here belong fishes, the little stickleback and the harser; but the most wonderful of all such creations may be seen in the depths of a pool. The water-spiders, caddis-flies, all pupa-cases and larve-nests; and here may be added corals, serpulue and trechebelle. Social habitats, communities of creatures, whether all of the same species or mixed, by suflerance and by intrusion, are very common. The beaver, emblem of quietness and industry, is an example from mammals; but in birds we have the curious sociable-weaver of South Africa. Among insects, bees, hornets, some moths, some butterflies, and several curious kinds of ants, mostly from Africa. Parasitic nests, inhabited by the cuckoo and the cow-birds, the sparrow-hawk and the kestral, crow-blackbirds, occasionally the sparrow and the stork. Among insects, whole families of flies pursue the luckless moths and caterpillars, making of their cocoons, or their living bodies, nests for the generation of a swarm of destroyers. Here come most of the gall-insects, the leaf-miners, and the parasitic breeze-flies, and the curious companion of the snail, the drillas. Branch-builders are represented, as may be imagined, mostly by birds, yet we have among animals the dormouse and the loir; among birds, rooks, crows, herons, all finches, the eagle, the chat, the mocking-bird, the water-hen, some warblers, some humming-birds, some shrikes, and the hedge-sparrow. These all make open, usually round nests, on the fork of a branch, and woven of twigs or of miscellaneous trash. Here come also some spiders, many moths, and several species of strange nest-building insects. To sum up, a nest, visibly so, and for that purpose only, strikes us more commonly in birds than elsewhere, though upwards of one-half of them make no nest, and many others steal places already fitted to their use; but the fact is, many mammals have distinct and real nests; crustaceans and reptiles commonly construct them, and they are and must be the rule with all insects when undergoing the changes necessary to their development.

NESTS, Edible, an important article of commerce between the eastern islands and China, and of luxury in China, are the nests of several species of swallow (q.v.), of the genus collocalia. The best known of these birds, C. esculenta, is about 43 in. in length, 11 in. expanse of wing, dusky black above, pale ash-color beneath. The nest is shaped like that of the common swallow, and adheres to a rock; vast numbers being found together—often in absolute contiguity—in caves of the eastern archipelago; as those of the same and allied species are in other islands of the East Indies. The nests themselves are formed of grass, sea-weed fibers, small leaves, etc., and are attached to the rock by a sort of bracket, made of a gelatinous substance, which is the part really eaten. This was formerly thought to be made of sea-weeds, but is now known to consist of saliva, which the swallow exudes from the salivary glands under the tongue. The nests are collected by means of ladders, and often by means of ropes, which enable the gatherers to descend from the summit of a precipice, like the rock-fowlers of the north. The gathering of the nests takes place after the young are fledged, thrice in a year. In the Chinese market the nests are sold for from 42 to 47 per lb., according to the quality, and they are, of course, used only by the most wealthy, chiefly for thickening rich soups. The imports at Canton are reckoned at 1200 piculs, or 108,000 lbs., representing about 8,400,000 nests. The nests are very wholesome and nourishing, but quite devoid of the peculiar properties which the Chinese ascribe to them. Five caverns at Karang, Bolong, in Java, contain 380,000 swallows, and yield annually about 500,000 nests. The Dutch export them to China. The nests weigh about half an ounce each.

Netherlands, The Kingdom of, lies between 50° 43' and 53° 36' n. lat., and 3° 22' and 7° 16' e. long., is bounded on the n. by the North sea, c. by Hanover and the western part of Prussia, s. by Liége, Belgian Limburg, Antwerp, east and west Flanders, w. by the North sea. Its greatest length from n. to s. is 385 English m., and its greatest breadth from the w. on the North sea, to the extremity of Overyssel, on the e., 110 English miles. It contains 12,597 sq. miles. Pop., including the grand duchy of Luxembourg, 3,885,111. The following table gives the population, Jan. 1, 1872, the area of the provinces, including the reclaimed Haarlem lake, and the provincial capitals:

The pop. (Jan. 1, 1875) had, exclusive of Luxembourg, increased to 3,715,676, averaging 295 to the sq. mile. In Drenthe it is 105, and in South and North Holland rises to 693 and 581; Utrecht, Limburg, and Zeeland being the next densely populated. In 1871 the births amounted to 128,905, of which 4,590 were illegitimate. The average was 1 to 37.90.

In North Brabant, 1 to 44.28; Gelderland, 1 to 30.04; South Holland, 1 to 22.73; North Holland, 1 to 24.23; Zeeland, 1 to 26.30; Utrecht, 1 to 21.43; Friesland, 1 to 26.24; Overysssel, 1 to 45.07; Groningen, 1 to 22.54; Drenthe, 1 to 22.08; Limburg, 1 to 37.44.

The leading places are Amsterdam, Rotterdam, Dordrecht, Alkmaar, Middelburg, Schiedam, Leyden, Delft, Gouda, Utrecht, Amersfort, Groningen, Meppel, Zwolle, Kampen, Deventer, Arnhem, Nymegen, Tiel, Gorinchem, 's Hertogenbosch, Tilburg, and Breda.

**Physical Aspect.**—The land is generally low, much of it being under the level of the sea, rivers, and canals, especially in North and South Holland, Zeeland, the southern part of Gelderland, and Friesland. Along the west coast, the low lands are protected from the sea by a line of sand-hills or dunes; and where that natural defense is wanting, strong dikes have been constructed, and are maintained at great expense, to keep back the water. The greatest of these dikes are those of the Helder and of West Kapelle, on the east coast of Walcheren (q.v.), which require, each, upward of £6,000 annually to keep them in order. Engineers, called the officers of the Waterstaat, take special charge of the dikes and national hydraulic works, the expense of which is reckoned at about half a million sterling. A hilly district stretches from Prussia through Drenthe, Overysssel, the Veluwe or Arnhem district of Gelderland, the eastern part of Utrecht, into the Betuwe or country between the Maas and the Waal. This tract of country has many pretty spots, is of a light, sandy soil, well watered, and, when not cultivated, is covered with heath or oak-coppice. The greatest part of the Netherlands is very fertile, the low lands and drained lakes, called polders (q.v.), being adapted for pasturing cattle, and the light soils for cereals and fruits; but in some districts there are sandy heath-clad plains, extensive peat-lands, and undrained morasses, which industry is rapidly bringing under cultivation.

**Islands, Rivers, Canals, Etc.**—The islands may be divided into two groups, of which the southern, formed by the mouths of the Schelde and Maas, contains Walcheren, South and North Beveland, Schouwen, Duiveland, Tholen, St. Philipsland, Goeree, Voorne, Putten, Beyerdal, Ysselmonde, Rozenburg, and the island of Dordrecht. The northern group contains the islands at the entrance of the Zuyder Zee and along the coasts of Groningen and Friesland, as Wieringen, Texel, Vlieland, Terschelling, Ameland, Schiermonnikoog, and Rottum. In the Zuyder Zee are Marken, Urk, and Schokland.

The chief rivers are the Rhine, Maas, and Schelde. Important branches of these are the Waal, Leek, Yssel, Roer, etc.

Water-maps are more numerous than in any other European country, the immense tracts of meadow-land and the fertile polders being gridled by large canals, and cut in all directions by smaller ones for drainage and communication. Those of most importance to the national trade are, the North Holland canal, constructed 1819 to 1825, to connect the port of Amsterdam with the North sea; the Voorne canal, from the n. side of Voorne to Helvoetsluis, which shortens the outlet from Rotterdam; the South Williamsvaart, through North Brabant, Dutch and Belgian Limburg, from 's Hertogenbosch to Maastricht, being 71 miles long, in length, and having 42 locks. Besides these, there are numerous important canals, connecting rivers, and cutting the kingdom into a network of water-courses. To improve the entrance to the Maas, the Hook of Holland has lately been cut. A new canal through the Y and peninsula of Holland was opened Nov. 1, 1876. It is nowhere less than 80 yards broad, with sluices nearly 400 ft. in length, and a depth of nearly 23 feet. This has reduced the distance from Amsterdam to the sea to about 16 m., and provides a safe way for large ships. The harbor, in 53° 29′ n. lat. and 4° 36′ e. long., is formed by piers of concrete built into the North sea. The expense, excluding the recovery of 15,000 acres of land from the Y amounted to about two millions sterling.
Railways have been constructed to the extent of about 1008 m., forming lines of communication between the principal cities of the Netherlands, and with Prussia to the s.e., and Belgian to the s. west. The receipts of the three main lines in 1873 amounted to £696,555. These belong to companies. The state railways realized £445,966, and carried 3,188,443 passengers. The two oldest companies gave dividends of 6½ and 8½ per cent.

**Climate, Agriculture, Produce, etc.**—The climate of the n. is variable, chilly colds often closely succeeding high temperatures, inducing various forms of fever andague, and requiring peculiar care as to clothing, etc. In summer the thermometer sometimes rises above 90°, and even to 90° F. in the shade, and a winter of great severity usually occurs every fifth year, when carriages and heavily-laden wagons cross the rivers and the Y on the ice, and thousands enjoy the national pastime of skating.

The farms are generally small and well cultivated, though the implements are old-fashioned and clumsy. Much progress is being made in reclaiming the sandy wastes, in Drenthe and Overysell, by planting them with fir and oak, and sowing buckwheat, oats, and rye. The best implements are also being gradually introduced from England, and the steam-plow was, in 1862, put in operation on the lands of the drained Haarlem lake.

The following table shows the agricultural products, with their values, for 1872, according to government returns:

</table>

In 1874 the total value of agricultural products was about £17,500,000. In 1872 wheat occupied 211,960 acres; rye, 403,629 acres; barley, 111,811 acres; oats, 246,651 acres; potatoes, 312,929 acres; flax, 46,846 acres.

In 1872 the Netherlands possessed 247,900 horses, 1,377,000 head of cattle, 855,300 sheep, 139,500 goats, and 320,100 pigs. The leading agricultural products of Zealand are wheat and madder; in South Holland, madder, hemp, butter, and cheese; in North Holland, butter and cheese are extensively made, and cattle, sheep, and pigs reared and exported. The horses of Friesland, Zealand, and Gelderland are of first-rate quality. The exportation of butter from Holland and Friesland, and of Edam, Leyden, Gouda, and Frisian cheese, is large; in 1873 the value of the exports of cheese was £1,013,293, of butter £1,459,875. Fruit is abundant, and in several provinces, as Gelderland, Utrecht, and Drenthe, much attention is paid to bees. In Haarlem and neighbourhood, tullips and hyacinths are much cultivated, realizing a large annual amount. In 1874 the foreign trade in bulbs reached, in the district, £37,500. The inland sales realized £47,833. Wild ducks, snipes, plovers, and hares are plentiful; and there are also conies, partridge, pheasants, and deer—game forming an article of export.

**Geology, Mineralogy, etc.**—The Netherlands are of recent formation, and consist of an alluvial deposit, chiefly of a deep, rich clayey soil, superimposed on banks of sand, marine shells, and beds of peat and clay. It appears that at some distant period there had been a depression of the land below its former level, enabling the sea to burst through its sand-banks, submerge the land, and form new deposits. The higher districts are composed of sand-drift mingled with fertile earths, and resting on a bed of clay. Coal is worked in Limburg; and a soft sandstone, which becomes fit for building purposes after having been some time exposed to the atmosphere, is quarried in the southern part of that province, which has also pipe and other clays. Valuable clays for pottery, tile, and brick making, abound, in the various provinces.

**Manufactures, Industries, etc.**—The chief manufactures are linen, woolen, cotton, and silk fabrics; paper, leather, glass, etc. Leyden and Tilburg are famed for woven blankets, wool-dyed pilon, fine cloths, and frizes; 's Hertogenbosch for linens and rich damasks; calicoes, shirtings, drills, table cloths, striped dainties are made at Almelo, AMSFORT, and in the leading towns of Overysell. Good imitation Smyrna and Scotch carpets, and carpets of hair and wool, are manufactured at Deventer, Delft, Arnheim, Hilversum, Utrecht, and Breda; Turkey-red yarns, dyed silks, and silk stuffs at Roermond, Utrecht.
500

Netherlands.

Haarlem, etc.; leather, glass, firearms, at Maastricht and Delft; iron-founding, rolling and hammering of lead and copper, cannon-founding are carried on at the Hague, etc.; and powder-mills at Muiden; Oudekerk, Middelburg, 's Hertogenbosch, Amsterdam, Nymegen, etc., have important breweries, those of 's Hertogenbosch and Amsterdam manufacturing very large quantities. Walwyck, Hulsen, and surrounding districts, manufacture boots and shoes, of which Heusden sends to North and South Holland 1,000,000 pairs yearly. Gin is distilled at Schiedam, Delft, Rotterdam, and Weesp. Amsterdam has the largest diamond-cutting trade in the world, 10,000 persons depending on that branch of industry. Sugar-refining is largely carried on at Amsterdam, Rotterdam, and Dordrecht, from all of which sugar is exported to Russia, the Levant, and countries of Europe. Paper is chiefly made in Holland and Gelderland. The leading letter-type founders are at Amsterdam and Haarlem. Manufacturers of every kind are being rapidly increased in number, and adding to the material prosperity of the Netherlands. The chief motive power is the windmill, which forms a never-failing element in the scenery; but of late years steam is becoming more general. In 1854 the steam-engines employed in factories were 464, with 7,380 horse-power; and in 1872 they amounted to 21,403 horse-power, and the increase has since been going on.

Many people are employed in the immense inland shipping-trade which the canal network has fostered, there being, when the previous census was taken, 6,684 ships inhabited by families, or one inhabited ship to 81 houses. The houses were 542,295; families, 668,911. Fishing, not only in the inland waters, the coasts, and bays of the North sea, but also on the coast of Scotland, is vigorously pursued. In 1873 the total value of the herrings taken in the North sea was £127,660, 102 vessels having been employed; on the Netherlands coasts, to the value of £77,734; and in the Zuyder Zee and coasts were taken 8,733,950 herrings. The anchovy take, almost exclusively in the Zuyder Zee, amounted to 30,000 ankers, valued at about £58,750. There are productive oyster beds, besides extensive fishings of cod, ling, turbot, flounders, soles, shrimps, haddock, etc.; and from the rivers, salmon, eels, perch, etc.

The Netherlands is peculiarly a mercantile as well as an agricultural country. Its merchants not only importing and exporting the products of their colonies and the surplus of their own country, but also those of other lands. The general imports (1875) were 6,520,217 tons; exports, 3,290,944 tons. The value of goods imported for use was £59,820,520, and of exports, £44,914,342, home produce: both were less in 1876. The leading exports are cheese, butter, refined sugar, flax, cattle, sheep, pigs, gin, garumice, etc.; the imports, manufactured goods, unrefined sugar, coffee, grain, iron, yarns, cotton, rice, gold, silver, tin, tea, indigo, silk, and woolen fabrics. The trade with Great Britain is large and varied, and carried on chiefly by steam-vessels.

In 1877, 8,166 vessels (of which 2,488 were Dutch), with a burden of 8,119,327 tons, entered Dutch ports; and 4,936 (of which 2,628 were Dutch), of 4,572,850 tons, cleared. The mercantile marine of the Netherlands in 1878 comprised 1,247 sea-going vessels (79 being steamers), with a tonnage of 558,652. The trade along the rivers, by Belgian and German ships, is large. In 1873 the goods passing up the Rhine amounted to £44,191 tons; the Belts, £108,084, of which £68,561 was grain, timber, and coal. Wheat carried up, 110,263 tons, and rye, 116,774 tons; down, 4,854 tons of wheat, and 10,335 of potatoes. Timber, upwards, 86,042 tons; downwards, 56,087 tons. Coal, 1,026,119; and iron, 31,119 tons.

Religion, Language, Education, etc.—At the last census (1879) there were 2,193,281 Protestants, 1,313,052 Roman Catholics, 68,003 Jews, and 5,193 to small sects. There were (Jan. 1, 1875) 2,034 Protestant ministers, of whom 1,508 were Dutch Reformed, 2,062 Roman Catholic priests; and 168 Jewish congregations. The official estimate of the population at the beginning of 1878 gave the total as 3,924,792.

There are five dialects spoken respectively in Groningen, Friesland, Gelderland, Holland, and Zeeland. These differ considerably from each other, and the Frisian is not at all understood by natives of the other provinces. The written language is the Dutch, that branch of the great Teutonic stock which preserves more of its original character than any part of the same family. It possesses numerous words the same as Lowland Scotch, and bears a strong affinity to the old Saxon English, as the following Dutch proverbs show:

As de wyn is in den man,  
Is de wysheid in de kan.

The kingdom of the Netherlands has produced many great names in all branches of literature and science. Coster (q.v.), according to his countrymen, invented printing, Leeuwenhoek the microscope, and Huygens applied the pendulum. Out of a long list of distinguished names, may be mentioned those of Erasmus, Scaliger, Heinsius, Hugo de Groot (Grotius), Huygens, Leeuwenhoek, Vittura, Boerhave, and the poets Hooff, Vondel, and Cats; whilst the writings of Van der Palm, Van Lennep, Des Amoere van der Hoeven, Haafner, Staart, Van Kampen, and those of the poets Bildertyk, Du Costa, De Bull, Van den Berg, ter Haar, and Houdtly, show that literature is not waning. Exclusive of newspapers, there are 226 magazines and periodicals published in the Netherlands, of which 67 are religious, 42 on art, belles-lettres, and general literature, and 7 on antiquity, history, etc. Leading painters of the old Dutch school were Rembrandt, Gerrit (Gerard) Don, Gabriel Metza, Jan Steen, Paul Potter, Ruysdaal, Van der Helst;
and among those of the present century, Ary Schaffer, Koekoek, Schelfhout, Pieneman, Kruseman, Van Os, Craeyvanger, Ten Kate, Israels, Blies, Louis Meyer, Roedoff, Springer, etc., have distinguished themselves.

There are universities at Leyden, Utrecht, and Groningen; also academic or colleges at Amsterdam, Deventer and Maastricht, the students attending which must be examined for degrees at one of the universities. Latin schools are in all the leading towns. The universities and atheneums have faculties of theology, medicine, philosophy, law, and letters. There are also the royal military and naval academy at Breda, and that for engineers and the India civil service at Delft; seminaries in several places for the training of the Roman Catholic clergy; and others, especially in Amsterdam, for those of the smaller Protestant sects; and many literary, scientific, and agricultural institutes.

Each community or parish must have, at least, one elementary school, supported from the local public funds, in which reading, writing, arithmetic, history, geography, etc., are taught. A higher class of schools includes also foreign languages. All are under government inspectors, and the teachers must undergo stringent examinations on all the branches before obtaining permission to teach. Many society or subscription schools are being erected all over the land, with a normal school at Nymegen, not under government surveillance, and including religious instruction, which is excluded from the national public schools. The members of these societies pay a yearly subscription and a small fee for each pupil sent by them to the school, a select number acting as managers. There are national normal schools at St. Hertogenbosch, Haarlem, and Groningen, the pupil-teachers boarding themselves, and receiving, at St. Hertogenbosch, £21 a year, and at Haarlem £24. The attendance at school is about 1 to 8 of the population in winter, and 1 to 10 in summer. In Jan. 1873, 256,489 boys and 225,779 girls; in July, 237,685 boys and 218,729 girls were at public and private elementary schools, with 8,888 male and 2,351 female teachers.

Armed Forces.—The strength of the army, in Europe (1878) was 2,000 officers and 60,850 men; of the Indian army, 1,680 officers and 37,800 men. It is composed of volunteers, and of one man for every 500, drawn by lot for five years' service. There is also a local force, called the schuttery, drawn by lot from those between 25 and 44 years of age, to assist in keeping order and peace, and in case of war, to act as a mobile corps, and do garrison duty. If attacked on the land-side, 90,000 men are required for the defenses, and if by land and sea, 106,000. The first, or Maas line of defense, is formed by Maastricht, Venlo, Grave, St. Hertogenbosch, Woudrichem, Geertruidenberg, Willemstad, Breda, and Bergen-op-Zoom. The second line is formed by Nymegen, Forts St. Andries and Loevestein and Gorinchem. The inner line of Utrecht is formed by various forts from Faarden, Utrecht to Gorinchem, which, by inundations, can make the provinces of North and South Holland into an island. There are many other forts, batteries and strengths at the mouths of the rivers and along the leading ways, and a new line of defense was agreed upon in 1874.

The royal navy consisted (July 1, 1878) of 99 steamers carrying 400 guns, and 16 sailing vessels with 103. The sailors and marines numbered 8,470 officers and men, including 701 native East Indians. A large double-turret ship, with four 36-ton Armstrong guns, was built in 1879 to the iron-clads. Prince Frederic, uncle of the king, is admiral; the prince of Orange, vice-admiral; and his majesty is commander-in-chief of the land and naval forces.

Revenue, Expenditure, etc.—The revenue of 1878 was estimated at £8,539,580, and the expenditure at £9,049,941, the difference to be met from accumulated surpluses and the regular increase. The principal receipts are from direct taxes, excise, indirect taxes, import and export duties. Among items of expenditure are £888,300 for public works, chiefly railways: £2,250,000 for interest on the national debt; and £333,300 to improve the defenses. The India revenue for 1878 was estimated at £12,000,478; the expenditure equals the revenue. The East India colonies, which were a burden in the earlier years of the kingdom, have long been a source of profit.

From 1850 to and with 1874, there has been paid off £25,576,218 from the national debt, lessening the annual interest by the sum of £754,709. The interest payable on the debt was estimated in 1879 to £2,225,000. The material prosperity of the Netherlands is rapidly increasing, and the sum of £600,000,000 is invested by Netherlands capitalists in the funds of other nations.

The chief colonies are Java, Sumatra, Borneo, Celebes, the Spice Islands, and Papua or New Guinea, in the East; and Surinam, Curaçao, and its dependencies, in the West Indies, with factories on the coast of Guinea. Colonial pop. estimated at 24,386,991.

Government, Franchise, etc.—The government of the Netherlands is a limited constitutional monarchy, hereditary in the male line, and by default of that in the female. The crown-prince bears the title of prince of Orange, and attains his majority at eighteen, when he takes his seat in the council of state. The executive is vested in the king, with a council of state composed of twelve members, nominated by his majesty, and the ministers of the interior, foreign affairs, finance, war, the colonies, marine, and justice, the last named taking charge of ecclesiastical affairs through two administrators, or under-secretaries of state, for the Protestant and Roman Catholic churches. The legislative power is shared by the king and the two chambers of the states-general; the first chamber having 99 members, elected for nine years, by the provincial states, one-third of their
number retiring every three years. The second chamber has 80 members chosen by elec-
tors numbering, in 1874, 108,813, above 23 years of age, who pay from £1, 14s. to
£13, 12s. of direct taxes, according to the size and importance of the electoral
district. These are elected for four years, one-half of the chamber retiring every two years.
For members of the town-councils, the electoral qualification is half the above sums. The
members of both chambers must be 30 years of age before the day of election, and those
eligible for the first chamber are the nobility. This exceedingly high franchise, which,
in Amsterdam, is a higher direct tax than the rental qualification of Great Britain,
makes an election a thing of no interest except to a few. In 1871, only 30.2 per cent.
of the electors of North Holland gave their votes, and the maximum in any place was
66.9 per cent in Limburg, 62.5 in North Brabant, the average being 48.6.

The king nomimates the governors of provinces, the burgemeesters of every city,
town, or village, and a host of other officials. The cities, towns, and rural parishes are
governed by a council, burgemeester (mayor or provost), and wethouders (aldermen or
buities). The council consists of from 7 to 39 members, according to the population,
who are chosen for six years, one-third part retiring every two years. The council
selects out of their number from 2 to 4 wethouders for six years, one-half retiring every
third year. These with the burgemeester form the local executive. The law
departments are the high council, the provincial courts of justice, those of the arrange-
ments and cantons; appeal in many cases being open from the lower to the higher
courts.

History.—Nothing is known regarding the original inhabitants of the Netherlands;
but about a century and a half before our era the people known as the Batavi came out
of Hesse, where they were living in hostility with their neighbors, and settled down
between the Rhine and the Waal. At this time the Frisians occupied the country n. of
the Rhine to the Elbe. The Batavi and Frisians differed little in appearance, manner
of life, and religion. They clothed themselves with skins, lived by fishing, hunting, and
pasturing cattle, possessing horses, cows, and sheep; were faithful, open-hearted, chaste,
and hospitable. The songs of the bards composed their literature and history. Warlike
and brave, they selected their leader for his courage and prowess, were armed with the
bow and a short spear. They worshiped the sun and moon, and held their meetings in
consecrated woods.

The Romans having subdued the Belge, next attacked the Frisians, who agreed to
pay a tribute of ox-hides and horns, but continued restless and rebellious. The Batavi
became allies of Rome, paying no tribute, but supplying a volunteer contingent, chiefly
of cavalry, which decided the battle of Pharsalia in favor of Caesar, and formed a gal-
Iant band of the Roman armies in all parts of the empire. About 70 a.D., Claudius
Civilis, a Batavian, whose original name has not been preserved, made a bold effort to
overthrow the Roman power in Rhenish or Germanic Gaul, but he was finally compelled
to sue for peace. Towards the close of the 3d c. began the inroads of the Franks, fol-
lowed by the Saxons and other races; and in the 5th c. the Batavi had ceased to exist as
a distinct people. The Franks continued to spread, and with them the Christian religion,
Dagobert I., one of their princes, erecting a church at Utrecht, which, 695, became the
seat of a bishopric. The Frisians were opposed to and the last to embrace Christianity,
to which they were forcibly converted by Charles Martel. At the end of the 8th c. all
the Low Countries submitted to Charlemagne, who built a palace at Nymegen, on the
Waal. The feudal system now began to develop itself and expand into dukedoms,
counties, lordships, and bishoprics. It was the Baltic lands, which the Frisians, the
Batavians, and the Franks left to the Holsteins and the bishops of Utrecht, endeavored to enlarge and to rule over
with as little submission to their superior as possible. The crusades weakened the
power and drained the resources of the nobles and priesthood, so that, during the middle-
ages, cities began to assume importance, strengthen themselves with walls, choose their
own rulers, and appear in the state meetings. In 1384 the county of Flanders passed,
to marriage, to the duke of Burgundy, whose grandson, Philip the good, made it
his special life-effort to form the Netherlands into a powerful kingdom. He bought
Namur, inherited Brabant with Limburg, and compelled Jacoba of Bavaria to resign
Holland and Zealand. Charles V., as heir of the house of Burgundy, inherited and
united the Netherlands under his scepter, and the country attained to prosperity through
the encouragements which he gave to commerce and shipping. Philip II., who suc-
ceeded his father, 1555, by his harsh government and persecution of the reformers
excited the Netherlands to rebellion, which after a struggle of 80 years resulted in the
firm establishment of the republic of the United Provinces. The founder of the inde-
pendence of the Netherlands was William of Nassau, prince of Orange, called in history
the silent, who freely sacrificed his own property, and put forth every effort to unite
the discordant states of the south with those of the north in resisting the Spanish yoke.
Retiring to Holland, and banding together several provinces for mutual defense, he
by an agreement made at Utrecht, 1579, he perseveringly opposed the efforts of Spain; and in
1609 the independency of the United Provinces (the boundaries of which nearly coinci-
ded with those of the present kingdom of the Netherlands) was virtually acknowledged
by the Spanish king, an armistice for twelve years being signed at Antwerp, April 9 of
that year. The struggle was renewed and carried on till 1648, when all the powers
acknowledged the independency of the United Provinces by the treaty of Munster, while
the Belgo provinces, divided among themselves, remained submissive to Spain, and to the Roman Catholic church.

Prince William the silent did not live to see his efforts for freedom crowned with success. Excited by religious fanaticism, and the hope of a great reward, Balthazar Gerard, or Guion, 1584, shot the prince in his house at Delft, from a narrow passage, as he was stepping from the dining-room to ascend an adjoining stair which led to the second floor. With the 17th c. the United Provinces began to advance in power and wealth, their ships visiting all parts of the world. Meanwhile the contest between the Arminians and Calvinists broke out, and raged with fury for many years; Grotius and others fleeing to other lands, and the statesman Oldenbarnevelt suffering on the scaffold at the age of 72. The United Provinces were presided over by the princes of Orange till the troubles at the end of the 18th c. began the long European war, which the battle of Waterloo brought to a close. The national convention of Great Britain having declared war against Great Britain and the stadtholder of Holland, 1793, French armies overrun Belgium, 1794; and being welcomed by the so-called patriots of the United Provinces, William V. and his family, Jan., 1795, were obliged to escape from Scheveningen to England in a fishing-junk, and the French rule began. The United Provinces now became the Batavian republic, paying eight and a half millions sterling for a French army of 25,000 men, besides giving up important parts of the country along the Belgian frontier. After several changes, Louis Bonaparte, June 5, 1806, was appointed king of Holland, but four years later was obliged to resign because he refused to be a mere tool in the hands of the French emperor. Holland was then added to the empire, and formed seven departments. The fall of Napoleon I., and dismemberment of the French empire, led to the recall of the Orange family, and the formation of the southern and northern provinces into the ill-assorted kingdom of the Netherlands, which in 1820 was broken up by the accession of Belgium. In 1839 peace was finally concluded with Belgium; but almost immediately after national discontent with the government showed itself, and William I., in 1840, abdicated in favor of his son. The Netherlands being moved by the revolutionary fever of 1848, king William II. granted a new constitution, according to which new chambers were chosen, but had scarcely met when he died, March, 1849, and the present king, William III., ascended the throne. The nation is prosperous, and on May 11, 1874, the twenty-fifth anniversary of the present king's reign was celebrated with great rejoicings.

A bill for the emancipation of the slaves in the Netherlands West India possessions passed both chambers Aug. 8, 1862, and received the royal assent. It decreed a compensation of 800 guilders for each slave, except those of the island of St. Martin, who were to be compensated for at 90 guilders each. The freed negroes may choose the place to labor, but must be able to satisfy the government officers that they are employed somewhere. This surveillance to continue during ten years. The law came into force July 1, 1863, and in Surinam and all the other colonies the day passed quietly over. Those, however, interested in agriculture have sent an address to the minister of the colonies, protesting against the high-wages tariff as hostile to the successful carrying on of their operations. The rate, however, is not higher than the planters in the neighboring British colony of British Guiana are accustomed to pay. In the budget for 1863 provision was made for the extraordinary expenses connected with the emancipation to the amount of £1,065,366, of which £867,000 as compensation for the slaves of Surinam, and £21,250 as premiums for free labor. For Curâçao and its dependencies, £106,000 of compensation money, fully £12,000 being for various other outlays connected with the change. The number of slaves set free may be stated in round numbers to be 42,000, of whom 35,000 are in Dutch Guiana.

On July 16, 1863, a treaty was signed at Brussels by all, the naval powers for the buying up of the tot levied, under treaty arrangements, by the king of the Netherlands, of vessels navigating the Schelde (q.v.), the king of Belgium binding himself also to reduce the harbor, pilot, and other charges on shipping within that kingdom.

The Netherlands have suffered much from floods, either caused by the breaking in of the sea, or by the descent of masses of water from Germany, while the rivers of the Rhine delta were blocked up with ice. The Zuyder Zee (q.v.), which contains 1385 sq.m., was of trifling extent till the flood of All Saints' day, 1247, when the North sea swallowed up a large tract of country. In 1277 the Dollart gulf, in Groningen, was formed at the mouth of the Ems, by floods in the spring and autumn of that year, which destroyed 33 villages and 100,000 people. The immense waste of waters known as the sunken South Holland Waarde, or Biesbosch, arose out of the breaking of one of the dykes, 1421, by which 72 villages were laid under water, only 34 of them reappearing. In modern times great floods, but fortunately with only temporary results, have occurred in 1800, 1835, and 1855. That of 1855, which placed the town of Veenendaal, in Gelderland, and an extensive tract of country under water, was caused by a rapid thaw in the high lands of Germany pouring down torrents of water into the Netherlands while the rivers were ice-locked after a winter of unusual severity.---See the Algemeene Statistiek van Nederland; Nederland-Geographisch-Historisch Overzigt, by Luth. L. G. Beuwsa; Statistiek Jaarboek (Witkamp, Amsterdam), an excellent book of reference, which is published yearly up to the present time; the provincial annual reports, etc.

NETHERLANDS (suite). See DUTCH LANGUAGE AND LITERATURE.
NETHERLANDS TRADING COMPANY, a chartered joint-stock association, with limited liability, formed to aid in developing the natural resources of the Dutch East Indian possessions. The company possesses peculiar privileges, acting exclusively as the commission-agents of the Netherlands government in importing and selling the produce of the colonies, as well as doing a large business as merchants. Private enterprise having failed to develop the trade of Java, after that island was restored to the Netherlands, King William I., in 1824, erected the trading company, with a capital of upwards of £3 millions sterling, not only becoming a large shareholder, but guaranteeing an interest of 1 per cent on the paid-up capital. The early transactions were unprofitable, and in 1827 the king had to pay a part, and in 1830 the whole of the guaranteed interest. From that date, it has prospered and handed over, from the trade of Java (q.v.), large surplus balances into the national revenue. The head office of the directors is at Amsterdam, with agents at Rotterdam, Middleburg, Dordrecht, and Schiedam; the principal factory at Batavia, with agencies at the chief ports in Java and the other Netherlands possessions in the Eastern Archipelago. Formerly the company supplied largely the fifth part of the solvent, the company paid for the production of the Dutch government; but since the beginning of 1875, the business for the government has been confided to colonial produce, which is placed in factories, forwarded to Holland, and disposed of at the company's sales in Amsterdam, Rotterdam, etc. In 1875, they sold for the government 56,959 bales of coffee, which realized £4,378,292; 136,768 blocks of bencana and 2,956 of Billiton tin, at £376,548; 492 packages of cinchona bark and powder at £5,977. On the company's account, colonial produce was sold to the value of £761,267; and calicoes, yarns, woolen stuffs, various goods, precious stones, and money to the value of £314,688, were sent to Netherlands-India, Singapore, British India, China, Japan, and Surinam. The company also advance money to planters and manufacturers in the colonies, who bind themselves for a number of years to consign their produce. They are also owners of a large sugar plantation, Resolute, in Surinam. The present capital is 36,140,000 guilders, or £5,011,668. The commission paid by government is a chief source of profit. For 1875, the dividend was 3.3 per cent. The suit would have been more favorable had not heavy loss been sustained in the Japan trade.

The success of the trading company depends mainly on the culture system, which was introduced into Java in 1830. Under the native rule, the land belonged to the princes, and the cultivators paid one-fifth of the produce, and one-fifth of their labor as ground-rent. The Dutch, by conquest, are now the proprietors of the greater part of the island, and the old produce rent, relaxing the labor to one-seventh, and causing the holders of crown-lands to plant one-fifth of their cultivated fields with the crop best adapted for the soil and required for the European market. The government also has supplied, free of interest, enterprising young men with the capital necessary to erect and carry on works for the preparation of the raw materials, to be repaid in ten yearly instalments, beginning with the third year. The land-holders of a certain district allotted to a sugar-plant are bound to supply a fixed quantity, receiving advances upon the crop to enable them to bring it forward. The rule of fixed quantity was relaxed in 1860, and has caused great complaint among the contractors. The European residents and their assistants, the native princes, chiefs, and village head-men, receive a percentage according to the quantity which is manufactured from the produce delivered, so that all are interested in taking care that the lands are cultivated and the crops cared for. Sugar, tobacco, and tea are prepared by contractors: indigo, cochineal, coffee, cinnamon and pepper, by the natives under European surveillance, all passing into the trading company's factories for shipment to the Netherlands. The objections to the system are, that it does not leave the labor of the natives free, and that the passing of so much of the export and import trade through one favored company injures the general merchant. On the other hand, it must be said that the Dutch government only carries out the old law, and it is therefore not regarded by the peasantry as an infringement of their rights; and the merchants and capitalists of the Netherlands did not of themselves put forth sufficient efforts to work out the natural capabilities of Java when it returned under Dutch rule.

NETLEY, ROYAL VICTORIA HOSPITAL AT, is a superb building, on the shore of Southampton water, for the reception of invalids from the army on foreign service, and from among the troops serving in the adjoining military districts. In times of peace, it is only necessary to use a portion of the vast structure; but in the event of a European war, in which the British army should take part, the exigencies of the service would probably tax its accommodation to the utmost. There is provision for 1,000 patients, with power to increase the number if necessary. The medical staff of course varies in proportion to the work to be done; but at present it consists of a governor, an adjutant, a pay-master, an assistant-commandant, and medical officers, and officers of ordnance of various ranks. The total cost of the construction of this hospital, which was commenced in 1855, has been about £350,000. Attached is the medical school for candidates for the army medical department, the students having the best means of practical instruction in the wards of the hospital. Netley is also the head quarters of the Royal Army, who are under the control of a lady stationed here as superintendent. Complete arrangements have been made for the landing of wounded men in front of the hospital, and for conveying them thither with the least disturbance. There is no doubt as to the
convenience of this great hospital for its purposes: but some questions have been raised, under high sanitary authority, as to the salubrity of the site, adjacent as it is to the wide banks of mud which Southampton water uncovers at low tide.

NETS are fabrics in which the threads cross each other at right angles, leaving a comparatively large open space between them; threads are also knotted at the intersections. In this respect netting differs essentially from weaving, where the intersecting threads simply cross each other. The open spaces in nets are called meshes, and these correspond in size with an instrument used in net-making, consisting of a flat piece of wood or other hard substance, usually about the shape and size of a common paper-knife. In addition to this, a peculiar kind of needle is used, upon which a large quantity of the thread is placed by winding it from end to end between the forked extremities; the holes are used to insert the end of the thread, to prevent it slipping off at the commencement of the winding. The art of net-making has been practiced from the earliest times by the most savage as well as the most civilized nations. Even where the art of weaving was quite unknown, as in some of the South Sea islands when first discovered, that of netting was well understood and it is easy to see that the human race could not help learning the value of this art from seeing how frequently land and water animals get entangled in the shrubs and weeds through which they attempt to pass: hence we find amongst savage tribes, almost universally, nets are used not only for fishing, as with us, but also for entrapping land animals. We have ample illustrations of the uses of nets for both purposes in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt.

Until recently nets have been always made by hand, and generally the thread has been a more or less thick twine of hemp or flax, the thickness of the twine and the size of the mesh depending upon the kind of fish for which it was made; recently, however, great improvements have been made in the manufacture of nets, and machinery of a most beautiful automatic kind has been introduced by Messrs. Stuart of Musselburgh, whose manufacture is of vast extent. This establishment commences with the raw materials, which are hemp, flax, and cotton, the last having been extensively employed for herring and sprat nets of late years. Hemp, however, is the chief material for net-making; and in order to prepare it, it is first passed in long rolls through a machine consisting of two rollers with blunt ridges, the upper of which is kept down on the material by means of a hanging weight, consisting of a loaded box suspended to a chain from the axle of the roller. After the fiber has passed through this, it is much more supple than before, and is then hackled; this process is also done by machinery, which was first introduced into this manufacture for hemp-hackling, and succeeds admirably. It subsequently passes through the carding, roving, and spinning processes, as in all other kinds of yarn, and is finally twisted into threads or twines of the required thickness. Messrs. Stuart have in one room 4,000 spindles at work, besides the carding and twist machines. Of their patent loom they have 200 at work, the largest of which makes nets 450 meshes in width. It would be useless to attempt to describe these ingenious looms, which are worked by hand, otherwise than by saying that their leading features are like the stocking-frames; a series of sinkers push forward, pull down, and pass in and out the thread, which is carried from one side of the web to the other by long non needles, which act as shuttles passing not over-quickly from a long box on each side of the loom. The bobbin of twine which feeds the needle must have a conical form, which is most ingeniously given it by a special contrivance, in the twisting-machine; twine passes through small rings to prevent it being given off too quickly, or in knots or kinks. This simple yet most effectue contrivances is worked by wheels and jointed rods, and might be advantageously applied to many other purposes. After the net comes from the loom, it goes to the trowsers, who, by hand, make the addition of a kind of selvage, consisting of several thicknesses of twine, to give strength to the edges. The nets are then ready for use, and are sent in vast numbers to all parts of the world. Machine net-making is now becoming general.

A great variety of nets are in use amongst fishermen, but the principal are the seine, trawl, and drift nets. The seine is a very long but not very wide net, one side of which is loaded with pieces of lead, and consequently sinks; the other, or upper, is buoyed with pieces of cork, and consequently is kept up to the surface. Seines are sometimes as much as 190 fathoms in length. When stretched out they constitute walls of net-work in the water, and are made to inclose vast shoals of fish. The trawl is dragged along the bottom by the fishing-boat; and the drift-net is like the seine, but is not loaded with lead; it is usually employed for mackerel fishing.

Various kinds of nets are used in bird-catching, one of which is noticed in the article CLAP-NET. Nets are used in catching quadrupeds, chiefly for the purpose of inclosing spaces within which they are, but sometimes also for throwing upon them to confuse and entangle them.

Nets are used by gardeners to protect crops from birds; also to protect the blossoms of trees from frost, and it is wonderful how well this object is accomplished, even when the meshes are pretty wide, and the son's mays have very free access.

NETSCHER, GASPAR, or KASPAR, 1639-84; b. Germany; adopted by the physician Tullekens, who placed him under the instruction of Koster, a painter of poultry and
NETSUKE, Nettle. objects of still life. He afterwards studied under Gerard Terburg at Dussent. He set out for Italy, where he intended to complete his studies, but having married at Bordeaux, he returned to Holland, and established himself at the Hague. He now took up portrait painting, having previously painted only small cabinet pieces. His best works are his musical and conversational pieces. He was a brilliant colorist, a master of light and shade, and very skillful in his treatment of accessories and draperies. Many of his pictures are in Louvre, at Dresden, Munich, or Florence. His eldest son, Theodon, 1661-1732, b. Bordeaux, was for many years a portrait painter in Paris, imitating his father's style, but inferior to him. He went to London in 1715, as paymaster of the forces, and being introduced at court, painted many of the principal persons in England, where he remained for six years. Kaspar's second son, Constantine, 1670-1732, was also a painter of some reputation, who followed closely the manner of his father.

NETSUKE, from the Japanese ne (wood or root) and tsukkó (to suspend), a button of wood, crystal, or porcelain, but usually of ivory, by which the Japanese smoker suspends his outfit of tobacco, flint and steel, pipe, etc., from his girdle. Generally the netsuké is an elaborate work of art in carving, and is among the most characteristic products of native skill, portraying the fun, humor, grotesque or pathetic traits in human and animal nature, and illustrating the national legendary and historic lore. The best specimens have engraved on them the mark of the carver, and are very costly.

NETTING, NAVAL. A boarding-netting is of strong rope, and stretched above the bulwarks of a ship, over the port-holes, etc., to a considerable height, for the purpose of preventing the entrance of boarders from hostile boats. In positions where boat attacks are feasible, ships are thus protected at night, and at other times when attempts at boarding are anticipated. The hammock-netting is in the bulwarks of a ship, usually in the waist, and its purpose is to keep the hammocks of the crew when stowed there during the day; thus netted together, the hammocks form a valuable barrier against bullets.

Nettle, Urtica, a genus of plants of the natural order Urhiceae, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4-parted perianth, and 4 stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an achenium. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a nettle is grasped in such a way as to press the hairs to the stem, no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The sting of the native nettles of Europe is trifling in comparison with that of some East Indian species. U. erinacea is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is U. urentissima, the Devil's Leaf of Timor. Of British species, the most venomous, but the most rare, is the Roman Nettle (U. pilulifera); next to it is the Small Nettle (U. urens), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the Great Nettle (U. dioica), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye wooden stuffs of a beautiful and permanent green. The young shoots of U. dioica are used in some parts of Scotland and other countries as greens, and their peculiar flavor is much relished by some, although, in general, the use of them is confined to the poor; which, however, is probably the result of mere prejudice. Whatever it is that gives nettles their stinging power, is dissipated by boiling. The high value of nettles as food for swine, is well known to the peasantry of many countries; the great Nettle is cultivated in Sweden for fodder of domestic animals; nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry; and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England, for the manufacture of a light kind of beer, called Nettle beer. At Stalbridge, near Wimborne Minster, and in humble towns and other towns, the bast fiber of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fiber of U. dioica was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fiber, the plant is cut in the middle of summer, and treated like hemp. The names Nettle Yarn and Nettle Cloth are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics. — The fiber of U. erinacea, a native of the south of Siberia and other middle parts of Asia, is much used; and from
that of *U. Whittlaeri*, both fine lace and strong ropes can be manufactured. The fiber of *U. japonica* is much used in Japan, and that of *U. argentea* in the South Sea islands; that of *U. Canadensis* is used in Canada.—The seeds and herbage of *U. membranacea* are used in Egypt as emmenagogue and aphrodisiac; and somewhat similar properties are ascribed to *U. dioica*.—*U. tuberosa* produces tubers, which are nutritious, and are eaten boiled or roasted. — *U. gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 ft. high, but sometimes 120 or 140 ft., with trunk of great thickness, and very large green leaves, which, when young, sting violently. In some places, it forms scrub forests, and its stinging leaves form a great impediment to the traveler.

**NETTLE-RASH**, or *Urtica* (Lat. urtica, a nettle), is the term applied to a common form of eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular outline, and either white or red, or most commonly both red and white, there being a white center with a red margin. The rash is accompanied with great heat, itching, and irritation; the appearance on the skin and the sensation being very much like the appearance and feeling produced by the stinging of nettles: and hence the origin of its names.

The disease may be either acute or chronic. In the acute form, feverishness usually precedes the rash by a few hours, although sometimes they commence together. The disorder is always connected with some derangement of the digestive organs, and it may often be traced to the imperfect digestion of special articles of food, such as oatmeal, the kernels of fruit, strawberries, cucumbers, mushrooms, and especially oysters mussels, and crabs, which are eaten with perfect impunity by most persons. An hour or two after the offending substance has been swallowed, there is a feeling of nausea, with oppression about the pit of the stomach; the patient often complains of giddiness, and the face frequently swells; the skin then begins to tingle, and the eruption breaks forth; vomiting and diarrhea often supervene, and act as a natural cure; but even when they do not occur, the violence of the rash usually subsides in a few hours, and the disorder altogether disappears in a day or two.

The chronic form is often very troublesome; and frequently comes on periodically in the evening. Cases are reported in which persons have been afflicted for ten years continuously by this form of the disease. Patients have left off all their customary articles of diet, one by one, without in all cases meeting with relief; and hence it may be inferred, that although the disease depends in all cases on a disordered condition of the digestive organs, it is not always the consequence of some special offending article having been swallowed.

The main treatment of the acute form consists in expelling the offending matter by an emetic and by purgatives, and the cure is thus usually completed. In the chronic form, the patient should, in the first place, determine whether the rash is caused by any particular article of diet, and if this seems not to be the case, an attempt must be made to improve the state of the digestive organs. A few grains of rhubarb taken daily, just before breakfast and before dinner, will sometimes effect a cure. If this simple remedy fails, Dr. Watson recommends the trial of a draught composed of the infusion of serpen-taria (about an ounce and a half), with a scrupule each of the carbonates of magnesia and soda. He adds, that although external applications are usually of little avail, he has found that dusting the itching surface with flour sometimes affords temporary relief; and that a still more useful application is a lotion composed of a dram of the carb-

**NETTLETON, Asahel, D.D., 1783-1844; b. Conn.; graduated at Yale college in 1809; studied theology at New Haven; was licensed to preach in 1811 by the West Congregational association of New Haven; ordained as an evangelist in 1817 by the South consociation of Litchfield county. He commenced study with the view of being a missionary, but his services being in great demand, and his preaching very successful, he was led to consider it his duty to remain at home. For several years he preached in some of the largest and most important towns in Connecticut with great effect. In 1822 he had an attack of typhus fever, from the effects of which he never entirely recovered. In 1827 he visited Virginia for his health, and on his return in 1829, preached for two years in New York and New England. In 1831 he visited England, preaching there, and in Scotland and Ireland. After his return he was appointed in 1835 professor of pastoral theology in East Windsor theological seminary. He declined the professorship, but resided in the place, and lectured for several years to the students. His sermons were extemporaneous and generally doctrinal and argumentative, but with fervent appeals to the conscience. His style and manner were deeply solemn, to which impression his various methods in the conduct of his meetings contributed. He was a decided oppo-nent of Dr. Taylor's (New Haven) theological views. He published a small hymn-book, entitled *Village Hymns*, which was very popular and widely used. His *Remains and Sermons* were edited by Dr. B. Tyler, who published also a *Memoir*, which was republi-cated in Edinburgh, and revised by Dr. A. A. Bonar.

**NETTLE-TREE**, *Celtis*, a genus of deciduous trees of the natural order *ulmaceae*., with simple and generally serrated leaves, considerably resembling those of the common met-
tle, but not stinging. The genus is distinguished chiefly by its fruit, which is a fleshy, globose, or sub-globose 1-celled drupe. The common or European nettle-tree (C. Aus-

tralis) is a native of the s. of Europe, the w. of Asia, and the n. of Africa. It grows to
the height of 30 to 40 ft., and is a very handsome tree, often planted along public walks
in the s. of France and n. of Italy. The wood is very compact, very durable, and takes
a high polish. It was formerly much imported into Britain for the use of coachmakers.
It is used in Italy by musical instrument makers for flutes and pipes. The flowers are
borne near the middle of May, and solitary; the fruit black, resembling a small wild cherry, not
catable till after the first frost, and then very sweet. The kernel yields a useful fixed
oil. The tree succeeds here in the s. of England.—C. occidentalis is a native of North
America from Canada to Carolina, sometimes there called the nettle-tree, sometimes the
Sugar Berry. Its leaves are much broader than those of C. Australis, its fruit very
similar. It is a much larger tree, attaining a height of 60 to 80 feet.—Another American
species, C. crassifolia, often called Hackberry or Haggerberry, and Hooe Asll, is very
abundant in the basin of the Ohio and westward of the Mississippi. It grows to a great
height, but the trunk is not very thick. The wood is not much valued, but is said to make
very fine charcoal. The fruit is black, and about the size of a pea.—The inner
bark of C. orientalis, consisting of reticulated fibers, forms a kind of natural cloth, used
by some tribes of India.—A number of other species are natives of the warm parts of
America and of Asia.

NEU-BRAN DENBURG, a t. of Mecklenburg-Strelitz, the prettiest, and after the capital,
the largest in the duchy, is situated on lake Tollens, 17 m. n.e. of Neu-Strelitz. It is
regularly built, contains two churches, a castle, etc., is the center of a picturesque dis-
trict, and the seat of considerable industry. Pop. 75, 7,465.—About half a league from
Neu-Brandenburg, on a rock overlooking lake Tollens, stands the ducal pleasure-castle
of Belvedere, commanding, it is said, the most beautiful prospect in Mecklenburg.

NEU BURG, an ancient t. of Bavaria, is picturesquely situated on the right bank of
the Danube, 29 m. n.w. of Augsburg. It contains a handsome palace, the chateau of
the dukes of Bavaria of the line of Pfalz-Neuburg, who resided here from 1506 to 1742.
The palace contains a collection of ancient armor. Brewing and distilling are carried on, and
there is a considerable commercial trade on the Danube. Pop. 75, 7,291.

NEU-CHWANG, or YING-TSZE, a t. of the Chinese empire, in Manchuria. It stands
on the left bank of the river Liaow, about 25 m. from its mouth, and in lat. 41 ° n., and
long. 123° 30' eut. The Liaow, which falls into the gulf of Liaow-tang, at the head of
the Yellow sea, is navigable for sea-going vessels to Neu-Chwang; and Neu-Chwang
is therefore regarded as a seaport, and is one of those opened to foreign trade by the
treaty of Tientsin. A British consul resides here; but the trade is as yet inaccessible,
and only to Chinese ports.

NEUFCHATEL, or NEUFCHATEL, known also as Neurenburg, a canton in the w. of
Switzerland, between lake Neufchatel and the French frontier. Area, 310 sq. miles.
Pop. 70, 97,284; '78, about 103,850. Above 17,000 families speak French, and 2,700
German. Neufchatel lies in the midst of the Jura mountains, four chains of which, run-
ning from n.e. to s.w., traverse the canton, and are separated by elevated longitudinal
valleys. The most easterly of these is the broken chain, running parallel to the lake of
Neufchatel, on whose banks, and on the second and lower ranges beyond it, the vine is
carefully cultivated. This second chain has five principal passes, the highest of which,
La Tourne, has an elevation of about 4,000 feet. The third and fourth ranges, running
on France, consist of barren flats; the fifth part of barren hills, separated by elevated valleys; but
here and there these high lands are well wooded and fruitful, producing corn, good pasture,
fruits, etc. The greater number of the numerous streams which water the canton
flow into the Rhone. Among these mountain torrents the principal are the Reuse, the
Seyon, and the Serriere, the two former of which, together with the rivers Orbe and
Broie, are the feeders of the lake of Neufchatel, known also as the lake of Yverdon.
The Thiele serves as its outlet, and carries its waters into the neighboring lake of Bienne,
and into the river Aar. The lake is 25 m. long and from 3 to 51 m. wide. Its level
above the sea is 1420 ft., and it has a depth of 400 or 500 feet.

The natural products are iron ores, coal, asphalt, fruit, including grapes—from which
good red and white wines are made—timber and corn, although the latter is not grown in
sufficient quantity for the demands of the home consumption. The rearing of cattle
constitutes an important branch of industry, and large quantities of cheese are exported;
but the specialty of the canton is watch-making, which occupies from 18,000 to 20,000
persons, and is prosecuted in detail at the homes of the work-people, in the rural districts,
where some families manufacture only special parts of the machinery, while others are
engaged solely in putting together the separate portions that have been manufactured by
others; and the watches thus prepared are exported in large quantities to every part of
Europe and America. Muslim-printing employs upwards of 10,000 persons, and lace is
extensively made by the country-women of the Val de Travers.

The climate of Neufchatel varies greatly with the locality; being temperate on the
shores of the lake, cooler in the valleys, and severe on the mountain-sides. The popula-
tion, with the exception of between 9,000 and 10,000 Catholics, belongs to various Prot-
estant denominations.
The history of Neu-Feuchat was identical with that of Burgund till the 11th c.; and after the principality had been for a time incorporated with the territories of the counts of Oldenburg, to whom it had been granted in 1288 by Rudolph of Hapsburg, it passed to the house of Oldenburg. In 1707, on the extinction of the Neu-Feuchat branch of the latter family, 15 claimants came forward to advance more or less valid pretensions to the Neu-Feuchat territory. Frederick I. of Prussia, who based his claim to the principality of Neu-Feuchat on the ground of his descent from the first prince of Orange, a descendant of the house of Oldenburg, was the successful candidate; and from this time it continued connected with Prussia till 1806, when Napoleon bestowed upon Joseph Berthier; but in 1814 it was restored to the house of Oldenburg. This connection with the Prussian monarchy has been wholly dissolved since 1857, and Neu-Feuchat is now a member of the Swiss confederation.

**Neu-Feuchat**, or Neu-Oldenburg, is the chief t. of the canton, and occupies a magnificent site on the n.w. shore of the lake of Neu-Feuchat, and is noted for its many charitable institutions, and for the beauty of its charmingly situated environs. Pop. '70, 13,321.

**Neu-Haus**, a t. of Bohemia, on the Neschara, about 70 m. s.s.e. of Prague. Its palace, belonging to count Czerny, is a splendid edifice. Cloths, paper, and chemical products are manufactured. Pop. '69, 8,620.

**Neu-Hausel** (Hung, Eszék-Ujvár), a t. of Hungary, on the right bank of the Neutra, 74 m. n.w. of Pesth, by the Vienna and Pesth railway. It was formerly strongly fortified, and played an important part in the Turkish wars. No traces of its fortifications now remain. Pop. '69, 9,483, chiefly engaged in agriculture and the rearing of cattle.

**Neuhof, Theodor Von**, Baron, 1809-1576; b. in Metz, Westphalia; became a lieut. in an Alsace regiment, but soon left on account of his poverty, indebtedness, and, it is said, a duel. From this time he wandered about Europe, making use of his title and address to contract new debts. In Spain he met with some success, was offered a colonel's commission, and was engaged to marry one of the queen's ladies of honor. Finding that her dowry was less than represented, he fled with her jewels. In 1735 he became interested in the Corsican movement to assert the independence of Genoa, and in the following year persuaded the duke of Turenne to intrust to his command two regiments, with supplies and ammunition. Landing in Corsica in March, he was received with enthusiasm. Exaggerated and totally false ideas as to his rank in nobility and his influence with the governments of Europe were promulgated, and in April he was elected king under the title of Theodore I. His reign lasted but eight months, during which time he made great display personally and formed a new order of knighthood. His promises of foreign assistance were not realized, though the Netherlands made some vague treaty of alliance; and when in 1738 the French came to the aid of the Genoese, the Corsican cause was lost and Neuhof fled. After the departure of the French, 1741-42, Neuhof found that his popularity had vanished and that his life was in danger. He fled again to England, where he was imprisoned for debt by his Dutch creditors (he had in 1738 mortgaged two Corsican cities for funds to carry on the war), and was released in 1736, a few months before his death, by the assistance and intercession of Horace Walpole.

**Neully** (sometimes called Neully-sur-Seine, to distinguish it from several much less important places of the same name), a t. of France, in the department of Seine, on the right bank of the river Seine, immediately to the n. of the Bois de Boulogne. Neully may now be regarded as a suburb of Paris, with which it is connected by several streets or roads, lined with numerous villas. Here, near the Seine, and in a large and beautiful park, formerly stood the château de Neuilly, which was successively occupied by Louis N., and the favorite residence of Louis Philippe, which was burned at the revolution in 1848. The park was also then divided into lots for sale, the consequence being a rapid increase of the number of houses in Neully. Neully manufactures of porcelain and starch, chemical works, and distilleries. Pop. '72, 15,466. When Louis Philippe abdicated, and took refuge in England, he assumed the title of count de Neully.

**Neukomm, Steinsburg, 1778-1858; b. Germany; studied under Michael and Joseph Haydn, and in 1804 became leader of the German opera. In 1816 he went to Rio Janeiro, and was appointed music teacher to the court. He returned in 1821, and lived at Talleyrand's house in Paris. He composed many cantatas, symphonies, sonatas, etc., and two successful oratorios, Mount Sinai, 1831; and David, 1834.

**Neumann, Karl Friedrich, 1798-1870; b. in Bavaria; educated at the universities of Heidelberg, Munich, and Göttingen; afterwards studied in Paris and Vienna. Of Jewish birth, he became converted to Christianity and joined the Lutheran sect. In 1829 he traveled in China and India, making a very large collection of books in the native languages. From 1831 to 1852 he was professor of oriental languages at the university of Munich; but his political views caused his dismissal. It was after this that he wrote his Geschichte der Vereinigten Staaten von Amerika, and Histoire Schein, an account of the alleged discovery of America by Buddhist monks. He also published very many pamphlets and papers relating for the most part to oriental languages and literature, especially those of the Armenians.

**Neumunster**, a prosperous manufacturing and market town of Holstein, on the Schwale, one of the head-waters of the Stoor, and on the railway between Altona and
Neuralgia.
Neuroptera.

510

Kiel. 19 m. s. by w. from Kiel. There are large woolen and linen factories, tanneries, dye-works, and breweries. Pop. 75,10,124.

NEURALGIA (Gr. neuron, a nerve; algos, pain) is a term employed to designate pain of a purely nervous character, usually unaccompanied by inflammation, fever, or any appreciable change of structure. The pain, which occurs in paroxysms, usually followed by complete remissions, is of every possible degree and character, being described in different cases as piercing, tearing, burning, etc. These paroxysms may occur at intervals of a few seconds only; or they may take place daily or on alternate days, or they may be separated by much longer intervals, which are often, but by no means always, of a regular length. With the pain there is frequently spasmodic twitching of the adjacent muscles. The duration of the disease is very uncertain. The patient may have only a single attack, or he may be liable to recurring attacks for months, years, or even for his whole life; it is, however, very seldom that the disease occurs but once. Death scarcely ever results directly from this affection, but the pain may, by its severity and persistence, gradually undermine the constitution.

The disease may affect any part of the body where there are nerves; but in no part does it occur so frequently as in the face, when it is popularly known as tic-douloureux; its seat being in the facial branches of the fifth pair of nerves (the trigeminal nerves). The following graphic description of the ordinary varieties of this form of neuralgia is borrowed from Dr. Watson's Lectures on the Principles and Practice of Physic.

"When the uppermost branch of the trigeminal nerve is the seat of the complaint the pain generally shoots from the spot where the nerve issues through the superior orbital fissure; and it involves the parts adjacent, upon which the filils of the nerve are distributed—the forehead, the brow, the upper lid, sometimes the eyeball itself. The eye is usually closed during the paroxysm, and the skin of the forehead on that side corrugated. The neighboring arteries throb, and a copious gush of tears takes place. In some instances the eye becomes blood-shot at each attack; and when the attacks are frequently repeated, this injection of the conjunctiva may become permanent."

"When the pain depends upon a morbid condition or morbid action of the middle branch of the nerve it is sometimes quite sudden in its accession, and sometimes comes on rather more gradually; being preceded by a tickling or prickling sensation of the cheek, and by twitches of the lower eyelid. These symptoms are shortly followed by palpitations of the heart, by irregular respiration, by a dashing of blood in the face, by a general sense of oppression in the region of the head and face. There is a sudden and violent contraction of the eyelid, temple, and cheek, accompanied by a twitching of the naso-labial line. At times it extends to the teeth, the antrum, the hard and soft palate, and even to the base of the tongue, and induces spasmodic contractions of the neighboring muscles."

"When the pain is referrible to the inferior or maxillary branch of the fifth pair of nerves it darts from the mental foramen, radiating to the lips, the alveolar processes, the teeth, the chin, and to the side of the tongue. It often stops exactly at the symphysis of the chin. Frequently it extends in the other direction, to the whole cheek and to the ear. During the paroxysm the features are liable to be distorted by spasmatic action of the muscles of the jaw, amounting sometimes to tetanic rigidity, and holding the jaw fixed and immovable."

The paroxysms of suffering in this frightful disease are apt to be brought on by apparent cause—by taking cold, or by a sudden jar or shake of the body; or they may be initiated by the application of air blowing upon the face, by a sudden jar or shake of the bed on which the patient is lying, by a knock at the door, or even by directing the patient's attention to his malady by speaking of it or asking him questions about it. The necessary movements of the face in speaking or eating are often sufficient to provoke or renew the paroxysm. At the same time, firm pressure made upon the painful part frequently gives relief, and causes a sense of numbness to take the place of the previous agony" (vol. i, pp. 723–24).

Tic-douloureux in the form of severe neuralgia which is by far the most commonly met with; the reason probably being that the trigeminal nerve lying superficially, and being distributed over a part of the surface which is usually unprotected by any artificial covering, is very liable, for that reason, to be affected by exposure to atmospheric influences, which are undoubtedly to be included among the exciting causes of this disease. Amongst other seats of neuralgia may be mentioned the arm, especially the fore-arm, the spaces between the ribs, especially between the sixth and ninth, and the lower extremity, which is more frequently affected than the sciotic nerve, giving rise to the affection known as sciatica, which, however, not always being purely neuralgia, will be noticed in a separate article.

The causes of neuralgia are various. Excluding inflammation of the nervous trunk or neuritis, the pain may be excited by a tumor pressing on the nerve, or originating in its substance; or by roughness of a bony surface with which the nerve may be in contact, as when it passes through a foramen: or it may be due to tumors within the cranium, or a morbid state of the spinal cord. Sometimes, again, irritation applied to one branch of a nerve will give rise to pain at the extremity of another branch of the same nerve, the sensation being reflected along the branch which is not directly exposed to the irritation. In this way we may explain the pain in the shoulder which often accompanies

In this way we may explain the pain in the shoulder which often accompanies
Neurop'tera (Gr. nerve-winged), an order of mandibulate insects, having four nearly equal and membranous wings, all adapted for flight, divided by their nervous nerves, cellular in the form of little spaces, and not covered with the scales, as in the lepidoptera.

The wings are often extended horizontally when at rest, nearly as in flight; but the position is various. The form of the wing is generally somewhat elongated. The body is generally much elongated, particularly the abdomen. The head is often large, the compound eyes very large, and there are often also simple or stigmatic eyes.

The habits are predacious, at least in the larva state; often also in the pupa and perfect
states, the food consisting of other insects, often caught on the wing. The power of flight is accordingly great in many. The larve and pupae are often aquatic. The females have no sting, and only a few have an ovipositor. The metamorphosis is complete in some, incomplete in others. Dragon flies, May flies, scorpion flies, ant-lions, and termites, or white ants, belong to this order.

NEUROTICS (Fr. néroïque; Gr. νευριωτής, a nerve), a word recently come into use to specify such drugs as tend to affect principally and specifically the nerves of thought and motion. Alcohol, ether, chloral, opium, potassium, bromide, amyl-nitrate, strychnine, quinine, aconite, and digitalis are examples of drugs to which this name may be applied.

NEUSATZ (also Neoplasta or Uj-Vidék), a t. of the Austrian empire, in the Hungarian province of Bác, is situated on the left bank of the Danube, opposite Peterwardein. Its origin dates from the year 1700, and by the year 1849 it numbered nearly 30,000 inhabitants. A bridge, 840 ft. in length, extends between Neusatz and the town and fortress of Peterwardein. Neusatz is the see of the Greek non-united bishop of Bác. On June 11, 1849, it was taken from the Hungarian insurgents by the imperial troops, and was almost wholly destroyed. It has been rebuilt in excellent style. Neusatz is a station for steamers on the Danube, and carries on an important and active trade. Pop. '69, 19,119.

NEUSE, a river of North Carolina, rises near the middle of the northern boundary of the state, and, after a south-easterly course of 250 m., falls by a broad channel into Pamlico sound, which communicates by several inlets with the Atlantic ocean. It forms the harbor of New Berne.

NEUSIELI LAKE (Hung. Perto-laka), a small lake on the n.w. frontier of Hungary, 22 m. s.e. of Vienna. It is 28 m. in length, and about 6 m. in average breadth, with a mean depth of 13 feet. Its waters are light-green in appearance, and are brackish in taste. The slopes of the Leitha mountains in the vicinity produce excellent wine.

NEUSOHL (Hung. Besertersz-Bánlya), a beautiful and thriving t. of Hungary, the chief place of the richest mining district in the country, is situated in a hill-inclosed valley on the right bank of the Grai, about 85 m. n. of Pesth. Neusohl, consisting, as it does, of the town proper and five suburbs, contains a population, in all, of (1869) 11,750, who are employed in the copper and iron mines of the vicinity, in the smelting-houses, and in the manufacture of beet-root sugar, paper, colors, etc. It is the seat of a bishop, and contains a beautiful cathedral, a bishop's palace, and two evangelical churches, and several other handsome edifices.

NEUS, a fortress and flourishing manufacturing t. of Rhenish Prussia, near the left bank of the Rhine, with which it is connected by the river Erf!t, 4 m. s.w. of Düsseldorf. Its church of St. Quentin, a beautiful edifice, and a noble specimen of the transition from the round to the pointed style, is supposed to have been built in 1209. Neus is the principal grain-market of the province, and carries on manufactures of woolen and other cloths, ribbons, hats, vinegar, etc. It is supposed to be the Novesium of the Romans, sacked by Attila in the year 451. Pop. '75, 15,563.

NEUSTADT (Polish, Pnzdalt), a t. of Prussian Silesia, 29 m. s.w. of Oppeln. It is the seat of considerable manufacturing industry, woolen and linen fabrics being the staple goods manufactured. Damask-weaving alone employs 660 hands, and 380 looms. Pop. '73, 12,515.

NEUSTADT, or WIENER-NEUSTADT, one of the most beautiful t. of lower Austria, called, from its loyalty, "the ever-faithful town" (eine getreue Stadt), is situated 28 m. s. of Vienna, on the Vienna and Gloggnitz railway, and is also connected with the capital by a canal. It is surrounded by a broad and deep ditch, and by a fortified wall pierced by four gates. The town is overlooked by the large old castle of the dukes of Babenberg, now a military academy for the preparatory instruction of officers of the line. It accommodates from 400 to 500 pupils. The castle contains a fine Gothic chapel (date, 1490), rich in painted windows. It is the burial place of the emperor Maximilian I. On Sept. 14, 1834, the whole town, with the exception of 14 houses, was destroyed by a dreadful conflagration, which involved the loss of many lives. The new town has been laid out with great taste and regularity. The canal (40 m. in length) and the railway to Vienna, and the converging roads from Styria and Hungary, are the sources of the prosperity of the town. In Neustadt machinery is extensively constructed; and sugar-refining and manufactures of silk, velvet, and cotton fabrics, flax-cure, leather, etc., are carried on. Pop. '69, 18,070.

NEUSTADT AN DER HARDT, a small t. of Rhenish Bavaria, charmingly situated on the Speyerbach, at the foot of the Hardt mountains, 12 m. n. of Landau. Its church, with several curious monuments of the counts palatine, and with some ancient fresco-paintings, was finished in the 14th century. It carries on manufactures of paper, cloth, oil, brandy, etc. Pop. '75, 10,924.

NEUSTADT-EBERSWALDE (since 1876 called officially Eberswalde only), a t. of Prussia, in the province of Brandenburg, 38 m. n.e. of Berlin. It is well known on account of
its mineral springs, and carries on extensive manufactures in steel, iron, copper, brass, paper, and porcelain. Pop. '75, 10,069.

**Neustadt an der Waag**, a t. near the n.w. frontier of Hungary, 33 m. n.n.w. of Neutra. Here excellent red wine is grown, and there is a good trade in grain, wool, sheep-skins, and wax. Pop. '69, 5,451, nearly half of whom are Jews.

**Neustettin**, a t. of Prussia in the province of Pomerania, 92 m. s.w. from Danzig, on the southern shore of the Vilm See. It is the capital of a circle, and a place of some importance. Pop. '75, 6,971.

**Neustrelitz**, the capital and the residence of the court of the grand duchy of Mecklenburg-Strelitz, pleasantly situated in a hilly district, between two lakes, 60 m. n.n.w. of Berlin. It was founded in 1733, is built in the form of an eight-rayed star, and contains the ducal palace, with a library of 70,000 vols., and having magnificent gardens attached. Pop. '75, 8,325, supported chiefly from the expenditure of the court, and by brewing and distilling. A mile s. of the town is the Alt-Strelitz, with the largest horse-market in the duchy.

**Neustria**, or West France (Francia occidentalis), the name given in the times of the Merovingians and Carolingians to the western portion of the Frank empire, after the quadruple division of it which took place in 511. Neustria contained three of these divisions. It extended originally from the mouth of the Scheldt to the Loire, and was bounded by Aquitania on the s., and by Burgundy and Austrasia (Francia orientalis), on the e. The principal cities were Soissons, Paris, Orleans, and Tours. Bretagne was always loosely attached to Neustria, of which the strength lay in the duchy of France. After the cession of the territory afterward called Normandy to the Normans in 912, the name Neustria soon fell into disuse.

**Neuters**, an Indian tribe, so named by the French from the neutrality observed by them in the wars between the Hurons and Iroquois tribes, between which they were situated. They lived on the banks of the Niagra. In 1649 the Neuters were conquered by the Iroquois, the larger part killed, and the rest incorporated in the Five nations. Early efforts to establish missions among them were not successful.

**Neutitschein**, a small manufacturing town of Moravia, on the Titsch, 80 m. n.e. of Brünn. It contains an old castle, and carries on manufactures of cloth and woollen-goods, dyeing, and wagon-making. Pop. '69, 8,645.

**Neutra**, a co. in n.w. Hungary, having Moravia for its n.w. boundary, and a range of the Carpathian mountains; 2,319 sq.m.; pop. '70, 361,005. It is drained by the Neutra, March, and Waag rivers, head-waters of the Danube. Its surface is hilly, and its pastoralure excellent; and it exceeds all other localities of Hungary in the number of cattle and sheep raised. Its trade, carried on principally with the province of Moravia, is very active. Its manufactures are the products of the loom, linen, cotton, and woollen-goods. Its soil is adapted to vine-culture, and much wine is exported, Neutadler being considered the most desirable. Capital, Neutra.

**Neutra**, a t. of Hungary, the capital of a county of the same name, on a river of the same name, 72 m. n.n.w. from Pesth. Neutra is a very old town, having been the residence of a Moravian prince in the 8th c., before the Magyar invasions. Weaving is carried on to some extent; and Neutra, being not far from the Moravian frontier, has a considerable transit-trade. Pop. '69, 19,683.

**Neutral Axis**, the name given to an imaginary line to any body which is being subjected to a transverse strain; and separating the forces of extension from those of compression. If the ratio of the resistances to extension and compression were the same for all substances, and depended merely on the form of the body, then in all bodies of the same form the neutral axis would have a definite geometrical position: but it has been satisfactorily proved by Mr. Eaton Hodgkinson that this ratio has a separate value for each substance. In wood, where the ratio is one of equality, the neutral axis in a beam supported at both ends, whose section is rectangular, passes lengthwise through the center of the beam; while in cast-iron, in which the resistance to compression is greater than that to extension, it is a little above, and in wrought-iron, in which the contrary is the case, it is a little below, the center.

**Neutral Salts.** See Salts.

**Neutrals**, nations who, when a war is being carried on, take no part in the contest, and evince no particular friendship for or hostility to any of the belligerents. As a general rule neutrals should conduct themselves with perfect impartiality, and do nothing which can be considered as favoring one belligerent more than another.

The duties and obligations of neutrals at sea have given rise to many complicated questions. It is allowed on all hands that a neutral state forfeits her character of neutrality by furnishing to either belligerent any of the articles that come under the denomination of contraband of war (q.v.). If she does so, the other belligerent is warranted in intercepting the vessels, and confiscating them as lawful prize. Contraband of war, besides warlike stores, has sometimes been held to include various articles, a supply of which is necessary for the prosecution of the war: and it has been doubted how far, in some circumstances, corn, hay, and coal may not come under that category.

U. K. X.—33
An important question regarding the rights of neutrals is, whether enemies' goods not contraband of war may be lawfully conveyed in neutral bottoms. The principle that free ships make free goods was long resisted by this and other maritime countries; and the general understanding has been that belligerents have a right of visiting and searching neutral vessels for the purpose of ascertaining—First, whether the ship is really neutral, as the hoisting of a neutral flag affords no absolute security that it is so; Second, whether it has contraband of war or enemies' property on board. Neutral ships have therefore been held bound to provide themselves with passports from their government, and such papers as are necessary to prove the property of the ship and cargo; and it is their duty to have to when summoned by the cruisers of either belligerent. It has been considered that a neutral ship which seeks to avoid search by crowding sail, or by open force, may be captured and confiscated. When a merchant-ship is sailing under convoy of a vessel of war it has been said that the declaration of the officer in command of the convoy that there is no contraband of war or belligerent property on board is sufficient to bar the right of search of the ship.

A declaration having important bearings on the rights of neutrals was adopted by the plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in congress at Paris on April 16, 1856. By its provisions, 1. Privateering is abolished. 2. A neutral flag covers enemies' goods, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag. 4. Blockades, in order to be binding, must be effective—that is, maintained by a force sufficient really to prevent access to the coast of the enemy.

It has sometimes been proposed to exempt private property at sea from attack during war. Such a project, however, seems inexpedient. There may be a propriety in respecting the property of individuals on land in a time of war, because its destruction, however injurious to the persons immediately concerned, can have little influence on the decision of the contest. But at sea private property is destroyed, because those from whom it is taken, being purveyors or carriers for the community at large, its loss must seriously affect the public, and have no small influence in bringing the contest to an end. See Blockade, Privateer.

NEUWIED, a t. of Rhenish Prussia, on the right bank of the Rhine, 8 m. below Koblenz. It is the capital of the principality of Wied, now mediatised and attached to Prussia, and is the seat of the princes of Wied, with a beautiful castle. It was founded in the beginning of the 18th c. by prince Alexander of Wied-Newied, who, offering perfect toleration in religious matters, as an inducement, invited colonists of whatever persuasion to settle here. The town is well built, with wide, straight streets, running at right angles to each other, and contains the churches of Protestants, Catholics, Jews, Hurriners, etc. The inhabitants are well-conditioned, and industrious. Pop. 75, 9,474, who carry on manufactures of hosiery, woollen and cotton fabrics, iron-wares, leather, and tobacco.

NEVA, a river of Russia, in the government of St. Petersburg, flows westward from the s.w. corner of lake Ladoga to the bay of Cronstadt, in the gulf of Finland. Its length, including windings, is about 40 m., 9 m. of which are within the limits of the city of St. Petersburg; and in some places it is 2,100 ft. broad, and about 66 ft. deep; although at Schusselburg, where it issues from the lake, and at St. Petersburg, where it enters the sea by several branches, it is shallow. From Cronstadt, goods are brought to St. Petersburg in lighters, or with the help of tugs. By the Ladoga canal the n. communities are connected with the vast water-system of the Volga, and thus it may be said to join the Baltic with the Caspian sea. Its current is very rapid, and the volume of its waters is immense. It is covered by ice for upward of five months—from about Nov. 25 to April 27. An extensive traffic is carried on its waters, both from the interior, and from the Baltic.

NEVADA, one of the states of North America, is bound on the w. by California; on the s. by California and Arizona; on the e. by Utah and Arizona; and on the n. by Oregon and Idaho. Lat. 35° to 42° n.; long. 114° to 120° w.; area, 104,125 sq. miles. The population in 1870 was 42,491 (including 2,128 Chinese), besides 4,000 tribal Indians. The chief river is the Humboldt. The principal lakes are the Mud lakes, Pyramid lakes, and the Walker and Carson lakes. Nevada is the center of that elevated basin which reaches westward from the Rocky mountains to the Sierra Nevada, at a mean altitude of about 4,000 ft. above the level of the sea. Numerous mines, either of gold or silver, have been discovered. The whole country is rich in mineral wealth. Besides gold and silver, quicksilver, lead, and antimony are found. The territorial capital is Carson city (pop. 3,042); but the principal town is Virginia city (pop. 7,048). The product of silver in Nevada during the decade 1850 to 1869 was valued at $137,983,000; in 1875 its value was about $40,478,369.

NEVADA (ante) is a portion of the territory acquired by the United States from Mexico under the treaty of Guadalupe Hidalgo, belonging previous to its transfer to the "department of Alta California." Prior to its acquisition by the government it was inhabited only by the aboriginal races, there being no settlement of civilized people, not even a mission, within its borders. The first settlements were made in 1848 by the
Mormons, some of whom, in passing back and forth between California and Salt lake, observing the excellence of the land, located in the Carson and Washoe valleys. The following year they were joined by a few adventurers, who, attracted by the gold discoveries in California, had made the journey overland, but stopped on finding here the object for which they had set out. From this time the population gradually increased until in 1859, when silver was discovered, it had swelled to about 1000 people. During the next two years it increased to 17,000; and, as stated above, by the returns of the census for 1870, it had passed upon way 19,491. It then constituted a territory in Mar., 1861, and was admitted into the union as a state in Oct., 1864.

Viewed as a whole, geographically, the state, in common with the great American basin of which it forms a part, may be considered an elevated plateau, having a general altitude of more than 4,000 ft. above tide-water. Traversing this lofty plain are numerous chains of mountains, separated by valleys having a width varying from 5 to 20 m., and usually about equal to that of the adjacent mountains measured through their bases. The course of these valleys is, as a general thing, parallel to the main axis of the mountains, which have for the most part a northerly and southerly strike. These mountains vary in height from 1000 to 5,000 ft. above the common level of the country, having therefore an absolute elevation of from 5,000 to 9,000 ft. above the sea. For a distance of nearly 300 m. the Sierra Nevada forms a natural barrier along its western and south-western border; the boundary line between this state and California running partially upon its summit and partially along or near the eastern base of this range, which, though not here attaining its greatest altitude, has nevertheless within the limits of Nevada a general height of more than 7,000 ft., a few of the loftier peaks reaching a height of 10,000 ft. The mountains are covered nearly everywhere from base to summit with a growth of forests, consisting of a variety of pine, spruce, and fir, which are well adapted to make superior lumber. No oak or other hard wood of any size is found on this slope of the Sierra, nor, indeed, in any other part of Nevada. The alternation of mountains and valleys is preserved with much regularity throughout the state, being most marked in the central portion. Sometimes the former contract or are so broken up as to transform the valleys into broad plains or basins, some of which are open and unobstructed, while others are covered with isolated clusters of rugged hills. Though a few of these run streams of water supplied from the mountains, these much of the land is arable, the quantity usually being proportioned by the size of the stream in the valleys, however, that have no streams there is scarcely any land that can be used for agriculture. In fact, the more extended plains are marked by a great degree of sterility, being destitute for the most part of wood and only scantily supplied with grass. This system of valleys and plains, inclosed by mountains, and sometimes connected with each other, constitutes a series of basins, each having a drainage of its own, but scarcely any of them having an outlet to the sea. To this mode of drainage Nevada, as well as many other parts of the great basin, is entitled for some of its peculiar topographical and geological features, the common receptacle of the gathered waters becoming, according to circumstances, a lake, a meadow, an alkali flat, or a salt-bed. The Humboldt, the longest and largest river in the state, is usually fordable in many places; and the Reese river, though having a length of nearly 500 m., is not over 15 ft. wide, nor has its current above 12 cusec. Like the other rivers of the state it terminates in small lakes and pools. In respect to the approximate amount of land of the different qualities, the state surveyor's report for 1874 states that the agricultural land amounted in that year to 1,505,000 acres; grazing land, 22,210,276 acres; timbered land, 3,609,700 acres; and that the mineral lands already opened were 2,582,720 acres. The entire amount of mineral land is believed to exceed 6,000,000 acres; the amount of agricultural land is 17,608,960 acres; of reclaimable swamp-lands, 74,880 acres. The barren and worthless sandy lands amount to about 2,151,680 acres.

While the state will never be largely agricultural, it possesses, as will be noticed from the above estimate, an amount of arable land that will probably quite supply its own needs. Its great wealth is in its mines and mineral resources. Besides the precious metals, there have been found within its boundary lead, copper, iron, platinum, tin, zinc, antimony, sulphur, coal, lignite, coal scoria; beds of pure sulphur, gyspum, rock salt, nitrate of potassa, carbonate of soda in large quantities, borax, lignite or brown coal, kaolin, etc. Gold and silver are commonly found associated with each other, gold predominating in the Antelope, Tuscara, Gold mountain, Sacramento, and Sierra districts. Silver, however, is the staple mineral product, and the yield of this metal is constantly increasing. The Comstock lode, discovered in 1859, equals perhaps in value any deposit of the precious metals ever encountered in the history of mining enterprise. It is situated in Story co., about 25 m. from the western border of the state, on the eastern side of mount Davidson, and partly under Virginia City and Gold Hill. It has been traced on the surface 27,000 ft., explored 19,000 ft., and opened to a depth of 2,000 ft. Its ores contain about one-third in value of gold and two-thirds in silver. Other silver lodes are found in nearly every part of the state, some yielding from $85 to $100 to the ton, others from $300 to $500 more to the ton. In 1874 there were 243 mines in 12 counties; and the yield of both gold and silver amounted to $35,420,263.

The interest manifested in agriculture and stock-raising throughout Nevada has greatly increased during the past six years. In agricultural industry in 1874 the sur-
veyor general's report shows that there were 77,564 acres of land under cultivation, and that there were raised, among other products, 73,600 bushels of wheat; 506,790 bushels of barley; 74,655 of oats; 1,000 of rye; 13,960 of Indian corn; and 298,108 of potatoes. The livestock consisted of 4,736 head of cattle, 1,405 steers, 4,805 milch cows, 28,005 calves; 75,582 beef cattle; 155,486 sheep; and 5,290 hogs. The census of 1870 shows the number of manufacturing establishments to have been at that period 330, which employed 2,839 hands and had a capital invested of $5,127,790. Their annual product amounted to $15,870,539, divided as follows: nilled quartz, $13,119,719; pig lead, $894,600; iron castings, $641,250; machinery, $273,500; lumber, $447,500; gold and silver reduced and refined, $260,000. The number of railroads in the state in Jan., 1875, was 14, and their entire mileage, 603.06 miles. The chief among these were the Central Pacific, which crosses Nevada from e. to w., connecting with San Francisco and the Union Pacific railroad; the Virginia and Truckee, from Reno on the Central Pacific to Virginia; and the Eureka and Palisade railroad, from Palisade on the Central Pacific to Eureka. On Jan. 1, 1875, the state debt was $600,000, and the assets applicable to its reduction, exclusive of the school fund, were $471,853.67. There was a balance in the treasury of $717,639.39. The assessed valuation of real and personal property for 1874 was $260,630,279.22.

In educational institutions Nevada is not old enough yet to have made much progress. Its school fund in 1875 amounted to $250,000, and during the previous year there were expended for school purposes $154,812.43. About 4,000 children were enrolled, though not more than half that number were in attendance. A state university was established at Elko in 1874, and opened its preparatory department with 12 pupils. Of the religious denominations represented in the state there were, in 1875, 5 Protestant Episcopal churches, 11 Methodist, 5 Presbyterian, 10 Roman Catholic, and 10 Mormon, having 19 church edifices, and owning property valued at $921,000. The number of newspapers published in the state in 1874 was 12.

The constitution of Nevada provides that every male citizen who has attained the age of 21 years, and who is neither insane, an idiot, nor an unpardoned felon, shall be entitled to vote. General elections occur on the Tuesdays next after the first Monday of November of each year. The state is entitled to two representatives in the U. S. senate and one in the house of representatives, and consequently to three electoral votes. The following is the state's electoral record: 1864, Abraham Lincoln, 3; 1868, Ulysses S. Grant, 3; 1872, Ulysses S. Grant, 3; 1876, Rutherford B. Hayes, 3; 1880, James A. Garfield, 3.

NEVADA, a co. in s.w. Arkansas, bounded on the n. and e. by the Little Missouri river, and drained by Terre Rouge creek and Cypress bayou; about 600 sq. m.; pop. '80, 12,959—3,732 colored. The surface is diversified and heavily wooded, and the soil in the valleys fertile. The principal productions are cotton and Indian corn. It was set off from Ouachita and Columbia counties. It is on the St. Louis, Iron Mountain, and Southern railroads. Co. seat, Prescott.

NEVADA, a co. in n.e. California, adjoining Nevada, bounded on w. n.w. by the Middle Yuba river, drained by Bear creek and the South Yuba river, and crossed by the Central Pacific railroad; 1,050 sq. m.; pop. '70, 19,134—10,479 of American birth. The surface is irregular and mountainous, particularly in the e. portions, which are traversed by the Sierra Nevada. There are immense forests of evergreen trees. The soil in the river valleys and on the plains is fertile. The county contains Donner lake, a summer resort, and the mountain scenery in the e. is much admired. The principal agricultural productions are potatoes, butter, wine, and hay. There are breweries, flouring and saw mills, metal-ware manufactories, and machine-shops. But agriculture is little followed, the chief industry being gold mining. About one-half of the area contains valuable mineral deposits. Some of the richest veins of quartz in the state are found here, and there is a large number of mines, placer, hydraulic, and quartz. The placer mining is especially valuable. Limestone and granite abound. Large quantities of timber are exported. Co. seat, Nevada City.

NEVADA CITY, a t. in. California, the terminus of the Nevada County narrow gauge railroad from this point to Colfax, connecting there with the Central Pacific; pop. '70, 3,986. It is the co. seat of Nevada co. in the midst of a mountainous region containing valuable gold mines, supplanting 6 quartz mills. It is on Deer creek, 5 m. n.e. of Grass Valley, 33 m. e. of Marysville, and 65 m. n.e. of Sacramento. Its climate is considered very healthy, especially for consumptives, and its natural scenery attracts many visitors. It has 5 churches and several hotels, and is well built, mostly of brick. It has one newspaper, good public schools, a court-house, a bank, a masonic hall and places of meeting for all the secret orders, and an iron-foundry. The principal occupation is the cultivation of fruit and vines, and considerable wine is made.

NEVERS, a t. of France, capital of the department of Nièvre, and formerly the capital of the province of Nièvres, is built on a hill in the midst of fertile plains, at the confluence of the Loire and the Nièvre, 140 m. s.e. of Paris. Highly picturesque, as seen from a distance, its interior shows steep, winding, and badly-paved streets. It contains a beautiful cathedral of the 10th c., and a fine public garden; the large cavalry barracks, the fine bridge of 20 arches over the Loire, and the triumphal arch, erected in 1476, to
ommemorate the battle of Fontenoy, are also worthy of mention. Nevirs is the see of a bishop, contains a public library, and has numerous educational, scientific, and benevolent institutions, and an arsenal. There is here an important cannon-foundry, and the principal manufactures are porcelain and earthenware, glass, brandy, iron cables and chains, and anvils. Pop. '76, 29,601.

Nevers, the Noviodunum of the Romans, existed prior to the invasion of Gaul by Julius Caesar. It has been the seat of a bishop since the beginning of the 6th c., when it was called Neivirnum, became a co. in the 10th c., and was erected into a duchy by Francis I. in 1538.

NEVIANSK, a t. of Russia, in the government of Perm, 50 m. n. from Ekaterinburg. It is on the eastern or Siberian side of the Ural mountains, and stands on the Neiva, the waters of which flow by the Tobol and the Itirish to the Obi. The district around Neviars is famous for its mineral wealth, particularly for its productiveness of gold, copper, and platinum. Neviars has a mint, the tower of which is remarkable as leaning even more than the celebrated tower of Pisa. Pop. 18,000.

NEVILLE'S CROSS. See Bruce, David.

NEVIN, John Williamson, D.D., LL.D., b. Penn., 1803; graduated at Union college 1821; studied in the theological seminary at Princeton, and remained there some time as an instructor, and wrote Biblical Antiquities (2 vols.). In 1829-30 he was professor of Hebrew and Biblical Literature in the Presbyterian theological seminary at Allegheny City; in 1840 became professor of theology and president of the German Reformed theological seminary at Mercersburg, Penn., and also, 1841, president of Marshall college at the same place; in 1843 published The Anxious Bench, which produced much discussion on the subject of revivals; in 1844 translated Dr. Schaff's inaugural address, The Principle of Protestantism, which was viewed as containing the germ of what was afterward called "Mercersburg theology" (q.v.), and was followed by The Mystical Pressures of Time and the English in the Federal Period. Dr. Nevin also edited the Mercersburg Register, 1849-53; in 1851 he resigned the presidency of the seminary, and, in 1853, of the college, on its removal to Lancaster to be consolidated with Franklin college. He was afterward chosen president of Franklin and Marshall college, and still holds the position.

NEVIS, a small island of the West Indies, belonging to Great Britain, forms one of the group of the Lesser Antilles, and lies immediately s.e. of St. Christopher's, from which it is separated by a strait, called the Narrows, two m. wide. It is circular in form, rises in a central peak to the height of about 2500 ft., and has an area of 20 sq. m. Pop. '71, 11,735, of whom very few are white. Charlestown, a seaport, with a tolerable roadstead, situated on the s.w. shore of the island, is the seat of government, consisting of a government council and general assembly. The soil is fertile, and the principal products are sugar, molasses, and rum. In 1875 the revenue of Nevis was £16,001; and the expenditure £9,536. The imports for 1873 were valued at £52,293; and the exports at £83,325. The value of the sugar exported was £73,342, more than double the value of the revenue before, but only about £6,000 more than in 1871. The tonnage of vessels entering and clearing in 1873 amounted to 24,429.

NEW, John C., b. Ind., 1831, educated at Bethany college, West Virginia; a graduate of the class of '53; studied law, but turned his attention to politics and never became a practitioner. He has served his native state in the capacity of state senator, and filled the office of adjt. gen. of Indiana; was cashier of the first national bank of Indiana, and in 1875 was appointed U. S. treasurer under president Grant. In 1879-80 he was chairman of the Indiana republican committee.

NEW ALBANY, a city in Indiana, United States, on the n. bank of the Ohio river, at the foot of the falls, opposite Portland, and 2 m. below Louisville, Ky.; a finely-situated, well-built town, having 22 miles of streets, 6 ship-yards, 6 foundries, 30 churches, and is the site of Asbury college and a collegiate institute. It has a large river-trade and railway connections with Indiana and Kentucky. Pop. '70, 15,369; '74, 22,246.

NEW ALBANY (ante), the co. seat of Floyd co., on the Louisville, New Albany, and Chicago railroad; pop. '80, 16,422. It has manufactories of cars, engines, and boilers; rolling, planing, and flour mills, iron foundries, etc. It has 1 daily and 2 weekly newspapers.

NEWARK, a municipal and parliamentary borough of England, in the co. of Notts., on the Great Northern and Midland railways, and on a navigable branch of the river Trent, 16 m. s.w. of Lincoln. The parish church, a large and elegant edifice, though often rebuilt, still shows traces of its original Norman character. Newark is approached from the north by a causeway a mile and a half long, carried over the flat island formed by the Trent on the w. and the Ouse branch on the east. The castle of Newark, in which King John died in 1216, was built early in the 12th century. Newark is said to be the greatest malting town in England; there are flour-mills, breweries, and trade in corn, malt, flour, cattle, wool, and coal. A corn exchange has been recently erected. Newark returns two members to parliament. Pop. '71, 12,218.
NEWARK, a city and port of entry of New Jersey, United States, on the w. bank of the Passaic river, 13 m. from New York, on the New Jersey railway. It is a handsome and industrious city; its principal street is 2 m. long, 120 ft. wide, shaded by great elms, and bordering on three public parks. It contains a custom-house and post-office, 95 churches, numerous public schools, 11 banks, 17 newspapers, and extensive manufactories of leather, patent leather, enameled cloth, carriages, saddles and harness, boots and shoes, clothing, hats, jewelry—1015 establishments producing annually $75,000,000. It was settled in 1666 by a Puritan colony from Connecticut. Newark has 140 vessels of 12,000 tons. Pop. in '70, 105,659.

NEWARK, a city of Essex co., New Jersey, a port of entry and capital of the co.; pop. '80, 136,400, being an increase of 30 per cent since 1870. It is situated on an elevated plain on the right bank of the Passaic river, 9 m. from New York city, and 4 m. from Newark bay. Its history is somewhat peculiar. In 1665 the colonies of Hartford and New Haven, Conn., being united in spite of the opposition of the people of Bradford, the latter deserted that part of the country in a body, headed by their pastor, and taking with them their families and household goods. They bought the land on which Newark now stands, from the Hackensack Indians, for $130, 12 blankets, and 12 guns, and there founded their city, laying it out in broad streets. No one was permitted to hold office, to vote, or was a freeman, who did not have membership in the Congregational church; in 1767 the church building was fortified against attacks by the Indians. In 1682 Newark was famous for the manufacture of cider. In 1745–46 the English grantees of East Jersey undertook to invalidate the titles of the Puritans to their lands, whereupon rioting occurred, which was suppressed with difficulty. The college of New Jersey was in Newark from 1747 to '55, and here was founded the Newark academy in 1792. In 1777 the town was occupied by the British, when it was sacked and plundered, and nearly destroyed. The population was 1000 in 1780; 10,950 in 1830; 17,290 in 1840; 71,041 in 1860. Newark contains 104 churches, an academy, high-school, and 25 public schools; 11 banks, 9 horse-railroads, a paid fire department, and a fire-alarm telegraph. Among its public buildings are the city-hall, court-house, and custom-house and post-office. Literary associations are the library association and the state historical society. Newark is a leading manufacturing city, particularly in jewelry, India-rubber goods, carriages, paper, leather, and machinery. The Passaic flour-mills produce 2000 barrels of flour daily, and a spool-thread company employs 750 girls in its manufactory. The life insurance companies of Newark have $30,000,000 capital, and the fire insurance companies, $6,000,000. There are large shipping interests, and the docks extend a m. in length. The streets in the city cover 150 m. in length, and there are 40 m. of sewers. A short distance from Newark are brown-stone quarries which supply great quantities of building material for New York.

NEWARK, a city in Ohio, capital of Licking co.; situated at the union of three branches of the Licking river; pop. '70, 6,698. It is on the Ohio canal, and the Baltimore and Ohio, and Pittsburg Cincinnati, and St. Louis railroads. It is built on an extended plain, surrounded by a fertile and productive country, and is laid out attractively, with broad streets. It has a graded public school system. In the neighborhood are sandstone quarries, a coal mine, and petroleum refineries.

NEWAYGO, a co. in w. Michigan, intersected in the s. by the Grand Rapids, Newaygo and Lake Shore railroad, one division terminating at Everett, and another, from Big Rapids to Muskegon, crossing it centrally; 864 sq. m.; pop. '80, 14,688—11,902 of American birth, 146 colored. Its surface is generally level, largely covered with forests of hard wood and sugar maple. It is drained by the head-waters of the Muskegon, Marquette, and White rivers. Its soil is fertile and adapted to the production of wheat, rye, corn, oats, potatoes, wool, dairy products, and maple sugar. Its rivers furnish valuable water-power, and it has manufactories of lumber, sashes, and shingles. Much attention is paid to stock raising. Co. seat, Newaygo Court-House.

NEW BEDFORD, a seaport city of Massachusetts, on Buzzard's bay, 55 m. s. of Boston. Since 1733 it has been the chief center of the American whale fisheries. The value of this industry has been for many years on the decline. The trade was at its height in 1833–54, when there were in the district 410 whalers of 152,900 tons, which brought home 44,925 bbls. of sperm oil, 118,672 bbls. of whale oil, and 2,858,506 lbs. of whalebone. In 1877 New Bedford possessed 125 whalers, which brought home 30,961 bbls. of sperm oil, 25,729 bbls. of whale oil, and 150,598 lbs. of whalebone. It has oil and candle factories, cotton mills, iron mills, copper and glass works, 30 churches, 6 banks, 2 daily and 2 weekly newspapers, a public library of 30,000 volumes, city hall, custom-house, and almshouse. Pop. '70, 21,329.

NEW BEDFORD (town), a city in e. Massachusetts, set off from Dartmouth, 1787, incorporated 1847, on the w. bank of Acushnet river, near its mouth; pop. '80, 26,875. It is one of the capitals of Bristol co., and has become a manufacturing city of considerable importance. Besides its reciprocal trade with other ports, it is a shipping place for coal consigned to the south. It is connected with Boston by two railroad routes owned by the Old Colony railroad, the road across the river affording a route to Cape Cod, through Fairhaven, and the other, through Taunton direct, to Boston. Propellers run
from this port to New York, and steamers to Martha's Vineyard. It has public schools, a high-school building erected at a cost of $126,000, an academy under the direction of the society of Friends, and 27 churches. The public library was opened to the public by the city in 1852, and was one of the first free public libraries in the United States. In 1857 it was placed in a commodious and convenient building, costing $45,000. A fund of $100,000 was bequeathed to the city by the late Sylvain A. Howland for the promotion of liberal education, and for the introduction of water into the city. Among its institutions is the union for good works, a worthy charity accomplishing much toward the relief of the suffering poor. It also contains St. Joseph's hospital (Catholic), an orphan asylum, a well-organized fire department with 5 steam fire-engines, an electric fire-alarm telegraph, and a horse railroad constructed in 1872. It is well supplied with water from Acushnet pond, the works having been erected in 1857–60 at a cost of $1,000,000, the reservoir having a capacity of 400,000,000 gallons. The water is carried 6 m. and raised 100 feet. It is lighted by gas. Among its industries are the manufacture of Prussian blue, paraffine candles, cordegage, shoes, etc., and it has oil and paint works, two manufacturing photographic establishments, and tanneries. It contains seven banks, five of them national, fire and marine insurance companies, daily and weekly newspapers, and a weekly shipping list. The Clarke's Cove fertilizing company has been lately established, its buildings covering 40,000 sq.ft. of land. Among some of the more recently built factories are the Wamsutta mills, making superior cotton cloth, and having a capital of $3,500,000; the Potomka mills, making print cloths, with a capital of $600,000; the Morse twist drill factory; and the Gosnold iron mill, named in honor of Bartholomew Gosnold, an English mariner, who attempted to colonize New England in 1602, and named cape Cod. It is 11 m. in length and 2 m. in width, and is regularly laid out, with streets at right angles, shaded by maples and ancient elms that, on some streets, almost meet and form an arch over the wide thoroughfares. The land slopes toward the water, and the elevated portion offers fine sites for the erection of the elegant private residences for which the city is noted. The river is crossed by a bridge 4,000 ft. long connecting the city with Fairhaven. It has an elegant drive 44 m. in extent around Clarke's point, commanding an unobstructed view of the harbor and far out to sea. A granite fort, situated on the extremity of the point, commands the entrance to the harbor, which is convenient and easily approached. Its valuation is larger than any other city of its size in the United States in proportion to its population. In 1857 the valuation for real estate was $12,600,000; personal, $10,854,000.

NEW BERNE, a city and port of entry of North Carolina, on the s. bank of the Neuse river, at its confluence with the Trent, 30 m. from its mouth in Pamlico sound. It exports tar, turpentine, naval stores, flour, and lumber. Pop. '70, 5,849.

NEW BERNE (ante) is the port of entry of Pamlico district, 40 m. from the mouth of the Neuse river, on the Atlantic and North Carolina railroad. It has a considerable commerce, having direct communication with the sea by way of Ocracoke inlet. Its chief trade is coastwise, in fish, cotton, lumber, and naval stores. Its manufactures include agricultural implements, carriages, etc., and it has turpentine distilleries, grist and saw mills, foundries, and machine shops. In 1802, during the rebellion, Gen. Burnside was sent to New Berne at the head of an important expedition, designed to weaken the enemy by interfering with their base of supplies, and by the occupation of a point at which a threatening attitude could be constantly maintained: it was entirely successful; and on Mar. 14 the city was captured after a severe engagement, being well defended by strong intrenchments. Sixty-nine cannon and a large quantity of ammunition were taken, and the city was seriously damaged.

NEWBERRY, a c. in central South Carolina, having the Saluda river for its s. boundary, the Ennawee and Tiger rivers for its n., and the Broad river for its e. boundary; 700 sq.m.; pop. '80, 26,497—26,383 of American birth, 18,362 colored. It is intersected by the Greenville and Columbia railroad, and the Laurens railroad terminates at Newberry. Its surface is undulating, in some portions rising into considerable elevations, and timber is abundant. It has extensive granite ledges, and the soil is fertile, especially the alluvial soil near the rivers. Cattle, sheep, and swine are raised; and wheat, corn, oats, sweet potatoes, and cotton are the chief products. It has steam saw-mills and a few manufactories. Co. seat, Newberry Court-House, an important cotton mart.

NEWBERRY, JOHN STRONG, M.D., LL.D.; b. Conn., 1822. In 1824 his father emigrated with his family to Ohio, and founded the town of Cuyahoga Falls. Newberry graduated from Western Reserve college in 1846, and from the Cleveland medical college in 1848. After two years of study and travel abroad he settled down to the practice of medicine in Cleveland, but his growing fondness for natural science led him to accept the appointment of assistant surgeon and geologist on lect. Williamson's survey of northern California and Oregon in 1855. Newberry's researches were published in a separate quarto volume, as well as in the Pacific railroad reports. In 1857–58 he accompanied lect. J. C. Ives's expedition to the Colorado river, taking out an iron steamer in sections and navigating that stream for 500 miles. Newberry's portion of the report was acknowledged by his commander to constitute "the most interesting material gathered by the expedition." He assisted, in 1859, capt. Macomb's exploration of the
upper Colorado and San Juan rivers, opening up an interesting region of immense mineral resources, and published a report on it. During the rebellion his administrative capacity was demonstrated by his superintendence, as secretary, of the affairs of the sanitary commission throughout the Mississippi valley. In 1866 he was appointed to, and still continues to hold, the professorship of geology and paleontology in the school of mines of Columbia college. He has been state geologist of Ohio since 1869, and completed an exhaustive geological survey of the state within five years, the final reports of which, now in process of publication, will make eight volumes, besides a map. Prof. Newberry has made many contributions to the literature of fossil fishes and plants, and geology in general. He is a member of numerous American and European scientific societies, and is now president of the New York academy of sciences.

NEW BRIGHTON, a village in s. New York, on the n.e. shore of Staten island, in the s. portion of New York harbor, 6 m. s.w. of the city. Pop. '70, 7,405. It is in Castleton township in the county of Richmond, and contains the post-office of West New Brighton. It is connected with the metropolis by steam ferries, and has many elegant villas occupied by persons engaged in business who make the trip daily. It is the seat of "Sailors' Snug Harbor," a hospital or home for mariners who are past their usefulness, and also for the destitute sick or infirm families of seamen. It has 9 churches and a number of fine hotels. Its situation is on an elevation which commands a magnificent view of the bay, and granite is found in the immediate neighborhood. Its manufacturing establishments are a paper-hanging factory, silk-printing works, a fancy dyeing establishment, and dyeing and printing works, which are very extensive.

NEW BRIGHTON, a borough in w. Pennsylvania, on the Pittsburg, Fort Wayne and Chicago railroad; pop. '70, 4,067. It is on the e. bank of the Beaver river, which furnishes very extensive and valuable water-power, and is 28 m. n.w. of Pittsburg, and 21 m. s. of New Castle. The Beaver river empties into the Ohio 3 m. below. It has a large chink of valuable iron which is of use to the iron furnaces. There is a public library, a newspaper, and excellent schools. It is connected with the town of Beaver Falls by a bridge across the river. It is in a coal region, and is connected with lake Erie by the Beaver and Erie canal. Its manufactures are important; among its industries may be numbered the manufacture of chairs, wooden goods, twine, nails, pottery, lead-kegs, coffee-mills, rivets, wire, etc. It has a variety of stores and an extensive greenhouse.

NEW BRITAIN, a manufacturing t. in Connecticut, 10 m. s. of Hartford, engaged in the production of stockinet goods, locks, jewelry, hooks and eyes, and various kinds of hardware. It has six churches. The water supply is from a reservoir of 175 acres, with a head of 200 feet, supplying public fountains with jets of 140 feet, and dispensing with fire-engines. Pop. '70, 9,480.

NEW BRITAIN, the name of one principal and of several subsidiary islands in the Pacific ocean, in lat. between 4° and 6° s., and long. between 148° and 152° 30' e. The principal island, 300 m. in length, and having an area of 12,000 sq. m., lies e. of New Guinea, from which it is separated by Dampier's straits. The surface is mountainous in the interior, with active volcanoes in the north, but along the coast are fertile plains. Forests abound in the island, and palms, sugar-cane, bread-fruit, etc., are produced. The inhabitants, the number of whom is unknown, are described as a tribe of "oriental negroes," and are well-formed, active, and of a very dark complexion. They are further advanced in civilization than is usual among the Polynesians, have a formal religious worship, temples, and images of their deities. New Britain was first seen by Le Maire and Schouten in 1616, but Dampier, at a later date, was the first to land.

NEW BRUNSWICK, a city of New Jersey, is on the s. bank of the Raritan river, at the head of navigation, 15 m. from its mouth, 30 m. s.w. of New York, on the New Jersey railway, and the Delaware and Raritan canal. It has extensive manufactures of cotton, leather, India rubber, paper-hangings, iron, and machinery, 17 churches, 2 banks, and 4 newspapers. It is the seat of Rutgers' college and a theological seminary. Pop. '60, 11,255; '70, 15,028.

NEW BRUNSWICK, a province of the Dominion of Canada, is bounded on the n.w. by Canada and the bay of Chaleur, on the n.e. by the gulf of St. Lawrence and the Strait of Northumberland, on the s. by Nova Scotia and the bay of Fundy, and on the s.w. by the state of Maine. It has an area of 27,710 sq. m., or 17,754,400 acres (rather more than the area of Scotland), and a population, in 1871, of 288,594. The coast line is 500 m. in extent, and is indented by spacious bays, inlets, and harbors, which afford safe and commodious anchorage for shipping. The chief are Fundy, Chignecto, and Cumberland bays, the last two being merely extensions of the first; Passamaquoddy bay in the s.; Verte, Shediac, Cocaigne, Richibucto, and Miramichi bays on the n.e.; and the bay of Chaleur, 80 m. long by 25 broad, in the n.w. The province of New Brunswick abounds in rivers. The principal are the St. John and the St. Croix, the former 450 m. long, the latter 100 m. in length, and both falling into the bay of Fundy. The rivers that flow eastward into the gulf of St. Lawrence, the Richibucto, the Miramichi, and the Restigouche. The province contains numerous lakes, one of which, Grand lake, is 100 sq. m. in area. Most of the others are much smaller. The surface is for the most part flat or undulating. With the exception of the district in the n.w. bordering on
Canada and the river Restigouche, no portion of New Brunswick is marked by any considerable elevation. Here, however, the country is beautifully diversified by hills of 500 to 800 ft. in height. These elevations, which form an extension of the Appalachian range, are interspersed with fertile valleys and table-lands, and are clothed almost to their summits with lofty forest-trees. In this district the scenery is remarkably beautiful. In the s. of the colony the surface is broken up by great ravines, and the coast is bold and rocky. The shores on the e. coast, and for 20 m. inland, are flat. The soil is deep and fertile. Of the whole acreage, 14,000,000 acres are set down as good land, and 3,600,000 acres as poor land. New Brunswick contains a rich and extensive wheat-producing district; but the inhabitants, dividing their time between farming, lumbering, fishing, ship-building, and other pursuits, and following no regular system of tillage, have not till quite recently attempted to keep pace with modern agricultural improvements. The farming has not been judicious; many parts of the country have been allowed to become exhausted; and, although signs of improvement begin to be manifest, still there is prevalent a deplorable lack of knowledge of the principles of scientific agriculture. Several cheese factories have been established in the province within the last few years. In one year one of these has manufactured as much as 25,000 lbs. The crown lands are at present being disposed of under the act 31 Vict. cap. 7, 1868. This act provides that certain portions of eligible land shall be reserved for actual settlers, and not be disposed of to speculators, or for lumbering purposes. A male of 18 years of age or upwards may obtain 100 acres, either by payment, in advance, of $20 ($4 3s.), to aid in the construction of roads and bridges in the vicinity of his location, or upon his portability labors on such roads during the year. He must also, within two years, build a house on his land of not less dimensions than 16 ft. by 20, and clear two acres. After a residence for three years in succession he receives a deed of grant if he has paid the $20 in advance or cultivated ten acres. The receipt of the crown-lands department of the provincial government for the year ending Oct. 31, 1868, amounted in value to $3,893,100. During 1870 no less than 925 grants of land were issued. The climate is remarkably healthy, and the autumn—and especially the season called the Indian summer—is particularly agreeable. In the interior the heat in summer rises to 80°, and sometimes to 95°; and in winter, which lasts from the middle of December to the middle of March, the mercury sometimes falls as low as 40° below zero. At Fredericton, the capital, situated on St. John river, 65 m. from the s. and 130 m. from the n. coast, the temperature ranges from 95° below to 95° above zero; and the mean is about 42°.

The north-western portion of the province is occupied by the upper Silurian formation. Next are two belts of lower Silurian. Small patches of the Devonian, Huronian, and Laurentian systems are found on the bay of Fundy. A large part of the province is occupied by carboniferous strata. The mineral coal is for the most part impure or in thin seams, and is hardly worked; but the so-called Albertite of Albert county is the most valuable bituminous matter on the American continent. It yields 100 gal. of crude oil per ton. Salt springs are numerous. Copper and iron ore are found, as also antimony and manganese; gypsum, plumbago, and lime stone are very abundant, and the freestone of the province, unsurpassed for beauty and durability, commands a high price in the states. Wild animals abound in the province; the lakes and rivers are well stocked with fish, and along the coasts, cod, haddock, salmon, and other fish are caught in great plenty. The number of schools in New Brunswick during the winter of 1869 was 398, in which 39,754 pupils were enrolled. The value of the imports for 1873-4 was $10,232,871; of exports, $6,504,394. The number of vessels entering the ports was 2,784, of 775,638 tons: clearing, 2,662, of 799,265 tons. The number of men employed in the fisheries was 6,656; number of vessels, 131, of 2,518 tons; number of boats, 3,551; value of catch, $3,685,795. In 1871 the total value of manufactured products was $17,367,687. In 1874 there were in operation 455 m. of railway. Around the coasts and along the banks of the rivers there are excellent public and coach roads. Principal towns, the city of St. John and Fredericton, the political capital.

The province of New Brunswick, together with that of Nova Scotia, originally formed one French colony, called Acadia, or New France. It was ceded to the English in 1713, and was first settled by British colonists in 1764. In 1784 it was separated from Nova Scotia, and erected into an independent colony. It joined the Dominion of Canada in 1867.

**NEWBURG**, a village of New York, on the w. bank of the Hudson, 61 m. n. of New York, amid the grand scenery of the highlands. Its handsome edifices, villas, and gardens, on a gentle slope from the river, command a noble prospect. It contains a court-house, 5 foundries, a cotton factory, breweries, a railway carriage manufactury, 2 piano-forte manufactories, steam-boiler works, 5 soap factories, 41,000 tons of shipping, a large lumber trade, 20 churches, 5 banks, schools, and academies. It was Washington's headquarters during a critical portion of the war of independence. Pop., '70, 17,014.

**NEWBURG** (ante), situated on a steep slope of the Hudson river, has its waterfront lined with warehouses, and enjoys a considerable commerce; pop., '80, 18,650. The locality was seen by Hudson in 1609, who wrote of it: "It is as beautiful a land as one can tread upon; a very pleasant place to build a town on." It was occupied at that
time, and for some years later, by a portion of the Delaware tribe of Indians, who were defeated by the Dutch in the war of 1655-60, and driven away in 1663. In 1709 it was settled by German Lutherans from the Palatinate of the Rhine, who called it "The Palatine Parish of Quassaic." In 1752, the Germans having been displaced, its name was changed to "The Parish of Newburg," from its resemblance to Newburgh on the river Tay in Scotland. It was the headquarters of gen. Washington in 1782-83; and the house which he occupied, in the s. part of the city, is now the property of the state, and is preserved as a historical relic, containing a museum of revolutionary curiosities, open to the public. Here the continental army was disbanded, and it was from this place that the celebrated "Newburg letters" emanated, containing a treasonable suggestion to create Washington "king of America," considered so important that Washington convened the officers of the army in a public building in the city, and addressed them in earnest remonstrance—a course which at once destroyed any possible influence of the letters in question. Newburg is an important coal market, and has some manufactures. It has 23 churches, a public school system, and a water-supply with expensive works. The Newburg and New York railroad connects with the Erie railroad at Turner's. On a height overlooking the city is the theological seminary of the United Presbyterian church. Steamboats connect the city with New York.

NEWBURY, a municipal borough and market t. of Berkshire, England, on both banks of the Kennet, 17 m. w.s.w. of Reading. The church, a specimen of the perpendic- ular style, was built in the reign of Henry VII.; but the tower was built by John Winchcombe, a clothier and famous citizen of Newbury in the reign of Henry VIII. Since 1862 an annual wool-market has been held here. In 1862 a new corn exchange was built. Newbury is the best known for two hard-fought battles between the royalists and parliamentarian forces which took place—the first in September, 1643, the second in October, 1644. In the former, victory was undecided; in the latter the advantage was on the side of the parliamentarians. Pop., 71, 600.

NEWBURYPORT, a city and port of entry of Massachusetts, on the s. bank of the Merrimac river, 3 m. from its mouth, 34 m. n.e. of Boston. Lat. 42° 18' 30" n., long. 70° 52' 3" w. It is a pretty town, built on a swell of land rising 100 ft. from the river. High st., 3 m. long, shaded with trees, a beautiful mall, and pond of six acres, are its chief ornaments. It has 16 churches, in one of which is the tomb of Whitefield, who died here (1770). 4 banks, 4 manufacturing companies, making 16,000,000 yards of cloth annually, several ship-yards, and manufactories of machinery, hats, clothing, etc.; 2 daily newspapers, one of which was established in 1792; a free high school, and a free library of 10,000 volumes. Pop., 70, 1595.

NEWBURYPORT (a.d.), in Essex co., Mass., on the Eastern railroad. It was settled about 1635, and has always been prominent among the towns and cities of the state. During the revolution and in the war of 1812 its citizens were distinguished for their patriotic spirit, and the first privates were fitted out were from this port. In 1831 it received the charter of a city, and since then its population has increased about 4,000. Besides other institutions, the city contains a court-house, a grimate house, a city hall, and a marine museum. Ship-building is a prominent business. In 1854 the aggregate tonnage of the vessels built was 20,000; 1874, 15,000. Its national banks have an aggregate capital of $820,000; and the savings banks have deposits amounting to $5,300,000. The place, which was important for enterprise and wealth and the c. ago, has an air of antiquity and established social conditions not usual in American cities.

NEW CALABAR RIVER. See Calabar, a.d.

NEW CALEDONIA, an island of the South Pacific ocean, belonging to France, and lying about 720 m. e.n.e. of the coast of Queensland, in Australia, in lat. 20°—22° 30' s., long. 164°—167° e. It is about 200 m. in length, 30 m. in breadth, and has a population estimated at 60,000. It is of volcanic origin, is traversed in the direction of its length, from n.w. to s.e., by a range of mountains, which in some cases reach the height of about 8,000 ft., and is surrounded by sand-banks and coral-reefs. There are secure havens at port Baalae and port St. Vincent, the former on the n.e., the latter on the s.w. part of the island. In the valleys the soil is fruitful, producing the cocoa-nut, banana, mango, breadfruit, etc. The sugar-cane is cultivated, and the vine grows wild. The coasts support considerable tracts of forest, but the mountains are barren. The inhabitants, who resemble the Papuan race, consist of different tribes, some of which are cannibals. New Caledonia was discovered by capt. Cook in 1774. In 1853 the French took possession of it, and it has since 1872 been used by the French authorities as a penal settlement. Mission stations have been established. In 1878, some of the natives rose in insurrection and massacred a number of the white residents.

NEW CASTLE, a c. in n. Delaware, having the Delaware river for its e. boundary, the state line of Pennsylvania for its n. and n.w., bounded by the state of Maryland on the w.; 500 sq.m.; pop., '80, 77,746—69,023 of American birth, 12,649 colored. It is intersected by the Philadelphia, Wilmington and Baltimore railroad, the Wilmington and Reading, and the Delaware railroads. It is drained by the Brandywine and Christina rivers, and Red Clay and Duck creeks, emptying into the Delaware. Its surface is broken, rising into hills in the w. portion, furnishing good pasturage. Its soil is
exceptionally fertile, and adapted to the production of grain, dairy products, and fruit, especially peaches; honey and sorghum are among the products. The rivers furnish extensive water-power. Its leading industries are the manufacture of flour, carriages, metallic wares, woolen goods, ships, etc. Co. seat, Newcastle.

NEWCASTLE, a borough in w. Pennsylvania, on the Beaver and Erie canal, at the junction of the Erie and Pittsburg railroad, the New Castle and Beaver Valley, the New Castle and Franklin, and the Pittsburg and Lake Erie railroads; pop. 70, 6,164. It is the county seat of Lawrence co., on the Shenango river, at the mouth of Neshannock creek; 50 m. n.w. of Pittsburg. Coal, iron ore, and limestone are mined. Fire-clay is abundant, and it has manufactories of nails, window glass, flour, paper, etc. It has blast furnaces, rolling mills, foundries, gist and planing mills, and breweries. Manufacturing and mining are its principal industries. It is the seat of New Castle college, has excellent public schools in convenient buildings, 12 churches, 5 banks (2 national), and an institution for savings. It has good hotels, a fine opera-house, a variety of stores, and 4 weekly newspapers.

NEWCASTLE, Duke of, THOMAS PELHAM HOLLES, minister of the first two Georges, b. 1692, and representative of the noble family of the Pelhams, played a prominent, but by no means illustrious part in the political history of his time. While a very young man, he succeeded to the family peerage by the death of his father, lord Pelham, and George I. rewarded his attachment to the house of Brunswick by creating him first, earl of Clare, and afterwards duke of Newcastle. He was made secretary of state when but thirty years old, although the king declared that he was not fit to be chamberlain to the smallest court in Germany. There was much of the absurd and grotesque in his character. Macaulay says of him, that "his guilt was a shuffling trot; his utterance a rapid stutter; he was always in a hurry; he was never in time; he abounded in fulsome caresses, and in hysterical tears." Yet this man was during thirty years secretary of state, and for nearly ten years first lord of the treasury! He served under sir R. Walpole, retained his secretaryship in the "broad-bottomed administration" in 1744, and in 1754 succeeded his brother, Mr. Pelham, as head of the government. In 1757 he was compelled to take the first William Pitt (afterwards earl of Chatham), into his ministry, and to give him the lead in the house of commons, and the supreme direction of the war and of foreign affairs. A succession of brilliant victories followed—Newcastle being only nominal head of the administration—and the great commoner had almost brought the war to a successful termination, when the accession of George III. led to the resignation of Mr. Pitt, and the replacement of Newcastle, in May, 1762, by lord Bute, as head of the ministry. Newcastle declined a proffered pension, with the remark that if he could no longer serve he would not burden his country. In the Rockingham ministry, formed in 1765, Newcastle filled the office of privy seal. He died Nov. 17, 1768. His title descended to Henry, ninth earl of Lincoln, whose great-grandson, HENRY PELHAM-CLINTON, fifth duke of NEWCASTLE, and twelfth earl of Lincoln, was b. 1811, and educated at Christ-church, Oxford. He represented South Notts in parliament from 1832 to 1846, when he was ousted by the influence of his father, the fourth duke, for supporting sir R. Peel in his free-trade measures. He adopted politics as a profession; was a lord of the treasury in the brief conservative administration of 1834—35; and first commissioner of woods and forests in the Peel administration, from 1841 to 1846. He was then made chief secretary to the lord-lieut. of Ireland, but went out of office with his chief a few months afterwards. He succeeded to the dukedom in 1851, and returned to office in 1852, filling the post of secretary of state for the colonies (which formerly included the department of war) in the Aberdeen government. The war with Russia broke out, and in June, 1854, it was found necessary to create a secretary of state for war, and the new office was assigned to Newcastle. The "horrible and heart-rending" sufferings of the British army before Sebastopol in the winter months of 1854 raised a storm of popular discontent, and when the house of commons determined to inquire into the conduct of the war, the duke resigned. Yet, as is now acknowledged, no blame was attributable either to the minister for war or his subordinate, Mr. Sidney Herbert. They were called upon to administer a vicious system of military organization which broke down under the strain brought to bear upon it. Newcastle was reappointed colonial secretary in the second administration of lord Palmerston, and held the seals with general approval from 1859 to the year of his death, 1864. In 1860, as secretary of state for the colonies, he accompanied the youthful prince of Wales during a tour in Canada and a portion of the United States, and in his return received the order of the garter from the queen. He died Oct., 1864.

NEWCASTLE, MARGARET CAVENDISH, Duchess of. See CAVENDISH, MARGARET, ante.

NEWCASTLE, WILLIAM CAVENDISH, Duke of. See CAVENDISH, WILLIAM, ante.

NEWCASTLE-UNDER-LYME, a parliamentary and municipal borough of England, in the county of Stafford, 16 m. n.n.w. of the town of that name. A branch railway connects it with the North Staffordshire line, and a branch canal with the Grand Trunk Navigation. One of its churches, rebuilt early in last century, has a very old square tower of red sandstone. The free grammar school has an income of about £100 a year, and
was founded in 1602. Hats are the principal branch of manufacture, and silk, cotton, and paper mills are in operation. Newcastle-under-Lyme is surrounded by famous potteries, and coal-mines are worked in the vicinity. Pop. 71,15,949.

**NEWCASTLE-UPON-TYNE**, the chief t. of Northumberland. Lat. 54° 58' 11" n., long. 1° 36' 36.5' west. It has the privilege of a county of itself. Gateshead, which stands upon the opposite side of the river, though in a different county and having a separate jurisdiction, is virtually a part of Newcastle. According to the census of 1871, Newcastle contained a pop. of 128,443, Gateshead, 48,627; making together 177,070 inhabitants. Newcastle sends two members to parliament.

The Romans had a stationary camp here, called Pons Ælii—one of the chain of forts by which the wall of Hadrian was fortified. On the withdrawal of the Romans, the deserted camp became the residence of a colony of monks, and the town was called Monkchester. Robert, eldest son of the conqueror, commenced to build a castle here in 1079 or 1090. Hence the modern name of New Castle. William Rufus built his brother's castle, surrounded the town with a wall, and gave the inhabitants peculiar privileges. The present castle, which displays better than any other in England the genius of Norman military architecture, was erected by Henry II. between the years 1172 and 1177. Newcastle being made the rendezvous of the vast armaments which the first three Edwards led into Scotland, it was in their time surrounded with new walls of unusual strength and magnitude; portions of them yet remain.

The town stands partly upon an elevated platform, and partly upon the n. bank of the river. The more ancient houses in the lower part of the town are chiefly built of timber; those in the center of the town are mostly of stone; but the houses generally are of brick. Chieflly through the instrumentality of one man of humble origin—Richard Grainger—Newcastle has in modern times received the addition of many elegant streets, squares, and public buildings. The river is crossed by three bridges—the High-level bridge, the Redheugh bridge, and a swing bridge (completed in 1874), one of the largest structures of the kind in the world. The High-level bridge forms one of the engineering triumphs of Robert Stephenson. It consists of six cast-iron arches, supported upon piers of masonry. The length of the viaduct is 1337 feet, and the height of the railway above high-water mark, 112. It has a broad carriage-way, by which the ordinary traffic avoids the precipitous streets on both sides of the river, with passenger path on each side, and the railway above. A quay, at which the depth of water at ebb-tide is 22 ft., has been constructed by the corporation, at a cost of over a quarter of a million, or at the rate of about £130 per lineal yard.

There are 16 churches and chapels in the town connected with the Established church, and about 60 belonging to other classes of worshippers. The mother church (St. Nicholas) is a noble edifice, chiefly in the decorated style; its steeple, which is singularly light and bold, is early perpendicular. In the Guild hall, an old and somewhat inconvenient building, situated beside the river, the town assizes are opened, and the quarter sessions held. Under the Guild hall proper there is an exchange for the merchants, ship-owners, and brokers of the quay-side. In the Moot hall, a modern and very handsome Grecian building overlooking the swing-bridge, the town and county assizes are held. A new and very spacious town-hall was built about twenty years ago on a block of ground facing St. Nicholas's church; associated with it are a corn market and offices for the transaction of the town business. The market for the sale of butcher-meat and vegetables is probably the most spacious and commodious in the kingdom. All the railways entering the town terminate in a large station near its center. The jail, a heavy and costly mass of building, occupies a low and confined situation. The central police station, police court, and offices, built in 1873, are comprised in a large and handsome structure in Pilgrim street. The new postal and telegraph office, begun in 1875, is one of the latest and finest of the public buildings in the town. There are two theaters—the Royal (the greatest ornament of Grey street, the handsomest street in the town), and the Tyne theater in Westgate street. Newcastle has two monuments—a column surmounted by a statue of Sir John Grey, to commemorate the passing of the reform bill, and a bronze statue to George Stephenson.

The corn market is held on Tuesday and Saturday; the hay market and the cattle market on Tuesday. During the year 1873, 81,655 fat cattle, 350,638 sheep and lambs, and 39,385 swine were brought to the cattle market. A very large market is held every Thursday morning for the sale of butter, bacon, cheese, eggs, and other articles of country produce. Saturday is general market day. Newcastle is well supplied with surface water, the chief place of collection being Hallington, about 20 miles n.w. of the town. The trade of Newcastle consists chiefly in coal, and in those articles in the production of which great heat is required. The Newcastle coal trade had its origin in the reign of Henry III. This branch of industry is not now confined to Newcastle, but is spread over the greater part of the sea-board of Northumberland and the whole of Durham. Nearly 32,000,000 tons of coal and coke were produced in the northern coal field in 1876, of which about 7,000,000 tons were shipped to foreign ports. The number of persons employed in connection with the pits may be computed at 80,000. Since the discovery of the Cleveland ironstone the manufacture of iron has prodigiously increased in the district embraced by the northern coal field. The make in 1876 was about 890,000 tons.
There are annually produced on the Tyne about 3,000 tons of steel. Large quantities of lead, the produce of the mines of Alston Moor and Weardale, are brought to Newcastle for manufacture. A very large quantity of unrefined lead is also imported from Spain. Having been refined and desilverized, the lead is rolled into sheets and pipes, or converted into shot, litharge, red and white lead. The value of these imports is about £1,000,000 per annum. Copper, to the extent of £200,000 worth, is annually got from the copper pyrites used at the chemical works of the Tyne.

At Newcastle the railway system had its origin. Here, as might be expected, locomotive and engineering establishments are found upon a great scale. The ordnance works of Sir William Armstrong at Elswick, the western part of Newcastle, are well known. Iron ship-building and various branches of engineering are extensively carried on upon the Tyne. Newcastle occupies an important position in the manufacture of soda, bleaching-powder, vitriol, and other chemical products, the annual value of which is about £1,300,000. There are decomposed in the district 200,000 tons of salt per annum. Earthenware is largely manufactured, window glass and flint glass have declined; impressed glass is largely manufactured, and plate-glass is made. Glass-staining has attained great perfection. The fire-brick trade is a new industry, which has attained gigantic proportions. About 80,000,000 fire-bricks are annually made, besides gas-retorts and sanitary pipes, which are sent all over the world. About 100,000 grindstones leave the Newcastle quarries annually. Portland and other cements are made to the extent of 11,900 tons in a year.

The river Tyne, from the sea to Newcastle, forms a natural dock for the accommodation of shipping. Three artificial docks have, however, been constructed at a cost of £1,700,000. Within the last 20 years improvements upon a large scale have been made by the river Tyne commission. The entrance to, and many parts of the river have been deepened by dredging. The depth of water on the bar has been increased from 6 to 33 ft. at low water. In 1876, 10,194 vessels of 2,871,700 tons entered the Tyne ports (Newcastle, with North and South Shields); and 15,931, of 3,353,129 tons, cleared.

Of the benevolent institutions established in Newcastle there are an infirmary, a dispensary, asylums for the blind, the deaf and dumb, and two orphanages. The literary and philosophical society, the society of antiquaries, the natural history society, the mechanics' institution, and the institution of mining engineers (to which has been recently added a large hall, as a memorial of Nicholas Wood, an engineer of celebrity) successfully cultivate their several fields of labor. A college of physical science, with four professorships (geology, experimental philosophy, chemistry, and mathematics) was established in 1871 in connection with the university of Durham; and there is also in Newcastle, associated with the same university, a college of medicine.

Lords Stowell, Eldon, and Collingwood, Mark AKenside, and Hutton, the mathematician, were natives of Newcastle. Intimately connected with it, though not born in it, were Thomas Bewick, the engraver; Robert Morrison, the Chinese scholar; and George and Robert Stephenson.

NEW CHRISTIANS. The name given to Jews who, 400 years ago, were compelled by the Spanish inquisition to embrace Christianity in order to escape torture and death. Many outwardly complied, while their secret attachment to their own religion was un changed. The persecutors, not satisfied with outward professions, and finding that Jewish services were still secretly held and Jewish customs rigidly maintained, resolved to seize the property of the obstinate ones even if they could not gain possession of their minds and hearts. They consequently ordered the arrest of several of the suspected convers and the confiscation of their goods, and denounced excommunication against all who favored or helped them. The Dominican convent at Seville, where the inquisition was held, being soon crowded with the prisoners, the tribunal was removed to the castle of Triana in the vicinity of the city. A second edict commanded every person, under penalty of excommunication for mortal sin, to inform against all who had relapsed into Judaism or were suspected of having done so. Sentences of death were soon pronounced. In that year about 300 New Christians were burned alive in Seville, 2,000 in other districts of Andalusia, and 17,000 were subjected to minor penalties. The property of the New Christians was carried into the hands of the Inquisition, which sold it to the highest bidder. They were meted out to their new owners like cattle. Many were sold for a trifle and refused. They were cruelly maltreated with unusual justice. They had consequently become well educated, and filled, to some extent, the places of the expelled Moors as the authors, merchants, and physicians of the land. From their academy in Lisbon went out skillful mathematicians, grammarians, poets, theologians, botanists, and geographers. By steadfastness and united action, combined with native talent, they acquired great influence through the kingdom. But their superiority aroused popular jealousy, which at length produced an edict for their expulsion from Portugal. Soon the storm burst severely on the New Christians. In 1506 the plague raged violently in Lisbon and was aggravated by famine. During these combined calamities, while the people were offering up prayers for divine interposition, on Sunday, April 19, a brilliant light illuminated the figure of Christ. While men doubted the genuineness of the miracle one of the New Christians was bold enough to express publicly his belief. This arousing the populace, they seized the man and burned him at the stake. This one death was like a spark that kindles a conflagra-
tion. Within three days more than 2,000 persons were put to death; old men, women, and children were burned in the fire that raged in the public squares. The king was absent from Lisbon, but on hearing of the outrage, with righteous indignation, inflicted summary justice on the leaders of the massacre and on the magistrates who had failed to resist and stop it. Terrified by such calamities many both of the Jews and New Christians fled to Holland, where those of their nation enjoyed complete toleration. The king, anxious to keep all he could of such valuable citizens, commanded that children under the age of 14 should be retained and instructed in Christianity. This was a cruel order, but it doubtless impelled many Jews to profess Christianity. The Jewish historians affirm that the exodus of their people was complete both from Portugal and Spain; but Jewish physiognomy and family traditions alike prove that the movement was not universal. There certainly are many Jews in Portugal, and Jewish blood flows in the veins of many noble Roman Catholic families there. In modern times the descendants of New Christians have been treated with traditional favor, and national pride points the way out. But in remote provinces some traces of the ancient worship remain, especially in observing the great day of atonement. A few families abstain from eating bread during the passover, and many retain the sacred Jewish prayer.

NEWCHURCH, a very thriving t. of Lancashire, England, 19 m. n. from Manchester, in Rossendale, not far from the source of the Irwell. It has recently and rapidly risen to its present importance. There are numerous cotton and woollen manufactories, employing many operatives. Coal is also wrought in the neighborhood, and there are numerous large quarries of excellent freestone. Pop. about 4,000. The neighborhood is very populous, abounding in manufactories and other public works. Not much more than a m. to the w. of Newchurch, is Rawtenstall, a large village, now almost a town, and rapidly increasing.

NEW COLLEGE, OXFORD. The college of St. Mary of Winchester, in Oxford, commonly called New College, was founded by William of Wykeham, bishop of Winchester, and lord high chancellor, in 1386. The buildings are magnificent, and the gardens of great beauty. The most remarkable peculiarity of New College is its connection with Winchester school, another noble foundation of Wykeham. After the kin of the founder (to whom a preference was always given), the fellows were to be taken from Winchester. The late practice was that "two founders," as they were called, were put at the head of the roll for Winchester, and two others at the head of the roll for New College. In 1381, the college consisted of a warden and 70 fellows (elected in this way from Winchester), 10 chaplains, 3 clerks, and 16 choristers. By the ordinances under 17 and 18 Vict. c. 81, considerable changes were introduced, but the connection of the college with Winchester was in great measure preserved. The number of fellows was fixed at 30. Of these, 15 are open only to those who have been educated at Winchester, or who have been for 12 terms members of New College. The other 15 are open without restriction. The value of the fellowships is not to be more than £200 per annum, so long as their number is less than 40. There are also to be 30 scholarships, tenable for 5 years, of value not less than £80 per annum, inclusive of rooms, to be appointed by the warden and fellows of New College, by the election of boys receiving education at Winchester school. No conditions of birth are to be regarded in the election either of fellows or scholars. By a subsequent statute, the chaplains are made three in number, and from 8 to 10 choral scholars are added, to whom an equality with the fellows is given. This college presents to its benefactors, and elects the warden of Winchester college.

NEWCOMB, HARVEY, D.D., 1803-62, n. Y., taught school for 8 years at Alfreed, N. Y.; in 1833 became editor and publisher of the Western Star, Westfield, N. Y., and two years later was editor of the Buffalo Patriot. In 1830-31, he published the Christian Herald at Pittsburg, Penn., and for several years was engaged by the American Sunday school union in the preparation of books for the young. In 1840 he was licensed to preach, and in 1841 became pastor of the Congregational church at West Roxbury, Mass., and afterward of the churches at West Needham and Granville. In 1849 he was for a year assistant editor of the Boston Daily Traveller, and in 1850-51 of the New York Observer. He spent several years after this in establishing Sunday schools in Brooklyn, N. Y., and supplied the Park st. mission church of that city, and in 1859 was installed pastor of the Congregational church in Hancock, Penn. He was a regular contributor to the Boston Recorder and other religious papers. Dr. Newcomb was a copious writer, being the author of 178 volumes, most of which were designed for children and youth, and had a large circulation. His largest work was Cyclopaedia of Missions, a book of great value at the time.

NEWCOMB, SIMON, LL.D.; b. Nova Scotia, 1835, came to the United States when a boy and here received his education, graduating at the Lawrence scientific school, Cambridge. From an early age he displayed remarkable proficiency in the higher mathematics and astronomy. For some years he taught school in Maryland, and in 1857 took part in the preparation of the Nautical Almanac for that year. He now began to attract the notice of the scientific world by his original investigations in astronomy, and in 1861 was appointed mathematical professor in the naval department and placed in charge of the naval observatory. In this position he made the contract and supervised the details of the purchase, construction, and mounting of the great telescope. In 1871, he was
secretary of the commission created by congress to arrange for the thorough scientific observation of the transit of Venus of Dec. 9, 1874. He was made a foreign associate of the English royal astronomical society in 1873, and two years later a gold medal was bestowed upon him by the same society for his tables of Neptune and Uranus. He is also a member of the French institute and of many American societies. In addition to his scientific attainments he has given attention to finance and political economy, and has delivered a course of lectures at Harvard college on kindred topics. Besides many scientific papers he has published Popular Astronomy (1880), The A. B. C. of Finance, and A Critical Examination of the Financial Policy during the Rebellion (1865).

NEWCOME, WILLIAM, D.D., 1729-1800; b. Bedfordshire, Eng.; educated at the grammar school and the university of Oxford, first a student at Pembroke college, and then a fellow and tutor of Hertford. He suddenly and rapidly rose to preferments. In 1755 he was appointed chaplain of the diocese of Bristol, and bishop of Ireland, in 1766 he was made archbishop of Dublin, and in 1785, archbishop of Armagh. He faithfully performed his official duties, securing the respect of all parties. He was a diligent Biblical student, and published several valuable works, of which the first was, The Harmony of the Gospels, containing much important critical information. His other works are, The Duration of our Lord's Ministry particularly considered, Observations on our Lord's Conduct as a Divine Instructor, and on the Excellence of His Moral Character; a new version with critical remarks on the Twelve Minor Prophets and Ezekiel. His next work was, A Historical View of the English Biblical Translations. His last work, except an episcopal Charge, was, An Attempt toward Revising our English Translation of the Greek Scriptures. This was printed four years before his death, but not published till afterward.

NEWDIGATE, Sir Roger, 1719-1806; b. England, patron of the Newdigate prizes at the university of Oxford, where he was educated at Westminster school and University college, and became distinguished as a classical scholar, of refined taste and brilliant attainments. He was a member of the house of commons for Middlesex 1751-30, representing the university of Oxford. He established the prizes for the best English verses on the arts of painting, sculpture, and architecture; having given to that institution Piranesi's works on architecture and antiquities, and the candelabra in the library founded by Dr. John Radcliffe.

NEWEL, the central column or spindle formed by the ends of the steps of a circular staircase, and round which the stair winds. In turret-stairs, it is a plain roll; but in Elizabethan and old Scotch castles, there are frequent examples of handsome staircases of this kind with ornamental newels.

NEWELL, Harriet (Atwood), 1793-1812; b. Mass. She was the first American woman who went as missionary to India. She sailed for India with her husband Samuel Newell, and Adoniram Judson and wife, Feb. 19, 1812. They were forbidden by the East India company to remain in Calcutta, and sailed Ang. 4 for the Isle of France. "Their passage was long and perilous. After having been driven about for a month in the bay of Bengal during which Mrs. Newell was sick of a fever, the ship put in to Coringa in distress. They left that port and early in November arrived at the place of their destination. About three weeks before their arrival, Mr. and Mrs. Newell commenced to the deep body of an infant daughter, five days old. From this time Mrs. Newell rapidly declined. Her disease, the consumption, baffled medical skill, and on Nov. 30 at Pondi Louis she was released from the toils and sorrows of this mortal life." A volume containing her life and writings was published by the American Sunday-school union. A memoir of her by Dr. Woods has been widely circulated in several languages. She was much beloved at home, and many hearts were touched by the example of her early consecration. It may be that her death causing the knowledge of this example to be so widely diffused, and calling attention to the great missionary work, effected more for the heathen than a long life of labor would have done.

NEWELL, Robert Henry, b. New York, 1836; engaged in business in his early life, but when about 21 entered upon the career of a journalist and literary man. He was connected with the Mercury of New York, 1858-63, and there first published the humorous articles in burlesque style under the pseudonym of Orpheus C. Kerr (office-seeker), on which his literary reputation mainly rests. Several volumes of these papers were published, and had a large sale. In 1863 Mr. Newell visited California, and has since published several volumes of prose and poetry. He has been a contributor to the New York World and editor of the Hearth and Home.

NEWELL, Samuel, 1785-1820; b. Mass.; graduated at Harvard college 1807. While engaged in the study of theology at Andover, he with five other students signed a paper addressed to the general association of Massachusetts (Congregational), expressing their desire to go as missionaries to the heathen and asking advice. It was this appeal that led to the formation of the American board. He married Harriet Atwood, and Feb. 1813, sailed for Calcutta. Arriving there they were forbidden by the East India company to the missionary work, and sailed for the Isle of France. After being driven about for a month in the bay of Bengal, the ship put in at Coringa in distress. Again sailing, their little daughter died, and was buried in the ocean. Soon after their
arrival Mrs. Newell also died and was buried on the island. Mr. Newell went to Ceylon, and afterward to Bombay, where he died of cholera. He was greatly endeared to the friends of missions by his devotedness and peculiarly amiable character. He wrote with Mr. Hall while at Andover, The Conversion of the World, or Claims of Six Hundred Millions, a work of thrilling interest which had great effect in churches in awakening a missionary spirit.

NEW ENGLAND, a collective name given to the six eastern states of the United States of America—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut—including an area of 63,000 sq. miles. The people, distinctively known as Yankees, and mostly descended from an English Puritan and Scottish ancestry, are engaged in commerce, fisheries, and manufactures, and are celebrated for industry and enterprise. This region was granted by James I. to the Plymouth company in 1606, under the title of New England, and the coast was explored by capt. John Smith in 1614. See accounts of the several states.

NEW FOREST, the name of a district in Hampshire (q.v.), triangular in shape, and bounded on the w. by the river Avon, on the s. by the coast, and on the n. by a line running from the borders of Wiltshire along the Southampton water. Area about 61,400 acres. This triangle appears to have been a great wooded district from the earliest times, and its present name dates from the Norman conquest, when it was regularly afforested. Since that period it has remained a possession of the crown, subject to rights of "pannage," vert (greenwood), and turf-cutting, claimed by various estates in or near the forest. During the "pannage" month, which commences at the end of September, and lasts for six weeks, the borderers drive in herds of swine to feed on the mast in the forest, and this right they obtain by paying a small annual fee in the Stewarts court at Lyndhurst, which is considered the capital of the forest. Formerly this district was the haunt of numerous "squatters," but their huts are now rarely to be seen. Gipsies, however, still congregate here in considerable numbers. In 1854 a commission was appointed to examine the extent and nature of the rights of pannage, etc., claimed by the foresters and borderers, and in a large majority of cases the claims were confirmed. The principal trees in the forest are the oak and beech, with large patches of holly as underwood. The oaks have been much used as timber for the British navy. Tracts of exquisite woodland scenery are everywhere to be met with. The afforestation of this district by the conqueror, enforced by savagely severe forest laws, was regarded as an act of the greatest cruelty, and the violent deaths met by both of his sons, Richard and William Rufus—both of whom were killed by accidental arrow-wounds in the forest—were looked upon as special judgments of providence. A small breed of ponies lives wild under its shelter.

NEWFOUNDLAND, an island and British colony of North America, not yet incorporated with the Dominion of Canada, lies at the mouth of the Gulf of St. Lawrence, separated from Labrador on the n. by the straits of Belle Isle (about 12 m. broad), and extending in lat. from 46° 38' to 51° 37' n., and in long. from 52° 44' to 59° 30' west. In shape it resembles an equilateral triangle, of which cape Bauld on the n., cape Race on the s.e., and cape Ray on the s.w. form the angles. It is 370 m. in length, 290 m. in breadth, and has an area of 40,290 sq. miles. Pop. '69, 146,536; '74, 161,486.

The island, as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mountains, marshes, barrens, ponds, and lakes. The mountains in the Avalon peninsula (stretching s.e. from the main portion of the island, and connected with it by an isthmus of 3 m. in width) rise, in some cases, to 1400 ft. above sea level; while both here and along the western shore the height of 1000 ft. is frequently reached. The number of the lakes and "ponds" (the latter name being used indiscriminately for a large or a small lake) is remarkable, and it has been estimated that about one-third of the whole surface is covered with fresh water. The "barrens" occupy the tops of hills. The coast line is everywhere deeply indented with bays and estuaries, many of which are spacious enough to contain the whole British navy. Of these inlets, the principal, beginning from the northern extremity of the island, are Hare, White, Notre Dame, Bonavista, Trinity, Conception, St. Mary's, Placentia, Fortune, St. George's, and St. John's bays. These bays vary in length from 25 to 70 m., are of great breadth, and are lined—as indeed the whole coast is—with excellent harbors. The rivers, none of which are navigable for any distance, communicate between the lakes of the interior and the shore, and are narrow and winding. The main streams are the Exploit, with its affluent the Great Ratting, and the Humber. Much of the soil is sterile and unproductive, although there is considerable cultivation along the sea-board of the settled districts, limited principally to the s.e. coast; exploration has shown that the best land and the best timber are in the interior. The great body of the people being employed either in the fisheries or in establishments connected with them, little attention used to be paid to the culture of the soil; but very considerable improvements in this respect have latterly been made by the entering islanders. In 1845 the only crops raised were oats and hay; but within recent years large supplies of grain, vegetable, and garden seeds have been imported; and now about 600,000 bushels of potatoes are produced annually, and turnips, hay, carrots, clover, barley, and oats are cultivated with success. The Island possesses some minerals, among which are marble, limestone, gypsum, roofing-
The fisheries are of two kinds—the "shore fishery" and the "bank fishery;" the former comprises the shores and bays of Newfoundland; the latter comprises a great tract known as the "banks" of Newfoundland, from 500 to 600 m. in length, and about 200 m. in breadth. The banks form the greatest submarine plateau known; the depth of the water is from 20 to 108 fathoms, and the most productive "ground" is said to extend between lat. 42° and 46° north. Great variety of valuable fish is found in the waters around the colony, as the cod, salmon, herring, etc. The principal articles of export are fish—comprising dry cod, herring, and salmon—and cod-oil. Of dry cod, 970,176 quintals, value £10,948, were exported in 1870; 3,593 tons of unrefined cod-oil, value £107,813; 401 of refined cod-oil, value £21,068; 4,989 of seal-oil, value £176,472; and 265,189 seal-skins, value £55,248. The imports are chiefly provisions, as bread, butter, tea, etc.—cordage and cables, and manufactured goods. The imports and exports for 1874 amounted in value to £1,532,227 and £1,529,314 respectively. The revenue of Newfoundland in 1875 was £167,283; the expenditure, £197,691. In 1873 the total tonnage of vessels that entered and cleared the ports was 412,024. Newfoundland possessed itself 1501 vessels of 68,183 tons.

The seal affords one of the most important fishing interests of Newfoundland. This industry occurs once or twice every year, and is most important any day from Feb. 25th to March 5th, according to the winds—a n.e. wind blocking up the coast with ice, which the first strong westerly wind clears away. At the beginning of the present century, the seal-fishing was carried on with vessels of from 30 to 40 tons, manned by 8 or 10 men. Vessels of from 70 to 180 tons, manned by from 25 to 90 men, were substituted for these, the most suitable being vessels of from 120 to 140 tons. About 1866, steamers were introduced into the seal-fishing, and they have proved so serviceable that it is probable that this kind of vessel will, by and by, be used exclusively in these fisheries. In proportion to the population of Newfoundland, its religious institutions are ample, while education is within reach of all classes, government grants to the district schools being liberal.

There are no railways in the island, and its peculiar configuration renders even road-making a matter of great difficulty. There are no roads across the island; they are confined chiefly to the south-eastern and south-western sea-board. There is weekly communication for nine months in the year between Newfoundland and Europe. In the colony and connected with it, 400 m. of lines of telegraph have been constructed, and the Atlantic telegraph has its western terminus on this island.

The early history of Newfoundland is involved in obscurity. It was discovered, June 24, 1497, in the reign of Henry VII., by John Cabot; and the event is noticed by the following entry in the accounts of the privy-purse expenditure: "1497, August 10, To hym that found the New Isle, £10." It was visited by the Portuguese navigator, Gaspar de Cortereal, in 1500; and within two years after that time, regular fisheries had been established on its shores by the Portuguese, Biscayans, and French. In 1578, 400 vessels, of which 50 were English, were engaged in the fishery. Sir Humphrey Gilbert, with his ill-fated expedition, arrived in St. John's harbor, August 1583, and formally took possession of the island in the name of queen Elizabeth. In the return voyage, the expedition was scattered by storms, the course of the fleet (the Dantzig, Sardinia, and York) was lost, and the latter two (the Dantzig and York) settled in the great peninsula in the s.e., and named it the Province of Avalon. The history of the island during the 17th and part of the 18th centuries, is little more than a record of rivalries and feuds between the English and French fishermen; but by the treaty of Utrecht (1713), the island was ceded wholly to England; the French, however, retaining the privilege of fishing and drying their fish on certain portions of the coast. A governor was appointed in 1728. The present form of government, established in 1855, consists of the governor, a legislative council (appointed by the crown), and a general assembly (elected by the people). The coast of Labrador on the mainland, and the island of Anticosti, have been included, since 1809, within the jurisdiction of the governor of Newfoundland.

**NEWFOUNDLAND DOG**, one of the most sagacious and esteemed of the large kinds of dog. It is said to have been originally derived from Newfoundland, where it is used chiefly as a beast of draught, to convey light loads of wood or provisions, on sledges, over rugged tracks. Many of these dogs, in St. John's and elsewhere, are left to shift for themselves during the fishing season; and are again called to service when required by their masters. There are several varieties of Newfoundland dogs, particularly a smooth breed, with rather small head, white and spotted with black, which seems now to be extinct; a very large breed, with broad muzzle, head raised, noble expression, waved or curly hair, very thick and bushy curled tail, black and white color; and a smaller almost black breed. Some of the breeds seem to be crossed with hounds and other dogs. The Newfoundland dog is remarkable for memory, and for patience and forbearance of temper. It is, however, apt to become irascible in confinement, and will then bite even its master. Some of the most interesting anecdotes of the affection and

U. K. X.—34
sagacity of the dog, relate to the Newfoundland dog. No dog excels it as a water-dog. Its paws are half-webbed. Its power of endurance in swimming is very great.

NEWGATE, a celebrated London prison, stands at the western extremity of Newgate street, opposite the Old Bailey. It is the chief criminal prison for the city and county. The exterior presents high dark stone walls, without windows, and with entrances from the side next the Old Bailey, in front of which public executions take place. The earliest prison here was in the portal of the new gate of the city, as early as 1218; and hence the name. About two centuries afterward, it was rebuilt by the executors of sir Richard Whittington, whose statue with a cat stood in a niche, till its destruction by the great fire of London in 1666. Shortly after, it was reconstructed, from which time, till 1780, the date of the erection of the present edifice, its condition was, in a sanitary point of view, horrible. Mr. Akerman, one of the keepers, in his evidence before the house of commons in 1770, stated, as a proof of this, that in the spring of 1750 the jail dis-temper, spreading to the adjoining sessions house, caused the death of "two of the judges, the lord mayor, and several of the jury and others, to the number of 60 persons and upwards." The place, however, is now kept in the cleanest possible condition. The cells for condemned prisoners are at the n.e. corner, next to Newgate street. The Newgate Calendar contains biographical notices of the most notorious murderers, burglars, thieves, and forgers who have been confined within its walls.

NEW GRANADA, since Sept. 1861, has been officially styled The United States of Colombia. This federative republic was formed at the convention of Bogotá, at the date specified, and consists of nine "states," Panama, Santander, Cauca, Boyacá, Cundinamarca, Antioquia, Tolima, Bolívar, Magdalena. It is bounded on the n. by the Carib- bean sea, on the e. by the Magdalena river and the Pacific; on the s. by Ecuador and Brazil; and on the w. by Venezuela. Area, 513,783 sq., pop. 70, 2,894,992, of whom nearly a half are of European descent. By a constitution dated May 1863, the executive authority is vested in a president elected for two years, while the legislative power rests with a senate and a house of representatives. The federal army of this republic consists of 3,000 men on the peace footing, but in a time of war each state is bound to furnish a contingent of one in a hundred of its population. The revenue in 1878 was $4,868,800, and the expenditure $7,371,933. The public debt in the same year was close on $10,000,000. The total imports in 1876-77 had a value of $6,709,169; the exports $10,049,071. Besides the railway across the isthmus of Panama, there is another short line; and about 1,250 miles of telegraph are in operation.

The country is intersected by three great ranges of the Andes, which spread out like the rays of an open hand from the plateau of Pasto and Tuniriquer in the s. (14,000 ft. high) to the central, and the western cordilleras. Between these chains lie the long and beautiful valleys of the Cauca and the Magdalena. The central Cordillera is the highest chain, rising in Nevada de Tolima to a height of 18,020 ft., and from one of its peaks, near the frontiers of Ecuador, called the Paramo de las Papas, descend the two principal rivers of New Granada, the Magdalena and its tributary the Cauca, flowing n. in the Caribbean sea, besides several affluents of the Amazon in the e. and one or two streams flowing westward into the Pacific. The eastern Cordillera is by far the largest chain, and consists of a series of vast table-lands, cool and healthy, where the white race flourishes as vigorously as in Europe. This temperate region is the most densely peopled portion of the confederation, being, in some places, at the rate of 2,600 to the square league, Bogota (q.v.) the present capital, is situated on one of these plateaux, at an elevation of 8,664 feet. Eastward from this Cordillera stretch enormous plains as far as the Orinoco, the greater part of which belongs to New Granada, and through which flow the Meta, the Guaviare, and other tributaries of the Brinoco. The geology of the country is very extraordinary. "Everywhere," we are told, "are found traces of stupendous cataclysms, and a disarrangement and intermixture of primitive and sedimentary rock, which seem to put all classification at defiance." In the course of one day's journey, the traveler may experience in this country all the climates of the world. Perpetual snow covers the summits of the Cordilleras; while the rich vegetation of the tropics covers the valleys. With its great variety of levels and climates, New Granada yields naturally an equally great variety of productions: cattle, horses, wheat and other European grains, maize, tobacco, coffee, plantains, cotton, cacao, sugar, cedar, mahogany, cinchona bark, ipecacuanha, gold, silver, copper, iron, and lead, coal, emeralds, pearls, and rock-salt.

By the constitution, complete toleration in matters of religion and worship, the freedom of the press, a system of parish schools, with gratuitous primary education, and many other important helps to civilization and liberty have been established. The inhabitants rank first among the South Americans in point of literary and scientific culture. There are at present about 1000 public schools in the country, many seminaries and colleges for higher and professional instruction; there are printing establishments, periodicals, and numerous literary, scientific, and benevolent institutions.

The chief aborigines of the country, called Chibchas or Mayos, held a high rank among the semi-civilized nations of the New World. They are said to have been frugal and industrious, with a well-organized government and a very passable religion—for heathens. They were conquered by Ximenes de Quesada (1536-57), and their descendants.
are now "Christians," and speak the Spanish language. Several of the other tribes still maintain a savage mode of life; and some, as the Mesayos, are even said to be cannibals. In 1718, New Granada was erected into a vice-royalty by Spain. In 1819, it became independent, and then joined with Ecuador and Venezuela to form the republic of Colombia; but the union was dissolved in 1829-30, and New Granada was organized as a separate republic in 1832. After several changes in the constitution (in 1843, 1851, 1853), a complete fundamental change was made in 1858, by which the separate "provinces" were changed into "states," associated under a federal government like the "United States" of America. The constitution has since been amended, and territorial changes have taken place. In 1861, the revolution broke out, and for more than two years, the country was devastated by civil war. Finally, on Sept. 29, 1861, a convention was concluded between the conservatives or federalists, and the "liberals," which put an end to the strife. As the victory lay with the latter, certain changes have again been made in the constitution, and the country is now, as stated above, officially designated the "United States of Colombia." The first president under the new form of the constitution commenced his term of office on April 1, 1864.

NEW GUINEA. See Papua.

NEW HAMPSHIRE, one of the original thirteen United States of America, in lat. 42° 41'—45° 11' n., long. 70° 40'—72° 38' w., is 176 m. long, and on an average 45 m. wide, having an area of 9,280 sq. m., or 5,939,200 acres. It is bounded, by Canada, e. by Maine, and the Atlantic ocean, s. by Massachusetts, and w. by Vermont, from which it is separated by the Connecticut river. It has ten counties; the chief towns are Manchester, Portsmouth, Dover, Nashua, Keene, and Concord, the capital. The population in 1830 was 630,381. In 1840 the recent influx of Irish in the manufacturing towns, is almost entirely descended from the original English and Scottish settlers. It has 18 m. of sea-coast, and one seaport, Portsmouth, at the mouth of the Piscataqua river, with a deep and commodious harbor. Its other chief rivers are the Connecticut and the Merrimack. It is a state of mountains and lakes, much visited by tourists, and called "The Granite State" and "The Switzerland of America." The White mountains lie in the n. central region. Their highest summits are Mt. Washington, 6,283 ft.; and Mt. Lafayette, 5,500 ft. A notch in the White mountains, 2 m. long, and in the narrowest part only 22 ft. wide, affords passage to a road and mountain stream, and is much visited. The lakes and rivers of New Hampshire occupy in all about 110,000 acres. Lake Winnipiscocee is 25 m. long by 1 to 10 m. wide, with 300 islands, from a few yards to many acres in area, mostly covered with evergreens. The rocky strata consist of metamorphic rock, mica, and talcose slates, quartz, granular limestones, granite, gneiss, and contain magnetic and specular iron ores, barytes, tourmalines, mica, graphite, and steatite or soap-stone. The soil, except in the fertile valleys, is better adapted to pasturage than culture. The winters are long and cold, so that in the mountainous regions mercury sometimes freezes. In the forests are oak, maple, pine, hemlock, spruce, etc. The chief agricultural products are maize, rye, oats, apples, potatoes, and products of the dairy. Numerous water-falls give motive power to many cotton-factories, woolen, iron, and paper-mills, etc. The state has 915 m. of railway, 45 national and 65 savings banks, a college (at Dartmouth), 700 churches, 50 newspapers, an excellent system of free school, and government and judiciary similar to all the American states. New Hampshire was settled in 1633 by colonists from Hampshire in England, who suffered during the colonial period from Indian wars and depredations. The state was organized in 1776. It has furnished a multitude of emigrants to the newer and more fertile western states. Pop. '10, 214,390; '10, 284,574; '10, 318,300.

NEW HAMPSHIRE (ante), was first visited by capt. John Smith, the English navigator, in 1624, and revisited by Capt. John Mason and sir Ferdinand Gorges. In some of the earliest histories it is called Laconia, and in others capt. John Mason's Patent, and Pascaatnaxa. The first settlements were made at Dover and Portsmouth in 1623, and 12 years later another was formed at Exeter; but the settlers were unable to defend themselves against the Indians, and in 1641 all the settlements in the state united with the colony of Massachusetts. In 1679, however, Charles II. made it a separate royal province, with a president and council appointed by the crown, and an assembly chosen by the people. Then again from 1689 to 1692 it reunited with Massachusetts, which relation it continued 49 years before becoming for the third time an independent province. The settlements were gradually extended further w. than the original patent prescribed, and it was believed until 1764 that the territory at present included in Vermont formed part of the grant, a mistake that led to a vexatious controversy which lasted many years. In 1788 the state declared its independence, and a temporary government was established that continued during the revolutionary war, in which its people were among the most active and noted participants. The state was also represented in the continental con-
gness, and ratified the constitution of the United States by a vote of 57 to 46. At a con-
vention in Oct., 1783, a constitution was prepared similar to that of Massachusetts, and
this as altered slightly six years afterwards is still the constitution of the state. In 1807
Concord was chosen as the permanent capital.

Previous to 1860 large gains in the state's growth were reported in every census; but
by the census of that year it was found that there was a decrease of 2.38 per cent in the
population, and for many years its agricultural interests have been declining. The
soil never was very fertile, and much of the land which was once productive has become
worn out by long use. This fact, in connection with the severity of the climate has
caused many of the younger generation to seek new advantages in the west. In 1850
there were 72,141 families with an average of 4.41 persons to each, and 67,946 dwellings
with an average of 4.75 to each. Of the total population 10 years of age and over (200,426)
there were engaged in all occupations 120,168, which total was divided as follows:

<table>

The number of acres in farms was 3,603,944, of which 2,334,487 acres were improved.
The value of the farms was estimated at $80,598,318, and of the farming implements and machinery, $3,459,943. The chief productions were: Winter wheat, 189,229 bushels; spring wheat, 4,339 bushels; rye, 47,420; Indian corn, 1,277,766; oats, 1,146,451; barley, 105,822; buckwheat, 100,034; peas and beans, 58,375; potatoes, 4,515,589; hay, 612,648 tons; tobacco, 153,334 lbs.; wool, 1,129,442 lbs.; butter, 5,965,-
089; cheese, 49,419; hops, 99,469; maple sugar, 1,800,704; honey, 50,941; maple molas-
ses, 16,884 gallons. The value of all kinds of live stock in the state during the same
year was estimated at $15,246,515. It included 43,533 horses, 90,680 milk cows, 40,513
wool sheep; 91,765 other cattle, 248,900 sheep, and 83,275 swine. It is in manufactur-
ing rather than agriculture that the state ranks. Within the present boundaries of Manches-
ter, Dover, and Nashua, together with the numerous smaller towns active with manufactur-
ing industry, make it among the first in the union in this respect. Cotton and wooden
goods, boots and shoes, machinery, and other iron and metallic wares, are the leading
articles of manufacture; but paper, carriages, furniture, hosiery, leather, lumber, wooden-ware, and a large variety of other goods are extensively produced. In 1870 the total
number of manufacturing establishments was 3,342, employing 40,783 hands, and
using a capital of $36,023,743. The value of material used was $44,577,967, and of the
products, $71,083,249. Of this amount the manufacture of cotton goods furnished the
largest single item, $16,999,672; the woolen and worsted goods produced were valued at
$10,150,739; lumber, $3,820,523; boots and shoes, $4,780,629; printing-cotton and woolen
goods, $4,670,363; iron, rolled and castings, $1,200,968; furniture, $1,792,162; leather,
tanned and period, $5,065,996; machinery of all kinds, $2,065,563; $8,488,358; carriages,
wagons, and cars, $1,286,084; flouring-mill products, $1,270,226; hosiery, $1,757,345. As to the state's foreign commerce, it is usually very small. Portsmouth is its only port of entry; and in 1874 the value of imported goods received there amounted to about $41,000. The exports were not $200 in value. The number of American vessels that entered and cleared from the New York port were 25, with a tonnage of 5,959; the
number of foreign vessels, 46, with a tonnage of 5,471. The number of railroads, with their
vessels lying wholly or partly in New Hampshire, in 1875 was 12. These were the Bos-
ton, Concord and Montreal, 160 m.; Boston and Maine, 34 m.; Cheshire, 42 m.; Port-
smouth, Great Falls and Conway, 72 m.; Atlantic and St. Lawrence, 52 m.; Ports-
smouth, 59 m.; Concord 55 m.; Manchester, Lawrence and North Weare, 42 m.; Nor-
northern, 8 m.; Nashua and Rochester, 49 m.; Eastern, with Conway division, 89 m.,
and Dover and Winnipesaukee, 20 miles. The number of national banks in operation in
the state at the beginning of the year was 43. Their capital amounted to $3,365,000; bonds
on deposit, $3,342,000; outstanding circulation, $1,707,365. There were also two state
banks and trust companies with $175,000 capital, and 68 savings-banks, which had deposits to the amount of $30,214,585. The fire insurance companies com-
prired 16 town companies, 6 mutual not limited to towns, and the New Hampshire joint-
stock company. The amount of risks carried by the town companies was $2,431,262, and by the mutual $12,993,299. Besides these companies there were 50 fire and 5 marine
insurance companies of other states and foreign countries licensed to transact business in
the state.

In 1872 the assessed valuation of real and personal property in New Hampshire
was reported by the assessors of the several cities and towns to be $152,987,177; but these
returns were considered to be much below the real value, which was believed to be about
$230,000,000. In 1875 the assessed valuation was $206,930,017. The state tax is divided
among the several cities and towns according to an apportionment made every four years, based
on the assessed valuation of the taxable property. Railroads are taxed separately, the
judges of the superior court determining the present value of the capital and assessing in proportion to the taxation of other property. The state income for the fiscal year ending
May 31, 1879, was $1,173,104.10; the expenditures for the same period amounted to
$1,109,347.20; leaving a balance on hand of $63,756.90. A month later the public debt
amounted to $3,573,550.90. This includes the municipal war loans, the burden of which
has been assumed by the state.

The public school system of the state, like that of the other New England states, is
New Hanover, New Harmony.

The general supervision is vested in a state superintendent, and the several towns annually choose committees, among whom, since 1872, women are eligible to direct the conduct of the schools in their respective localities. A compulsory educational law was passed in 1871, requiring all children between 8 and 14 years of age to attend school at least 12 weeks of every year. In 1872 there were 2,149 district and 2,589 public schools in the state, of which 405 were graded schools. The number of children in attendance was 68,751; and there were only 4,164 children between the ages of 5 and 15 who attended no school. The whole number of teachers was 3,663, of whom 503 were males and 3,160 females. Besides the common public schools, there is a state normal school at Plymouth with 13 teachers, and also 50 academies, seminaries, and private schools, which have about 160 teachers. These include some of the oldest and most noted schools in the country, such as Phillips academy at Exeter, founded in 1781; St. Paul's school at Concord; the Kimball Union academy at Meriden, and the New Hampton literary institute at New Hampton. At Hanover, Dartmouth college is located, which, besides the college proper comprises the Chandler scientific school, the Thayer school of civil engineering, a medical school, and the New Hampshire college of agriculture and mechanic arts. (See DARTMOUTH COLLEGE.) The total amount of receipts in 1873 for public school purposes was $821,649, of which $590,167 was raised by taxation, $271,880 from a literary fund, $25,345 from local funds, and $81,264 by contributions from other sources. The amount expended the same year was $792,894, and the average appropriation for each registered scholar, $7.08. The estimated value of school-houses and lots in the state was $2,228,905, and of the school apparatus, $29,154. Of the public and private libraries, the census of 1870 reported 1,526, having 704,269 volumes, of which 856 with 379,876 volumes were private and the rest public. The largest library in the state is the one belonging to Dartmouth college, which numbers 57,000 volumes. The number of newspapers and periodicals printed in the state is about 60, there being 9 daily, 44 weekly, 6 monthly, and 1 quarterly. The religious organizations of all denominations in 1874 numbered 653, and they possessed 624 edifices with 261,000 sittings, and property valued at $3,905,720. The denominations were divided as follows: Baptists, 102; Free-will Baptists, 82; Christians, 19; Congregationalists, 168; Protestant Episcopalians, 21; Friends, 13; Methodists, 118; Presbyterians, 7; Roman Catholics, 17; Second Adventists, 21; Shakers, 2; Unitarians, 33; Universalists, 24; Union, 12.

The constitution of New Hampshire extends the right of suffrage to every male citizen who is 21 years of age and who has resided in one town six months previous to election, excepting paupers and persons who are excused from paying taxes. Only Protestantists, according to the constitution, are eligible to the office of governor, or are eligible as senators or representatives. The executive department consists of a governor, five councilors, secretary of state, treasurer, commissary-general, and superintendent of public instruction, who are elected annually. All the judicial officers, such as the attorney-general, solicitor, sheriffs, coroners, registers of probate, and general field officers of the militia, are appointed by the governor. The judicial power is vested in a superior court of judicature and a circuit court, probate court, police courts, and justices of the peace. The legislature, styled the general court, comprises a senate of 12 members and a house of representatives. The state is represented in congress by two senators and three representatives. The electoral votes have been cast as follows: 1788, Washington and Adams, 5; 1792, Washington and Adams, 6; 1796, Adams and Ellsworth, 6; 1800, Adams and Pinckney, 6; 1804, Jefferson and Clinton, 7; 1808, Pinckney and King, 7; 1812, Clinton and Ingersoll, 8; 1816, Monroe and Tompkins, 8; 1820, Monroe and Tompkins, 7; 1823, Adams and Rush, 1; 1824, Adams (for president), 8; 1828, Jackson (vice-p.), 7; 1832, Adams and Rush, 8; 1833, Jackson and Van Buren, 7; 1836, Van Buren and Johnson, 7; 1840, Van Buren and Johnson, 7; 1844, Polk and Dallas, 6; 1848, Cass and Butler, 6; 1852, Pierce and King, 3; 1856, Fremont and Dayton, 5; 1860, Lincoln and Hamlin, 5; 1864, Lincoln and Johnson, 5; 1868, Grant and Colfax, 5; 1872, Grant and Wilson, 5; 1876, Hayes and Wheeler, 5; 1880, Garfield and Arthur, 5.

NEW HANOVER, a co., in s. North Carolina, having the Atlantic ocean for its s. and e. boundary, the broad cape Fear river and its affluent the Black river for its w., intersected by the n.e. branch of the former river: about 850 sq. m., pop. '80, 21,387—29,864 of American birth, 13,224 colored. It is intersected by the Wilmington andeldon, and the Wilmington, Columbia, and Augusta railroads, forming a junction at Wilmington, which is the e. terminus of the Carolina Central railroa enthusiast. Its surface is generally level and largely covered with pine forests, sinking into low swampy land in some sections. Its soil is sandy and adapted to the cultivation of the vine. Stock is raised; also corn, sweet potatoes, rice, and wool. Its leading industries are the manufacture of carriages and wagons, railroad cars, cooperage, fertilizers, iron castings, and machinery. It has flour and saw mills; and lumber, tar, and turpentine, are the chief commodities. It has cotton factories, rice mills, and turpentine distilleries. Steamboats ply between its chief town and the ports of Baltimore and Charleston, and vessels stop here to recruit their stores. County seat, Wilmington.

NEW HARMONY, a village of Indiana, first settled in 1815 by a German community of religious socialists, called Harmonists, under the leadership of George Rapp. In 1824,
the village and domain was purchased by Robert Owen, for an experimental community on his system. After the speedy failure of this society, the property was bought by William Maclure for a school of industry. It is now a flourishing western village of, 78, 896 inhabitants.

NEW HAVEN, a co. in s.w. Connecticut, bounded s. by Long Island sound, and w. and s.w. by the Housatonic river, which separates it from Fairfield co.; about 620 sq. m. Pop. 80, 156,526—119,218 of American birth, 1591 colored. Naugatuck river is the only stream of any size, though several small creeks and rivers empty into the sound; the principal railroads are the New York, New Haven, Hartford, and Springfield, with its shore line branch to New London; the New Haven and Northampton; the Boston and New York air line, and the Naugatuck. The surface is uneven; the soil sandy in places, and only moderately fertile; covered in part with forests of maple, oak, beech, elm, and chestnut; the staples are potatoes, Indian corn, oats, tobacco, and dairy product. The manufactures are very extensive and profitable, especially at Waterbury, Meriden, Wallingford, and New Haven. Carriages, clocks, plated ware, hardware, machinery, bricks, pens, tools, cutlery, and rubber articles, being among the chief products. A proposition is now (1881) being agitated to set off the northern part, including Waterbury and some small towns, to form a new county. County seat, New Haven.

NEW HAVEN, the chief c. and seaport of Connecticut, U. S., at the head of a bay, 4 m. from Long Island sound, 76 m. c.n.e. of New York. Its broad streets are shaded with elms, and the public squares, parks, and gardens, with its handsome public and private edifices, make it one of the most beautiful of American cities. It is the seat of Yale college (q.v.), which has more than a dozen large buildings and a gothic library, 150 ft. long. There are a handsome custom-house, state-house, hospital, 51 churches, academies and schools, 9 banks, 5 daily papers, and 3 ornamental cemeteries. There are large manufactories of carriages, clocks, and leather, iron and India-rubber works. It has railroad and steamboat connection with New York, etc. Pop. 70, 50,840.

NEW HAVEN (ante) is situated on a sandy plain inclosed between the Quinnipiac and Mill rivers on the e. and T. West river on the w., East Rock and West Rock on either side are of volcanic formation, about 450 ft. in height, and front the city with their precipitous faces. The railroads which center here are the New York, New Haven, and Hartford—running w. and n. and with a branch, the Shore line, running to the e.; the New Haven and Northampton, the New York and Boston air line, and the Derby and New Haven; pop. 80, 62,882. The harbor is large but not of great depth: improvement is now being made by extensive dredging. The shipping business is considerable, but not as great, proportionately, as in former years, when a large trade was carried on with the West Indies. Two lines of steamboats run to New York, four boats leaving each port daily. The city is distant from Hartford, the capital, 30 m., from New London about 50 m., and from New York 76 miles.

New Haven was founded in 1638 by a Puritan colony under the rev. John Davenport and Theophilus Eaton, and with the adjoining towns of Guilford, Milford, Stamford, and Branford, constituted an independent colony until 1662, when it was brought under the same charter with Connecticut. Hartford and New Haven were then made joint towns. Later they were separated, and New Haven became a separate town in 1875, and Hartford became sole capital. There are both town and city governments, the latter under a special charter; the villages of Westville and Fair Haven are included in the city limits. There are ten wards, each sending two aldermen and three councilmen to the common council, who are elected annually, as is the mayor. The fire, police, and street departments, are controlled by boards of commissioners, and are very efficient. Taxes are moderate and, including that for the school fund, amount to about 16 mills on the dollar. The city has long been called "Elm City," from the great number of ancient elms which adorn its streets and parks, most of which were planted at the end of the last and beginning of this century. The public square or "green" lies in the center of the city as originally laid out, and is surrounded by a double row of elms, which also border Temple street passing through the green, and that part of the college grounds adjoining. In this park are three churches; one, the oldest in the city, has a crypt containing the tombs of the old heads of families of the state. Here also is the old state capital, in decay of late years. Behind Center church are the tombs of the "regicides," Goffe, Whalley and Dixwell, and upon the slope of West Rock may be seen a cave, or rather shelter among boulders, said to have been occupied by them as a place of concealment, and bearing the inscription "Opposition to tyrants is obedience to God." Among the principal streets are Chapel, Church, and State, the business thoroughfares, and Hillhouse avenue, Prospect, West Chapel, and Dwight streets, where are many of the best residences and handsome grounds. The town is remarkable for the abundance of trees and the absence of all crowding of residences, even in the center of the city. The most noteworthy public buildings are the post-office, city hall, and county court-house, the finest buildings of the city, the police building, the public high school, the Peabody museum, and other of the college buildings. See YALE COLLEGE. There are nearly 50 churches, among the finest are Trinity and St. Paul's Episcopal, St. Mary's Roman Catholic, Church of the Redeemer, Congregational, and the Baptist church on Chapel street. Besides the various departments of the college, there are several academies for
boys and young ladies, Hopkins grammar school being the best known. There is a fine high school and a good common school system. For many years New Haven has been largely engaged in the manufacture of clocks and carriages, and there are many factories for making the latter. Winchester's rifle, pistol, and cartridge factory; Condée's rubber works (the second largest in the world); Sargent's factory of domestic hardware, etc.; and Wheeler's iron works are among the largest concerns in the city. Among many other articles produced are pianos, organs, pins, fish-hooks, matches, paper boxes, all kinds of iron and brass ware, machinery, corsets, skirts, paper, and shoes. The city is the center of a large retail trade with the surrounding country, and through it passes nearly all the coal and freight of the New England states. The city debt is not burdensome, and consists mainly in bonds for the expense of the excellent sewerage system, and in aid of the Derby railroad. There are five daily newspapers, nine weeklies, several monthly magazines, and a quarterly published in the city. The college, which of late has assumed the features, though not the name, of a university, has for over a hundred years been a center for much of the social life of the community, but this influence is now less dominant, as the city has greatly enlarged.

NEW HEBRIDES, a group of islands in the Pacific ocean, to the n.e. of New Carloina, and to the w. of the Fijiis, in s. lat. between 14° and 20°, and in e. long. between 167° and 170°. Total area estimated at 3,500 sq. miles. They are regarded as the most easterly point of the western division of Polynesia. The group embraces Espiritu Santo (65 m. long by 20 broad), Malicolo (40 m. long by 38 broad), Vati Ambrym, Annatom, Erromango, and Tanna, with an active volcano. Anomone is noted as the birthplace of the group, disappeared in 1871, leaving no trace. Most of the group are hilly and well wooded, some even mountainous. The most important woods are ebony and sandal; the principal edible products, yams, bananas, cucumbers, cocoa-nuts, and sweet potatoes; and the only animal of consequence, a diminutive species of hog, which, when full-grown, is no bigger than a rabbit. The inhabitants, who number about 200,000, are fierce, but are excessively dirty and unintelligent. Erromango is a well-known name in missionary history, being the scene of the barbarous massacre of the rev. John Williams — generally called the martyr of Erromango.

NEW HOLLAND, the former name for Australia (q.v.).

NEW INN HALL, Oxfords. This hall, with certain gardens adjoining, was presented to the warden and fellows of New college, by William of Wykeham in 1392. The first principal on record occurs in 1438. During the civil war it was used as a mint for Charles I. It was restored to the purposes of instruction by Dr. Cramer, the late principal, who erected a handsome building for the use of the students.

NEW IRELAND, a long narrow island in the Pacific ocean, lying to the n.e. of New Britain (q.v.), from which it is separated by St. George's channel; lat. 2° 40' to 4° 52' s., long. 150° 30' to 152° 50' e. Length about 200 m.; average breadth, 12 miles. The hills rise to a height of from 1500 to 2000 ft., and are richly wooded. The principal trees are cocoas on the coast, and in the interior, forests of areca-palm. The chief products are sugar-cane, bananas, yam; cocoa-nuts. Dogs, pigs, and turtles abound. The natives are apparently of the same race as the inhabitants of Australia; but our information about them is extremely scanty.

NEW JERSEY, one of the original thirteen United States, in lat. 38° 55' to 41° 21' n., and long. 73° 58' to 75° 29' w., 168 m. long, with a breadth which varies from 39 to 52 m., containing an area of 8,930 sq. m., or 5,324,800 acres; bounded n. by New York, e. by the Hudson river and the Atlantic ocean, s. by the ocean and Delaware bay, and w. by Delaware bay and river, which separate it from Delaware and Pennsylvania. It has 21 counties. The chief towns are Trenton (the capital), Newark, Paterson, Jersey City, Elizabeth, Camden, Hoboken. Its coast line is 120 m., or, including bays, 540 miles. Besides its bordering rivers, the Hudson and Delaware, its principal streams are the Passaic, Hackensack, and Raritan. The northern portion of the state is hilly and mountainous. The Palisades, a wall of perpendicular trap-rocks, from 200 to 500 ft. high, form the western bank of the Hudson river for 15 m., and one of the grandest features of its scenery. The central portion of the state is a rolling country, and the southern and eastern portion a sandy plain declining to the sea. Five geological belts cross the state, containing a sandy pine plain with bog iron ore, shelly marls used for manure, glass sand, green-sand or marl, plastic clay, used in making fire-bricks, metamorphic rocks, argillaceous red sandstone, copper ores, gneiss with specular and magnetic iron ores, red oxide of zinc, and Franklinite iron. Among the most attractive features in the scenery are the falls of the Passaic, the Delaware water gap, and Schooley's mountain. Atlantic city, a bathing place on the seacoast, connected by railway with Philadelphia, is a fashionable summer resort. The climate is mild, the soil n. of the pine plains fertile, the country healthy, except the malarious river-bottoms. The agricultural products of the state are wheat, maize, oats, common and sweet potatoes, apples, peaches, plums, grapes, melons, and garden vegetables for the great neighboring markets of New York and Philadelphia. There are cotton and woolen factories; iron-works, extensive manufactories of machinery, locomotives, carriages, glass, boots and shoes, etc. The state draws a large revenue from 1233 m. of railway, and several important canals, connecting
New Jersey and the coal regions of Pennsylvania. There are 4 colleges, normal and free schools, numerous churches, periodicals, and daily papers. The government is similar to those of all the states.

New Jersey was settled in 1620 by Dutch and Swedes. Taken by the English, it was ceded by Charles II. to the duke of York; it was retaken by the Dutch in 1673, and afterwards bought by William Penn and other Friends, who have here numerous descendants. It was the scene of some of the most important military movements of the war of independence, and of the battles of Trenton, Princeton, Monmouth, and Germantown. Pop. in 1840, 373,306; in 1860, 672,031; in 1870, 905,096.

NEW JERSEY (contd). One of the original thirteen United States of North America, lying between the Hudson river and the Atlantic ocean on the n., New York on the n., Delaware bay and Delaware and Pennsylvania on the w., mostly between 39° and 41° n. lat. and meridians 73° 53' 5' and 75° 33' 02' w. from Greenwich. Its extreme length is 168 m.; greatest breadth, 59 m.; narrowest part, 32 m.; 7,576 sq.m., or 4,849,000 acres; pop. '80, 1,130,892. There are 21 counties: Trenton is the capital; Newark the largest city. The following table shows the growth of the state and the character of its population from 1790 to 1880 inclusive:

</table>

By the above table it appears that the ratio of increase of population more than doubled its preceding rate between the years 1840 and 1870, and is now (1880) decreasing. In 1790 it was the ninth state in population; in 1870 the seventeenth.

Topography.—Three ranges of mountains of moderate height traverse the n. part of the state in a direction n.e. and s.w., and all form low links in the Appalachian chain, which merge into the Catskills, the Shawangunk, and the Highlands of the Hudson on the n.e., and are divided from the Alleghany mountains of Pennsylvania by the Delaware river on the s.w. The overcropping rock formations cross the state in bands, in the same n.e. and s.w. direction. The most northerly and highest range of mountains is the Blue or Kittatinny, having a maximum height of 1800 ft. near the New York line, whence it forms an unbroken ridge to "the Delaware water gap." This range has a more rapid ascent on the e. side than on the w., and its summit has a considerable extent of table-lands, naturally well timbered and fertile, under culture. The Kittatinny valley lies between the range just described and the Highland range s.e. of it. It is a valley of great beauty of scenery and agricultural capability, from 500 to 650 ft. above the sea, about 39 m. in length by 10 in breadth. Berkshire, Longwood, and Greenwood Lake valleys are smaller vales of the same general character. The Highland range next s.e. is in many broken mountain ridges and spurs, extending over a width of 22 m. on the n.e. boundary of the state, and narrowing to 10 m. at the Delaware river, where they leave the state. The maximum height of this range is at Rutherford's hill or Hamburg mountain, 1488 ft. above the sea, and Wawayanda mountain, near the New York line, which is 1450 feet. The summer resorts on Schooley's and Musconetcong mountains are on two separate ridges of this range. This range of hills and ridges is generally more abrupt on its s.w. than on its n.e. side. The trap-rock formation which the Hudson river exhibits in its palisades, beginning a few miles above New York, is a dike breaking through a red sandstone formation which approaches the Hudson from the w., turns s. so as to form the palisades, and terminates at Jersey City, near which it has been tunneled by the Erie and the Delaware, Lackawanna and Western railway companies, and cut deep for the passage of the New Jersey Central. West of this ridge of trap rock are what are known as first, second, and third mountains, being the names given to the successive comparatively abrupt ascents from the alluvial levels near New York bay to the mountain ranges before described. Parts of the first rise are known as Orange, Fairmount, and Mont Clair mountains. This portion of the state, geologically a part of the sandstone belt, is one of the richest upland slopes, and has been noted as the northermmost limit of many trees and shrubs of the southern states, which find protection from westerly winds on the e. sides of the hills, with a climate modified by proximity to the sea. Michaux, in his North American Sylva, shows that he found a greater variety of trees and shrubs in this locality than in any other part of the northern states. South-west of the Orange mountain range are
trap ridges, known as Rocky hill, Ten-Mile-Run mountain, Long hill, Sourland mountain, and Goat hill; and, further n., Round mountain and Pickle mountain, the latter 767 ft. above the sea. All these elevations of trap rock show their most abrupt faces to the e., and slope away gently to the westward. The s.e. part, and nearly two-thirds of the area of the state, has no elevations of any importance; the Neversink highlands, seen from Sandy Hook as one approaches by sea from the e., have a maximum height of 400 feet. They are exceptional elevations in a gently rolling sandy plain which stretches from the sea to the Delaware river, with a slight rise from each towards the center of the state, where the average summit-level is about 160 ft. above the sea.

The state has several distinct drainage basins, which should really be grouped into only two systems, those whose water-shed is to the Atlantic ocean, and those which contribute to the Delaware river and bay. The latter drain more than one-half of the entire state from n. to south. Beginning at the n., on the sea-side slope, an exceedingly narrow strip drains into the Hudson. On the w. side of the palisade the Hackensack comes into the state from New York, and flows southwardly through a narrow valley into Newark bay, w. of and parallel with the bay of New York. The Passaic river, next w., has its sources near the center of the northern half of the state, directly w. of New York; flows thence n.e. to its junction with the Pequannock, the Ringwood, and the Ramapo; then e. through a gap in the Highland range, and through Paterson, to its main valley, through which it courses southerly to Newark bay. The Raritan is a larger stream, having its sources directly w. of those of the Passaic, flows southerly within 15 m. of the Delaware river, and then in a generally e. course to its mouth in Raritan bay, s. of Staten island. Its principal tributaries are the Lauring, Millstone, and South rivers. It has the largest and most fertile soil of any of the streams of the state. South of Raritan bay the streams which empty into the sea are small down to Toms river, a stream about 30 m. long, emptying into Toms bay, an estuary from Barnegat bay. Thirty m. s. of that is the Little Egg Harbor river, and 20 m. further s. is Great Egg Harbor river, both draining the southern part of the state from within 15 m. of the Delaware river. The main streams, draining the western slope into the latter river, beginning at the n., are Paulius-hill, Paquedge creek, Musconetcong river, emptying about 10 m. below Easton, Penn., and Rancocas creek. Smaller streams are numerous. On the s. the Maurice river drains a considerable area into Delaware bay. One hundred m. of the Atlantic shore, n. of cape May, is a continuous line of harbors and bays, separated from the sea by long stretches of beach, with few inlets on the n. and many on the south. Barnegat bay and Little Egg harbor form a continuous bay more than 40 m. long, parallel with the sea, with inlets only at the middle and at the s. end. Atlantic City has been built for a summer resort on the outer beach, midway between Little Egg and Great Egg bays. See ATLANTIC CITY. The extent of inland navigation formed by the bars is about 75 m. from n. to s., but in length of inland shores it is several hundred m. in extent. South of Barnegat bay and Little Egg harbor the inlets are very numerous to these inland channels. The harbors are: Great bay (at the mouth of Little Egg Harbor river), Little bay, Reed's bay, Absecon bay (entered through Absecon inlet just n. of Atlantic City), Lake bay, Great Egg harbor, Peck's bay, Ludlow's bay, Townsend's sound, Style's sound, Learning's sound, Jenkin's sound, Grassy sound, Richardson's sound, Jarvis sound, and Cape Island sound. The n. shore of Delaware bay is mostly marshy, with no outer sea-bench inclosing harbors and inland passages as on the Atlantic side. See CAPE MAY.

There are many pretty lakes in the northern part of the state. Greenwood lake, in Passaic co., sometimes called Long pond, the largest, lies across the n. boundary, one-half in New Jersey. It is 8 m. long and 1 m. in greatest width. In Sussex co. is Culver's, and many smaller ponds. In Morris co. are lakes Hopatcong, 5½ m. long and 1¼ m. wide; Budd's lake, 2 m. long and 1 m. wide; and Green pond, a charming lake, at an elevation of 1044 ft. above the sea, between Green Pond mountain and Copperas mountain, 3 m. long and half a m. wide.

The soils of different parts of New Jersey differ to an unusual degree. On the valleys of the Delaware, the Raritan, the Passaic, and in many valleys among the mountains of the n. part, the soil is of the best quality. The eastern slope of First, or Orange mountain, which is a red sandstone formation, was remarkable in a state of nature for the variety and strength of its forest vegetation. In general, it may be stated that the central part of the state is the most fertile, and adapted to the greater variety of products. While parts of the alluvial basins are rich enough to bear crops of tobacco, other sections were originally so thin as to have given rise to the expression—"as poor as the barrens of New Jersey." But those sand-barrens, as they were called, have been found well adapted to fruits and vegetable gardening. The average value of farming land in 1870 was $86.14 per acre. The geologic survey of the state has called attention to the oak and pine lands of its southern part. Two-fifths of the area of the state s.e. of the marl belt is divided into two classes: the sands upon which pines alone thrive, and those which grow oak as well as pine, which have more clay and humus. The white-oak bottoms are the best parts of the latter. The oak lands have been found particularly susceptible to improvement, and are showing good crops of grains as well as fruits since intelligent industry has been applied to them.

Geology.—The bands of geological outcrop cross the state from n.e. to s.w. The
Jersey, the marl, value. The geologic surveys have been quite exhaustive. Prof. Henry D. Rogers made the first in 1839-40; the second was undertaken by Dr. Wm. Kitchell in 1854; the third by prof. George H. Cook, state geologist, was begun in 1864, and has been continuous since. A volume, entitled the Geology of New Jersey, embraced the results of surveys up to 1868, since which time annual reports have been published.

Mineralogy and Geologic products.—The azei and palaeozoic formations of the n. w. part furnish magnetic iron ores in many places in Sussex, Warren, Morris, and Passaic counties; the product in 1873 amounting to 605,000 tons. The greater portion of this is sent to the furnaces of Pennsylvania, near the coal supply. About one-fifth of it is worked up by the local blast-furnaces at Ringwood, Boonton, Stanhope, Oxford furnace, and Phillipsburg. In 1874 there were 214 tons of iron ores worked here, 12 mines of red and brown hematite ores worked on a large scale; besides mines of bog-iron worked here and there on a small scale. Copper ores have been found and worked in Somerset co., but have not proved remunerative. Zinc ores have been found in two places in Sussex co., said to supply 1/5 of the zinc oxide and 1 of the metallic zinc product of the United States. In 1868, according to prof. Cook, 25,000 tons of zinc ores were taken out in that county, since which time there has been a falling off. Lead ore is often found, but has not been of a profitable grade to work; nickel also has been found. Graphite, or plumago, has been mined with profit in several places in Morris and Passaic counties. Sulphate of baryta, manganese, and iron pyrites are mined and used in the manufacture of sulphuric acid, and greensand, and other sands for glass-making and chemical uses are drawn from many parts. Mineralogists enumerate upwards of 160 minerals which are found in the state. The proximity of the mineral regions of New Jersey to the great city of New York brings all its mineral wealth into convenient use, and gives it high value. The geologic products of highest value to the state are its extensive deposits of pure marl, clay marl, and shell marls, used in connection with other fertilizers; for on these have depended the improvement of millions of acres of its soil, large portions of which were formerly considered too poor to cultivate, but are now made productive beyond the average per acre of any state in the union. These marls will probably be the means, in connection with the excrements of the great neighboring cities, of making New Jersey, in soil, one of the richest, instead of one of the poorest states. Upwards of 200,000 tons of marl were used annually before 1875. The quantity now used must be double that. Lime quarried in vast quantities for burning to make into quick-lime for use as manure, and also for the manufacture of Portland and potter's clay; is also excellent as the lime required in the state, are used in manufacturing, to the amount of 300,000 tons annually. Kaolin also is found in large deposits, though much of it is not of superior quality. Morris co., furnishes insufioral earths, used in the manufacture of dynamite and giant powders, and for poli-hing purposes, and sand valuable for molding purposes and to enter into the manufacture of fire-brick for reverberatory furnaces. Burlington co. also supplies these sands. A pure white sand of the finest quality, for glass-making, is found in s. New Jersey, and used in the glass-works of Glassboro and Millville. The variety of building stones furnished by the quarries of New Jersey is great, and includes the granite, or gneiss-granite, sand-stones of a variety of tone and quality, limestones (including water-lime and some marbles), bluestone, trap-rock, slates, fire stones, and conglomerate, altogether providing the great cities around New York bay with a large part of all their building and paving stones. The steeple church in New York is an example of brown sandstone from the New Jersey quarries.

Climate.—Proximity to the Atlantic on its whole eastern and southern parts, and its generally low surface above the sea, give New Jersey a climate of less extreme cold than the states inland in the same latitude, but not less extreme heat. The southern counties, however, surrounded by sea waters, show less range between extremes than other portions of the state. Where fresh water joins the sea the marshes are malabrous, and there are some portions of the lands overlying the trap-rock dikes where water settles into fissures below the surface and gives rise to malarial diseases. The very rich alluvial lands of the Delaware were formerly more subject than any other portions of the state to the same class of ailments, but in general have long since become quite as healthful as the average of lands. As a whole the state is eminently healthful, and the sandstone belt is considered particularly favorable to persons inclined to lung disease. The following table of thermometric and barometric observations gives the climate of Newark, which may be taken as representing the average of the state:
Mean temperature, year (F.) 51.25
Highest " " 98.5
Lowest " " 12.5
Range of " " 116°
Mean " spring, " 48.48
Highest " " 85.50

Industries—Agriculture and Horticulture.—The value of the farm and garden lands, with their implements, in 1870, was returned at $265,411,367, and the total value of the products of that year at $42,725,198. The record of quantities and values of market-garden products is necessarily very imperfect. The immense orchard products of the state, especially peaches, also are not likely to be fully stated in any official reports. The value of market-garden products in 1870 was reported, $2,978,390; that of orchard products at $1,295,282. The following table of grain products is from the report of the U. S. commissioner of agriculture for 1878:

<table>

The amount of milk sold from New Jersey in 1870 was 5,373,323 gallons, which at 20 cents per gall. would give a value $1,074,664. Butter, 8,265,000 lbs.; value, $2,066,506. The cranberry harvest the same year was estimated worth $358,600. Sweet potatoes are grown to a large extent, the sandy lands of the state being the most northerly section of the country in which they are grown with profit. The fisheries on the coast, especially of oysters, are a prolific source of wealth, and return nearly half a million dollars annually in value. The state has a board of fish commissioners, who are engaged in stocking its fresh-water streams and upland lakes from their hatcheries. They reported for 1878 58,000 landlocked salmon and 2,500 black bass put into the lakes; 1,663,000 put in the Delaware river; 500,000 California salmon and 243,000 brook trout hatched and partially distributed; and 100,000 white fish hatched and not distributed. The work of this year indicates the result intended. A board of riparian commissioners have charge of the interests of the state in lands under tide-water.

Manufactures.—In 1870 New Jersey ranked seventh among the states in the value of her manufactures. The number of establishments was 6,639, and of employees 75,552; of whom 58,115 were men, 11,198 women, and 6,239 children. The capital supposed to be invested was $79,606,719, which would represent an average of $12,000 capital to each establishment. The wages then paid annually were $62,648,409, equal to an average of $432 per annum for each employee. This was at a period of highest prices for
Everywhere. The value of raw materials used was $108,415,245, and of the products of the year $169,237,732. The following are among the products greatest in value of these manufactures: The refining of sugars and molasses, $11,199,710; flouring mills, $10,557,070; iron and its rough products, $13,611,271; machinery, $8,818,123; leathers, $9,307,945; hats and caps, $5,907,270; cotton and woven printed goods, $5,006,397; silk threads and fabrics, $4,527,644 (which increased in 1874 to $6,097,092, and will probably reach a far higher figure by the census of 1880); bleaching and dyeing, $4,889,695; cotton goods, thread, and yarn, $4,053,238; trunks, valises, and satchels, $3,793,000; clothing, $3,346,125; jewelry, $3,155,679; glass, window, and hollow ware, $2,805,726; boots and shoes, $2,530,322; liquors, malt and distilled, $3,674,218; carriages and wagons, $2,281,643; India rubber and elastic goods, $2,224,939; sash, doors, and blinds, $2,160,795; woolen and worsted goods, $2,415,805; lumber, planed and sawed, $3,697,891; paper of all kinds, $1,562,321; saddlery and harness, $1,732,395; brick, $1,695,520; tin, copper, and sheet-iron ware, $1,657,609; soap and candles, $1,600,234; steel, cast, and springs, $1,847,887; hardware, $2,182,395; paints, lead and zinc, $1,269,082; stone and earthenware, $1,106,985; bakery products, $1,203,082. Quarry products, a very important item, are not returned. Of all the manufactures of New Jersey, it is probable that those of silk and iron will show the largest increase by the census of 1880, and that the annual products of most factories will be more largely increased than their values.

Commerce.—The metropolis of New York is the great port of entry of the United States, and still more exclusively of the state of New Jersey; so that the foreign commerce of the state shows as a part of the customs business of that city, and its commercial relations with other states of the Union also appear in the statistics of the imports, exports, and sales of the city of New York. The custom-house districts of Perth Amboy, Newark, Little Egg Harbor, Great Egg Harbor, Burlington, and Bridgeport therefore show imports and exports of less than $100,000. The number of foreign vessels entered and cleared in 1874 was but 61, amounting to 9,707 tons—or less than 160 tons each; American vessels 55, tonnage 6,043, averaging 173 tons each. At the same time the registered, enrolled, and licensed tonnage belonging in New Jersey custom districts, June 30, 1874, was 1196 vessels, aggregating 103,100 tons. Of these 90 were steamers, representing 17,518 tons. Built in 1874, 75 vessels; aggregate tonnage, 8,301. While these figures are insignificant compared with the real share which the products and the capital of New Jersey have in foreign and coastwise commerce, railroads, on the other hand, bear across the state an immense commerce between the great cities of New York and Philadelphia and the country at large. By the returns in 1878, 58 railway companies have charters from the state, representing 1652 m. of road. Twenty-three are operated by their own boards; the other 35 are leased by seven railway corporations. A general law for the incorporation of railway companies was passed in April, 1873, doing away with special charters and monopolies in the future. The capital in railways and equipment in the state in 1873 was $156,324,108. The horse railways of the larger cities of the state, with their equipments, represented a capital of $1,550,000, managed by five companies.

Education.—The canals of New Jersey were once its principal commercial channels. The Morris and Essex canal, 101 m. long, from Jersey City to the Delaware river at Phillipsburg, was built before the Erie canal of New York, and has always transported vast quantities of coal from Pennsylvania to New York. By its corporation charter it was invested with banking powers, or, rather, its corporators assumed such powers from the indefinite range of the powers granted. It cost originally $2,825,907. The Delaware and Raritan canal, from New Brunswick to Bordentown, 43 m. long, with a feeder to Trenton 22 m., was built in the beginning of the present century, at a cost of $3,953,257. It is under lease to the united railroad and canal companies of New Jersey.

Education.—The children of school age (3 to 18 years) enumerated in 1875 were 295,000; the enrolled children of the public schools, 188,392; average attendance, 96,324; number attending private schools, 36,507; attending no schools, 11,955. The public school buildings provide places for 155,432. The number of school districts is 1369; number of public school buildings, 949; 645 private schools, 101 are sectarian and 253 unsectarian. Fund raised by tax for public schools in 1875, $2,272,829; from other sources, $31,573, total, $2,304,398. Teachers employed, 3,216, of whom 960 were men, and 2,256 women; average monthly salary of men, $65.77; of women, $38. Value of public school buildings and realty, $6,006,732. The cities have a distinct organization of their schools under the control of the city superintendents, who, however, are subject to the state laws and the direction of the state superintendent of education. Each county has a superintendent, and teachers' institutes had been organized in 18 of the 21 counties. The state normal school for teachers, at Trenton, embraces a system of model schools in which the students are trained in the respective departments of school teaching. The Farharn preparatory school at Beverly prepares students to enter the normal school, or for the practice of business. The numbers in attendance at the normal school in 1874 were 156 men and 234 women, under 12 teachers. The model school, under the charge of the superintendent, composed of 175 boys and 268 girls. In 1879 an act passed the legislature for the establishment of schools for industrial education. The annual school tax on all the property of the state is two mills on a dollar, which yielded in 1876, $1,238,115. In addition to the fund raised annually by this tax
New Jersey has a school fund valued in 1876 at $2,268,680, of which $1,214,333 was invested in securities, $238,000 due from the state fund, and the remainder in the form of grants or leases of land. For higher education there are 4 colleges, 4 collegiate schools for women, 8 scientific schools, including the state agricultural and scientific college connected with Rutgers, and 4 theological schools, besides many private seminaries for the instruction of youth of both sexes in the higher courses of study. The colleges are: the Burlington (Episcopal) at Burlington, founded in 1846, which has 7 professors, 65 students, income $15,000, and a library of 2,000 volumes; the Rutgers (q.v.) (Reformed) at New Brunswick, founded in 1770; the Princeton (Presbyterian) at Princeton, chartered as the college of New Jersey (q.v.) in 1746; the Seton Hall (q.v.) (Roman Catholic) at South Orange, chartered in 1856, employs 32 professors or teachers, with 105 students, and has a library of 8,000 volumes; the Bordentown female college at Bordentown, founded in 1851, has 8 teachers, 104 students, and $50,000 invested in buildings; the Ivy Hall college for women at Bridgeton, founded in 1861, has 9 teachers, 68 students, $20,000 in buildings, $14,000 income, and 1000 volumes in library; St. Mary's Hall (Episcopal), Burlington, founded in 1874, has 25 professors and teachers, 200 students, and $20,000 invested in library; the Pennington female college institute at Pennington, founded in 1840, has 9 teachers, 181 students, $100,000 in buildings, and a library of 2,000 volumes. The schools or colleges of science are: the Stevens institute of technology (q.v.) at Hoboken, founded in 1871; the scientific school of Rutgers institute (including the state agricultural and scientific college) at New Brunswick, founded in 1864, has 11 professors, 62 students, $116,000 endowment, and a library of 8,500 volumes; the John C. Greer school of science at Princeton (q.v.), founded in 1873. Most of the above colleges have preparatory schools connected with them. The Peddie institute at Hightstown is a high grade seminary founded in 1864, and has 7 teachers, 67 students, $150,000 invested in buildings, and $19,000 income. New Jersey's rich theological institutions include the Presbyterian church, founded in 1812, which has 7 professors, 116 students, $200,000 in buildings, $450,000 endowment, $290,000 income, and 26,000 volumes in its library; the seminary of the Reformed church in America at New Brunswick, founded in 1784, has 5 professors, 38 students, $200,000 in buildings, $220,000 endowment, $12,500 income, and 20,000 volumes; the Drew theological seminary (q.v.) (Methodist) at Madison, founded in 1867; and the German theological school of Newark presbytery at Bloomfield, founded in 1859, with 6 professors, 23 students, $30,000 in buildings, $20,000 endowment, and $700 income. Of churches and their adherents the following table presents a synopsis for 1874:

The journals published in the state are as follows: Dailies, 22; tri-weekly, 1; semi-weekly, 2; weekly, 146; bi-weekly and monthly, 2; total, 178. Politically these are classified: 49 in sympathy with the democratic party, 53 with the republican party, 4 national republican, 46 independent of party affiliations. One weekly and 1 monthly are devoted to the cause of temperance, 2 weekly to mechanical information, 1 monthly to literature alone, 1 monthly to law, and 1 bi-weekly and 2 monthly to college matters. Of these, 1 daily, 2 semi-weeklies, and 9 weeklies are in the German language. The aggregate subscription to these papers varies from 200,000 to 300,000 per year, and the total number of copies circulated annually exceeds 20,000,000. 

*History and Government.*—The date of the first settlement is not certainly known. Dutch traders are believed to have occupied Bergen point between 1614 and 1620. On the e. bank of the Delaware a party of Dutch under Cornelis Jacobson Mey and Adrian
New Jersey.

Jarvis built a fort 4 m. below Philadelphia in 1623, and called it fort Nassau. The King of England, in 1634, granted the whole region along the Delaware to sir Edward Poyden under the name of New Albion; and in 1638 Swedes and Finns purchased lands of the natives and settled on the river. The Dutch and Swedes prevented the English from getting a foothold, however, until 1655, when Peter Stuyvesant from New Amsterdam (New York) drove out the Swedes, or forced them to acknowledge Dutch rule. In 1664 Charles II. assumed sole jurisdiction, and granted all the country between the Delaware and Connecticut rivers to his brother, the duke of York, who took possession of New Amsterdam with a force sent out under col. Richard Nichols, who soon after made land grants w. of New York bay to colonists from New England, who began the settlements at Newark, Elizabeth, Middletown, and Shrewsbury. The next year the duke of York assigned his grant to lord Berkeley and sir George Carteret, who named the region New Jersey in compliment to the isle of Jersey, where Carteret had been the king's governor. Elizabeth was made the seat of government in 1664, and Philip Carteret was the first governor of New Jersey. He was not liked, and had trouble with the colonists about land rents. He went to England in 1670, returned soon afterwards, and continued governor till 1674, when the Dutch recaptured New Amsterdam, and the adjacent country fell into their hands. But Great Britain regained possession by treaty the same year. The conflicting claims of grantees of lands from Nichols and from Carteret were settled by the king, who confirmed all grants to his brother and Carteret. But the duke had made a conveyance to sir Edmund Andros, governor of New York, who assumed the power to control the government in New Jersey also; and in April, 1680, imprisoned Carteret. The duke of York interceded in behalf of the grantees under Nichols and New Jersey's governor, and in 1681 they were settled in their rights. In the meantime (1679) William Penn with other Quakers had bought lands in New Jersey, and in 1675 had established a Quaker settlement at Salem in the southern part of the state. One Fenwick seems to have exercised jurisdiction in s. New Jersey after the settlement at Salem, up to a line drawn from Little Egg Harbor to lat. 41° on the Delaware, while all of Jersey n.e. of that line remained under the gubernatorial rights of Carteret. In Feb., 1682, William Penn and 11 other friends purchased the whole territory. In 1668 a legislative assembly had convened at Elizabeth, and passed criminal laws of excessive severity. Another was convened in 1675. Robert Barclay, a Scotchman, one of the associate purchasers, was the first governor under the new ownership in 1682. Respect for the rights of the settlers and a peaceful and wise administration gave New Jersey 20 years of prosperity. But the company-proprietorship of so large a country was found to have such disadvantages that in 1702 the proprietary rights of the purchasers were ceded back to the crown, and the same year queen Anne appointed lord Cornbury governor of New York and New Jersey; but each colony continued to have its separate assembly. In 1708, on the petition of the colony to have a separate administration, Lewis Morris was made governor of New Jersey, which then had a population of 40,000. The growth of New Jersey was peaceful until the beginning of the revolution. The last royal governor was William Franklin, son of Benjamin Franklin, who was appointed in 1763, and was noted as a bitter tory. New Jersey, through her legislature, entered cordially into the measures for the defense of colonial rights against the oppressive legislation of the mother country, and on July 2, 1776, anticipating the declaration of independence by the continental congress, adopted a state constitution, which was ratified on the 18th, and which continued as the organic law until 1844, when another was adopted. On June 25, 1776, governor Wm. Franklin, who had set himself against the action of the legislature, was deposed, placed under guard, and sent to Connecticut a prisoner. William Livingston was elected governor Aug. 13, 1776, and re-elected for 14 years. The important battles of Trenton, Princeton, and Monmouth are historical monuments of New Jersey's part in the war for independence. Her position in the center of the confederacy made her soil the principal theater of war. Trenton was made the state capital in 1790. The constitution of 1776, which was superseded by another Aug. 13, 1844, was again materially modified by a commission of 14 in 1873, whose work was approved by the legislature in 1874, and again in 1875, and ratified by the people by an immense majority the latter year at a special election. The following is a list of New Jersey's governors since the state organization: William Livingston, 1776-90; William Patterson, 1790-94; Richard Howell, 1794-1801; Joseph Bloomfield, 1801-12; Aaron Ogden, 1812-13; William S. Pennington, 1813-15; Mahlon Dickerson, 1815-17; Isaac H. Williamson, 1817-20; Peter D. Vroom, 1823-32; Samuel L. Southard, 1832-33; Elias P. Seeley, 1833; Peter D. Vroom, 1833-36; Philipmon Dickerson, 1836-37; Latham Pennington, 1837-43; Daniel Graves, 1844-48; Daniel Holmes, 1848-51; George H. Fort, 1851-54; Rodman M. Price, 1854-57; William A. Newell, 1857-60; Charles S. Olden, 1860-63; Joel Parker, 1863-66; Marcus L. Ward, 1866-69; Theodore F. Randolph, 1869-73; Joel Parker, 1872-75; Joseph D. Bedle, 1875-77; George B. McClellan, 1877-81; George C. Ludlow, 1881. The legislative assembly consists of a senate and a general assembly. One senator is elected from each county for three years, making 21 members. The assembly is limited by law to 60 members, elected annually, and represents districts apportioned by population after each national census. The governor is elected for three years. The treasurer and comptroller are elected by the legislature for three years. The attorney-general,
secretary of state, superintendent of schools, prosecuting officers, and clerk of the
supreme court are appointed by the governor, subject to the approval of the senate.

Judiciary.—The distinction between courts of law and courts of equity is still main-
tained in New Jersey. All judges are appointed by the governor for a term of six years,
subject to confirmation by the senate. The first, or lower courts, are the county courts
of common pleas and oyer and terminer, consisting of not more than five judges; an
orphan's court, and court of general quarter sessions of the peace. Next above is the
supreme court, which makes the circuit of the state, and is composed of a chief-justice,
and four associates. A prerogative court is presided over by the chancellor alone.
The court of errors and appeals in the last resort is composed of the chancellor, the justices of
the supreme court, and six judges. The pardoning power is vested in the chancellor, 5
judges, and the governor; but is not exercised without the sanction of the governor.

Charitable Institutions.—There is a state board of charities, a part of whose duties is to
visit the state institutions, those of the counties, and private incorporate benevolences.
Care and instruction to the deaf and dumb is provided out of the state at New York and
Buffalo at the state institutions of New York, for which in 1876 $25,000 was paid. The
blind are taken care of in New York and Pennsylvania institutions at a cost of about
$14,000 per annum. Idiocy and insanity are greatly on the increase. The total number of
insane, idiots, and epileptics for 1878 was 9,501; mortality among them, 793. Idiots
and the feeble-minded are sent to the training school at Media, Penn., at an annual cost
of about $8,000. The home for disabled soldiers is maintained at an annual cost from
$40,000 to $50,000. The home for soldiers' children, formerly maintained, has been
closed, after it was executed its trust in educating and providing homes for them. An
act for the establishment of orphan asylums was enacted Mar. 9, 1877, providing that
any five or more persons may form themselves into an orphan-asylum association for
the purpose of receiving, supporting, and educating orphan children, under such name
as they may choose, after being duly incorporated under the further provisions of the
act. Such private associations are believed to be a more efficient means of providing for
the orphans in each locality than state institutions. An industrial school for girls at
Trenton is maintained by the state. A state reform school for juvenile delinquents
is located at Jamesburg in Middlesex co., on a farm of 490 acres, where the boys are
employed at farm labor and taught a few trades. The old state lunatic asylum is at
Trenton. The number of patients in 1877 was 510 and its expenses the same year
$37,807. The state pays $4 per week for every county patient in addition to what each
county is obliged to pay for those it sends. The institution derives a revenue from the
care of private patients who are sent to it. The new asylum for the insane at Morristown
is one of the finest structures for the purpose in the country, having recently been
finished at a cost of about $650,000. It will accommodate upwards of 800 patients. In
1877 it maintained 445, at a cost of $26,441. The financial condition of the charitable
institutions reported in 1879 is as follows:

The state prison is at Trenton. Its average number of convicts is 815. The earnings
and income of 1877 amounted to $75,611; the expenditures to $123,148. The earnings
of the convicts exceeded the expense of their keeping that year by $49,129. In 1879 the
legislature appointed a special committee to prepare a report on the questions of prison
labor and its relation to other labor, which it is supposed will be the basis of the future
prison policy of the state.

Finances.—The outstanding debt of the war loan, originally about $2,500,000, was
reduced by 1878 to $2,196,300; $100,000 is required to be paid annually. Of this, the
sinking fund, which has increased to $4,158,852, pays $10,000 per annum, besides pay-
ing the interest on the entire debt; leaving $90,000 to be raised annually by taxes. In a
few years the sinking fund will pay the whole annual reduction required. All the state's
floating debt was paid off in 1878, leaving a balance in the treasury of $120,000. The
general fund state tax is one mill on the dollar valuation; the school tax, two mills on the
dollar. The state taxes are low, but the county taxes and the municipal taxes of many
New Jersey.

| 1828                  | John Q. Adams, P. Richard Rush, V.P. | 8         | "              | "              | "              | "              |
| 1832                  | Andrew Jackson, P. M. Van Buren, V.P. | 8         | "              | "              | "              | "              |
| 1836                  | Wm. H. Harrison, P. Francis Granger, V.P. | 8         | "              | "              | "              | "              |
| 1840                  | Wm. H. Harrison, P. James Madison, P. | 8         | "              | "              | "              | "              |
| 1844                  | Henry Clay, P. T. F. Leffingwray, V.P. | 7         | "              | "              | "              | "              |
| 1848                  | Jackson, V.P. Wm. W. Clay, V.P. | 7         | "              | "              | "              | "              |
| 1852                  | Franklin Pierce, P. William R. King, V.P. | 7         | "              | "              | "              | "              |
| 1856                  | James Buchanan, P. J. C. Breckenridge, V.P. | 7         | "              | "              | "              | "              |
| 1860                  | Abraham Lincoln, P. | 4         | "              | "              | "              | "              |
| 1864                  | Geo. B. McClellan, P. G. H. Pendleton, P. | 7         | "              | "              | "              | "              |
| 1868                  | Horatio Seymour, P. F. B. Blair, Jr., V.P. | 7         | "              | "              | "              | "              |
| 1872                  | James Madison, P. Henry Wilson, V.P. | 9         | "              | "              | "              | "              |
| 1876                  | Samuel J. Tilden, P. | 9         | "              | "              | "              | "              |
| 1880                  | W. S. Hancock, P. Wm. H. English, V.P. | 9         | "              | "              | "              | "              |

It will be seen that New Jersey cast her electoral votes for presidents Washington and John Adams; against Jefferson for his first term in 1800, and for him the second in 1804; for Madison's first term in 1808, and against his second in 1812; for James Monroe both terms, 1816-20; against John Quincy Adams in 1824, when he was elected, and for him in 1828, when Andrew Jackson was elected; for Jackson's second term in 1832; against Van Buren in 1836, when he was elected, and for him in 1840, when Harrison was elected; against Polk in 1844; successively for the presidents-elect Pierce,
Buchanan, and Lincoln, in '52, '56, and '60; against Lincoln's second term; against Grant in '68, and for him in '72; against Hayes in '76; and against Garfield in '80.

NEW JERSEY. COLLEGE of, founded through the exertions of some leading members of the synod of New York—which then included many of the Presbyterian churches in New Jersey—under charters granted, 1746, by acting governor Hamilton, and, 1748, with more liberal provisions by governor Becher. It was opened, 1747, at Elizabeth-town; was removed to Newark, and thence to Princeton, where a large college building was erected and named Nassau hall, in honor of William III, of the house of Nassau. This building was used as a barracks and hospital by both American and British soldiers during a part of the revolutionary war. At the battle of Princeton, the British troops made a stand within its walls, and were driven out by Washington's advance. The continental congress met in it in 1783, and attended the commencement of that year in company with Washington, who presented 50 guineas to the trustees to aid in repairing the damages occasioned by the battle. The money was used for a full-length portrait of Washington—painted by the elder Peale—to fill the vacancy in a large gilt frame, hanging in the prayer-hall, from which the portrait of George III. had been shot away by a cannon ball during the assault. Jonathan Dickinson was the first president, Jonathan Edwards the third. Dr. Witherspoon—a member of the continental congress, and a signer of the declaration of independence, the fifth; Dr. Maclean, the tenth, yet lives, venerable in years and honored for his lifelong efficient and varied service in the college. Dr. James McCosh, from Queen's college, Belfast, Ireland, the present head of the institution, elected 1868, has greatly advanced its interests by his distinguished reputation, able instructions, and skilful administration. During his presidency the faculty has been enlarged, and the number of students greatly increased; commodious and elegant buildings have been erected, new studies introduced, the school of science established, and more than $3,200,000 contributed for various objects designed to increase the efficiency of the college. Of this sum $1,356,000 was given by Mr. John C. Green and by his legatees, since his death, in carrying out his wishes. Among the other large donors are Messrs. N. X. Halsted, Robert Bonner, Henry G. Marquand, William Libby, R. L. and A. Stuart, James Lennox, and John J. Blair. The college year is divided into three terms. A part of the very complete curriculum of studies is elective, during the junior and senior years. There is a large number of prizes, scholarships, and fellowships, the winners of the last are required to pursue a prescribed course of study for one year after graduation. The faculty consists of the president—who, in addition to his charge of some other departments of instruction, is professor of Biblical instruction,—21 other professors, with 13 tutors and other instructors. During the current year, 1890–91, there are 7 fellows, 39 post-graduates, 93 seniors, 106 juniors, 106 sophomores, 89 freshmen, 56 in the school of science, and 11 "specials," making a total of 491. The American whig and Chiosophic literary societies have for more than a century added greatly to the fame, attractive power, and usefulness of the college. The college and society libraries contain nearly 50,000 volumes. The whole number of graduates is more than 5,500, among whom have been many distinguished and useful men both in church and state. The campus forms a large quadrangle, fronting on the main street of the town, and is ornamented with many fine and venerable trees. The principal buildings are Nassau hall—twice ravaged by fire and rebuilt, East and West halls; Whig and Clio halls, marking the administration of president Carnahan; the Halsted observatory, gymnasium, Dickinson, Reunion, Witherspoon, Edwards, and Murray halls; school of science, library, new observatory, and the Marquand chapel now being built. There are also commodious residences for the president and many of the professors.

NEW JERSEY T.E.A. See Red Root, ante.

NEW JERUSALEM CHURCH. See Swedenborgians, ante.

NEW JOHORE, formerly Tanjong Putri, a Malay settlement on the southern extremity of the Malay peninsula. Here the rajah or tinmumong of Johore, who is an independent sovereign, occasionally resides. The climate is healthy; large quantities of gambir and pepper are raised in the vicinity; saw-mills on an extensive scale are in operation. Vessels of the largest draught can approach close to the shore. The valuable timbers of these immense forests are yet scarcely known, but must find their way to the Indian, if not European markets ere long. Pop. in the New Johore territory about 20,000, chiefly Chinese.

NEW KENT, a co. in e. Virginia, having the Broad York river, formed by the union of the Paminkey and Mattapony rivers, for its s.e. boundary; and the Chickahominy river for its s. and s.w. boundary; 270 sq. m.; pop. '80, 5,515—5,301 of American birth, 3,240 colored. It is intersected in the extreme n.w. by the Richmond, York river, and Chesapeake railroad. Its surface is generally level, and largely covered with forest. Its soil is a light sandy loam, and produces wheat, corn, tobacco, and sorghum. Horses, cattle, sheep, and swine are raised. Co. seat, New Kent Court House.

NEW LANARK. See Lanark, ante.

NEW LEBANON, a. i. in s.e. New York, on the Harlem Extension railroad; pop. '70, 2,459. It is 18 m. from Chatham Four Corners, and 24 m. s.e. of Albany. It includes U. K. X.—55
the villages of Mount Lebanon, Lebanon Springs, Tildens, New Lebanon Center, West Lebanon, and New Britain. The Shaker village of Mount Lebanon is inhabited by nearly 600 persons owning about 4,000 acres of land, which they industriously cultivate, and store their produce in 8 barns, one of which, built of stone, is $96 \times 50$ ft., and said to be the best in the country. They live in 8 dwelling houses, and have 26 workshops, 2 seed establishments, saw and grist mills, and manufactories of chairs, brooms, and baskets.

A kind of cider apple-sauce is made and largely exported. They are specially occupied in preserving garden seeds and preparing extracts of roots and herbs, the annual production being about 260,000 lbs. They have a laboratory, and a large meeting-house.

Lebanon Springs is a summer resort noted for its thermal springs, the largest of which discharges 16 barrels of water per minute, with a uniform temperature of 73° at all seasons. It supplies what the baths require, and the water-power for 3 mills, which are run the year round. It has a number of first-class hotels. In the town is a factory where thermometers are made for India, sent to them by the United States. It has also an extensive manufactary of medicines, with a glass-factory under the same management. The manufacture of vinegar is among the industries, and it has 8 churches, public schools, a young ladies' seminary, and 2 newspapers.

NEW LEON, one of the states of the Mexican confederation. It is bounded by Tamaulipas, San Luis Potosí, Zacatecas, and Coahuila; has an area of 23,632 sq.m.; and a pop. of 145,000 whites and mestizos. The surface is generally mountainous, the soil fertile, and the climate healthy. Lead, gold, silver, and salt are found within its limits. The natural resources of the state have suffered in their development by many military disturbances. The capital is Monterey, and other chief towns are Florida, Sultillo, and Linares.

NEW LONDON, a co. in s.e. Connecticut, bordering on Rhode Island, and bounded s. by Long Island sound and the Atlantic, and s.w. by the Connecticut river; drained also by the Thames, Yantic, Shetucket, and Quinnipaug rivers; intersected by several railroads, the chief being the Shore Line branch of the New York and New Haven consolidated road, the Stonington and Providence, and the Boston, Hartford and Erie; about 600 sq.m.; pop. '80, 73,137—58,965 of American birth, 1,591 colored. The surface is very hilly, but not rugged; the soil is only moderately fertile; oats, Indian corn, potatoes, and dairy products are the staples; the sloping hills give excellent pasturage for cattle. Extensive granite quarries are found near New London. Water-power is furnished in abundance by the streams, and there are extensive manufactories of cotton and woolen goods, furniture, flour, articles of India rubber, paper, fish oil, and other productions, in former years the inhabitants were in great numbers interested in the whale fisheries. The chief towns are New London and Norwich, the former being the co. seat.

NEW LONDON, a city and port of entry in Connecticut, on the right bank of the river Thames, 3 m. from Long Island sound, 40 m. s.e. of New Haven. It is a rich and handsome town, with a custom-house, 11 churches, academy, public schools, a daily and a weekly paper, 5 banks, several iron-foundries and steam saw-mills, a machine-manufacturing company, a deep, secure harbor, protected by a fort of 80 guns, with 20,000 tons of shipping, much of it engaged in the whale fisheries, and railway and steamboat communications. Pop. '70, 9,575. It was settled in 1644, and in 1781 burned by Gen. Arnold.

NEW LONDON (ante), one of the capitals of New London co., Conn.; about 60 m. s.w. of Providence, and 40 m. s.e. of Hartford; the terminus of the Shore Line division of the New York and New Haven, the New London and Northern, and the Stonington and Providence railroads; connected also with New York by a line of large steamboats; pop. '80, 10,529. The city, on the w. bank of the Thames near its mouth, lies at the foot and on the slope of hills which rise behind it. The harbor is a very fine one, 3 m. in length and of a good depth. It is guarded by fort Trumbull, 80 guns, in which a garrison is constantly maintained by the government. The U. S. navy yard is on the e. side of the river above the city. On the same bank is fort Griswold, in Groton, the scene of a massacre by the British forces under Benedict Arnold in 1781. The town was originally settled by colonists under the lead of a son of gov. Winthrop of Massachusetts. The principal public buildings are the city-hall, custom-house, and courthouse. There are 10 churches, 6 or 7 banks, schools and academies, and 2 or 3 hotels, one of which, on the sound, at the mouth of the river, is a very popular summer resort. There are manufactories are woolen, sewing mills, machinery, and hardware; people formerly many years were engaged in the whale fisheries, the source of much wealth; that business declined; but recently many vessels have been sent out to the sealing grounds of Alaska and the South Shetland Islands. The number of vessels belonging to the port is not far from 200.

NEW MADRID, a co. in s.e. Missouri, having the Mississippi river for its s.e. boundary, separating it from Kentucky and Tennessee; the Little river for its s. ; and drained by White river; 750 sq.m.; pop. '80, 7,694—7,587 of American birth, 1881 colored. Its surface, now diversified by swamps, prairie land, and bayous, was considerably lowered in the central portion by the earthquake of 1811-12, forming a large
lake. It has another lake in the w. portion, and its soil is very fertile. Corn and pork are raised, and there is good pasturage for live stock. Co. seat, New Madrid Courthouse.

NEW MADRID, a village in s.e. Missouri, settled 1780; on the upper Mississippi river; pop. 70, 624. It is in the township of New Madrid, the co. seat of New Madrid county, 40 m. s.w. of Cairo, Illinois, 280 m. s.e. of Jefferson city, at the terminus of the Little River Valley and Arkansas railroad. It is in the center of a fertile agricultural district, and has an extensive trade by the river in market produce, lumber, and live stock; large cargoes being sent down the river to supply southern markets. It was settled by Spaniards from Louisiana, and has received severe shocks from earthquakes, notably that of 1811, which have destroyed most of the original town. The present village is built principally of wood. It has 3 churches and a newspaper.

NEW MALTON. See Malton.

NEWMAN, EDWARD, 1801-76; b. England; founded the Entomological Magazine in 1833, and the Entomologist in 1840. In the latter year he began business as a printer and publisher in London, retiring in 1869. He edited the Zoologist in 1843, and the Physiologist in 1844. He published a History of British Ferns, 1846; The Insect Hunters, or Entomology in Verse, 1858; A Dictionary of British Birds, 1866; Illustrated History of British Moths, 1869; and Frustrated History of British Butterflies, 1871. His researches were especially devoted to the study of insects injurious to vegetation.

NEWMAN, FRANCIS, d. 1660; b. England; settled in New Hampshire in 1638, and afterwards removed to Connecticut. He was secretary of New Haven colony in the administration of Governor Theophilus Eaton, and was an assistant in 1663, in which year he went to Manhattan as a commissioner for the colony to demand reparation from gov. Stuyvesant for damages inflicted upon the New Haven people by the Dutch. He was one of the commissioners of the confederation of colonies in 1654 and 1658, and succeeded Eaton as governor in the latter year, retaining the office till his death.

NEWMAN, FRANCIS WILLIAM, brother of the preceding, was b. in London in 1805, and educated at the school of Ealing. Thence he passed to Worcester college, Oxford, where he obtained first-class honors in classics and mathematics in 1829, and, in the same year, a fellowship in Bahal college. This fellowship, however, he resigned; and he withdrew from the university in "20, at the approach of the time for taking the degree of m.a., declining the subscription to the 29 articles which was required from candidates for the degree. After a lengthened tour in the east he was appointed classical tutor in Bristol college, 1834. In 1840 he accepted a similar professorship in Manchester New college, and, in 1846, his great reputation for scholarship and his general accomplishments led to his being appointed to the chair of Latin in University college, London, which he held till 1863. During all this time he has not only been an active contributor to numerous literary and scientific periodicals, and to various branches of ancient and modern literature, but also has had a leading part in the controversies on religion, in which he has taken the line directly opposite to that chosen by his elder brother, being no less ardent as a disciple of the extreme rationalistic school than John Henry Newman of the dogmatical. These opinions, and the system founded upon them, form the subject of his published work, Phases of Faith, or Passages from the History of my Creed (1850); and of many essays in the Westminster, Keble, and other reviews; but he is also the author of very many separate publications. Of these several regard the controversy to which we have referred—as Catholic Union; Essays Towards a Church of England (1844); A State Church not Defensible (1846); a History of the Hebrew Monarchy (1847); The Soil, its Sources and Aspirations (1849). Others are on political or social topics—as, Radical Reform, Financial and Organic (1848); The Crimes of the House of Hanbury (1851); Lectures on Political Economy (1857); Europe of the Near Future (1857). A large number are devoted to historical, classical, and scientific subjects, the most important of which are Contrasts of Ancient and Modern History (1847); Royal Rome (1852); translations into "unrhymed meter" of the Odes of Horace (1853), and the Iliad of Homer (1856); a treatise on Difficulties of Elementary Geometry; Handbook of Arabic (1866); Orthography (1889), etc.

NEWMAN, JOHN HENRY, d.d., was b. in London, Feb. 21, 1801, and educated at the school of Dr. Nicholas at Ealing, whence he passed in 1816 to Trinity college, Oxford, of which college he became a scholar by competitive examination in 1818. Having graduated in 1820, he was elected fellow of Oriel college in 1822, where he attracted the notice of Dr. Whately, and was by him employed in the preparation for publication of his well-known Treatise on Logic, and introduced to the editor of the Encyclopaedia Metropolitana, to which he became a contributor. He was ordained in 1824; and in the following year, his friend Dr. Whately having been appointed head of St. Mary's hall college in 1827, as also public examiner, he resigned the vice-principalship. In 1828 he was presented to the vicarage of St. Mary's, Oxford, in which church the sermons which he delivered at a late period had an extraordinary influence in forwarding the religious movement with which his name is permanently associated. At this period Newman was an earnest antagonist of the Roman Catholic church. He was one of those who
transferred their support from Sir Robert Peel to Sir Robert Inglis on occasion of the former's introducing the Roman Catholic relief bill; and he was one of the most active in commencing and carrying on the so-called Oxford movement—the great object of which was to counteract as well the Romanizing as the dissenting tendencies of the time, by restoring and bringing into notice what Newman and his friends believed to be the Catholic character of the English church. With this view he commenced, in 1833, the series known as the Oxford Tracts, to which he was himself one of the chief contributors; and in 1838 he also became editor of the British Critic, which was an organ of the same views, and, in conjunction with Drs. Pusey and Keble, of a Library of Translations from the Greek and Latin Fathers. He continued the publication of the tracts up to the 90th number, which was written by himself, and the tendency of which was so distasteful to the Anglican authorities that the heads of houses at Oxford condemned the tract, and the Bishop of Oxford Called on Newman to discontinue the publication—a request with which he at once complied. The British Critic continued for some time longer to advocate the same opinions; but in 1843 that publication also was discontinued; and Newman, who had for some time resided at Littlemore, near Oxford, engaged, in company with some of his more youthful adherents, in study and ascetic exercises, thenceforward confined himself chiefly to his Littlemore residence, and eventually, in Oct., 1845, was admitted into the Roman Catholic church, a step which was immediately followed by the publication of a work on the Development of Doctrine, which was intended as an explanation of the process through which the writer's own mind had passed. Soon afterwards Newman repaired to Rome, where, after some preparation, he was admitted to orders in the Roman Catholic church; and in 1848, on his return to England, he established a branch of the congregation of the oratory of St. Philip Neri, of which he was himself appointed the superior. In 1852 he was appointed rector of the Catholic university established in Dublin, an office which he held for five years; afterwards returning to Birmingham, where he still resides, and in connection with which he has established a school of higher studies for the youth of the Roman Catholic religion. Dr. Newman, in addition to the large share which he had in the publications already named, is the author of several very important works, written as well before as after his withdrawal from Anglicanism. Of the former period are his History of the Aviars; Prophetic Office of the Church; The Church of the Fathers; an Essay on Miracles; A Translation of the Tacticles of St. Athanasius, with many learned dissertations, and several volumes of sermons. To the latter period belong the Development of Christian Doctrine; Lectures on Catholicism in England; Apologia pro Vita Sua; Letter to Dr. Pusey; Essay on Assent; and Letter to the Duke of Norfolk on Mr. Gladstone's Exposition (1855). Newman is also the author of two religious tales, Loss and Gain, and Cathedra, and of some fine hymns. He was also a cardinal deacon in the church in 1879.

NEWMAN, John P., D.D., b. New York, 1826; educated at Cazenovia seminary, and entered the ministry of the Methodist Episcopal church. He was for some years pastor of the metropolitan church of that denomination in Washington, and was chaplain of the U. S. senate, 1869-74. Gen. Grant sent him to Asia as an official inspector of consulates, and he has published a couple of books of travels, describing his oriental tour. He is now (1881) pastor of a church in New York.

NEWMAN, Samuel, 1692-1693; b. England; educated at Oxford, graduated in 1693, and became a minister of the established church. In 1693 he came as a Puritan to Dorchester, Mass., remaining there about a year and a half, when he removed to Weymouth, being settled there five years. In 1644 with several members of his church he went to Seento, then a small settlement, and established a church, founding a community out of which grew the town of Rehoboth, formerly including Seekonk and Pawtucket. He is called the first minister of Rehoboth by whom he conducted his labor till his death. His Cambridge Concordance, a valuable work, was first published in 1643, a new addition appearing in Cambridge in 1683, and a fifth much improved edition was published in London, 1730.

NEWMARKET, a market-t. of England, famous for its horse-races, is situated in a valley 13 m. e.n.e. of Cambridge, and is partly in the county of that name and partly in Suffolk. It contains many well-built and elegant houses, the residences in many cases of gentlemen who are drawn hither from their interest in the turf. The market-house and the famous jockey club are the chief edifices. Malt-making and brewing are carried on to some extent; but the town owes its prosperity to the horse-races, and nearly the half of the population are jockeys, grooms, trainers, or stablemen. The race-course of Newmarket, owned partly by the jockey club, and partly by the duke
of Rutland, is said to be the finest in the world, and the training-ground bears a similar character for excellence. There are seven race-meetings held here annually. See Horse-Racing. The population in 1871 was 4,544.

NEW MEXICO, a territory belonging to the United States, formerly a state of Mexico, in lat. 31° 22' to 37° n., long. 103° to 109° 9' w., 350 m. from e. to w., and 350 to 400 from n. to s., with an area of 132,981 sq. miles; bounded n. by the state of Colorado; e. by the Indian territory and Texas; s. by Texas and Mexico; and w. by Arizona. Its chief towns are Santa Fé, Albuquerque, Taos, Silver City, Mesilla. Its chief rivers are the Rio Grande, which crosses the territory from north to south; the Pecos, a branch of the Rio Grande; the Colorado, on the California boundary; the Gila, which rises in the Rocky mountains, and flows westward into the Colorado. These rivers and their branches winter broad and fertile valleys, and supply the back of rain, the cold of winter. Two great chains of the Rocky mountains or Cordilleras pass through the eastern portion of the territory from north to south, and lesser mountain-ranges diversify the west, rising to elevations of 12,000 feet. The climate is cold in the elevated regions, hot in the plains, but everywhere dry and healthy. Heavy rains fall in July and August, but the rest of the year is dry. The productions are wheat, maize, fruits, and tobacco, with abundant pasturage. There are numerous mines of gold, silver, copper, iron, and salt. Merchandise is transported from St. Louis and Texas in wagon or mule trains. The Indian population consists of 23,268 who sustain tribal relations, and 1309 out of these relations—total, 24,577. The tribes are the wild and predatory Navajoes, Apaches, Utahs, Camanches, etc., who possess large herds of horses, and make perpetual war upon the neighboring settlements. This territory was explored by the Spaniards in 1537, who opened missions, established missions, and made some progress in civilizing the natives. In 1846, Santa Fé, the capital, was taken by an American expedition under gen. Kearney. At the close of the war in 1848 New Mexico was ceded to the United States, and erected into a territory in 1850. White population in 1870, 90,289.

NEW MEXICO (state). Since this territory came into the possession of the United States by the treaty of Guadalupe Hidalgo, it has always been considered a region of promise both in respect to its physical conditions and its natural resources. In 1850 it was organized as a territory, and three years later the region south of the Gila river known as the Gadsden purchase was obtained through another treaty with Mexico and annexed. The territory then contained, besides the region within its present limits, the whole of Arizona and a portion of Colorado and Nevada. But in 1861 a tract of about 14,000 sq. m. east of the Rocky mountains, between the 37th and 38th parallel was annexed to Colorado; and in 1863 Arizona was set off. New Mexico is now divided into 13 counties and the government is established upon the ordinary model of territorial governments; that is, the executive power is administered by a governor and secretary, appointed by the president with the consent of the senate for four years, and by an auditor, treasurer, adjt. gen., and atty. gen. chosen by the territorial legislature for two years. The capital, Santa Fé, is next to St. Augustine, Fla., the oldest town in the United States. The population of the territory has been steadily increasing during the past ten years. Of the total population in 1870, 86,251 were natives and 5,620 of foreign birth, 47,135 males and 44,139 females. There were 21,449 families with an average of 4.28 persons to each, and 21,653 dwellings with an average of 4.36 to each. Until within the past six or seven years, however, the south and west portions of the territory have been subject to Indian incursions which have kept settlers back. Pop. '80, 118,430.

Like Colorado and Nevada, the chief inducements New Mexico offers to those already located within its boundary or to emigrants are its dry and healthful climate and the resources of its mines. In the southern part of the territory the temperature is mild, being seldom below the freezing point, and rarely rising to extreme heat, owing to the elevation of the surface. The sky is usually clear and the atmosphere so dry that meat can frequently be preserved a long while without salt. Iron and steel also rarely rust, though exposed continually day and night. Inflamations and typhoid fevers occasionally prevail in the winter season; but pulmonary diseases are rare and malaria does not exist. The mines of the precious metals, copper, lead, iron, and salt have never been so successfully worked as they might have been, had not the Indians molested their regions. These Indians, however, are now removed, and new mines now are being opened in many directions. The oldest mining districts are the Old and New Placers, Pinos Altos, Arroyo Hondo, Chimaron, Manganos and Moreno, tracts in the Organ mountains, and also in the Sierras Blanca, Carriza, and the Magdalena mountains. The most available of all these that contain gold are those of the New Placer district which are about 38 m. from Santa Fé. Silver is not now largely mined, but there are deposits of it at Pinos Altos and in the Magdalena mountains. Copper also is found in these regions, and one mine in the first named has yielded as high as 9,000 lbs. of metal a week. Lead occurs in the Pinos Altos mines, in the Organ mountains, and elsewhere. Iron and salt are abundant in several districts throughout the territory. The amount of gold from New Mexico deposited at the United States mints and assay offices to June, 1874, was $1,004,755.; of silver $239,574. In 1870
The census stated the number of gold mines to be 17, of which 12 were placer and 5 quartz; number of hands employed, 177; capital invested, $2,384,000; value of material used, $83,138; and the value of products, $343,250.

In agricultural products the territory is not particularly abundant; for with the exception of the valley lands in the immediate vicinity of its rivers and streams, the land is obliged to be irrigated artificially. The most important agricultural regions are the valleys of the Rio Grande and Rio Pecos, which are generally from one to four miles wide, though the former expands in places to 10 or 15 miles. In 1870 there were 4,480 farms and 143,000 acres of improved land. Among the products there were 338,960 bushels of wheat; 640,823 bushels of Indian corn; 67,600 of oats; 28,856 of peas and beans; 8,587 lbs. of tobacco; 684,930 lbs. of wool; and 12,912 lbs. of butter. The ordinary cereals all grow sufficiently well in the territory; but wheat, maize, pumpkins, onions, and beans afford the principal supplies of vegetable food. The land and the climate are especially suited for the cultivation of the apple, peach, melon, apricot, pomegranate, fig, and the grape. The European vine grows here in the open air, and the wine that is made from it is considered particularly rich. In 1870 there were manufactured 19,056 gallons. Stock raising, and particularly wool growing, however, have been for many years the chief occupations of the natives; and for these pursuits the mildness of the climate and the large tracts, where agriculture is not practicable, afford exceptional opportunities. Neither shelter nor hand-feeding is required for the flocks. The valleys, foot-hills, and table-lands are covered with nutritious grasses throughout the year, which provides abundant grazing. The estimated value of the live-stock in the year already mentioned was $2,380,157; and the stock consisted of 26,500 horses; 6,141 mules and asses; 16,417 milch cows, and a total of 186,301 neat cattle; 619,438 sheep; and 11,267 swine.

The number of manufacturing establishments of all kinds throughout the territory in 1870 was 182, which were chiefly flouring and grist mills and saw mills and quartz mills. They employed about 100 hands, and the estimated amount of capital invested was $1,450,763; amount of raw material used, $880,957; and the value of the annual product, $1,489,585. With the completion of the Atchison, Topeka, and Santa Fe railroad to Santa Fe and the Texas and Pacific railroad, which is expected to traverse the territory from e. to w., it is probable that every industry will greatly increase; and the manufacturers will undoubtedly prosper better than they have in the past. Gov. Axtell in his message submitted to the legislature in January, 1878, believed that the general condition of the territory was far more prosperous and promising than it had ever been before. At that period the territory was nearly free of debt and the taxation was about one cent. The total expenses the past two years had been $12,656.72; the total amount paid into the treasury from November 1875 to November 1877 was $118,628.36. Of this amount $33,395.65 was received for licenses and fines, and $84,642.31 for property taxes. This message also directed the attention of parents to the educational condition of the territory, which is low. A few schools were established as far back as 1822 by the Mexican authorities, but the system was never effective; and after the conquest by the United States no public schools were again established until 1872. Two years later 728 schools were reported in operation with 5,420 pupils enrolled. Only a few of these schools, however, are above the grade of primary schools. The number of church organizations is about 158, possessing property valued at $222,631. The denominations represented are Baptist, Methodist, Presbyterian, Protestant Episcopal, and Roman Catholic.

Of important events in the recent history of the territory, mention should be made of the completion in 1875 of the United States military telegraph from Santa Fe to Mesilla, and in 1876 from Mesilla to Tucson, Arizona. During the same year the Denver and Rio Grande railroad also was completed nearly to the territorial line at Trinidad, and direct telegraphic communication was extended to San Diego, Cal., and to El Paso, Mexico.

NEW MILFORD, a t. in Litchfield co., Conn., on the Housatonic river and railroad, 14 m. n. of Danbury, and about 40 m. s.w. of Hartford; pop. '80, 3,907. There are 5 churches, 2 banks, a weekly newspaper; and paper, boots, buttons, hats, and tobacco are manufactured. The village is well laid out, and the streets are shaded with fine elms and surround a handsome common. The place is to some extent a summer resort.

NEW ORLEANS, capital city and port of entry of Louisiana, on the left bank of the Mississippi river, 100 m. from its mouth, lat. 29° 58' n., long. 90° west. The city is built on the alluvial banks of the river, on ground lower than the high-water level, protected from inundations by the levees or embankments, which extend for hundreds of miles on both banks of the river. The streets descend from the river bank to the swamps, and the drainage is by canals which open into lake Pontchartrain, which is on a level with the gulf of Mexico. The city is long and narrow, extending about 6 m. along the river, on an inner and outer curve, giving it the shape of the letter S. The older portion, extending around the outer curve, gave it the name of "the Crescent City." New Orleans is the great port of transhipment for a large portion of the cotton crop of the southern American states, the sugar crop of Louisiana, and the produce of the vast region drained by the Mississippi and its tributaries. It commands 10,000 m. of steamboat navigation, and is the natural entrepot of one of the richest regions of the world. In the fiscal year
ended June 1874, the value of imports into New Orleans was 14,553,864 dollars; of exports, the value was 93,715,710 dollars. The sugar product in 1873 was 108,241,112 lbs., value 8,122,575 dollars. The custom-house is one of the largest buildings in America. The hotels, theaters, and public buildings are on a magnificent scale. There are a branch mint, 55 hospitals, infirmaries, and asylum, several colleges, Roman Catholic cathedral, 150 churches, 7 daily newspapers, cotton-presses, cotton and sugar warehouses, all the taverns for a vast commerce. Besides the great river, New Orleans has a railway connecting it with the north, east, and west. It is a beautiful, and, but for the very frequent visits of the yellow fever, a healthy city. The visitation of this dread epidemic in the lower Mississippi valley in 1878 was one of the most terrible on record. The soil is full of water, so that no excavations can be made. The largest buildings have no cellars below the surface; and in the cemeteries there are no graves, but the dead are placed in tombs, or "ovens," above ground. New Orleans was settled by the French in 1718; with Louisiana, it was transferred to Spain in 1763; and, in 1802, re-transferred to France, and sold, with a vast territory drained by the Mississippi and Missouri, by Napoleon I. to the United States in 1803. In 1815 it was successfully defended against a British army, under gen. Jackson. In 1820, Louisiana having been freed from the union, New Orleans became an important center of commercial and military operations, and was closely blockaded by a federal fleet. An expedition of gun-boats, under commander Farragut, forced the defenses near the mouth of the river. April 24, 1862; the city was compelled to surrender, and occupied by gen. Butler as military governor. In 1866, on its cession to the union, the population was about 8,000, mostly French and Spanish; in 1820 it had increased to 27,000; in 1860, to 105,823, and consisted of Americans, French creoles, Irish, etc.; in 1870 it was 191,418.

NEW ORLEANS (with), in magnitude and population, is the ninth city in the United States, and in the value of its exports and foreign commerce ranks next to New York. It comprises about 40 sq. m., one-half of which is closely inhabited, while the rest is barely redeemed from being a swamp. In general appearance it is a métange of French and American taste, most of the streets running parallel with the Mississippi river present an unbroken line from the lower to the upper limits of the city, a distance of 12 m.; and those at right angles to these extend from the river to the lake. Those in the newer portions of the city are wide, bordered with trees, and have an attractive appearance; and Canal street, the chief thoroughfare, has many handsome stores and private residences. There are 11 public parks and squares, 3 canals for commercial purposes, 10 or 12 for drainage, and 16 markets. Though the city is not notable as a whole for either the beauty or grandeur of its architecture, it has several public buildings that are conspicuous exceptions—the custom-house, the branch mint, the post-office, the city hall, and the St. Charles hotel. Besides these, mention should be made also of the state-house, the university buildings, the charity hospital, the marine hospital, and the Hôtel Dieu, as well as several churches, of which there are 142 in all. In 1861, when the city had attained its greatest commercial prosperity, it received and handled 3,255,448 bales of cotton, 4,900,000 lbs. of sugar. Since the war its business and prosperity have been much disturbed by political agitation, and by two or three severe visitations of the yellow fever. Nevertheless, during the years 1878-80 its export trade showed a fair increase, and its imports held a steady bulk, though showing a decline in valuation. The imports in 1877 were $11,310,990; in 1878, $8,723,751; in 1879, $8,259,606. The exports for the same years were $70,270,593; $71,936,388; $83,105,822. In consequence of recent navigational improvements, allowing ships of greater burden to come to its wharves, it is believed that the future commerce of New Orleans is to be greatly increased. In the line of manufactures the city can make little claim. Although in 1870 it contained 911 "manufacturing establishments," many of them were scarcely worthy of designation, being principally small manufactories of cotton-seed oil, syrup, and oil, soap, sugar refineries, distilleries, and breweries. Of the other business corporations at that time, there were 5 dry-dock companies and 42 insurance companies, 23 banking institutions, 5 tow-boat companies, and 42 custom-house warehouses. The administrative officers of the city are a mayor and 7 officers known as administrators, who hold their offices two years, together with a board of health, a city surveyor, city attorney, and school superintendent. The police are sort of a mounted state militia, rather than a metropolitan organization, and are under the control of the governor of the state. According to the census of 1870 the assessed value of the real and personal estate was $146,719,888; its true value, $155,925,187. The total taxation not national was $4,191,417. The public debt of the city was $26,500,000. The public schools, of which there were about 90, are under state control, although the city provides for their support. Other educational institutions are the university of Louisiana, the mechanical and agricultural college, the dental college, and the Jesuit college. Most of the French, Italian, Spanish, and Irish population is Roman Catholic; the American and German residents are chiefly Protestants. There are 36 Roman Catholic churches; 25 Baptist; 11 Protestant Episcopal; 5 Evangelical Protestant; 1 Greek; 3 Lutheran; 19 Methodist Episcopal; 11 Methodist; 12 Presbyterian; 1 Swedish; and 1 Unitarian, and 6 Hebrew synagogues. In conclusion it may be said, that although New Orleans is usually believed to be an unhealthy city to reside in, a care-
ful comparison of its vital statistics with those of other cities, not only in the United States but throughout the world, shows that on the whole it is not exceptionally unhealthy. Since the epidemic of 1874, vigorous sanitary improvements have been in progress. The temperature is rarely below the extreme; the average maximum for the year being 88.7° Fahr., the average minimum 51.8°, and the general average about 67°.

NEW PHILADELPHIA, a village in e. Ohio, on the Tuscarawas river, near the Ohio canal; pop. '70, 3,143. It is in Goshen township, 100 m. by rail s.e. of Cleveland, 24 m. s.w. of Canton, 98 m. n. of Marietta, and 100 m. w. of Pittsburgh. It is the c. terminus of the Cleveland and Pittsburgh railroad, and is a junction of the Cleveland Tuscarawas Valley and Wheeling, and the Marietta, Pittsburgh and Cleveland railroads. It is in the midst of the Tuscarawas bituminous coal and iron region, and the country abounds in coal and iron ore. It has 7 churches, 4 banks, one of them national, good public schools, and 3 newspapers. Its leading industries are the manufacture of woolen goods, agricultural machines, lumber, flour, salt, matches, carriages, paper, boilers, etc.

NEW PHILIPPINES. See Caroline Islands.

NEWPORT, a parliamentary and municipal borough, market-town, and river-port of England, chief town of the Isle of Wight, and situated near the center of that island, on the Medina, which is navigable up to this point. St. Thomas's church, founded in 1854, on the site of an ancient structure built in the reign of Henry III., is a handsome edifice, and contains a monument erected by her majesty in memory of the princess Elizabeth, daughter of Charles I., who died at Carisbrooke castle, Sept. 8, 1609. Among the educational establishments of Newport is the free grammar school, in which frequent meetings and negotiations between Charles I. and the parliamentary commissioners took place. About a mile of Newport is Carisbrooke castle, where the king was confined under the guardianship of col. Hammond for twelve months (1647-1648). There are several important institutions in the vicinity, as the Albany barracks, the house of industry, and the Parkhurst prison for juvenile convicts. Manufactures of lace are carried on to some extent. Vessels of considerable tonnage can ascend to the quay at high tides. Pop. '71, 7,956.

NEWPORT, a thriving market-town, parliamentary and municipal borough, and river-port of England, in the co. of Monmouth, and 24 m. s.w. of the town of that name, on the Usk, and about 4 m. from the mouth of that river. It was anciently the port of the city of Caerleon, about 3 m. further up the river; but during the present century, it has become a shipping port of considerable importance, being the outlet of the produce of the extensive collieries, and iron and tin works of the neighborhood. It possesses a number of recently-erected public buildings, has spacious docks, manufactures nails and spikes extensively, exports iron and coal largely, and carries on an excellent general trade. In 1875, 10,243 vessels, of 1,100,891 tons, entered and cleared the port. Newport unites with Monmouth and Usk in sending a member to parliament. The remains of Newport castle are now used as a brewery. Pop. '71, 27,092.

NEWPORT, a co. in s.e. Rhode Island, having the state line of Massachusetts for its e. boundary, and Acaquast river flowing from Watuppa pond to the sea. It consists of several islands, Rhode Island, Canonicet, Coat, and others of less dimensions, besides the portion of land separated from Rhode Island by the e. passage of Narragansett bay; 100 sq. m.; pop. '80, 24,180-19,539 of American birth, 1129 colored. It is intersected by the Old Colony and Newport railroad, terminating at Newport. Prudence island is included in its territory, and Block island lying s.w. in the ocean. Its surface is much diversified by hill, valley, and stream; and is noted for pleasing scenery and beautiful drives. It contains beds of anthracite coal. Its soil is fertile and produces grain, great quantities of apples and other fruit, dairy products, and wool. Clams are dug along the shore, a lucrative business in the summer. Live stock is extensively raised. It contains Fort Adams and the fashionable summer resort of Newport. Its leading industries include the manufacture of flour, fish oil, copper ware, cotton goods, cotton and woolen machinery, carriages, upholstery, and shipping. Co. seat, Newport.

NEWPORT, a city of Kentucky, United States, on the Ohio river, opposite Cincinnati, and on the e. side of the mouth of the Licking river, opposite Covington. It contains a U. S. arsenal, and several iron foundries and rolling mills. Pop. '70, 13,087.

NEWPORT (ante), the co. seat of Campbell co., on the Kentucky Central, and Louisville, Cincinnati and Lexington railroads; pop. '80, 20,438. It is built on a high plain; the streets are regularly laid out, and ornamented with shade trees. A bridge over the Licking river connects it with Covington. It is connected by street railroads with Cincinnati, Covington, Dayton, and Bellevue. There are many manufactories, foundries, and rolling mills. It has a number of churches, public schools, a U. S. arsenal, banks, a tri-weekly and a weekly newspaper.

NEWPORT, a city and port of entry, and semi-capital of Rhode Island, United States, on the w. shore of the island of Rhode Island in Narragansett bay, 5 m. from the ocean. Lat. 41° 29' n., long. 71° 19' 12'" west. It has a deep, excellent harbor, defended by forts Adams and Wolcott. It has a state-house, custom-house, market, the Redwood library, many large hotels, and elegant villas; it is renowned for fine scenery and sea-bathing; and one of the most fashionable watering-places in America. The town also contains
cotton and other manufactures. It was settled, in 1638, by 17 adherents of Roger Williams, who followed him in his banishment from Massachusetts. In 1724 Newport had 135 sailing and steam vessels, of 8,660 tons. It was for a time the residence of bishop Berkeley. Pop. '70, 12,552.

NEWPORT (ann) is defended by fort Adams, 3½ m. distant, the third strongest fortress in the United States. The state house fronting Washington square, through which Washington passed to meet Rochambeau, was built in 1742. The Jewish synagogue on Touro street, built in 1762, was the first in this country. Judah Toure, a son of one of its pastors, gave to the city Toure park, on which stands the "Round Tower" or "Old Stone Mill," a circular stone tower with round arches. A Norse origin has been ascribed to it, but Palfrey, in his History of New England, has pretty conclusively shown that it was an old colonial windmill. Near the old mill is a statue of commodore M. C. Perry. Trinity church, on Church st., has an organ presented by Berkeley. On Clarke st. are the central Baptist church, founded in 1736, the armory of the Newport artillery company, formed in 1735, and the Vernon house, Rochambeau's headquarters in 1780. Franklin's printing-press, imported in 1729, is still in the office of the Weekly Mercury, founded in 1738. The fashionable drive of Newport is Bellevue ave., a broad street 2 m. long. There is excellent surf bathing off the first beach; the second, or Sachuest beach, is a favorite riding course. Old Newport, with many colonial mansions and narrow streets, is almost surrounded by the new town. Aside from the Bathing, boatng, and driving facilities of Newport, its chief attraction is its equable climate. The city is connected with Boston by the Old Colony and Newport railroad, and with New York by the Shore line, 67 m. from Boston, 180 m. from New York; pop. '35,633. The daily steamers of the Fall River line to New York touch here. Steamers run daily to Providence and Rocky Point. Newport harbor was visited by Verazzano in the 16th c., and by several subsequent English explorers. It was settled in 1639 by a party of colonists, adherents of Roger Williams, under William Coddington. Its relative importance a century ago was much greater than now. Its population in 1774 was 12,000, and its commerce next to Boston, and much larger than that of New York. It was explored in 1776 by the British, who held it till 1779. The next year a French fleet having on board the count de Rochambeau and 6,000 French soldiers, arrived at Newport. President Adams founded a naval station there, and the torpedo division of the U. S. naval service, with a school for the instruction of young officers in the torpedo service, is situated on Goat island. Among the historical names of Newport are dem Berkeley, who came to Newport in 1729 to found a university for the conversion of the Indians, built a house called "Whitehall," about 3 m. from the city, and returned to England in 1731, dividing his Newport estate between Harvard and Yale colleges; Dr. Samuel Hopkins and Ezra Stiles, the latter afterwards president of Yale; and William Ellery Channing, who was born 1780, in the Channing mansion, built 1739, on Thames street.

NEWPORT, Christopher, b. England, about 1565; commander of the vessels which brought over the Jamestown colony in 1606, and a member of the council for the government of that colony. Returning to England after a visit with capt. John Smith to Powhatan, he brought over 120 additional emigrants in 1608. Near Richmond he found some yellow mica, with which he loaded his vessels, supposing it to be gold. He came over with lord Delaware in 1610, was wrecked at the Bermudas, and returned to England in 1612. He wrote Discoveries in America.

NEWPORT PAGNELL, a small market town in England, in Buckinghamshire, on the Ouse, 50 m. n.w. of London. Lace is manufactured extensively, and there is a good trade in corn, coal, and timber. Pop. '71, 3,653.

NEW PROVIDENCE, one of the Bahama islands, between Eleuthera and Andros, in lat. 25° 5' n.; long. 21° 77' w., 17 m. long by about 7 wide; pop. 9,000. The surface is broken with hills, but some parts are fertile. Nassau, the capital of the island, is on the n. coast. New Providence was originally an English colony, founded in 1629, was twice captured by Spain, and definitely given back to England by the peace of 1783.

NEW RED SANDSTONE. A large series of reddish colored loams, shales, and sandstones, occurring between the carboniferous rocks and the lias, were grouped together under this name, in contradistinction to the old red sandstone group, which lies below the coal-measures, and has a similar mineral structure. Conybeare and Buckland proposed the title Poikilitie (Gr. variegated) for the same strata, because some of the most characteristic beds are variegated with spots and streaks of light-blue, green, and buff on a red base. In the progress of geology, however, it was found that two very distinct periods were included under these names; and the contained fossils of each group were found to be so remarkably different that the one period was referred to the paleozoic series, under the name of permian (q.v.), while the other, known as the trias (q.v.), was determined to belong to the secondary series.

NEW RICHMOND, a village in s. Ohio, on the e. bank of the Ohio river; 29 m. s.e. of Cincinnati; pop. '70, 2,516. It is in Ohio township, Clermont co., which is the chief town in respect to population and active trade in the county. It has 8 churches, good public schools, a newspaper, a national bank, a loan and fund association, and a town-
hall. Its leading industries are the manufacture of chairs and woolen goods; and it has steam, saw, and grist mills, distilleries, tobacco factories, foundries, and breweries.

NEW ROCHELLE, a t. in s.e. New York, on Long Island sound, at the junction of the Harlem River branch railroad with the New York, New, and Hartford; 18 m. from New York; pop. 70, 4,098. It contains many beautiful residences and is a favorite resort from the cities of the vicinity. It has 7 churches, good schools, a savings bank, 5 hotels, 2 weekly newspapers, a variety of stores, and an establishment for the manufacture of scales.

NEW ROSS, a seaport and parliamentary borough of Ireland, situated on the estuary of the Barrow, partly in the county of Kilkenny, but chiefly in that of Wexford, distant 84 m. s.s.w. from Dublin. It is an ancient town, having been surrounded by walls about the middle of the 13th century. Before the union it returned two members to parliament, of whom one was withdrawn by the act of union. It is now a place of considerable commerce, and the modern part of the town on the Wexford side is built with great regularity and taste. On the Kilkenny side is a struggling suburb called Rosbercon, connected with New Ross by a metal bridge, erected at a cost of £50,137, which has a swivel pillar in the center, to allow vessels to pass; formerly the connection was by a wooden bridge, nearly 700 feet in length. The port is approachable at spring-tides by ships of 800 tons, and at all times by vessels of 600 tons; and there is a communication by river and canal with Dublin, and also with Limerick. The town is managed by a board of 21 commissioners. It possesses no manufactures of any importance. Pop. '71, 6,772.

NEW RUSSIA. See Russia.

NEW RUTLAND, a t. in n. Illinois, in the extreme s.e. of La Salle co.; pop. 70, about 800. It is on the Illinois Central railroad, in the township of Groveland, and its railway station is called Rutland. It has 5 churches, excellent schools, several hotels, and a grain elevator. Its leading industries are the manufacture of harness, furniture, flour, and wagons; and coal is mined in the vicinity.

NEWRY, a seaport and parliamentary borough, situated partly in the county of Armagh, but principally in the county of Down, Ireland, distant from Dublin 63 m. n., and from Belfast 33 m. s.s.w., with both which places it is connected by a branch-railway communicating with the Dublin and Belfast Junction railway. The town is nearly joined with the English invasion, having grown up around a monastery founded in 1183, and a castle subsequently erected by De Courcy. This castle was the scene of several struggles; and in most of the civil wars of Ulster, Newry suffered severely. It was incorporated as a borough, with a corporation and two members of parliament, by James 1. Since the union, it returns but one member, and the corporation having been abolished by the Irish municipal reform act, the affairs of the town are now administered by 21 commissioners. It is traversed by a river of the same name, which falls into Carlingford lough, and by a canal, by which the navigation is prolonged to lough Neagh, a distance of 52 miles. A commission has been appointed for improving Carlingford lough and to remove the bar; the estimated cost being £90,000. The town is handsomely and compactly built. The quays are lined with spacious warehouses, and there are several mills, tanyards, coach and car manufactories, and iron foundries. Extensive waterworks have recently been constructed. Linen, cotton, and iron manufactures are carried on. The population of the town is nearly 1,000. The town is also connected by rail with Glasgow from Warrendale, a port 5 m. distant on Carlingford lough; and the Newry and Greenvale railway, connecting the Newry and Armagh line with Carlingford lough, is in progress. Pop. '71, 14,158.

NEW SCHOOL AND OLD SCHOOL PRESBYTERIANS, formerly the names of two great parties, and 1838-70, of the two principal divisions in the Presbyterian church of the United States. The parties were produced, and the rending of the church was caused chiefly by three forces having unequal degrees of strength, but all tending to one result. These may be here named without being fully discussed:

1. Differences in theological views. The Presbyterian church in the United States was, at the beginning, composed in a great degree of emigrants from Scotland and Ireland, and in its growth continued to receive fresh accessions from those lands. These brought with them and long retained theological opinions and practices which, while they may be spoken of in general terms as Calvinistic, had manifest traits peculiar to themselves. Yet they did not escape entirely the modifications to which opinions of every kind have been subjected by the isolation, conflicts, and liberty of discussion and action, that have given character to American government, churches, and institutions of every kind. During this time, theology and practical religion were among the chief factors in developing the New England colonies and states. Doctrines furnished themes for thought and discussion among ministers and people in a degree scarcely equaled, unless among the early Greek Christians and the reformers of the 16th century. No wonder, therefore, that important modifications were produced and embraced. And as many ministers and other members of churches went from New England to the other colonies, and afterward to the new states, these modifications entered into Presbyterian churches, accelerating and increasing the changes there. Many too, from these churches, obtained
their education in New England schools and colleges, a part of them becoming Christians there. And over theological seminary, preceding that at Princeton by 5 years, instructed a portion of Presbyterian students as well as many from New England who became Presbyterian ministers. This brief statement may show how it was that in the American Presbyterian church, there arose the terms, first of "new side," and "old side," with the division they occasioned, and afterward of "new school" and "old school."

3. Differences of opinion concerning church polity and extension. The early churches of New England were independent and congregational in government, yet were connected together by mutual conference, and, some of them, by associations gradually formed, and having different degrees of strength. But when Congregational ministers and members removed to other colonies, they generally, until comparatively recent years, became pastors and members of Presbyterian churches already established, or united with Presbyterians in forming new ones. The churches of Newark and vicinity, founded by a Connecticut colony, were at first Congregational, but soon became Presbyterian. In 1801 a plan of union was unanimously proposed by the Presbyterian general assembly to the general association of Connecticut, by whom it was unanimously adopted, with a view on both sides "to prevent alienation, and promote union and harmony in those new settlements which are composed of inhabitants from those bodies." This plan was not only adopted unanimously by the general assembly, but was also for a long time cordially approved by the most eminent ministers in the Presbyterian church. Under the operation of it, and of union with Congregationalists generally, hundreds of the best Presbyterian churches in the land were formed and built up. Yet the polity resulting from the union, like the doctrine embraced, was a Presbyterianism somewhat modified in its usages and forms. This modification entered gradually into the forces which produced the new school and the old school parties. Its chief power, however, was in an element more general than any difference between Presbyterians and Congregationalists alone could have supplied. This was the use of "voluntary societies" in benevolent and missionary work. The country passed through a period, during which many such agencies were formed, chiefly from the necessity for united effort, and partly from want of experience in the work. But as experience and denominational strength increased, conflict between voluntary and more strictly church agencies arose. This conflict entered largely into the development of party spirit between new school and old school Presbyterians.

4. Differences of opinion and practice concerning slavery and concerning the manner in which it should be treated by Christian churches. The origin and growth of this difference need not here be traced. It is sufficient to say that it was by far the most powerful of the influences which intensified the party spirit; and that as the region where slavery most prevailed was, because of it, the less subjected to the modifying influences already described, it came to pass that the modified doctrine and polity were found mainly united with opposition to slavery, forming generally new school Presbyterians; and the unmodified doctrine and polity were, in a like degree, united with adherence to slavery, or with silence concerning it, forming generally old school Presbyterians. Without the influence, direct and indirect, of slavery, neither of the other causes, nor both of them combined, would have been strong enough to divide the Presbyterian church; probably not to have caused even a serious attempt to divide it. Reasons for this opinion are found in the fact that after the division the new school part of the church safely outgrew the use of voluntary societies; that just before the reunion the old school portion accepted, as substantially orthodox, the declaration of doctrine made by the new school portion just after the division; that slavery, without auxiliary causes, divided the strong organization of the Methodist Episcopal church; that in the spring of 1861, it divided the old school portion of the church when in "a state of almost unprecedented doctrinal homogeneity;" that it was prevented from rending the national Union itself, only by one of the mightiest conflicts the world has ever known; and that when its power was removed, the process of uniting new school and old school Presbyterians at once began. At the reunion, agreed to in 1869, and organically effected in 1870, some of the chief statistics were:

Total amount contributed by both divisions during the year 1869-70, for the support and extension of religion was $8,440,121.

NEW SHOREHAM. See Shoreham.

NEW SIBERIA, a group of islands in the Arctic ocean, lying n.n.e. of the mouth of the river Lena, in Eastern Siberia. Lat. 73° 20' to 76° 12' n., long. 135° 20' to 150° 20' e.; area, 20,480 sq. miles. The principal are Kotchinoi (the largest), Liakov, Fadlevskoi, and New Siberia. The coasts are in general rocky, and are covered all the year round with snow.
The islands are very important, on account of the immense multitude of bones and teeth of mammoths, rhinoceroses, buffaloes, etc., which are found in the soil. They are now uninhabited, but there are traces of former inhabitants. Neither bush nor tree is to be seen anywhere.

NEW SOUTH WALES, a British colony in the s.e. of Australia. It originally comprised all the Australian settlements e. of the 155th meridian, but the formation, successively, of the separate colonies of South Australia (1836), Victoria (1851), and Queensland (1859) has reduced it to more moderate dimensions. It is now bounded on the n. by a line which, beginning at Point Danger, in lat. 28° 8' s., follows several lines of heights across the Dividing Range till it meets the 30th parallel, which forms the rest of the boundary to the s.; on the n. w. by the 141st meridian; on the e. by the Pacific ocean; and the line separating it from Victoria on the s. runs from Cape Howe, at the s.e. of the island, n.w. to the source of the Murray river, and then along that stream, in a direction w. by n., to the western boundary of the two colonies. Area, 323,437 sq. m., or somewhat less than four times that of the island of Great Britain; pop. 71, 563,981, of whom 275,551 were males, and 228,430 females; 76, 629,776. The more general physical character of the country is described under AUSTRALIA. Within the colony of New South Wales the mountain range, which girdles nearly the whole island, is most continuous and elevated, and is known as the Dividing Range. The section of this mountain system on the southern boundary of the colony, called the Australian Alps, rises in mount Kosciusko to 7,308 feet. From this the range extends northward, the water-shed being from 50 to 150 m. distant from the e. coast, and thus divides the colony into two slopes, with two distinct water-systems. The rivers on the eastern side descend with great rapidity, and in oblique tortuous courses, their channels often forming deep ravines. Many of them are navigable in their lower course for sea-going steamers. The principal are the Richmond, Clarence, McLeay, Manning, Hunter, Hawkesbury, and Shoalhaven. The Hunter river, about 60 m. n. of Sydney, opens up one of the most fertile and delightful districts in the country. The Dividing Range, which, opposite to Sydney, is called the Blue mountains, being singularly abrupt and rugged, and full of frightful chasms, long presented an impenetrable barrier to the west, and kept the colonists shut in between it and the sea, and utterly ignorant of what lay beyond. At last, in 1813, when the cattle were likely to perish in one of those long droughts that appear to visit this country at intervals of a dozen years, three adventurous individuals scaled the formidable barrier, and discovered those downs on the western slope which now form the great sheep-range of Australia. A practicable line of road was immediately constructed by convict labor, and the tide of occupation entered on the new and limitless expanse. The mountains descend into the river, the w. side of the watershed within the colony, all converge and empty their waters into the sea through one channel within the colony of South Australia. The southern and main branch of this great river-system is the Murray. The other great trunks of the system are the Murrumbidgee, which is navigable; the Lachlan, at times reduced to a string of ponds; and the Darling. The Macquarie, passing through the rich district of Bathurst (q.v.), is a large tributary of the Darling, but it reaches it only in the rainy seasons. The coast-line from cape Howe to Point Danger is upward of 700 m. long, and presents numerous good harbors formed by the estuaries of the rivers. Owing to the great extent of the colony, stretching as it does over eleven degrees of latitude, the climate is very various. In the northern districts, which are the warmest, the climate is tropical, the summer heat occasionally rising in inland districts to 120\(^o\), while on the high table-lands, weeks of severe frost are sometimes experienced. At Sydney, the mean temperature of the year is about 67\(^o\). The mean heat of summer, which lasts here from the beginning of December to the end of February, is about 80\(^o\), but it is much modified on the coast by the refreshing breeze. The annual fall of rain is about 50 inches. Rain sometimes descends in continuous torrents, and causes the rivers to rise to an extraordinary height. Sometimes the rains almost fall for two or three years in succession (see AUSTRALIA). The coast, for 300 m. from the northern boundary, is adapted for growing cotton, and in 1868, when a large quantity was grown, the average produce was 180 lbs. per acre; but cotton-planting seems now to have been abandoned. Further s., the climate is more temperate, and is fitted to produce all the grain products of Europe. Immense tracts of land, admirably adapted for agriculture, occur in the south-western interior; while in the s.e. coast districts, the soil is celebrated for its richness and fertility. In the n., the cotton and tobacco plants, the vine, and sugar-cane are grown, and pine-apples, bananas, guavas, lemons, citrons and other tropical fruits are produced. In the cooler regions of the s., peaches, apricots, nectarines, oranges, grapes, pears, pomegranates, melons, and all the British fruits are grown, and sometimes in such abundance that the pigs are fed with them. Wheat, barley, oats, maize, and all the cereals and vegetables of Europe are also grown. Agriculture is thus increasing in importance, though the predominating interest is still pastoral. In 1875-76, there were 36,984 freeholders and leaseholders occupying 13, 525,497 acres of land, of which 451,139 acres were under cultivation, 7,771,068 acres inclosed but not cultivated, and the remainder (5,303,290 acres) not inclosed. The largest crops were—wheat (133,610 acres) and maize (117,582 acres). The other crops included oats, barley, rye, potatoes, millet, etc. Considerable attention has been
bestowed on the cultivation of the vine and the manufacture of wine. The produce in 1775–76 was 831,749 gallons, of wine and 2,748 gallons, brandy, besides 768 tons of grapes.

The great produce of the colony is wool, the exports in 1815 amounting to $7,544,280 pounds, valued at $5,651,645. Sheep-farming requires a large capital, together with skill and experience; and the sheep-farmers or squatters form the territorial aristocracy of the colony. All the best pasturing land has long been taken up and rented (for periods of 10 to 15 years) from the Crown under certain conditions. Stations, or the right of grazing, with the stock on them, are continually advertised for sale; the price of a station is according to the number of cattle or sheep on it. The question of the rent that the "squatters" should pay (which used to be about $10), and of the tenure by which the pasture-lands should be held, was long a source of agitation and bitterness in the colony. They now pay about a furthering a year for each sheep the run can support.

According to the present regulations, arable lands are disposed of by two distinct systems of sale—one, to the highest bidder at auction in unlimited quantities; the other, at a fixed price in limited quantities. By this last, known in the colony as "free selection before survey," the intending cultivator can first select for himself, and then secure in fee-simple a quantity not less than 10, and not more than 200 acres, at the rate of 28s. per acre, on condition of residing on his farm, improving a portion of it, and not subletting it.

The coal fields of New South Wales are extensive, and the seams of great thickness. In 1875, 1,253,475 tons, valued at £755,133, were raised. Iron, lead, copper, and oil-shale are abundant. Gold was discovered here in May, 1851, and in that year gold was exported to the amount of £468,336. This amount was increased to £2,660,916 in 1852, but subsequently, owing to the discovery of the richer diggings of Victoria, good-mining in this colony began to languish. Since 1857, however, the annual amounts found and exported have been steadily increasing; that for 1869 being £24,382 oz., valued at £885,749; and in 1875 the value exported was £2,094,505, nearly all coin. In 1875 there were in the colony 32,382,892 sheep, 2,856,699 cattle, and 316,691 horses. In 1871 the revenue was £4,179,840; the expenditure £4,179,840; in 1875 the revenue amounted to £4,129,363, and the expenditure to £3,449,622. The exports in 1875 amounted to £138,671,590, comprising barley, oats, potatoes, live stock, preserved meat, leather, wool, tallow, coal, gold-dust, and sovereigns; the imports, consisting largely of articles for food and clothing, etc., were £123,490,200. The Sydney branch of the royal mint was instituted in 1855, and issues large quantities of gold in sovereigns and half-sovereigns. There were in 1876 about 500 m. of railway already open in the colony, while about 200 m. additional were in course of construction. There is telegraphic communication between all the important places in the colony, and also with other colonies; length of wire in 1876, 8,012 miles. New South Wales is self-governed, with a governor appointed by the queen, a responsible ministry, a legislative council nominated by the crown, and a house of assembly elected by permanent residents. As regards religion, all sects are on a footing of equality. On Jan. 1, 1876, there were 10,898 regular places of worship, affording accommodation to 57,000 Episcopalians, 50,000 Roman Catholics, 24,000 Presbyterians, 37,000 Methodists, 24,000 Baptists, and 18,000 others. The number of children sent to school, as stated in the returns of the census for the year 1875, is 104,544; and the number of private schools is 544. The total number of children attending the public schools is 133,000. For the higher education, see Sydney. The capital is Sydney, with a pop. of 151,494; and the other chief towns are Parramatta, Bathurst (q.v.), Goulburn, Maitland, Newcastle, Grafton, and Armidale, with populations ranging from 3,000 to 17,000.

New South Wales took its origin in a penal establishment, formed by the British government in 1788 at Port Jackson, near Botany Bay (lat. 31°). The prisoners, after their period of servitude, or on being pardoned, became settlers, and obtained grants of land; and these "emancipists" and their descendants, together with free enfranchised convicts, constitute the present inhabitants. Transportation to New South Wales ceased in 1840, and up to that date the total number of convicts sent thither amounted to 60,700, of whom only 8,700 were women. They were assigned as bond-servants to the free settlers, who were obliged to maintain them with a certain portion of their wages. In 1833 there were 23,000 free males and 13,500 free females, to 22,000 male and 2,700 female convicts; and of the free population, above 16,000 were emancipists. The following table shows the recent rate of increase in the population:

The inerease of population in Sydney within the past ten or twenty years has been over 33.5 per cent; and in the suburban districts it has been about 60 per cent.

The Newspaper, a periodical publication printed and distributed for the circulation of news. From the broad-sheet relating the most momentous intelligence without comment or interference, the newspaper has gradually grown up into a powerful political as well as social engine, diffusing information on all subjects of interest, circulating advertisements, and acting on the public mind, in times of excitement, to an extent that has led it to be called a fourth estate of the realm.
The earliest approach to the newspaper is to be found in the *Acta Diurna*, or *Acta Publica*, of ancient Rome, an official gazette, which in the later times of the republic, and during the empire, appeared daily under sanction of the government. The contents of these *Acta* consisted of an enumeration of the births and deaths in Rome, an account of the money paid into the treasury, and everything relating to the supply of corn; extracts from the *Acta Forcissae*, including the edicts of magistrates, the testimonies of distinguished men, reports of trials, with the names of the acquitted and condemned, a list of the magistrates who were elected; extracts from the *Acta Senatorii*, an account of public affairs and foreign wars, of the births, deaths, festivals, and movements of the imperial family; and generally news relating to public buildings, funerals, games, fires, sacrifices, and miracles, as well as amatory stories. The *Acta* seem to have been drawn up under the superintendence of censors, questors, and other magistrates, by officers called *octaviarii*, assisted by clerks and notaries; and their publication consisted in posting them in some public place in the city, where they could be read by any one who pleased. They continued to be issued until the downfall of the western empire, but there seems never to have been anything corresponding to them at Constantinople.

The beginnings of the newspaper of modern Europe are traceable to Germany and to Venice. Soon after the invention of printing, in the latter half of the 15th c., small news-sheets, called *Relationen* and the *Nuret Zeitung*, appeared in Augsburg, Vienna, Ratibon, and Nürnberg, generally in the form of a letter. The extant numbers contain, among other matters, accounts of the discovery of America, of the conquests of the Turks, of the French and Austrian war in Italy, with such local occurrences as executions, inundations, earthquakes, burnings of witches, and child-murders committed by the Jews. More important, perhaps, were the official *Notizie Scritte*, first issued by the Venetian government in the 16th c., containing accounts of the wars carried on by the republic, and other events of general interest. At first they were not printed, but were to be seen in various public places on payment of a small coin, called a *gazeta*, whence the name "Gazette." After they were allowed by the government to be printed, they obtained a wide circulation over the whole of Europe.

The earliest English newspaper, or news-letters, belong to the reign of James I., and were printed in the form of small quarto pamphlets. Some copies of a sheet, called the *English Mercury*, purporting to be published by authority of queen Elizabeth in 1588, the period of the Spanish Armada, have been proved by Mr. Watts of the British museum to be literary forgeries, executed about 1566. The first English newspapers appeared at occasional and irregular intervals—the earliest of them, so far as ascertained, is entitled *News out of Holland*, and was published for M. Newbery in 1619. In 1622 these occasional pamphlets were converted into the first printed newspaper, entitled *The Certaine News of the Present Week*, edited by Nathaniel Butter. About the same time appeared the *London Weekly Courant*. A large number of publications, hardly deserving the name of newspapers, were circulated during the civil war, with such names as *England's Memorable Accidents*, *The Kingdom's Intelligencer*, *Mercurius Aureus*, *The Sects Intelligencer*, *The Sects Doce*, *The Parish News*, *The Secret Diurna*, *The sects Duce*, *The Parliament Kitte*, *The Secret Orel*, *Mercurius Master*, *Mercurius Democritus*, *Mercurius Acherontiacus*, or *News from Hell*, etc. The arrangement of the news is poor in the extreme, and what few comments there are, are of the most virulent description. The long parliament subjected the newspaper press to a censorship, which became more strict under Charles II. The first English newspaper which could properly be considered a vehicle of general information, was the *Public Intelligencer*, established by sir Roger L'Estrange in 1663; it was dropped on the appearance of *The London Gazette*, the first number of which was published Nov. 7, 1665, at Oxford, where the court was residing in consequence of the plague being then in London. A second paper, called *The Observer*, was afterwards started by L'Estrange, who, in 1680, exercised his authority as licensor of the press by issuing a proclamation "for suppressing the printing and publishing of unfounded news-books and pamphlets of news." Small as was the sheet, a difficulty often arose how to fill it. One publisher was in the way of supplying the dearth of news by passing from the Bible into the *Acta Senatus*, and another fancied that "he should have left that any gentleman may write his own private business."

Up to the reign of queen Anne few of the newspapers appeared oftener than once a week. From the interest excited by Marlborough's victories arose a demand for more frequent intelligence, and besides 17 newspapers published three times a week, the *Daily Courant*, established in 1709, was issued every day except Sunday. Of the more noted London newspapers, the *London Daily Post and General Advertiser* was established in 1726, and in 1732 became the *Public Advertiser*; a celebrity attaches to it from having been the medium in which "Junius's Letters" first appeared. The *St. James's Chronicle* arose from an amalgamation of two papers, the *St. James's Post* and *St. James's Evening Post*, both which began in 1715. The *North Briton*, edited by Wilkes, first appeared in 1762. The *Morning Chronicle*, discontinued in 1802, dates from 1770; the *Morning Post*, from 1772; the now defunct *Morning Herald*, from 1781; the *Times* first appeared in 1788, as a continuation of the *London Daily Universal Register*, established three years earlier.

During the reign of George III. prosecutions were rife against newspaper writers and
editors; their result, generally, was to give a greatly increased currency to the doctrines assailed, and to confer a fictitious importance on the traders in politics, by whom many of the journals were conducted. The first attempt at parliamentary reporting was resented by the house of commons as a breach of privilege, but the resolutions and the imprisonments of 1771 all ended in the tacit concession of publicity of discussion which has ever since prevailed.

The newspapers of Great Britain have, within the present century, greatly increased in size and improved in literary character. In both respects they are far in advance of the journals of any other country. Each number of the Times now consists in general of 16 pages, occasionally 24, and contains upwards of 5,000 advertisements. The success of the Times is mainly due to the enterprise of its original promoter, Mr. Walter, who first introduced various improvements in the art of printing, and made a strong effort to secure the best literary talent attainable in all departments of his journal. One of the most notable incidents in the history of the Times, was the exposure, through means of its Paris correspondent, of a gigantic scheme of forgery, planned in France in 1840—a scheme which contemplated the almost simultaneous presentation, at the chief banking-houses of the continent, of forged letters of credit from Glyn & Co. The failure of the conspiracy was mainly due to the exertions made by the Times. One of the parties implicated, brought an action for libel against the printer, and obtained a verdict of one farthing damages. A public subscription was raised to defray the expenses incurred in defending the action; when the proprietors of the Times, declining personally to accept the sum subscribed, invested it in two Times scholarships in connection with Cambridge University and the city of London, for the benefit of pupils proceeding thence to Oxford or Cambridge.

The editing of one of the leading London newspapers involves an immense daily expense, and the co-operation of a number of talented writers. The principal editor, as representative of the proprietors, has the whole oversight and responsibility intrusted to him. He occasionally furnishes the leading article, but it is more frequently composed by one of a staff of literary contributors, who are bound on the shortest notice to write on any subject which the editor may assign. The leader is in form a relic of the time when the newspaper was the news-letter; it is its professed object to analyze, condense, and explain public transactions, to scrutinize what is doubtful or suspicious in the conduct of public men, and to expose sophistry and imposture. Under the editor are various sub-editors, having the superintendence respectively of the London, the provincial, the foreign, the literary, the industrial, and other departments. The commercial article is furnished every evening by a contributor in the city. There are 12 to 16 parliamentary short-hand reporters, who are continually relieving one another, besides reporters attached to the courts of law, and correspondents who furnish accounts of public meetings and local news of various kinds. The foreign intelligence, a most important department in the great London journals, is furnished by correspondents in all parts of the world, some of them, particularly those employed in time of war, being men of very high reputation in the literary world.

A stamp-duty on newspaper was first imposed in 1713 by 10 Anne, c. 19, amounting to one halfpenny on "half a sheet or less," and one penny "if larger than a half a sheet, and not exceeding a whole sheet. The duty was raised 3d. by 30 Geo. III. c. 19; another halfpenny was added by 16 Geo. III. c. 34; still another by 29 Geo. III. c. 50; and a further addition of 1d. was made by 37 Geo. III. c. 50, amounting to 4d. in all. And 6 Geo. IV. c. 26, reduced the stamp-duty to 1d., with the addition of 6d. or 1d., when the sheet contained upwards of 1550, or of 2,296 square inches on each side. An additional 4d. was chargeable on a supplement. By 18 and 19 Vict. c. 27, passed in 1855, the newspaper stamp was abolished, a change which occasioned an immense increase in the number of newspapers and diminution of their price, though many of the cheap papers then started were of very brief duration. The repeal of the paper-duty, which took effect on Oct. 1, 1861, also added, though to a much less considerable extent, to the number and cheapness of newspapers. The number of stamps issued on British newspapers was 7,500,000 in 1755, 16,000,000 in 1800, and 65,741,371 in 1850.

In 1843 the number of newspapers published in London was 79; in 1877 it was about 320. Nine of these are daily papers, 6 of them published in the evening, and 2 out of the 6 mere reprints of the morning papers, with what news had been received during the day. Of these, the most influential for 40 years back has been the Times, established in 1788, of which nearly 70,000 copies are printed daily, and its circulation has been larger on occasions of public interest. It professes independence in politics. The Daily News, Pall Mall Gazette (an evening paper), Daily Telegraph, and Morning Post are the most important liberal daily papers, the last named being also the organ of the fashionable world, while the Standard and Globe (an evening paper), represent the conservative party.

The price of the daily papers varies from 4d. to 3d. Of the 300 newspapers not daily, most are published once, some twice, some three times, one four times a week, some once a fortnight, and some monthly. They comprise agricultural, sporting, commercial, and railway journals; a dozen or so purely literary, or literary and scientific; military and naval, musical and theatrical, legal and medical journals. There is a Court Circular and a Court Journal, a French, a German, an Anglo-American, and a Spanish weekly
paper. There are a few pietorial and about half-a-dozen humorous papers. Of these last, Punch, which has been in existence since 1841, is ably conducted, and yields no small influence. A large number are the organs of particular religious sects or parties. The bankers, drapers, grocers, printers, booksellers, brewers, etc., have their respective journals; the builders have six; and there are many newspapers with a purely local circulation, some confined to the obscure quarters of London. The price of the weekly papers varies from 6d. to 1d., or 6d.

The earliest English provincial newspaper is believed to be the Norwich Postman, published in 1703, at the price of a penny, but "a halfpenny not refused." It was followed, in 1714, by the Norwich Courant, or Weekly Packet. A York Courant, Leeds Courant, and York Journal were established about 1720; the Manchester Gazette in 1730, and the Oxford Journal in 1740. In 1843, 212 newspapers were published in provincial towns of England, and 8 in Wales. The provincial newspapers of England numbered in 1877 about 980, besides 56 belonging to Wales, and 20 to the islands. About a fifth of the number profess conservative or liberal-conservative principles, a half liberal, a small number perfect independence in politics, and the rest are avowedly neutral. Only a very few of these are conducted with anything like ability. Among the more important are the Manchester Examiner, which is understood to have a circulation of 35,000, and the Newcastle Chronicle of 36,000, and the Manchester Guardian. A characteristic feature of many second-class provincial papers is a column of gossip or scandal, entitled a letter "from our London correspondent."

The newspaper press of Scotland began during the civil wars of the 17th century. A party of Cavaliers and Royalists, who arrived at Leith in 1652 to garrison the citadel, brought with them a printer named Christopher Higgins, to reprint the London paper, Mercureius Politicus. The first number was issued on Oct. 26, 1653, and in Nov. 1654, the establishment was transferred to Edinburgh, where the reprinting went on till 1660. On Dec. 31, 1660, the first number was published of the Mercureus Caledonius, which professed to furnish information regarding the "affairs in agitation in Scotland, with a survey of foreign intelligence." It lived only three months, and was succeeded by The Kingdom's Intelligencer. The Edinburgh Gazette, an official paper published by authority, was established in 1669 by James Watson, a printer of eminence and skill. In 1702 Watson also established the Edinburgh Courant, which attained its 215th number, and in 1706 the Scots Courant. In 1718 the town-council of Edinburgh gave a privilege to James McLaren to print the Edinburgh Evening Courant three times a week, on condition that before publication he should give one coppy of his print to the magistrates. This paper still exists as the Edinburgh Courant, now a daily paper, and the principal conservative journal in Scotland. The Caledonian Mercury, now defunct, was first published April 28, 1730. The Scotsman, which came into existence in 1817, under the conduct of Mr. Charles Maclean, and was for a short time edited by Mr. J. R. M'Culloch, the political economist, is the most influential liberal journal in Scotland, and is believed to have a circulation of 55,000, larger than that of any daily paper out of London. The earliest Scottish provincial newspaper was the Glasgow Courant, established in 1715. The Aberdeen Journal was founded in 1746 by Mr. James Chalmers; the first number contained an account of the battle of Culloden. The number of newspapers published in Scotland in 1843 was 69: it is now 164, 15 of that number belonging to Edinburgh. A few of the leading newspapers of Scotland contain articles little inferior in talent to those of the best English newspapers, and exercise considerable political influence, at least in matters relating to Scotland. Among a score of the Scotch Scottish papers, I name as conservative, 60-70 liberal, and the rest independent or neutral in politics. Edinburgh has in all 12 newspapers, including the weekly issues of the 4 dailies; Glasgow 17 (with 6 dailies); Aberdeen 3 in all; Dundee 4; Paisley 3. The price of most of the daily papers is 1d.; of some it is ½d.; that of the weeklies and bi-weeklies varies from ½d. to 1d.

In Ireland, a news-sheet, called Warranted Tidings from Ireland, was printed during the rebellion of 1641; but the first Irish newspaper, properly so called, was the Dublin Newsletter, commenced in 1685. Puck's Occurrences, a Dublin daily paper, originated in 1700, was continued for half a century. It was followed, in 1728, by another daily paper, Faulkner's Journal, established by George Faulkner, "a man celebrated for the goodness of his heart, and the weakness of his head." The oldest existing Dublin newspapers are Sanderson's (originally Edes's) Newsletter, begun in 1748, and the Evening Post, instituted in 1729. The Limerick Chronicle, the oldest Irish provincial paper, dates from 1760. Ireland possessed 79 newspapers in 1843, and had in 1857 about 150. Most of them are characterized by an energy of language, and a strength of political bias, unknown in the other parts of the United Kingdom. The Irish Times and the Evening Mail, published in Dublin, and the Belfast News Letter, are influential daily papers. The Isle of Man supports 1 conservative, 2 liberal, and 1 neutral journal. Jersey has 9 journals, 4 printed in French and 5 in English; 4 are liberal, 1 conservative, 2 liberal-conservative, 1 independent, and 1 neutral. Guernsey has an official gazette printed in French, which is Protestant and neutral, besides 2 liberal, 1 liberal-conservative, and 3 neutral papers. These local papers are conducted with a great amount of spirit and success.

In the British colonies, newspapers are numerous, including those in India, printed in
the Bengalee and other native languages. *Hickings's Gazette*, the first Anglo-Indian newspaper, appeared in Calcutta in 1781; it was followed, in 1784, by a small official sheet called the *Calcutta Gazette or Oriental Advertiser*. The still surviving *Bengal Hurkura* was established in 1755. In the earlier times of Indian newspapers, though there was no direct censorship, exemplary punishment was often inflicted on the authors of offensive paragraphs. In 1794 Mr. Ducane, editor of the *World*, was transported to Europe for an inflammatory address to the army which appeared in his paper; and a similar result followed, in 1798, to another editor, who made some severe observations on the official conduct of a local magistrate. A censorship, established by lord Wellesley, in 1799, was abolished by the marquis of Hastings in 1818; but a license, revocable at pleasure, was required to be taken out by every printer of a newspaper. In 1852 the Indian press consisted of 6 European and 5 native journals. The licensing system was done away with by lord Metcalfe's law of 1853, a step disapproved of by the East India directors, but was again reverted to on the occurrence of the mutiny in 1857. In 1878 an Indian press law took the place of the former censorship, applicable to the vernacular press only. In 1875 there were in India 135 Eng., 270 vernacular, and 55 mixed newspapers.—The first Australian paper was the *Sydney Gazette*, founded in 1808. Hobart Town had its journal in 1804, and in 1824 newspapers began to multiply in the Australian colonies. The principal are now the *Sydney Herald*, the *Sydney Mail*, the *Argus* of Melbourne, and the *South Australian Register*. The materials for printing this last-named paper were carried out by the original South Australian colonists, the first number having been previously printed in England. A similar course was adopted by the first New Zealand colony in 1839 in founding their *New Zealand Gazette* and *New Zealand Advertiser*. Tahiti has, since 1844, had its L'Océanie Française. There is also the *Fiji Times*, the *Fiji Gazette*, and the *Central Polynesian*. The first French newspaper is said to have been established by Théophraste Renanold, a physician, in the beginning of the 17th century. The first number of his *Gazette* appeared in 1631. In the following year, through interest of cardinal Richelieu, he obtained a royal privilege for his *Gazette*; it was continued weekly up to 1762, and then began to appear twice in the week, and to combine advertisements with public news. Commercial intelligence was added in 1765, and in 1792, theatrical announcements. In 1650 was started the *Gazette Militaire*, a journal in verse, edited by the poet Jean Loret, devoted in a great measure to the chronique sonneteuse of Paris; and in 1672, the *Mercure Galant*, a political and literary journal, which afterwards became the *Mercure de France*, and was continued during the revolution, and down to 1815. The first French daily newspaper was the *Journal de Paris*, which began in 1777, and was discontinued in 1819. A large crop of journals sprang into being with the revolution, organs respectively of republicans, Jacobins, and royalists, but most of them had a very brief existence. Under the first Napoleon the freedom of the press was much restricted. By one of his earliest ordinances as first consul, all the newspapers were suppressed except 13, and under the empire the tolerated journals were allowed to be little more than echoes of the official *Moniteur*. From the danger which attended the handling of political questions, arose the practice of filling a large portion of the sheet with the *Feuilleton* consisting of a sketch or tale by a popular writer, which has ever since been a characteristic of French journalism. During the restoration period, the press being again less fettered, there was a large increase in the number of newspapers. In 1826 there were 127, and in 1829, 307 newspapers published in Paris. The July revolution at first added still further to their number; but the restrictive measures of 1834, consisting in the imposition of a stamp duty, and of an obligation to find security to the amount of 24,000 francs, led to the collapse of a large proportion of the then existing journals. The *Moniteur*, *Débats*, and *Presse* were in possession of the government, and for a time also the *Constitutionnel*, and every shade of political opinion had its recognized organ. Émile de Girardin's scheme of widening the circulation of the government organ, the *Presse*, by bringing down the subscription price from 80 to 40 francs, had the result of reducing the price of the opposition journals also. Cheap newspapers being thus established, it soon appeared that with the class among whom they circulated most widely the *feuilleton* was regarded of more importance than the political article, and it thus became the policy of the journalists to pay enormous sums to the cleverest novelists of the day, in order to retain them in their service: 100,000 francs paid by Dr. Véron of the *Constitutionnel* to Eugène Sue for his *Juij Errant*, turned out as profitable a speculation for the journalist as for the novelist.

The revolution of 1848, like the revolutions that had gone before it, gave birth to a multitude of short-lived journals. There were 89 different political journals started in ephemeral existence in Paris during the late commune, from Mar. 19 to May 31, 1871. When the late emperor Napoleon was president of the republic, a law was passed obliging the author of every newspaper article to affix his name to it. In Feb., 1852, the press laws were incorporated, with increased stringency, into a *Décret organique sur la Presse*. Louis Napoleon, during the empire, relaxed the stringency a little. The republic holds newspapers in as great bondage as did its imperial predecessor. Among the most important daily papers published in Paris are the *République Française*, *Pays*, *Sicile*, *Presse*, *Débats*, *Bien Public*, *France*, *Journal Officiel*, *Chartier*, and *Figaro*.}

**Belgium.**—In the Low Countries an illustrated war gazette, called the *Nieuwjaarschijne*,

U. K. X.—36
Newspaper.

was first published in 1605; it was the precursor of the Gazette van Antwerpen, which survived till 1805. During the Spanish and Austrian rule, each town had its privileged newspaper, but the press was considerably fettered in the expression of political opinion. Under the French rule, most of these journals disappeared or sunk into insignificance. The Annales Politiques was a political journal of considerable popularity during last century.

Since the revolution of 1830, the press has been subject to few restraint, the newspapers have been numerous, and some of them well conducted. The Indépendance Belge has a large circulation, and exercises considerable political influence. It is the property of a company of bankers, and is conducted by a Frenchman of talent and liberal sentiments. The Moniteur Belge was instituted as the official organ of the ministry in 1830. Le Nord, a Russian organ published in Brussels, is conducted with great ability. A large circulation is enjoyed by the Journal de Bruxelles, the Émancipation, and the Étoile Belge—all papers in the interest of the parti prêtre, and supplied with correspondence from Rome. The Echo de Bruxelles and the Journal de Belgique are independent papers. The Précursor d’Avouer, and the Escour de Antwerp, have a good circulation—the latter is at once ultramontane and ultra-democratic.

Holland.—The earlier newspapers of Holland were in some respects, particularly in the accuracy of their information, in advance of those of other countries, but gave far more prominence to commercial than to political intelligence. They all bore the name of Courant appended to the name of the town where they were published. Though subject to no censorship since 1814, it was not till 1830 that they began to comment on political occurrences. At present the principal Dutch journals are the Allgemeine Handelsblad of Amsterdam, and Amsterdam Courant; the Hartmansche Courant; and the Journal de la Bege, De Nederlandische Stoompost, and Staats Courant—published at the Hague.

Switzerland.—Switzerland being a confederation of states, each with its own institutions, the Swiss newspapers have a very local character; but they are numerous, and some of them have of late years greatly improved in character. The Swiss Times, published in Geneva, and printed both in French and English, is now frequently quoted in all countries.

Germany.—Though in Germany the Relationen, above alluded to, were in some sort the precursors of newspapers, yet no serial newspaper, properly so called, seems to have existed till 1615. Frankfort was the first town that possessed its journal; next followed Fulda, Hildesheim, and Herford. The earliest Leipzig newspaper was instituted in 1660. The first newspaper with a staff of foreign correspondents was the Hamburgsche Correspondent; but no German newspaper can be said to have had any political weight till the institution of the Allgemeine Zeitung, founded by Gotta in 1788, now published at Augsburg, which still takes rank as the first paper in Germany. During French ascendancy, the German papers were little more than echoes of the Parisian; but a number of journals of a more national character sprung up during the war of liberation. The abuse of the liberty of the press after 1830 led to the imposition by the diet of restrictions of a somewhat severe character on newspapers. Although within the last 20 years there has been a decided improvement in the literary and political character of the German newspapers, the socialist law of 1878 is a severe restriction of the liberty of the press. Among the principal Berlin daily papers are the Vossische Zeitung, the Norddeutsche Allgemeine Zeitung (semi-official), the Neue Preussische Zeitung (usually known as the Kroez Zeitung), Post, National-Zeitung, and Volks-Zeitung. The Allgemeine Zeitung, published at Augsburg, is a very influential and well-conducted journal.

Austria.—The Austrian newspapers have partaken of the advance in the newspaper press of Germany. The most important of them is the Wiener Zeitung, with its evening reprint, the Wiener Abendpost, not insignificant either in a literary or political point of view. We refer to the Neue Freie Presse.

Italy.—We have mentioned the early Notizie Scritte or gazettes of Venice. The news-sheets which followed them were in disfavor with the see of Rome: and a memorable bull denouncing them was issued by Gregory XIII. Up to 1847 the newspapers of Italy were small, politically insignificant, and subject to a strict censorship. With the accession of Pope Pius IX., a flood of political journals made their appearance, one or two of which only were conducted with any approach to talent, and few lasted above a year. In the Sardinian dominions there continued to be no fewer than 45 political papers published in 1852, 41 of which were printed in Italian and 4 in French. Of that number a great many soon afterwards collapsed. The removal of the former restrictions of the press in other parts of the kingdom of Italy has started into life a number of newspapers; 17 political and 10 partially political papers are now published in the dominions of Victor Emmanuel, besides 61 periodicals, many of which answer more or less to our idea of a newspaper. Few of these newspapers are as yet of much promise. The leaders are poor, no great social or commercial questions are discussed, and each journal is the mere advocate of one or other of the political parties. Perhaps the best of them on the whole are Il Diritto and L’Opinione, which may be compared to some of the second-rate French papers. The Gazetta Ufficiale del Regno d’Italia is the ministerial organ, and L’Unita, published in France, is looked upon as the organ of the department of foreign affairs. Humorous newspapers, after the model of our Punch, are abundant. The Voce della Vertita is the paper which advocates the cause of the pope. La Libertà
and Il Fanfulla are published in Rome; Genoa issues its Corriere Mercantile; Milan, La Pervenanza; and Naples, the Pugno and Patria.

Spain.—Sheets called Relaciones, giving accounts of important occurrences, used to appear in Spain at irregular intervals in the 17th c., occasionally in the form of romances; but no Spanish newspaper, properly so called, existed till last century, and 50 years ago Madrid possessed but one journal. The first approach to political journalism followed in the wake of the scientific journals and the establishment of the Argo by Johansen in 1820. For a number of years the principal journals of Sweden were the Fädrarna, the organ of the royalists, and the Förmordad, that of the reformers. The latter, on king Oscar's accession, ceased to be an opposition journal. The official paper is the Post och Inrikes Tidningar. Every provincial town has now its journal, and there are about 114 newspapers in all published in Sweden. Of the Norwegian papers the oldest is the Christiania Intelligensveder, founded in 1763. Den Constitutionelle is the government journal, and Den Morgenblad the organ of the opposition.

Denmark.—In Denmark journalism is still more recent. Up to 1830 only two newspapers were published in Copenhagen, both entirely made up of extracts from foreign journals. Since 1834 there has been an improvement in the character and increase in the number of the Danish journals. They numbered 36 in 1849. The oldest newspaper now existing in Denmark is the semi-ministerial Dagsbladet, Tidende, founded in 1729. The Fædrelandet is the journal of the Scandinavian popular party.

Russia.—The earliest newspapers in Russia were published under the personal surveillance of Peter the great, first in Moscow and afterward in Petersburg, to report the progress of the war with Sweden. Political journalism, properly so called, has, however, never flourished in Russia, and has, in fact, only been allowed in important political crises—as the French invasion of 1812, the Polish insurrection of 1830, and recently during the Crimean war, when the journalists were allowed to exercise their ingenuity in defending the government policy. The largest circulation was at that time attained by the Sjönerdaja Posten, or Northern Bee, which had its feuilleton. Generally speaking, the Russian newspapers occupied themselves with scientific and literary subjects rather than public or political news. The Journal de St. Petersbourg, in French, is the oldest of them, and has considerable circulation out of Russia.

Turkey.—The first newspaper in Turkey was founded in 1795 by M. Vermininac, envoy-extraordinary of the French government to the court of Selim III., and printed in French at Pera. A Frenchman of the name of Blacque established at Smyrna, in 1825, the Spectateur de l'Orient, afterwards the Courrier de Smyrne, which had considerable political influence during the Greek war. The same M. Blacque afterwards edited the official journal of the pasha, called the Moniteur Ottoman, which has, since 1832, been reprinted in Turkish under the name of the Taqvim-i Vargi. The Taqvim was till lately a very badly printed sheet, but it has much improved, and now issues weekly instead of monthly, sometimes containing very fair literary and political articles. But the most important Turkish paper is the Hürriyet Haractis, founded in 1843 by Mr. Alfred Churchhill, an Englishman born in Turkey. It embraces a great variety of matter, a court gazette, official appointments, home and foreign news, advertisements, prices of stocks, and a feuilleton. There are besides in Constantinople two new and popular papers, called the Turgumun Ahval, or Interpreter of Events, published three times a week, and the Tas Veeri Etkiser, or Mirror of Thoughts, published twice a week. The latter has a scientific and literary repute. The Turkish papers have no leading articles, and from the constitution of political society in Turkey, there can be no avowed opposition to the policy of the government. The Courrier de Constantinople, in French, is one of the principal journals of the capital; here appear also the Levant Herald and the Levant Times in English. And papers in French, Italian, Greek, and Armenian are published in various parts of the empire.

Greece.—Various newspapers in modern Greek appeared at Paris and Vienna before Greece obtained independence; but the first political published in Greece was the Hellénika Solpíria, founded in 1824, and soon followed by the Heléntika Chronika and Helléniko Telegraphos in Missolonghi, the Philos ton Nomíon at Hydra, the Ephemerides Athenianes at Athens, and the official Geníco Ephemerís Haidás, published at Nauplia, with its opponent the Apólon, which afterwards became the Alíkina. Most of these papers disappeared in 1833 on the system of surtices being introduced. The Sôir was established as the government organ in 1838. Upwards of eighty newspapers are now
published in Greece, the largest number of them in Athens. Of these several appear in
in French, Italian, and English. The leading political journal of Athens is the semi-
monthly Specateur d'Orient; but generally speaking, the Greek papers make no endeavor
to lead the parties in the state.

United States.—In America, the earliest newspaper was the Boston Newsletter, founded in
1704, insignificant in size and contents, and conducted by John Campbell, the post-
master of the town. A rival to it appeared in 1719 in the Boston Gazette, published by
authority.” “The Boston Newsletter, however, to live in spite of opposition, in 1729, in
the name changed to the Massachusetts Gazette and Boston Newsletter, it was the support of
the British rule against the desire for independence, and ceased to appear when the Brit-
ish troops evacuated Boston. The New England Courant, established in 1731, was at
first printed by James Franklin, and afterwards edited by his brother the famous states-
man. It lasted but six years, but a subsequent newspaper, entitled the Pennsylvania
Gazette, was started by Benjamin Franklin in 1729, and continued weekly till 1745, when
it merged in the North American. Elde's Boston Gazette, begun in 1755, was for a long
a time the chief organ of the popular party; in it appeared John Adams's "Letters of
Novanglus." The Massachusetts Spy was another paper of note on the revolutionary
side. It was afterwards removed from Boston to Worcester, and still appears as the Wor-
cester Spy. At the revolution the New England colonies possessed 14 newspapers; Penn-
sylvania, 6; New York, 4; and the middle and southern colonies, 10. All save the semi-
weekly Advertiser of Philadelphia were published weekly. The development of the news-
paper trade has kept pace with the advancing prosperity of the country. In 1800
the number of newspapers had increased to 200, of which several were daily papers. In
1810 there were 359, including 27 daily sheets. In 1828 852 papers appeared; in 1850
no less than 2,526; while in 1870 there were 5,871 newspapers, with a circulation of
20,842,473, and a yearly issue of 1,508,250. In 1874 the number of weekly papers had
reached 5,544, besides the weekly issues of 678 daily papers. Some of the New York
weeklies have an enormous circulation, the Ledger having occasionally sent out upwards
of 400,000 copies. The Germans publish 310 papers in their own tongue; the Scandinavi-
ans, 19; Spaniards, 16; Italians, 2; Welsh, 4; Bohemians, 5; Poles, 2; Portuguese, 1;
while there is a Chinese newspaper published at San Francisco, and a Cherokee one at
Tahlequah in the Indian territory. About 250 periodicals, with a supposed aggregate
circulation of 65,000,000 copies, are issued in the United States. Among the leading
newspapers of New York, in the order of importance, both as to enterprise and circu-
lation, is the New York Herald, the Tribune, and the New York Times.

The principal religious papers published in New York are the Observer and Evangel-
ist, organs of the Presbyterians; Independent and Christian Union, of the Congregational-
ist; the Churchman is Episcopal; the Christian Advocate, Methodist; and the Examiner,
Baptist. The Unitarians are represented by the Liberal Christian; the Catholics by the
Tablet; and the Swedenborgians and Jews have also their papers.

All the other numerous journals of the American states are, compared with those of
New York, accounted provincial, but many are, nevertheless, vigorously conducted.
Each county, comprising, on an average, 360 sq. m., has generally two or three papers—
one being republican, another democratic, and if there is a third, it is probably the organ
of some religion or other sect. The printer is, in most cases, the editor, and the village
lawyer supplies leaders seasoned frequently with personal interest. Some of them have
been supported with a capital of less than $100 of borrowed money.

There is an immense collection of newspapers in the British museum, which belonged
in part to the library of Sir Hans Sloane, in part to that of Dr. Charles Burney. See
Andrew's History of British Journalism (London, 1859). Grant's The Newspaper Press;
it's Origin, Progress, and Present Condition (London, 1871).

NEWSPAPER (ante). See AMERICAN JOURNALISM.

NEWSTEAD ABBEY, the home of the Byrons, about 8½ m. n.w. of Nottingham,
England. It was founded by Henry II. in 1170, as a priory of black canons. When
Henry VIII. dissolved the monasteries it was granted to Sir John Byron, who made over
a part of it into a dwelling, and it has since been subjected to so many alterations and
additions that, though originally a fine specimen of the early Anglo-Gothic, it is now a
composite of many styles. The fifth lord Byron, the poet's great-uncle, tore down
much of the house, felled large tracts of timber, and did what he could to ruin the
estate, février 1817 for his son the heir, who, after all, did not survive his father. Lord
Byron sold the estate in 1817 to Col. Wildman for £180,000. Wildman spent over
£200,000 in improving it, and preserved all the memorials of the poet, his former school-
father, which he found. Newstead abbey is now (1881) the property of William Fred-
rick Webb.

NEW STYLE. See CALENDAR, DATE.

NEW SWINDON. See SWINDON.

NEWT, or Eft, Triton, a genus of batrachians of the family salamandridae, more
aquatic in their habits than the salamander, to which, in form and characters, they are
very similar, having an elongated body and tail, and four small weak limbs. The tail is
vertically compressed, and a crest is often developed on the back and tail, but the crest
is characteristic of the males in the breeding season, and the tail becomes rounded when the animals leave the water, as they often do, particularly in the latter part of summer, or in autumn; which, along with other variations apparently dependent on circumstances, have caused little multiplication of specific names. The most abundant British species is the Common Newt, or Smooth Newt (T. punctatus), which is from 3 to 4 in. long, brownish gray above, yellowish beneath, spotted with black, with a soft, smooth skin, and two bands of pores on the head; a well-known inhabitant of stagnant pools and ditches, often found also under stones, and in other damp situations. The Warty Newt (T. palustris, or cristatus), also pretty common, is 5 or 6 in. in length, blackish brown above with round spots of a darker tint, bright orange or orange-yellow with black spots on the under parts, the sides dotted with white, and the tail often exhibiting a white band, the skin rough or warty, and with many pores. The dorsal and caudal clefts of the warty newt are separate; those of the common newt are united. Many other species occur in other parts of the world. They all feed on animal food, of which tadpoles and aquatic insects form the chief portions. They deposit their eggs on the leaves of aquatic plants, each egg separately, twisting or folding the leaf with their feet so as to conceal the egg, which is surrounded by a viscus substance, so that the leaf is retained in this form. The transformation of newts are noticed, and illustrations given, in the article BATRACHIA. They very frequently change their skin. They possess, in an extraordinary degree, the power of reproducing lost members—a limb, a tail, even an eye—in every respect perfect. Spallanzani, who made many observations on this subject, found that the same member could be reproduced a number of times successively. Newts are also capable of surviving, although long frozen up in ice, and return to activity when a thaw takes place. A strong and almost universal popular prejudice exists against them as most noxious animals, although they are not in the slightest degree venomous. They have recently, however, begun to be more favorably regarded in consequence of the frequency of aquaria, of which they are interesting inmates.—It is a curious fact that Linnaeus, contrary to his usual discriminating penetration, confounded newts with lizards, which they resemble merely in form, differing widely in the most important characters. That they are often confounded by the unscientific is not wonderful.

NEW TESTAMENT. See BIBLE, ante.

NEWTON, a co. in n.w. Arkansas, drained by the Buffalo fork of White river, and other branches; 800 sq.m.; pop. '80, 6,127—6,124 of American birth, 5 colored. The surface is undulating, hilly in some portions, and heavily wooded. The soil is mostly fertile, and the principal productions are Indian corn, wheat, and tobacco. Large quantities of butter, honey, and sorghum molasses are made. There are deposits of lead in some portions. Co. seat, Jasper.

NEWTON, a co. in n. central Georgia, bounded on the s.w. by the South river, drained by the Yellow and Uleofunhatchee rivers, which unite with the South, in the s. portion of the co., to form the Ocmulgee; situated on the Georgia railroad; 300 sq. m.; pop. '80, 13,610—13 of foreign birth. The surface is undulating, hilly in some portions, and heavily wooded with hickory and oak. The soil is fertile, especially near the rivers, and produces good crops of corn, wheat, oats, cotton, and sweet potatoes. Considerable quantities of butter, molasses, honey, and wool are raised. There are a number of tanneries, saw-mills, and manufactories of cotton yarn. Co. seat, Covington.

NEWTON, a co. in n.w. Indiana, adjoining Illinois; bounded on the n. by the Kanakkee river, traversed in the s. by the Iroquois river, and on the line of the Pittsburg, Cincinnati, and St. Louis railroad. The surface is level, mostly prairie, with swamps in some portions. Beaver lake is situated in the north. The soil is fertile, and produces good crops of Indian corn, wheat, oats, potatoes, and hay. Other staples are cattle and wool. Co. seat, Keutaud.

NEWTON, a co. in e. central Mississippi, drained by the Young Warrior, and the branches of the Chickasawha river; on the Vicksburg and Meridian railroad; 569 sq. m.; pop. '80, 13,496—48 of foreign birth, 5,009 colored. The surface is undulating, and heavily wooded. The soil is fertile, and produces good crops of corn, wheat, oats, sweet potatoes, and cotton. Other staples are wool, pork, butter, and molasses. Large numbers of cattle are raised. Co. seat, Decatur.

NEWTON, a co. in s.w. Missouri, bordering on the Indian territory and Kansas, drained by the branches of Grand river and Elk river, and by Waterfall creek, and crossed by the St. Louis and Pacific railroad; 650 sq. m.; pop. '80, 18,945—603 colored. The surface is heavily wooded with hickory, red and white oak, black walnut, and ash. The principal products are Indian corn, wheat, oats, sweet potatoes, and tobacco. Other staples are cattle, butter, wool, and sorghum molasses. Carboniferous limestone and lead are found. There are flouring and saw-mills, and pig-lead is manufactured. Co. seat, Neosho.

NEWTON, a co. in s.e. Texas, bounded on the e. by the Sabine river, which separates it from Louisiana, and drained by the branches of the Sabine; 850 sq. m.; pop. '80, 4,359—1507 colored. The surface is broken by hills in the n., is more undulating in the s., and heavily wooded with good timber trees. The soil in the hilly portion is sandy.
and unproductive, but fertile in the lower lands around the rivers. The principal productions are corn, sweet potatoes, and cotton. There are large numbers of cattle; considerable molasses is made. Co. seat, Newton.

NEWTON, a township in Massachusetts, on Charles river, 8 m. w. of Boston. It contains 2 villages, Upper Falls and Lower Falls, with 3 paper-mills, 3 cotton and hosiery factories, a Baptist theological seminary, and 12 churches. Pop. ’70, 12,852.

NEWTON (ante), in Middlesex co., Mass., bounded on the n., s., and w. by the Charles river; on the Boston and Albany, and the New York and New England railroads; pop. ’89, 16,993. It contains, besides the villages mentioned, ante, several others, as Newtonville, Newton Center, West Newton, and Auburndale. It is a favorite place of residence for persons doing business in Boston. Its public schools are among the best in the state. A number of private schools, and the Newton theological seminary, founded by the Baptists in 1826, are situated here. There are 27 churches, 2 newspapers, 2 banks, a public library, and a number of private libraries. There are cotton, silk, and paper mills, machine and cordage manufactories, etc. Newton anciently belonged to Cambridge, was incorporated as a town in 1679, and as a city in 1873.

NEWTON, CHARLES THOMAS, b. England, 1816; educated at Oxford. In 1840 he became assistant keeper of the department of antiquities in the British museum, but resigned in 1852, and obtained the appointment of vice-consul at Mytilene, where he went for the purpose of securing some of the antique sculptures known to exist in Asia Minor, and in the Ægean islands. He passed a number of years in the exploration of the archipelago, discovering at Halicarnassus (the modern Bodrum) the site of Artemisia's mausoleum. He carried on excavations at Brachuida and Cnuidus, 1856-59. He unearthed many valuable sculptures, which, with a fine collection of ancient vases, coins, and inscriptions, he presented to the British museum. In 1860 he was transferred to the consulate at Rome, and in 1861 he was appointed keeper of Greek and Roman antiquities in the British museum. His wife, an artist of reputation, died in 1866.

NEWTON, GILBERT STUART, 1794-1835; b. N. S.; came to England in 1817, and, after a tour in Italy, became a student at the royal academy, where he made the acquaintance of Washington Irving and Charles R. Leslie. His first works to attract attention were "The Forsaken" and "The Lover's Quarrel," engraved in the Literary Souvenir for 1826; both were in the manner of Watteau. In 1830 he painted "Shylock and Jessica;" "Yorick and the Grisette," from the Sentimental Journey; and "Abbot Boniface" from the Monastery. In 1831 he exhibited "Portia and Bassanio," and "Lear attended by Cordelia." In 1832 he returned to this country in search of material. On his return to England the next year, he was elected to the royal academy, and exhibited a small picture of "Ahabed." He also painted "The Vicar of Wakefield," "Macbeth," and a few portraits. He was insane for the last two years of his life.

NEWTON, Sir ISAAC, the most remarkable mathematician and natural philosopher of his own or perhaps of any other age, was b. at Woolsthorpe, in Lincolnsire, in the year 1642. That year, remarkable in English history for the breaking out of the civil war between king and parliament, is distinguished to this day by the birth of Newton and the death of Galileo. The circumstances with which the pursuit of truth, in scientific matters, was at this time surrounded in the respective countries of these great philosophers, were not more different than the characters of the philosophers themselves. Galileo died a prisoner, under the surveillance of the inquisition, "for thinking, in astronomy," as Milton says, "otherwise than the Franciscan and Dominican licensers thought." In England, it had become the practice, and soon became the fashion, through the influence of Bacon and Desartes, to discard altogether the dictates of authority in matters of science. The dispositions of the two philosophers were happily suited to the situations in which they thus found themselves. Galileo's was a mind whose strength and determination grew by the opposition it encountered. The disposition of Newton on the other hand, diffident of the value and interest of his own labors, and shrinking from the encounter of even scientific controversy, might have all disappeared if he had continued in obscurity had it not been for the constant and urgent solicitation of his friends that they should be published to the world.

Newton received his early education at the grammar school of Grantham, in the neighborhood of his home, at Woolsthorpe. On June 5, 1661, he left home for Cambridge, where he was admitted as subsizar at Trinity college. On July 8 following, he matriculated as sizar of the same college. He immediately applied himself to the mathematical studies of the place, and within a very few years must have not only made himself master of most of the works of any value on such subjects then existing, but had also begun to make some progress in the methods for extending the science. In the year 1665 he committed to writing his first discovery on fluxions; and it is said that in the same year, the fall of an apple, as he sat in his garden at Woolsthorpe, suggested the most magnificent of his subsequent discoveries—the law of universal gravitation. On his first attempt, however, by means of the law so suggested to his mind, to explain the lunar and planetary motions, he employed an estimate then in use of the radius of the earth, which was so erroneous as to produce a discrepancy between the real force of
gravity and that required by theory to explain the motions, corresponding to the respective figures 16.1 and 13.9. He accordingly abandoned the hypothesis for other studies. These other pursuits to which he thus betook himself, consisted chiefly of investigations into the nature of light, and the construction of telescopes. By a variety of ingenious and interesting experiments upon sunlight refracted through a prism in a darkened apartment, he was led to the conclusion that rays of light which differ in color, differ also in refrangibility. This discovery enabled him to explain an imperfectness of the telescope, which had not till then been accounted for. The indistinctness of the image formed by the object-glass was not necessarily due to any imperfection of its form, but to the fact of the different colored rays of light being brought to a focus at different distances. He concluded rightly that it was impossible for an object-glass consisting of a single lens to produce a distinct image. He went further, and too hastily concluding, from a single experiment, that the dispersive power of different substances was proportional to their refractive power, he pronounced it impossible to produce a perfect image by a combination of lenses. This conclusion—since proved erroneous by the discovery of the astatic telescope by Mr. Chester More Hall, of More Hall, in Essex, about 1729, and afterwards, independently, by Mr. Dollond in 1731—turned Newton's attention to the construction of reflecting telescopes; and the form devised by him is the one which, at later periods, reached such perfection in the hands of Sir William Herschel and lord Rosse.

It was on Jan. 11, 1671, that Newton was elected a member of the royal society, having become known to that body from his reflecting telescopes. At what period he resumed his calculations about gravitation, employing the more correct measure of the earth obtained by Picard in 1669, does not clearly appear; but it was certainly in the year 1684 that it became known to Halley that he was in possession of the whole theory and its demonstration. It was on the urgent solicitation of Halley that he was induced to commit to a systematic treatise these principles and their demonstrations. The principal results of his discoveries were set down in a treatise called De Motu Corporum, and were afterwards more completely unfolded in the great work entitled Philosophiae Naturalis Principia Mathematica, which was finally published about midsummer, 1687.

Shortly before the Principia was given to the public, Newton had been called to take an active part in defending the rights of the university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the convention parliament, in which he sat from Jan., 1659, to its dissolution in 1660. In 1660 he was appointed warden of the mint, and was afterwards promoted to the office of master of the mint in 1669, an office which he held till the end of his life. He again took a seat in parliament, in the year 1701, as the representative of the county. Thus engaged in the public service, he had little time left for more scientific studies—pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, Newton showed that he still retained the scientific power by which his great discoveries had been made. This was shown in his solution of two celebrated problems proposed in June, 1696, by John Bernoulli, as a challenge to the mathematicians of Europe. A similar mathematical feat is recorded of him so late as 1716 in solving a problem proposed by Leibnitz, for the purpose, as he expressed it, of feeling the pulse of the English analysts. When in parliament, Newton recommended the public encouragement of the invention of a method for determining the longitude—the first reward in consequence being gained by John Harrison for his chronometer. He was president of the royal society from 1703 to 1727, and during his tenure of that position, and enjoying the confidence of prince George of Denmark, he had much in his power towards the advancement of science; and one of his most important works during this time was the superintendence of the publication of Flamsteed's Cyclopaedia Observations—a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer. The controversy between Newton and Leibnitz, as to priority of discovery of the differential calculus, or the method of fluxions, was raised rather through the partisanship of jealous friends than through the anxiety of the philosophers themselves, who were, however, induced to enter into and carry on the dispute with some degree of bitterness and mutual recrimination. The verdict of the impartial historian of science must be that the methods were invented quite independently, and that, although Newton was the first inventor, a greater debt is owing by later analysts to Leibnitz, on account of the superior facility and completeness of his method. The details of these controversies, with all other information of the life of this philosopher, will be found admirably collected in the life by sir D. Brewster, who writes with not only an intimate acquaintance with Newton's works, but in the possession of all the materials collected in the hands of his family. Newton died on Mar. 20, 1727, and his remains received a resting-place in Westminster abbey, where a monument was erected to his memory in 1731. A magnificent full-length statue of the philosopher, executed by Roubilliac, was erected in 1755 in the antechapel of Trinity college, Cambridge. This work was assisted by a cast of the face taken after death, which is preserved in the university library at Cambridge. In 1799 Newton had been elected a foreign associate of the academy of sciences, and in 1763 he received the honor of knighthood from queen Anne. Among the best editions of Newton's principal works
are the quarto edition of the *Opuscula* (Loud. 1704), and the quarto edition of the *Principia*, published at Cambridge in 1713.

**NEWTON, ISAAC, 1642-1727; b. New York; son of a revolutionary soldier; became a great ship-builder, superintended the construction of more than 90 vessels, and was a naval architect of distinguished reputation. He was the builder of the *Hendrick Hudson* a river steamboat named in honor of the discoverer, and at the time (1851) considered very elegant; also the *New World*, built about the same time, for the navigation of the North river.

**NEWTON, JOHN, 1672-1687; b. London; son of a sea-captain; devoted by his mother to the Christian ministry. But her death occurring when he was seven years of age, he was neglected by his father and stepmother, and soon learned the ways of vicious boys with whom he associated. After a little time at a boarding-school in Essex, he went to sea at the age of eleven. During the next six years he was exposed to the influence of atheistical books and companions. Reading Shaftesbury’s *Characteristics* he became an infidel. In his 18th year he was unexpectedly promoted to the rank of a midshipman on board the *Hearz* man-of-war. But in his self-will he abandoned the ship while she lay at Plymouth. He was caught, brought back, flogged, and degraded; but became only more hardened. In 1745 he set sail for India as a common sailor. Unable to endure the taunts of his messmates and the frowns of his superiors, he entered at Madeira a Guinea vessel which took him in exchange for another. In six months he left this ship and landed penniless on the African coast near Sierra Leone. He soon found employment in the service of a slave-trader in one of the islands of the Plantanes, and was compelled to perform the most groveling drudgery. In a year the "stout English sailor was transformed into a spiritless, half-naked wretch, suffering under the effects of fever, shivering under the wind and wet of the rainy season, devouring the nauseous roots which he stole by night from the plantations, or the fish which he caught by the sea-shore, and exciting the contempt and even the pity of the meanest of the slaves." In 1747 an English captain arriving at Sierra Leone with orders from his father to bring him home found him "herding contentedly with the negroes in their lowest mire and gross superstitions." He sailed in Mar., 1748. The ship came near foundering in a terrible storm. His mind was awakened to serious thoughts. At the near prospect of death his skeptical indifference and blasphemous defiance deserted him. He prayed, he read the New Testament and Thomas-a-Kempis, and when the ship reached Ireland he was a changed man. In 1750 he married Mary Catlett. Soon afterwards he was appointed commander of an African slaver, and for four years continued in the slave trade, confessing that "he never had the least scruples as to its lawfulness," though afterwards he labored earnestly to expose its cruelties. During the intervals between his voyages while on shore, and on deck at sea, he studied Horace, Livy, and Erasmus. In 1754 a sudden attack of sickness led him to abandon a sea-faring life, and for 8 years he was tide-surveyor at Liverpool. At this time he studied Greek and Hebrew, and the best theological works in Latin, French, and English. In 1759 he was ordained, and appointed curate of the parish of Olney, where he lived a fruitful and fruitful man of prayer. He was the author of *The Christian Character Exemplified*. In 1767 he was invited to preach in the churches of Hatfield and Whitemfield. At Olney he published *An Authentic Narrative of some Remarkable and Interesting Particulars in the Life of the Rev. John Newton*. Here too he formed an intimate friendship with Cowper, and in connection with him produced the *Olney Hymns*. Most of them were written by himself for the use of his congregation. In 1779 he was presented with the rectory of the united parishes of St. Mary Woolnoth and St. Mary Woolchurch Han, London, where he remained till his death, continuing to preach three times a week, even when more than four-score years old, and sight, hearing and memory were fast failing. When entreated to stop, he exclaimed, "What! shall the old African blasphemer stop while he speaks?" His labors were very effective, and he contributed much to dispel the religious apathy of that age. His works besides *Olney Hymns*, were *Omicron’s Letters; Rerice of Ecclesiastical History; Catechisms, or Utterances of the Heart; The Christian Character Exemplified; Letters to a Wife, Messiah, being 50 Discourses on the Scripture passages in the Epistle of the “Messiah; Letters to the Reader, William Bull, and numerous sermons, discourses, tracts, etc.* His letters are beautiful speciments of clearness and simplicity, and rich in Christian experience. Though in his preface to the *Olney Hymns* he disclaims all pretension to being a poet, and claims only the "mediocrity of talent which might qualify him for usefulness to the weak and poor of his flock," yet his verses, being as he himself says, "the fruit and expression of his own experience," live in the memory and affection of Christians, and some find a place in our best collections of hymns. He was a leader in the evangelical party in the church of England.

**NEWTON, JOHN, b. Va., 1823. He was appointed second lieutenant in the corps of engineers, July 1, 1842, on graduating from West Point military academy, where he acted as assistant professor of engineering 1843-46. The construction of fortifications and the improvement of rivers and harbors next employed his time at various points on the Atlantic coast and great lakes, and 14 years of continuous service secured his promotion to the rank of captain. He was chief engineer of the Utah expedition of 1858. All through the rebellion he was in active service, beginning as chief engineer of the department of
Pennsylvania, and later of Shenandoah. Then he was summoned to assist in constructing the defenses of Washington, and had command of a brigade. During the peninsular and Maryland campaigns of the army of the Potomac he was a brig. gen. of volunteers, and took part in the battles of Gaines Mill, Glendale, South Mountain, and Antietam, where he was brevetted lieu. col. Commanding a division, he was engaged at Frederickburg, in the storming of Marye heights and battle of Salem, and his services at the battle of Gettysburg gave him the rank of brevet col., and the command of the 1st corps. In the invasion of Georgia he led a division of the Cumberland through all the engagements preceding previous capture of Atlanta, and Mar. 13, 1865, he was made brevet major gen. Since the war he has been occupied it strengthening the defenses of New York harbor, removing the obstacles to navigation at Hell Gate and other portions of the East river, and improving some of the harbors of lake Champlain, the channel between Staten Island and N. J., and the Hudson river. June 30, 1859, he attained the rank of col. in the corps of engineers.

NEWTOW, Robert, 1789-1854; b. Roxby, Yorkshire, Eng. He was early brought under the influence of the Methodists, joining that church at the age of 17. In 1798 he was received by the British conference, and in 1803 was appointed to the Glasgow circuit, attending lectures on theology and philosophy at the same time at the university. Most of his time was spent in England and Scotland. In 1812 he was appointed to London, where he soon became distinguished for his eloquence, especially in behalf of the British and foreign Bible society. When he began his missionary work in England there were only 50 Wesleyan missionaries and 17,000 communicants; in a few years through his influence there were 350 missionaries and 100,000 communicants. His services were in great demand in England, Scotland, and Ireland. In Sheffield he did much to check the influence of Paine, which then prevailed among the working classes. From London he was sent to Wakefield, and thence to Liverpool. For 40 years he was known and honored in all the large towns and cities. He was four times elected president of the British conference, and for many years was its secretary. In 1839, at the centenary conference held in Liverpool, he was appointed delegate to the general conference of the Methodist Episcopal church of the United States. He preached in New York, April 26, 1810, to a large audience, and wherever he preached vast crowds were attracted by his eloquence. In Baltimore, where the conference was held, such multitudes gathered to hear him that he afterwards preached in Monument square to an audience, it is said, of 15,000. He published Sermons on Special and Ordinary Occasions.

NEWTOW, Thomas, an English prelate of the 18th c., was b. at Linclfield, Jan. 1, 1704. He was educated at Westminster school, and afterwards at Trinity college, Cambridge, where he took the degree of M.A. in 1730, in which year also he was ordained priest. After holding several minor preferments, he was made bishop of Bristol in 1761, and died Feb. 14, 1782. Without any remarkable merit, Newton has, one cannot well say how, succeeded in obtaining a place in literary history. His two productions, whose fortunes have surpassed their deserts, are an edition of Milton’s Paradise Lost (2 vols., 1749), with a memoir of the poet, and critical and explanatory notes; and The Dissertations on the Prophecies (3 vols., 1754 to 1758). Besides these, he wrote occasional sermons, and a host of scriptural dissertations, the theology of which is reckoned not always orthodox.”

NEWTOW-ABBOT, a market t. of England, in the co. of Devon, beautifully situated in a vale on the river Lemon, 13 m. s.s.w. of Exeter. The portion of the town called Newton-Bushel is on the left side of the stream. It has been undergoing considerable improvements within recent years. William of Orange, after landing at Torbay, in 1688, made his first public declaration here. Pop. 71, 682.

NEWTOW-IN-MAKERFIELD, a thriving manufacturing and market t. of England, in Lancashire, 15 m. w. of Manchester, on the Manchester and Liverpool railway. Two large iron foundries, as well as weaving, paper, and sugar works, an oil-distillery, and a brick, tile, and pot manufactory are in full operation. There is a beautiful lake in the town called Newton Mere, which is covered during the summer months with the pleasure-boats of the townspeople. Horse-races are held here in June, and horse and cattle fairs in May and August annually. The election of m.p.’s for South Lancashire takes place in Newton. Cotton and flour mills, iron foundries and glass-works are in operation, and bricks are made. Pop. 71, 244.

NEWTOW’S RINGS. In his investigations of the colors produced by thin plates of any material, solid, fluid or gaseous, sir Isaac Newton hit upon the following mode of exhibiting the colors produced by a film of air. He took two lenses, one convexo-plane, its convex side having a radius of 14 ft., the other equi-convex, with the radii of its surfaces 50 ft., and laid the first with its plane surface downwards on the top of the second, thus producing a thin film of air between the lenses; the film being thinnest near the center, and becoming gradually thicker outwards. On slowly pressing the upper lens against the under one, a number of concentric colored rings, having the point of contact of the lenses for their center, appeared, and increased in size when the pressure was increased. These rings, or more properly systems of rings, are seven in number, and each of them is composed of a number (ranging from 8 in the first or smallest ring, to
2 in the outermost) of rings of different colors, the colors, though different in each of the systems of rings, preserving the same arrangements as the colors of the spectrum, of which they seem to be modifications; thus, in the second ring the inside color is violet, and the outside scarlet red. The colors are very distinct in the first three systems of rings, but become gradually confused and dull towards the outside, till they almost fade away in the 7th system. The center is deep black. The thickness of the air-film at the center is about half a millionth of an inch, and increases gradually to nearly \( \frac{1}{100} \) of an inch, when the colors disappear.

**NEWTON THEOLOGICAL INSTITUTE**, at Newton, Mass.; organized, 1825; the first theological seminary established in the country by the Baptist denomination, and has always been served by professors eminent for learning and piety. The buildings and grounds, valued at $135,000, occupy the summit of a hill commanding a fine view. It has an endowment of over $313,000, and a library of 13,500 volumes. President, rev. Alvah Hovey, D.D., LL.D.

**NEWTON-UPON-AYR**, a burgh of barony and parish of Scotland, in the co. of ayr, on the n. side of the river ayr, and united with the town of that name by three bridges. See Ayr. Its population is included in that of ayr. Newton-upon-Ayr has ship-building docks, roperies, and iron and brass foundries. It exports 100,000 tons of coal annually.

**NEWTON, a t. in s. New York, on the w. extremity of Long Island, in Queens co.; pop. '70, 10,631.** It is on the flushing, North Shore and Central railroad, and formerly included Hunter's Point and Astoria; within its present limits are the villages of corona, mas-peth, Columbusville, Glendale, Melvina, Newton, and Ravenswood. Its n.e. boundary is an estuary of Long Island sound, its w. the city of Brooklyn, and it is bounded on the n.w. by the East river; 5 m. from New York. It has institutions of learning of high order, 22 churches, and a savings bank. Its surroundings offer many attractions. Market gardening is an occupation very generally followed; other industries are the manufacture of rope and oil-cloth, and it has an extensive iron foundry.

**NEWTOWN, a modern manufacturing t. of North Wales, in the co. of Montgomery.** 8 m. s.w. of the town of that name, on the right bank of the Severn, and on the Montgomery canal, which connects it with the inland navigation of the country. It is the center of the flannel manufactures of the county. It has 40 factories employing in all 960 men. Pop. '71, 5,744.

**NEWTOWNARDS, a market t. of the co. Down, Ireland, 12 m. e. from Belfast by railway. Pop. '71, 9,562.** It contains a court-house, a town-hall, and a market-square; a Protestant church, a Roman Catholic chapel, seven Presbyterian meeting-houses, numerous schools, and a union workhouse. It is a neat and well-built town, of considerable trade, and with extensive muslin, flax-spinning, and weaving factories. Since the union, it has ceased to be a parliamentary borough. The affairs of the town are administered by commissioners.

**NEWTOWN-LIMAVADY (Ir. Lein-a-maolba, "The Dog's Leap"), a market t. of the co. of Londonderry, Ireland, and 16 m. c.n.e. of the town of Londonderry. Pop. in 1871, 2,762.** Newtown-Limavady, in the period anterior to the establishment of English rule, was the seat of the powerful seft of the O'Cahans, or O'Kanes; and during the wars of the revolution it was the scene of more than one struggle between the followers of James II. and those of William. Its chief importance at present is as a center of the flax trade, once the staple of that district, and again rising in importance. It possesses a town-hall, weaving factory, extensive flour-mills, markets, and brewery; union workhouse. Protestant church and other places of worship, and two comfortable hotels.

**NEW WESTMINSTER, a t. in central British Columbia, on Fraser's river in the midst of the gold region, the former capital and one of the chief towns of the province; pop. 2,600, including Indians and half-breeds. It is 15 m. above the mouth of the river, 65 m. n.e. of Victoria, and 100 m. from Yale, at the head of river navigation. The river empties into the Gulf of Georgia, and steamers from Vancouver island make this place a freight and passenger station for ocean steamers, whence the river steamers forward them to Yale. Between this place and Victoria steamers run twice a week. The river at this point is about a mile wide, and contains several inhabited islands. The town is the center of considerable tracts of arable land, delightfully located, has a fine climate and a large rainfall, and the vicinity is a silver producing region, though mines are not yet opened. Its leading industry is salmon fishing, several establishments largely exporting the fish in cans and barrels; and other kinds of fish are caught for this trade, and for the manufacture of fish oil. It has also a large trade in lumber and furs. Anthracite and bituminous coal are exported. It has five churches, good public schools, a Roman Catholic college, a young ladies' seminary directed by the sisters of St. Anne, and a public hospital. It contains a mint and assay office, a council hall, court-house, and public library, a jail and penitentiary. It supports 2 newspapers.

**NEW YEAR'S DAY**, the first day of the year. The custom of celebrating by some religious observance, generally accompanied by feasting, rejoicing, the first day of the year, appears to have prevailed among most of the ancient nations. The Jews, the Egyptians, the Chinese, the Romans, and the Mohammedans, although differing as to
the time from which they reckoned the commencement of the year, all regarded it as a day of special interest. In Rome the year anciently began in March; and when Numa, according to the ancient legend, transferred it to Jan. 1st, that day was held sacred to Janus Ebronis, who was thus supposed to turn at once back upon the old year and forward into the new. On the establishment of Christianity, the usage of a solemn inauguration of the new year was retained; but considerable variety prevailed, both as to the time and as to the manner of its celebration. Christmas day, the annunciation (Mar. 25), Easter day, and Mar. 1 have all, at different times or periods, shared veneration. Thus, the honor of opening the new year was long till late in the 16th c., that Jan. 1 was universally accepted as the first day of the new year. The early fathers—Chrysostom, Ambrose, Augustine, Peter Chrysologus, and others—in reprobation of the immoral and superstitious observances of the pagan festival, prohibited in Christian use all festal celebration; and, on the contrary, directed that the Christian year should be opened with a day of prayer, fasting, and humiliation. The mandate, however, was but partially observed. The festal character of the day, generally speaking, was pertinaciously preserved, but the day was also observed as a day of prayer; and this character was the more readily attached to it when the year began with Jan. 1, as that day, being the 8th after the nativity of our Lord, was held to be the commemoration of his circumcision (Luke ii. 21).

The social observances of the first day of the new year appear to have been in substance the same in all ages. From the earliest recorded celebration, we find notice of feasting and the interchange of presents as usages of the day. Suetonius alludes to the bringing of presents to the capital; and Tacitus makes a similar reference to the practice of giving and receiving new-year's gifts. This custom was continued by the Christian kingdoms into which the western empire was divided. In England we find many examples of it, even as a part of the public expenditure of the court, so far down as the reign of Charles II.; and, as all our antiquarian writers mention, the custom of interchanging presents was common in all classes of society. In France and England it still subsists, although eclipsed in the latter country by the still more popular practice of Christmas gifts. In many countries, the night of New-Year's eve, "St. Sylvester's eve," was celebrated with great festivity, which was prolonged till after 12 o'clock, when the new year was ushered in with congratulations, complimentary visits, and mutual wishes for a happy new year. This is an ancient Scottish custom, which also prevails in many parts of Germany, where the form of wish—"Prosit (for the Lat. word Neu-jahr)"—"May the new year be happy"—sufficiently attests the antiquity of the custom. In many places the practice of tolling bells at midnight, and thus "ringing in the new year" is still observed. Many religious commemorations are wont to celebrate it with a special service. In the Roman Catholic church, the Te Deum is still sung at the close of the old year; and New-Year's day is a holiday of strict obligation.

**NEW YORK**, one of the thirteen original states of the United States of America, now the most important in population and wealth, occupies an irregular triangular area from the Atlantic ocean to the great lakes, lat. 40° 29' 40" to 45° 0' 42" n., long. 71° 51' to 79° 47' 25" w. The state is 412 m. from e. to w., 311 m. from n. to s., with an area of 34,994 sq. m., or 85,800,000 acres; bounded n. by lake Erie, o. by the river St. Lawrence, and Canada; e. by lake Champlain, and the states of Vermont, Massachusetts, and Connecticut, and by the Atlantic ocean; s. by the ocean, New Jersey, and Pennsylvania; w. by Pennsylvania, the Niagara river, and the lakes which make its irregular northern boundary. The state has 60 counties. Its chief towns are New York city, Albany (the capital), Buffalo, Rochester, Oswego, Troy, Hudson, Syracuse, Utica, etc. Pop. 50, 4,373,068, of whom 1,000,000 are of foreign birth, 500,000 being Irish, and about 250,000 Germans. New York, though resting only one corner upon the Atlantic, has its sea-coast extended by Long Island, Staten Island, etc., to 246 m.; while it has a lake coast of 352 m., and borders for 281 m. on navigable rivers. The Hudson, broad and deep, with tides flowing 150 m., joins at Albany a system of canals, which connect New York city with the great western lakes and the river St. Lawrence. This state is also traversed by railway-lines in every direction, and its center is beautified by many picturesque lakes, and its north-eastern portion and the banks of the Hudson by fine mountain scenery. The Blue Ridge of the Alleghanies form the highlands, whose peaks rise 1500 ft. from the Hudson; n. of these, the Catskills rise to a height of 3,800 ft., with a large hotel for summer visitors at an elevation of 2,600 ft.; while Mt. Marcy and Mt. Anthony, peaks of the Adirondacks, in the wild region w. of lake Champlain, are 5,337 and 5,000 ft. high. The chief rivers, besides the Niagara and St. Lawrence, are the Hudson, its chief branch the Mohawk, the Genesee, and the sources of the Delaware, Susquehanna, and Alleghany. Its geology presents a series of older rocks, from the azoic to the lower members of the carboniferous. Red sandstone of the middle secondary period is found on the borders of New Jersey; drift and bowlders are found everywhere; the great Silurian belt passes along the eastern line, and granite with iron occurs in the n. e. There is now no coal, but rich beds of marble near New York city; productive salt-springs in the center of the state, which yielded, in 1874, 6,594,191 bushels; and petroleum and natural gas, enough in some cases to light large villages, in the w. Among the mineral springs, those of
Saratoga and Dallston have a wine reputation. The climate, mild on the coast, is cold in the northern counties. The soil, particularly of the western and limestone regions, is very fertile, producing the finest wheat, maize, apples, peaches, melons, grapes, etc., in abundance. In 1870, New York state produced 5,614,365 tons of hay, 12,178,462 bushels of wheat, 55,259,625 of oats, 16,492,385 of maize, 17,535,681 lbs. hops, 6,092,040 lbs. apples, 29,722,904 lbs. cheese, 10,569,915 lbs. wool. Among the natural curiosities are the falls of Niagara; of the Genesee, three cascades of 86, 25, and 84 ft., in 23 m.; of the Trenton, which falls 290 ft. in 5 cascades; the Taghannick falls, of 220 ft.; and the of-pointed falls of the Catskill, 175 and 85 ft., in a gorge of the Catskill mountains.

In 1870 there were 36,206 manufacturing establishments, employing 351,800 persons, and a capital of $366,994,320; and in 1875 there were 5,442 m. of railway in the state; the Erie canal is 550 m., and the New York canals together 855 m.; 351 banks of issue have a capital of $124,559,000. In 1870 there were 5,474 churches; 11,678 public schools, attended by 719,181 pupils; 274 classical, professional, and technical schools, including 7 universities, 24 colleges, and 189 academies, with an attendance of 43,729 pupils; and 1608 boarding and other schools, with an attendance of 18,113 pupils. In 1874 the expenditure for teachers and scholars was $11,088,951, and the total number of children at school, 1,224,321. The number of puppets supported during the year ending June 1, 1870, was 20,152, at a cost of $2,061,283. The number of persons convicted of crime during the same period was 5,475, of which 2,000 were foreign born. There were 855 newspapers and other periodicals—87 daily, 518 weekly, 163 monthly, 19 quarterly; but a large number of these are published in the city of New York, and circulated over the union. The number of copies issued annually in the state was 471,741,714. In 1874 there were 1655 newspapers and periodicals.

The earliest explorations of New York by Europeans were in 1609 by Hendrick Hudson, who took possession of the country on the river which bears his name for the Dutch; and by Champlain, a Frenchman, who explored lake Champlain from Canada. It was possessed by the Iroquois, or Five Nations, and the Algonquins. In 1621 the Dutch made a settlement on Manhattan Island, which they bought for $24, and founded New Amsterdam, now New York. In 1664, New York was taken by the English. In the war of independence, (1776), Washington was driven from New York city, which was held by the British till July 3, at the war; but was after held, by Burgoyne, after two severe battles near Saratoga, compelled to surrender. The state constitution was adopted in 1777, and has since been repeatedly amended. The governor is elected for three years, 32 senators for two years, and 128 members of assembly for one year. In 1825 the opening of the Erie canal gave a great impetus to trade. Pop. (1800) 586,756; (1820) 1,372,812; (1860) 3,880,753; (1870) 4,382,759.

NEW YORK (ante). History.—While it is claimed that John de Verrazano landed on the coast of New York in 1524, the first white man who is known to have been within the present boundaries of the state, was Samuel Champlain, the French navigator, who set sail down the lake which was named after him, on July 4, 1609, anhanting by two months Hudson's discovery from the sea. Champlain, governor of Canada, was on an expedition up the St. Lawrence, when he met a war-party of Hurons, which he and two other men killed. This was the first European meeting of the Hurons meted Iroquois, and defeated them, Champlain shooting their chief with his musque-powder. This was the famous Iroquois anct which incurred the enmity of the Five Nations, with whom the French continued at war until the final surrender of their possessions in America. Sept. 9, 1609, Henry Hudson, an Englishman in the employ of the Dutch East India company, sailed his little 80-ton shallop Half-Moon into the waters of New York bay, and three days later commenced his voyage up the river to which his name is attached, which he explored to a point between Hudson and Albany. All the land which he discovered was claimed by the Dutch, and named New Netherland; and in 1611 the states-general offered special privileges to any company opening and encouraging trade with the natives of their newly acquired possessions. This encouragement procured not only trading but colonization. In 1613 a fort was built on Manhattan island, but the settlement about it was broken up by the English. In the following year another Dutch colony established itself on the same spot, and continued in possession; and during the ten years succeeding, the shores of the Hudson and those of Long Island were some time explored, and at Fort Orange (Albany) another trading-post was established. In this region the Indians were tribes of the great Algonquin family, while the remainder of the state was occupied by the Five Nations. But while Champlain had embroiled himself with the Indians in the part of the country included in his explorations, thus entailing a long and bloody war upon the French, the Dutch settles in the s.e., more wary, cultivated amity with the red men, to their own material advantage. In 1621 the prospects of a lucrative commerce with America had induced certain merchants in Holland to combine in the organization of the Dutch West India company, for colonization purposes, and two years later this company took out 18 families who settled at fort Orange, and 30 families who remained at New Amsterdam on Manhattan island.

The first important illustration of the benefits of amicable intercourse with the Indians occurred in the purchase from them of Manhattan island by the Dutch in 1626 for the sum of $24. This was accomplished by Peter Minuits, the director-general who had been
sent out by the Dutch West India company to take charge of its colonies, an able administrator and wise governor. See Minuits, Peter. A feature of his administration was the establishment of the patron system, by which certain speculators were permitted by an act of the company passed in 1629 to gain manorial rights over immense tracts of country; thus building up a powerful land aristocracy, whose influence was great in the early history of the state, and whose claims brought about more than two centuries later the "anti-rent" war between landlords and tenants in these manorial districts. The disturbance which this system immediately produced among the colonists themselves; being attributed wrongfully to maladministration on the part of Minuits, he was summoned home and his office filled, in 1638, by Wouter Willems Twiller, who was succeeded in 1639 by William Kieft. The administration of the latter was signalized by the first serious war by Dutch between the colonists and the Indians. Some slight disagreement brought about an attack on the natives by the Dutch, which resulted in the massacre of more than 100 unoffending Indians, men, women, and children, and the precipitation of a sanguinary war which threatened the very existence of the colony. Peter Stuyvesant succeeded Kieft in 1647, and his considerate and judicious direction of affairs relieved the latter from the serious danger into which it had fallen. He pursued a conciliatory policy with the Indians, and the wisdom of his administration soon produced its effect in a satisfactory and progressive condition in the settlements under his jurisdiction. These settlements now constantly extending, soon conflicted with those of the English on the Connecticut river, and of the Swedes on the Delaware. The latter had been established by Peter Minuits, who had joined the service of the Swedish government, after being dismissed from that of the Dutch West India company: in 1655. gov. Stuyvesant sold this settlement by force and annexed it to his government. The English opposition to the Dutch colonization schemes was persistent from the beginning, and fruitful of much conflict. The English claimed the territory n. of Virginia on the ground of the anterior discoveries by Cabot; and in 1664 a charter was granted by Charles II. to the duke of York, which covered all the lands lying between the Hudson and the Delaware, and included New Netherland, as well as lands already held by prior grant, by Connecticutt, Massachusetts, and New Hampshire. In the summer of the year in which this charter was given, col. Nicollet was sent from England with sufficient force, and on arriving at New Amsterdam, demanded the surrender of the Dutch possessions. This demand was acceded to by gov. Stuyvesant, who was powerless to prevent its enforcement, and the country in question passed into the hands of the English without a struggle. The name New Netherland was retained by the English government, and the colony settled, to be called the province, and that of Albany to fort Orange. A subsequent recapture by the Dutch was followed by speedy restoration to the English; and on the duke of York ascending the throne of England under the title of James II., the province passed into the possession of the crown. Its condition at this time was not encouraging as to progress, either in wealth or education. The most of the land was held by aristocratic families, much of it having been disposed by the duke of York among his favorites. Heavy taxation and burdensome restrictions on trade bore heavily on the people; there was little political freedom or religious toleration; even under the reign of William and Mary there was little improvement. Colonial possessions, according to the general policy of the European powers, were used to plant or dispose of personal enemies, or to reward personal friends; while their trade was deemed a just perquisite for the royal exchequer. So late as 1689, the persistent tyranny of Nicholson, governor of New York, aroused the colonists to insurrection, and Jacob Leisler, a mercenary merchant, was put in an official position, seized the government in the name of William of Orange, and held it for two years. He was then superseded by gov. Schuyler, and on very insignificant grounds was tried for high treason, condemned, and put to death. See Leisler, Jacob.

While the Dutch and English were colonizing s.e. New York and the line of the Hudson river, also at points some distance in the interior and on lake Champlain, the French were incessant in their warfare with the Indians and their inroads from Canada into northern and central New York, varying their warlike expeditions by missionary enterprises. Excepting brief periods of peace, established by treaty stipulations often broken, the French and Indians were constantly at enmity; while the generally friendly relations of the natives with the English resulted in the northern and western frontier settlements being protected by the Indians from French invasion during the French and Indian wars. After 1684, when gov. Dongan concluded an offensive and defensive treaty with the Indians, the English occupied, in peaceful agreement with the latter, the attitude which had been held by the Dutch prior to their ascendency. In 1687 a French army under de Nouville, governor of Canada, invaded New York; the Five Nations, in retaliation, made an invasion of Canada two years afterwards, killing 1000 French settlers, and threatening the destruction of the whole province. On Feb. 8, 1691, at midnight, the town of Schenectady was attacked by French regulars to the number of more than 200, accompanied by a large number of Indians, when 63 of the settlers were killed, and 27 carried into captivity. In 1690-91 the village of La Prairie was twice attacked; and in 1695 count de Frontenac, with 400 Frenchmen and 250 Algonquins, desolated the Mohawk country, and pursued his invasion almost to Albany, returning laden with plunder and prisoners. Lake Champlain was, in fact, held by the French and commanded by their fortifications until 1759. Hostilities between England and France were con-
cluded for the time by the peace of Ryswick in 1697, and from 1702 to 1748, during queen Anne's and king George's wars, there was no fighting in New York, except skirmishes along the frontier. But after the outbreak of hostilities in 1754, there being no concert of action among the colonies, the entire British possessions in North America were threatened with subjugation. The French had fortifications on lake Champlain, on the St. Lawrence, and at Niagara; while the English advanced posts were at fort Edward on the Hudson, and at Oswego. In 1755 the English under sir William Johnson defeated and nearly annihilated the French under Dieskau, at the head of lake George; but in the following year the French captured Oswego and destroyed it, and in 1757 took fort William Henry. In 1758 gen. Abercrombie, with an army of 16,000 men, attacked Ticonderoga, but was repulsed. Col. Bradstreet, however, captured fort Frontenac in the latter year, and in 1759 Niagara was captured by the British, and Ticonderoga and Crown Point were reconquered. The appearance of gen. Amherst with his army. This left New York free of the French, and the attention of its people could once more be turned to their own affairs. During the war, and under William Pitt's administration, colonial affairs had been administered less obnoxiously than before; but no sooner was the conquest of Canada completed, than a course of conduct was begun tending to irritate the colonists, and arousing in New York a spirit of opposition whose exhibition the presence of a large royalist force could not prevent.

New York joined earnestly in the arrangements made for self-defense on the part of the colonies. In Oct. 1755, gen. Tryon, the last British governor of New York, fled from his seat of government on board a man-of-war. Already, in May of that year, Ethan Allen and his "Green Mountain boys" had surprised and captured fort Ticonderoga. Generals Montgomery and Schuyler set forth two months later on their ill-fated expedition against Canada—whence they returned defeated and dispirited in the following year. In Feb. 1756, New York city was occupied by an American force, but the battles of Long Island and Harlem Heights, disastrous to the American arms, rendered that position untenable; and, being abandoned by Washington and his army, the British took possession of the city, and held it for 7 years. In the summer of 1777 the province was invaded by gen. Burgoyne from the Canada side, while simultaneously a British force proceeded up the Hudson to unite with him. The immediate result of this joint expedition was the capture by the British of several American forts on the Hudson and lake Champlain, but it ended in disaster. Burgoyne's entire army being forced to surrender, Oct. 17, at Saratoga. In 1777-78 West Point was fortified, and considered the strongest position in the country.

In 1779 the Indian country in New York was laid waste by gen. Sullivan; the Six Nations joined the British, and under sir John Johnson harassed the defenseless settlements on the frontier; and the Schoriarie and Mohawk settlements were constantly being subjected to depredations on the part of hostile Indians. Nov. 25, 1783, the final act of the revolution took place in the evacuation by the British of the cit. of New York, when the colonists were left to frame a government for themselves, which should comprehend the new attitude and larger relations which they held as citizens of a republic. A treaty was now concluded with the Six Nations, the Indians ceding a large portion of their lands to the state. Subsequently other treaties lessened the Indian possessions, until, excepting the reservations, all that they had once owned had been given up to the whites. What was known as the "Holland purchase," 3,500,000 acres sold by Robert Morris to an Amsterdam company—lying west of what was known as the preemption line, a boundary between New York and Massachusetts land—having been thoroughly surveyed by its Dutch owners, and made available for settlement, was speedily populated. The lands in central New York were settled as rapidly as the Indians surrendered them. In 1777 the first constitution of the state was adopted, revised in 1841, 1821, 1846, and 1867, the latest amendment having been made in 1874. In the meantime conflicting claims of other states on the boundaries of New York had been adjusted amicably; in the case of New Hampshire, by forming the state of Vermont from the disputed territory, New York receiving the sum of $250,000 for relinquishing its claim. The war of 1812 brought the New York frontier again into danger, and a number of engagements occurred in that part of the state bordering on Canada and the lakes. A British attack on Sackett's Harbor, an important American naval station on lake Ontario, resulted unsuccessfully.

Shortly after the close of the war, in 1816, the requisite legislative action was taken for the building of the Erie canal, originally suggested by Governor Morris in 1800. The canal was begun in 1817 and finished in 1825; its successful completion being mainly due to the energy and foresight of gov. De Witt Clinton. The effect of this great work was to enrich the state while opening the way for the stream of commerce which has resulted in making the city of New York the metropolis of the western continent. In 1829 the Hudson and Mohawk railroad was chartered—but only the first rail was char- ted. In 1830 this road was commenced, and in 1826, the New York and Erie in 1828. The gradual absorption of the various New York lines which form the Hudson river railroad, and the consolidation of the New York Central and Hudson river railroad into one powerful four-track trunk line connecting the metropolis with the west, were significant events in the development of the state.

The part taken by the state of New York in the war of secession was foremost, as became the first state in the union in wealth and population. Every county furnished
its quota of volunteers; its well-organized and thoroughly drilled militia regiments supplied capable officers to the inexperienced army which was so rapidly formed, and the great manufactories of the state were kept busy night and day in supplying arms, clothing, and equipment; at the Watervliet arsenal alone 1500 men were employed during the war. The wealth of New York was poured out like water to sustain the union cause. The United States sanitary commission and the union defense committee were organized from among its citizens.

Government.—"The Dutch political system made the judiciary supreme, and denied all arbitrary power, either in people or parliaments, in civil rulers or religious teachers, and sought to fortify the people against its exercise. Thus the feudal shell of Dutch government inclosed the seed of liberty, ready in fullness of time to germinate in most perfect form." A government was actually established for the first in New Netherland in 1624, after the arrival of a party of Walloons sent out by the Dutch West India company, under the command of Kieft, who, like his predecessor, when sent to Nieuw Amsterdam in 1623, had hoped to make a profit by the sale of lands to the Indians. The manorial system was introduced, the patroons being invested with the authority of feudal barons, but no political or judicial changes could be introduced without consent of the home government. In 1638 and 1640 the privileges of the patroons were materially restricted and those of free settlers enlarged. Whenever the people settled in sufficient numbers, the company was obliged to give them local government, the officers of which were to be designated by the director and council, in accordance with the custom in the Netherlands. But although by the plan of government "no other religion was to be publicly tolerated or allowed in New Netherland, save that then taught and exercised by authority of the Reformed church in the united provinces," this provision was a dead letter. English colonists were already settled on Gardiner's island, and at Southampton and Southold, at the eastern extremity of Long Island (1639-40), and others in Westchester and the vicinity of New Amsterdam were invited to settle and many of them, and heads of families of New Amsterdam and its vicinity to assemble in the fort on a given day, this being the first official recognition of the existence of the people in New Netherland. When these freemen convened, they gave their opinion on the questions before them, and appointed twelve men to continue to represent their interests. These twelve men proceeded to demand certain reforms of government, but were reminded by the director that they had only been appointed to consider the Indian troubles. They were again called together in 1643, when larger liberties were accorded them, and finally eight men were elected by the director, who became an actual representative body. Gov. Stuyvesant continued this plan, by appointing nine men, who were "tribunes" of the people, to hold weekly courts of arbitration, and advise the director and council. Troubles afterwards grew out of the demands of the tribunes for burglar government, and these were referred to the states-general for decision, and a more liberal form of government was ordered, to which order Stuyvesant paid no attention. The Dutch governor continued to oppose the efforts of the people for greater liberty, until his forced surrender to the English cut short his prerogative. Under Nicolls and Andros, the people of New York found themselves in a worse position than under the Dutch governors, but gov. Dongan convened the first general assembly of the colony, which passed the act entitled "Charter of Liberties and Privileges granted by His Royal Highness to the Inhabitants of New York and its Dependencies," and by which legislative power was granted to the colony, James II, abolished this general assembly, and endeavored to unite all the colonies as the dominion of New England, under gov. Andros. William and Mary revived the general assembly, and granted to the people of New York a certain degree of freedom; but the struggle between the aristocracy and the people continued until the final revolution in all the colonies resulted in the expulsion of English authority. The provincial convention which met in New York, April 20, 1775, was the first organized body in the colony after the overthrow of royal authority, the latter having been declared to have come to an end in the colony on April 19. The first constitution of the state of New York was adopted April 20, 1777. The articles of confederation of the continental congress were ratified by the state, Feb. 6, 1788. The constitution of the United States was ratified by the state July 26, 1788. The present executive government of the state of New York comprises a governor, lieutenant-governor, secretary of state, comptroller, treasurer, attorney-general, state engineer and surveyor, superintendent of the bank department, superintendent of the insurance department, superintendent of public instruction, auditor of the canal department, superintendent of state prisons, superintendent of public works, besides the governor's staff, and various boards and commissions for charity, insane, quarantins, etc. The names of the governors of the state from 1777 to 1881, inclusive, in order, are as follows: George Clinton, John Jay, George Clinton, Morgan Lewis, Daniel D. Tompkins, De Witt Clinton, Joseph C. Yates, De Witt Clinton, Martin Van Buren, Enos J. Throop, William L. Marcy, William H. Seward, William C. Bouck, Silas Wright, John Young, Hamilton Fish, Washington Hunt, Horatio Seymour, Myron H. Clark, John A. King, Edwin D. Morgan, Horatio Seymour, Reuben E. Fenton, John T. Hoffman, John A. Dix, Samuel J. Tilden, Lucius Robinson, Alonzo B. Cornell. The legislative branch of the state government includes a senate and assembly; the senate consists of 32 members, elected in November of every alternate year (1881, 1883, etc.), holding their offices for two years from the first of January next succeeding. The state is divided into 92 senatorial districts, each electing one senator. The senators receive an

**Geography.—** The outlines of the state are exceedingly irregular, but its river, lake, and ocean boundaries are nearly all navigable, including 532 m. on the lakes; 2811/4 m. on the St. Lawrence, Poughkeepsie, Hudson, Kill van Kull, Delaware, and Niagara rivers; and 246 m. on Long Island sound and the Atlantic ocean. The total extent of the boundary-lines on the border of Canada, Vermont, Massachusetts, Connecticut, New Jersey, and Pennsylvania is 541.28 miles. The chief harbors are New York bay and harbor; Dunkirk and Buffalo, on lake Erie; Tonawanda and Lewiston, on Niagara river; Genesee, Sodus, Oswego, Sackett’s Harbor, and Cape Vincent, on lake Ontario; Ogdensburg, on the St. Lawrence; Rousé’s Point, Plattsburg, and Whitehall, on lake Champlain; and Sag Harbor, at the e. end of Long Island, with other harbors on the n. and s. shores of that island. The principal rivers are the Hudson, Mohawk, Oswego, Allegheny, Susquehanna, and Delaware, with numerous branches and tributaries. The state is noted for the number and beauty of its lakes, among which are the Catskill, Champlain, Hoosac, Canajoharie, Adirondack, Seneca, Cayuga, Otsego, Skaneateles, Cross, Ongondaga, Otisco, Cazenovia, Oneida, Otsego, Schuyler, Schenectady, George, Avalanche, Colden, Henderson, Sandford, Eckford, Racket, F. K. East, Newcomb, Long, Saranac (upper and lower), Tupper’s, Rich, Pleasant, besides the great lakes and lake Champlain. Three mountain ranges, entering the state from the s., cross it in a n.e. direction. The first of these, a continuation of the Blue Ridge, runs through Rockland, Orange, Putnam, and Dutchess counties, and forms the highlands of the Hudson. Its highest peaks are Beacon hill, Dutchess co., 1665 ft.; Bull hill, Putnam co., 1586 ft.; Batter hill, Orange co., 1292 ft.; Old Beacon, Putnam co., 1471 ft.; Crow Nest, Orange co., 1418 ft.; Bear Mount, Orange co., 1550 ft.; Anthony’s Nose, Putnam co., 1228 ft.; and Breakneck, Orange co., 1187 ft. The second range extends through Sullivan, Ulster, and Greene counties, terminating in the Catskill mountains on the Hudson. Its highest peaks are Round Top, 3,804 ft.; High Peak, 3,718 ft.; and Pine Orchard, 3,000 ft., all in Greene co.; and Rockland mound, 2,400 ft., and Walnut hill, 1890 ft., in Sullivan county. The Shawangunk mountains are the extreme e. spur of this range, and the Helderberg and Hellsburg mountains extend from it north into Albany and Schoharie counties. The third range extends through Broome, Delaware, Otsego, Schoharie, Montgomery, and Herkimer counties to the Mohawk; and reappearing on the n. side of that river, continues to lake Champlain, forming the Adirondack mountain region. Geographically, the Adirondack region is bounded by lake Champlain, the St. Lawrence, the Mohawk, and the Black rivers. This extensive territory contains the only great forests remaining as a public domain within the borders of the state. The first surveys of this territory were made in 1772, but it was precisely 100 years later that a systematic topographical survey of the entire region was undertaken by acts of the legislature. The Adirondacks are geologically described as "igneous, plutonic mountains—the
rocks generally metamorphic, granite, and gneiss, with feldspar and hornblende. The principal peaks are Mount Marcy, 5,002 ft.; Mount Clinton, 4,957 ft.; MacIntyre, 5,100 ft.; Wright; Skygulight, 4,997 ft.; Haystack, 5,006 ft.; Colden; Dix; Blue; Blue Ridge, 4,744 ft.; Giant of the Valley, 4,220 feet. The lake and river levels here have an altitude of 1500 to 2,000 ft., and the climate is much more severe than in the lowlands of the same latitude. Here are extensive beds of iron ore, some of which have been worked; the average annual yield of the entire region is 20,000 tons. The fauna of the Adirondacks is very rich, affording the panther, lynx, sable, ermine, deer, black bear, rabbits, squirrels, and birds in large variety. This part of the state is accessible from Saratoga by the Adirondack railroad, and stage from North Creek to Blue Mountain lake; thence by small steamboats to Raquette lake; also from Plattsburg to the Saranac lakes by railroad and stage.—Of cutrars in the state, Niagara Falls, in the outlet of the four great upper lakes, are 164 ft. high and 1100 ft. wide on the American side, and 2,000 ft. wide on the Canadian side; the total descent being 333 ft., and the width of the river below the falls 1000 ft. The Genesee river has a descent of 290 ft. in three falls within the space of two miles near its source, and there are other falls near Rochester with a descent of 200 feet. Trenton Falls is a succession of five cascades, having 200ft., of full in course of two-thirds of a mile. Cohoes and Little Falls, in the Mohawk, form grand cutarars in times of freshet. In the Catskills a small stream is precipitated down a ledge 180 ft. high.—The water-shed that separates the n. from the s. drainage of w. New York extends in an irregular line through the southerly counties. The country s. of this water-shed, embracing the most of the two s. tiers of counties, is nearly all a hilly country. North of the water-shed the surface descends in rolling and smooth terraces toward lake Ontario, the region between the hills of the s. and the level lands of the n. being a beautiful, rolling country. The river system of the state comprises that part drained by the great lakes and the St. Lawrence, northerly, and that drained by the Hudson and other rivers, southerly. The water-shed between extends irregularly from Lake Erie eastward through the s. tier of counties to the Adirondack mountains, lake George, and the state line, east.

Agriculture.—Most of the crops and fruits of the temperate zone can be raised in New York. More than half of the total area of the state is improved, and under successful cultivation.

The average value per acre of cleared lands in New York in 1880 was $58.48; the average value of timbered lands, $19.88; the average increase in value of both classes in one year being 4.7 per cent.

In the northern counties and the highland regions along the s. border and upon the Hudson, stock and sheep raising and dairy farming are pursued; while the lowlands that form the greater part of the surface of the w. portion of the state are best adapted to grain growing. Broom corn has long been the staple crop of the Mohawk valley intervals, tobacco being extensively raised in the Chemung valley and parts of Onondaga and Wayne counties; hops have been an important crop in Madison, Oneida, Oswego, and Schoharie counties; grapes have been successfully cultivated in the valley of the Hudson below the highlands, on the n. shore of Long Island, and in several of the lake valleys in the central part of the state. Maple sugar is an important product of northern and central New York; and fruits, including apples, peaches, pears, and strawberries, are largely grown in the western counties n. of the water-shed; while latterly peaches have begun to be an important crop in Ulster county. Large tracts of land in the vicinity of New York city, and particularly on Long Island, are devoted to market gardening and dairying, and the inhabitants supply milk, butter, cheese, eggs, vegetables and small fruit to the markets of the metropolis.
The climate of New York is varied, with a range wider than any other state. Those portions which are under the influence of the ocean, sound, and lake winds, are more even in temperature, and suffer less severely from the late frosts of spring and the early frosts of autumn, and from summer heats, than portions of the country in the same latitude not thus influenced. The mean temperature of the state, as determined from observations made during 25 years, is 46.49°F. The mean length of the season of vegetation from the first blooming of apples to the first killing frost is 174 days; though on Long Island it is 123 days longer, and in St. Lawrence co. 29 days shorter. The mean annual fall of water in rain and snow is 40.93 inches.

The principal mineral and medicinal springs of the state are the salt springs of Onondaga co., from which more than 7,000,000 bushels of salt are made annually; Seratoga springs; New Lebanon, and Stockport, Columbia co.; Massena, St. Lawrence co.; Richfield, Otsego co.; Avon, Livingston co.; Clifton, Ontario co.; Sharon, Schlarbarie co.; Chittenango, Madison co.; and Alabama, Genesee county.

Geology.—With few exceptions the later rock formations are not represented in New York, but a very complete series of the older groups are found, from the aozoic up to the lower members of the carboniferous. From n.e. New Jersey, extending over Rockland co., and terminating at the trap formation known as the Palisades, on the w. side of Tappan bay in the Hudson, is the red sandstone of the middle secondary. On the borders of the St. Lawrence and lake Champlain are some tertiary deposits of the pleistocene period; and the drift or boulder formation overruns the whole state, being developed over Long Island in beds of sand, gravel, and clays, so deep that the rocky ledges are everywhere concealed from sight, except at a few points where the gneiss is laid bare on the shore of the East river opposite New York island. The great metamorphic belt of the eastern states passes into New York all along its eastern line, and to the n. of the Mohawk river branches off over nearly all the rough country lying between lakes Ontario and Champlain. In this district are the Adirondack mountains. The granitic and phyllitic rocks of which they consist spread almost to the St. Lawrence, from which the tract is separated by a belt of the Potsdam sandstone, which passes through Potsdam in St. Lawrence co., and surrounds the great district of aozoic rocks on its n. and w. sides; and next to this, bordering the St. Lawrence, the silurian sand-rock overlies the Potsdam sandstone. The beds of Black river, and Trenton limestones of the next upper group of rocks lie in Jefferson co. on the e. end of lake Ontario, and along the s.w. border of the aozoic district through Lewis co. and into Herkimer county. The region thus surrounded is the great iron-ore district of n. New York. Beds of magnetic and specular iron ores are worked near lake Champlain, and in the s.w. part of St. Lawrence co.; and in the latter neighborhood are also the most promising lead mines c. of Wisconsin. The region e. of the Hudson river consists of the lower members of the New York system of rocks more or less metamorphosed, the sandstone passing into quartz rock; blue stratified limestone into the crystalline and white marbles; and the argillaceous slates of the Hudson river group into silicious, talcose, and micaceous slates. The unaltered Silurian rocks cross the Hudson river in a belt reaching from the lower corner of Dutchess co. to Rondout in Ulster co., and extend into the n.e. portion of New Jersey. The metamorphic formations, comprising the slates and gneiss with occasional beds of crystalline limestone or marble, occupy the counties of Putnam and Westchester. The s.w. New York island consists of gneiss, and the series of formations extends across Staten island, and reappears in the neighborhood of Trenton, N. J. Along its s.e. half this formation is covered by the secondary red sandstone, which from Tappan bay crosses Rockland co. and New Jersey into Pennsylvania. This group contains valuable beds of hematite iron ore. In the highlands are also many beds of magnetic iron ore, and there are numerous beds of white marble. It is in the Hudson river slates or lower Silurian limestones that the mineral springs of Bath, Saratoga, and Sharon are found. In Delaware, Greene, Sullivan, and parts of Ulster and Broome counties the red and gray sandstones of the Catskill group overlie the Portage and Chemung series of sandstones, slates, and shales; and upon some of the Catskills, and at a few points in Delaware and Sullivan counties, the millstone grit or conglomerate, which forms the top of the coal formation, caps the highest summits. Only about 100 ft. more of height was needed to reach one or more of the lower coal-beds, and this is as near the carboniferous formation as is reached in New York, though in Pennsylvania coal-beds are formed within 6 m. of the state line. The Portage, underlying the shales of the Chemung, is composed of thin-bedded gray and bluish close-grained sandstones. These are quarried in Ulster, Greene, Albany, and Saratoga counties, and to the amount of several million ft. annually are sent to New York for flagging. This formation also yields grindstones. In the w. part of the state the sandstones are bituminous; and at a number of places in Alleghany, Cattaraugus, and Chautauqua counties, springs of petroleum issue from the rocks of this group, sometimes accompanied by jets of carbureted hydrogen gas. The rock formations from the Potsdam sandstone up, with their various subdivisions, constitute what is known as the New York system, and with the carboniferous group constitute the Appalachian system. In this state the formations below the carboniferous are very fully developed, and are particularly rich in fossils. At Trenton falls, the ravine is cut through the Trenton limestone formation of the transition period, which contains trilobites, nautili, and other fossils of interest.
New York.

The population of the state by the census of 1880 was 5,083,810. The following table shows the changes and the classification of the population since 1790:

</table>

In 1878 the report was as follows: Number of school districts, 11,270; school-houses, 11,824: teachers, 30,56; children of school age, 1,615,256; average daily attendance, S77,606: expenditures, $11,739,627.67; value of school property, $30,147,580. In 1879 the
New York. The most important city and sea-port of the United States, and the third in the civilized world, is situated on the east side of the mouth of the Hudson river, at its confluence with a narrow strait called East river, which opens into Long Island sound, in the state of New York, 18 m. from the ocean. Lat. 40° 42' 43'' n., long. 74° 0' 3'' west. The city comprises the island of Manhattan, formed by the Hudson river and the East river, and separated from the main-land by a narrow strait called Harlem river, on the e., and on the w. by Spuyten Duyvel creek; includes several smaller islands, containing the fortifications in the harbor, and the public institutions in the East river; and also part of the main-land n. of Manhattan island. The island on which the city is built is 13½ m. long, and with an average breadth of 1½ of a mile, comprising 32 sq. miles. The compactly built city extends five m. from the “battery” at its southern point, and is laid out regularly into 144,486 lots. Avenues 100 feet wide and 8 miles long, in straight lines, are crossed at right angles by streets from 60 to 100 feet wide, extending from river to river. The city is connected with the main-land of New York by bridges across the Harlem river, with Long island by a fine suspension bridge, and with New Jersey, Long island, and Staten island by numerous steam-ferries. Several railways radiate from the city, while the finest passenger steamboats in the world pass up the Hudson, Long Island sound, and down the Narrows, through the lower bay. The harbor, formed by the upper and smaller bay, with its two arms, which almost inclose the city, is one of the finest in the world. There are 80 piers for shipping on the west, and 70 on the east side of the city. The harbor is defended by fourteen forts, mounting 1500 guns. The streets are traversed by many city omnibuses and tramsways, which carry millions of passengers annually.

The city is built of brick, brown sandstone, and white marble. Among its finest edifices are the city hall, custom-house, Trinity church, Grace church, two universities, cathedral, academy of music, Cooper institute, and the numerous great hotels, several of which have accommodation for more than a thousand persons. Of 331 churches, 73 are Protestant Episcopal, 41 Roman Catholic, and the others of all denominations. In 1873 there were 223 public schools and 17 corporate schools with 239,513 pupils, and the college of the city of New York, formerly the free academy. Besides, there are 35 Roman Catholic schools, and colleges and academies of the religious orders. Columbia college is one of the oldest in the country; the university of the city of New York has been more recently established. Each has departments of law and medicine, and there are two other medical colleges, several theological seminaries, and many private academies. The hospitals and institutions of charity are on a liberal scale; and besides legal outdoor relief, the poor are visited and cared for by a public society, with agents in every district. Among the charities are asylums for insane, blind, deaf and dumb, magdalens, foundlings, etc. The Astor free library, founded by John Jacob Astor, has 150,000 carefully selected volumes; the mercantile library, 150,000 volumes, with a large reading-room; society library, 64,000; apprentices' library, 50,000, with rich museums of antiquities; the Cooper institute, a present to the city by Peter Cooper, has a free reading-room, picture-gallery, art-schools, etc. Annual art exhibitions are given by the national academy of design, Dusseldorf, and international galleries. The academy of music, or opera-house, has seats for 4,700 persons, and eight or ten theaters give nightly entertainment to 20,000. The Central park, laid out in the finest style of landscape-gardening, is two and a half miles long by three-fifths of a mile wide. Eighteen smaller public parks are scattered over the city. The Croton aqueduct brings a river of pure soft water from 40 miles distance, which is received in reservoirs of a capacity of 1,500,000,000 gallons, and distributed through 370 miles of pipes, with such a head as to sup-

*Estimated.*
ply public fountains of 60 and 90 feet jet, and the upper stories of most buildings. Eleven markets supply annually 140,000,000 lbs. beef, 25,000,000 lbs. mutton, 50,000,000 lbs. pork, and immense quantities of poultry, game, fish, oysters, fruits, and vegetables. The city government is composed of a mayor, boards of aldermen and councilmen, and bureaux of various departments. The police numbers about 2,500, with salaries of $800 to $7,500 a year. The stations are connected by telegraph, and have lodgings for destitute persons. A sanitary squad has charge of the public health. The commission for charity and correction has direction of asylums, hospitals, and prisons. Commissioners of emigration receive and attend to the wants of immigrants. The volunteer brigade of firemen has been replaced by a paid fire department, which is found to be much more effective for the protection of property. It consists of upwards of 700 men, with above 40 steam fire-engines, and a large number of telegraph stations.

New York is the great center of American finance and commerce. It receives 66 per cent of all imports, and sends out 50 per cent of all exports. The total value of imports in 1873–74 was $350,133,622; of exports, $554,993,732. Vessels entered, 6,723, of 5,049,618 tons; cleared, 6,106, of 4,837,218 tons. The total number of vessels belonging to the port of New York was 6,630, of 1,318,523 tons. There were, in 1879, 7,624 manufacturing establishments, employing 129,577 hands, the cost for wages being $63,884,049, and the value of products, $832,951,520. The assessed value of real and personal estate in 1875 was $1,134,029,176. The number of immigrants that arrived in New York during the year ending June 30, 1874, was 269,814.

New York, the Nieu Amsterdam of the Dutch, was founded in 1621; in 1664 it was taken by the English. At the period of the revolution it was smaller than Philadelphia or Boston; but increased in importance, especially after the completion of the Erie canal had opened to it the commerce of the west. In 1789, 2,086 persons died of yellow fever; in 1832, 3,513 of cholera; in 1845 a fire destroyed a large portion of the business part of the city, with a loss of $180,000,000. In 1741, in consequence of a supposed negro plot to burn the city, 13 negroes were burned at the stake, 20 hanged, and 78 transported. In 1863, in a riot caused by the conscription, the popular fury again turned against the negroes, and numbers were murdered.

NEW YORK, co. N.Y. (See New York, city.)

NEW YORK (state). The city of New York, which formerly comprised only Manhattan and other islands, was extended by legislative act, taking effect Jan. 1, 1874, to include the following villages of Westchester co., on the mainland: Morrisania, West Farms, Kingsbridge, Mott Haven, North New York, Port Morris, Melrose, Woodstock, Highbridgeville, Claremont, Tremont, Mount Hope, Mount Eden, Farmount, Belmont, Fordham, Williamsbridge, Spuyten Duyvil, Moshoron, Riverdale, and Mount St. Vincent. Its present boundaries are Yonkers on the n., the Bronx river and the East river on the e., the bay on the s., and on the w. the Hudson or North river. It extends 16 m. n. from the Battery, is 4½ m. wide at its widest part, and has a total area of 41½ sq. m., or 26,500 acres.—That part of the city comprised by Manhattan island is connected with the mainland by, 1, an iron drawbridge from 34th avenue, called Harlem bridge; 2, the railroad bridge at 41st avenue of the New York Central and Hudson River railroad, and the Manhattan bridge and Harlem and the New York and New Haven railroads; 3, Central, formerly McComb's Dam, bridge, 4, King's bridge, at the point of meeting of Harlem river and Spuy- ten Duyvel creek; 5, High bridge. The latter is the way by which the Croton aqueduct crosses the Harlem river at 175th street. It is 1460 ft. in length and 116 ft. at its highest elevation above the surface of the highest river. The water crosses it in great pipes made of cast-iron, and built into brick masonry. At the lower end of High bridge is an engine-house and a tower for high-water service. New York is connected with Brooklyn and other places on Long Island by numerous ferries, over which it is estimated that 75,000,000 persons cross annually. To relieve the ferry traffic the East river suspension bridge was undertaken by a company formed in 1859, with a capital of $70,000,000; to which the legislature of the state permitted the city of New York to add $8,000,000, and the city of Brooklyn $4,500,000—in all a capital of $5,000,000; see Bridge. Between New York and Jersey City, on the w. bank of the Hudson, a comprehensive ferry system is sustained, which is to be relieved by the tunnel under the Hudson river, now being constructed; see Tunnels. New York is also connected with Wolken, N. J., and with various points on Staten Island by lines of ferry-boats.—Piers. There are 123 piers or wharves, of which number 63 are on the Hudson and 70 on the East river. From the piers on the North river steamers sail coastwise to the West Indies, to Great Britain and the continent of Europe, and to Boston, Halifax, N. S., Albany and other points on the Hudson river, and New Orleans. From the East river side steamers sail coastwise to English and Scotch ports, to Philadelphia, to points on Long island, and to Portland, Me., New Bedford, Mass., and points on the sound, Connecticut river, and Narragansett bay. On this side, also, are the balance, sectional, and screw dry docks, and the New York city pumping-gardens. At the piers on both sides, also, is accommodated the enormous sailing commerce of the metropolis.—Railroads. Three railroad lines terminate within the city limits: the New York Central and Hudson River, the New York and Harlem, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Centre street, and the New York, New Haven and Hartf
New York.

York Central and Hudson River a depot for local trains at 30th street and 10th avenue, and a freight depot at the former site of St. John's park. All other railroad lines terminate in Jersey City and Hoboken, N. J., excepting the New Jersey Southern, which has its depot at Sandy Hook, connecting with the city by steamboat, and the Long Island railroads, which terminate at Hunter's Point, L. I., connecting with the city by ferry.

**Streets.** There are 378 named streets, places, courts, avenues, and boulevards, 168 numbered streets, 13 numbered avenues, and 5 avenues designated respectively A, B, C, D, and E. The numbered cross-streets are designated e. and w. from 5th avenue, each avenue beginning a new hundred numbers. —**Churches.** There are 572 churches, synagogues, chapels, and meeting houses, of which 91 are colored Methodist Episcopal, 2 Friends meeting houses, 26 Jewish synagogues, 21 Lutheran, 50 Methodist Episcopal, 42 Presbyterian, 72 Protestant Episcopal, 19 Reformed Dutch, 55 Roman Catholic, 3 Unitarian, 6 United Presbyterian, 4 Universalist, 3 Baptist, 6 Congregational, 5 Reformed Presbyterian, miscellaneous, 20. —**Libraries.** The public libraries include the **Apprentices'**, Astor, Bar Association, City, Cooper Union, American Institute, Mercantile, Harlem, Historical Society, Law Institute, Lenox, Mott Memorial, New York free circulating, Society, Printers', Woman's, and Young Men's Christian Association; see Libraries. —**Theaters.** The theaters include Aberle's, the Academy of Music, Bijou opera house, Daly's, Fifth Avenue, Germany, Glee, Grand Opera House, Harry Miller's, London, Havrely's 14th street, Havrely's Ribno's Garden, Madison square, Aquarium, Park, San Francisco ministers, Stoddard, Standard, Thalia, Theater Comique, Tony Pastor's, Union square, Wallack's, Wylie and Noyes, Century, Town Hall, Hay, Knickerbocker, Lotos, Manhattan, Merchants, New York, Press, Bouquet, St. Nicholas, Union, Union League, and University. —**Parks.** Besides the Central park there are the Riverside, Battery, City hall, Gramercy, Morningside, Madison, Stuyvesant, Jackson, Abingdon, Union, Reservoir, Washington, Mount Morris, and Tompkins squares, and Bowling Green. Central park was begun in 1858, that portion of the city being included which lies between 59th and 109th streets and between 5th and 8th avenues, and containing 840 acres, of which about one-half is woodland, the remainder being laid out in lawns, driving and bridle roads, gardens, pasture, play ground, etc.; there are two extensive lakes, with rustic bridges, used for boating in summer and skating in winter, covering 25 acres, and four smaller sheets of water, comprising in all as much more. —**Metropolitan Museum of Art.** This institution was founded in 1870, "for the purpose of establishing a museum and library of art, of encouraging and developing the study of the fine arts, of the application of art to manufactures and to practical life, of advancing the general knowledge of kindred subjects, and, to that end, of furnishing popular instruction and recreation." The number of members of the corporation is limited to 250; the trustees, 21 in number, holding office for 7 years, the term of office of 3 of the number expiring every year. The museum was at first in a building in 5th avenue, between 53d and 54th streets; afterwards removed to the Douglas mansion in 14th street, where it remained until 1879–80, when it was permanently placed in the building erected for it by the park department in the Central park, at a cost of $500,000. This building was opened Mar. 30, 1889, by the president of the United States. It is situated in Central park, at 5th avenue and 82d street; is built in modern Gothic style, of red brick, with sandstone trimmings; is 218 ft. long and 83 broad, facing to the east. It contains the Blodgett collection and library of art, of encouraging and developing the study of the fine arts, of the application of art to manufactures and to practical life, and of advancing the general knowledge of kindred subjects, and, to that end, of furnishing popular instruction and recreation." The number of members of the corporation is limited to 250; the trustees, 21 in number, holding office for 7 years, the term of office of 3 of the number expiring every year. The museum was at first in a building in 5th avenue, between 53d and 54th streets; afterwards removed to the Douglas mansion in 14th street, where it remained until 1879–80, when it was permanently placed in the building erected for it by the park department in the Central park, at a cost of $500,000. This building was opened Mar. 30, 1889, by the president of the United States. It is situated in Central park, at 5th avenue and 82d street; is built in modern Gothic style, of red brick, with sandstone trimmings; is 218 ft. long and 83 broad, facing to the east. It contains the Blodgett collection and library of art, of encouraging and developing the study of the fine arts, of the application of art to manufactures and to practical life, and of advancing the general knowledge of kindred subjects, and, to that end, of furnishing popular instruction and recreation. —**The Museum of Natural History.** Incorporated by the state legislature in 1869; opened to the public in its present building, Central park, 21st street and 7th avenue, on Dec. 22, 1877. It is built of red brick, with yellow sandstone trimmings, in the modern Gothic style. The collection comprises mounted specimens of mammalia and birds; archaeological specimens, including the De Morgan collection of stone implements; the Snyder and Davis Mississippi valley collection; geological specimens of New York state; building stones, marbles, woods, wax fruits, etc.; admission free. —The art galleries comprise those of the academy of design (where exhibitions are made); the Metropolitan museum and Lenox library; the American art gallery (Kurtz's) in 23d street; galleries of Knodler, Avery, Schaus, Cottier, Reichert, and Kohn, dealers in paintings, and the private galleries of leading citizens, which can generally be inspected on proper introduction. —**Banks.** There are in New York 46 national banks, 22 state banks, 25 savings banks. —There are 38 hospitals and 23 dispensaries and infirmaries. The number of benevolent societies and other similar institutions is 125, public and private.

**Education.** —The New York public school system is under the general control and direction of the board of education, supplemented by trustees and school inspectors. The board is composed of 21 members, appointed by the mayor, who are called commissioners, and who appoint 3 trustees in each ward, the mayor appointing 3 inspectors in
New York.

588

each school district; the rooms of the board of education are at 146 Grand street. The whole number of public schools is 305, the attendance being about 275,000 children, taught by 3,275 teachers, at an annual expense of $3,300,000. The classification of all the schools in the city is as follows:

| College of the city of New York | 1 |
| Normal school and training school | 1 |
| Seminary, normal school for females | 1 |
| Grammar schools for males | 46 |
| " " females | 46 |
| " " both sexes | 12 |
| Primary departments of grammar schools | 67 |
| Primary schools (separate) | 46 |
| Colored schools | 5 |
| Corporate schools (industrial, reformatories, orphan asylums, etc.) | 47 |
| Evening schools, including evening high school | 32 |
| Nautical school (ship St. Mary’s) | 1 |

Total | 305 |

The evening schools supply instruction to about 20,000 children and others who are obliged to work during the day. The salaries paid to teachers vary between $600 and $3,000 per annum. The college of the city of New York was established in 1814, and until 1866 was known as the New York free academy. The members of the board of education are ex officio trustees of the institution. It is open only to pupils from the public schools who have been in attendance at least one year. The faculty comprises a president, 14 professors, and 19 tutors. The students in the introductory classes number about 600, and those in the college classes about 450 each year. The college confers the degrees of B.A., M.A., B.S., and M.S. The buildings are on Lexington avenue and 33d street, massively built of brick, and valued at $150,000; they contain a library, natural history cabinet, and scientific apparatus, the whole valued at $75,000. The annual cost of maintaining the college is about $150,000. The normal college for women is on 60th street, between Lexington and 4th avenues. The building is 300 ft. long and 125 ft. wide, fronting on 4th avenue. It contains 80 recreation rooms, 3 large lecture rooms, a library, calisthenium, retiring rooms for instructors, president's offices, and a main hall to seat 1600 persons; its cost was $650,000. There is also a model or training school for practice. The main building is very striking, built in the secular Gothic style, with high tower. This college is under the control of the board of education, being a part of the public school system; its object is to prepare teachers for the common schools. About 1600 pupils are usually on the roll, the curriculum including Latin, physics and chemistry, German, natural science, French, drawing, and music. The cost of maintaining this institution is about $100,000 per annum. Other institutions of learning in the city are Columbia college, the university of the city of New York, and the medical, law, and theological schools and seminaries. Columbia college, originally King's college, was chartered in 1754, and at first supported from funds raised in England for the purpose. The corporation of Trinity church erected the first college building on the church lands between College place and the Hudson river. It was finally erected in 1795. In 1865 the charter was amended three years later, vesting the management of the college in a self-perpetuating body of 24 trustees, under which direction it still remains. About 1850 the old buildings were surrendered, and the college removed to its present site on Madison and 4th avenues, 49th and 50th streets. The college is under the control of a president and about 60 professors; the students reside at their homes. The departments are the academic, the school of mines, and the law school, the latter being in a building corner of Lafayette place and Great Jones street. The university of the city of New York is comprised in the university building on Washington square, and the medical college building on E. 26th street, opposite Bellevue hospital. The university was chartered in 1830, and is non-denominational. The building is a handsome Gothic structure of white freestone. The income is about $40,000 annually. Instruction in the departments of the arts and sciences is given free of charge, the course being 4 years; that of law is 2 years. The average number of students is 500. Examinations are held each year on the Tuesday preceding the commencement in June, and that preceding the opening of the first term in September, in the departments of arts and sciences. No examination is required for the other departments, their year beginning on the first Monday in October. The regular medical schools or colleges are Bellevue hospital medical college, the College of physicians and surgeons, and the University medical college, the second of these being the medical department of Columbia college. Bellevue hospital medical college is situated within the hospital grounds, at the foot of E. 26th street. It was founded in 1861, is independent of the city colleges, and is under the control of the commissioners of public charities and corrections, who are ex officio members of the board of trustees. The applicant for admission must be 18 years of age, but there are no other requirements. Graduation takes place after 3 years' study of medicine under a regular physician in good standing,
New York.

Attendance on two full courses of medical lectures (the last being in the college), attendance on one course of instruction in practical anatomy or dissections, proper testimonials of character, a written thesis, and examination in the practice of medicine, surgery, obstetrics, materia medica, physiology, anatomy, and chemistry. The fees in all amount to $185. The number of students is about 500, and the college ranks high in general estimation. The Protestant Episcopal theological seminary is situated in what is known as Chelsea square, between 9th and 10th avenues and 20th and 21st streets. It was founded in 1819 and chartered in 1832. The governing body comprises all the bishops of the church, ex officio; 1 trustee from each diocese, and 1 additional for every 8 clergymen in the same; 1 more additional for every $2,000 of money contributed, until the same amounts to $10,000, and then 1 more additional for every $10,000.” The faculty consists of a dean and staff of professors, and the course of study lasts 3 years. The Union theological seminary is on University place, between Waverley and Clinton places. It was founded in 1836, and is governed by a board of trustees, consisting of 28 members of the Presbyterian church, one-half clergymen and one-half laymen. The seminary course occupies 3 years. The library has 35,000 volumes, and as many pamphlets, and is very valuable.

Fire Department.—This department consists of 3 commissioners, appointed by the mayor, and confirmed by the board of aldermen, and holding office for 6 years. The president of the board receives a salary of $7,500, and the others $5,000 each. The machinery of the department includes 43 steam fire-engines, 4 chemical engines, and 18 book and ladder trucks; there are 12 fuel depots, 7 bell-towers and lookout stations, repair-shops, hospital, stables, etc. The department comprises 892 men, of whom about 750 perform active service. About 600 fire-alarm boxes are scattered over the city. The expense of the department is about $1,250,000 annually. The relief and life insurance fund of the department had on hand at the close of 1880 the sum of $450,072.88; the receipts during the year were $54,696.44; the disbursements, $57,192.63. Following is a table of fire statistics for 15 years:

The health department is under the direction of a board of health, which has charge of all sanitary matters pertaining to the city government (excepting street cleaning), and which records the births, marriages, and deaths within the city limits quarterly. During the quarter ending Dec. 31, 1860, the number of persons registered as married was 5,218, and the number of children born was 7,017.

The population of the city by the U. S. census of 1880 was 1,206,577. During the year 1880 the number of deaths was 31,957, an increase of 3,505 on the previous year; the number of deaths, in proportion to the population, was 29.47 in every 1000; 26.37 for the white population, and 33.87 for the colored. The annual death-rate per 1000 for previous years was: 1879, 25.82; 1878, 24.03; 1877, 24.50; 1876, 27.62; 1875, 29.47; 1874, 28.94; 1873, 29.68; 1872, 33.96; 1871, 28.26. Following is the table of diseases causing death for 1880, showing the comparative mortality according to sexes:

</table>

The number of deaths from suicide in 1880 was 152, of which 121 were male and 31 female; 34 single, 74 maried. Nativity: United States, 55; Germany, 64; Ireland, 20; Switzerland, 3; France, 7; Poland, 3; Scotland, 3; Italy, 3; England, 5. The means employed were:

- Gun and pistol .................................. 39
- Drowning ........................................ 14
- Hanging ......................................... 28
- Cuts and stabs .................................. 20
- Leaps from windows, etc. ........................ 9
- Inhalation of coal gas .......................... 2
- Poison .......................................... 40

The deaths of children under five years of age were 14,650, or nearly one-half the entire mortality, the number being almost equally divided between males and females.

The building department supervises the erection of new buildings and additions to old structures within the city limits. The superintendent of buildings is nominated by the mayor, and confirmed by the board of aldermen, for a term of 6 years; salary, $6,000.

The following are the statistics of building in New York during the past 4 years and in 1871, showing the number of new buildings erected in each ward for each year, from the annual report of the superintendent of buildings:

**Cemeteries.**—Intra-mural interment, except in certain specified instances, being prohibited by law in New York, the city’s dead are buried in the following cemeteries: Calvary, Cypress Hills, Evergreens, Greenwood, Lutheran, Machpelah, Maple Grove, Marble, New York Bay, Trinity, Union, Washington, and Woodlawn. The last-named is at Woodlawn station, on the Harlem railroad, in the 24th ward; Trinity is at 153d street and 10th avenue; Marble is in 2d street: these three are exempted from the law regarding city burial. Of the remainder, Machpelah and New York Bay are in New Jersey, and the others on Long Island.

**City Railroads.**—The surface (horse) railroads include the Broadway and University place, to Central park; Broadway and Broome street, to Broadway and Barclay street; Bleecker street, from Fulton ferry to 23d street ferry; Belt line, from South ferry around the city by 59th street, and return; City hall, Avenue B, and 54th street; Dry Dock and East Broadway to 22d street ferry (east side); Eighth avenue, from Broadway and Vesey street to Central park; First and Second avenue, Peck slip to 18th street; Fourth avenue and Madison avenue, City hall to 80th street; Ninth avenue, Broadway and Fulton street to 55th street; Seventh avenue, Broadway and Park place to Central park; Sixth avenue, Broadway and Vesey street to Central park; Third avenue, Astor House to Harlem; and 11 cross-town lines.—**Elevated Railroads.** These are all in the hands of one company, the N. Y. Elevated Railroad Company, and include the Ninth avenue line, from South ferry to 59th street; Second avenue, from South ferry to Harlem; Sixth avenue, from Rector street to the Harlem river; Third avenue, from City hall to Harlem river.—New York is lighted by gas supplied by the following companies: New York, Manhattan, Metropolitan, N. Y. Mutual, Harlem, Central, Northern, and Yorkers. The number of street lamps burning Sept. 30, 1880, was 4,455.—The number of hotels in the city is 63; of apartment houses, 44.—The number of the police force excluding superintendents, Dec. 31, 1880, was 2,510.—*The police department is governed by a board of four commissioners, appointed by the governor with the concurrence of the board of aldermen; removable (for cause) by the mayor, with the concurrence of the governor of the state. They receive an annual salary of $8,000 each, excepting the person whom they choose to be president of the board, who receives $8,000. The commissioners appoint all the members of the force, including 1 superintendent and 4 inspectors, and make all promotions and dismissals after trial. The city is divided into 30 precincts; each of which has a suitable building, and is under the command of a captain, assisted by a sufficient number of sergeants and roundmen. Patrolmen receive $1000 per year salary; roundmen, $1200; sergeants, $1500; and captains, $2,000.—*The public markets, under the general direction of a superintendent, are the following:* Catharine, foot of Catharine street, East river; Central, E. 43d street, opposite Park avenue; Centre, Centre street, from Grand to Broome; Essex, Grand street, from Laubod to Essex; Fulton, Fulton, Beekman, South, and Front streets; Fulton fish, South street, opposite Fulton market; Jefferson, Greenwich and 6th avenues, and W. 10th street; Tompkins, 3d avenue, between 6th and 7th streets; Union, Houston and 2d streets and Avenue D; Washington, Washington, West, Vesey, and Fulton streets; Market-wagon stand, West, Little 12th, Washington, and Gansevoort streets, for farmers’ wagons, and buyers of produce.—*Miloh.* The first division, national guard, state of New York, comprises the city militia organization, including 9 regiments of infantry, one regiment and a separate troop of cavalry, and 3 batteries of artillery, a complement of 6,600 men, thoroughly drilled and equipped. The division headquarters is at 155 Mercer street; and the ordnance department and quarter-master-general’s department of the state in the arsenal, corner 7th avenue and 35th street.—*Newspapers and Magazines.* The number of morning papers published in the city is 21: there are 8 evening papers, 11 semi-weekly, 195 weekly, 4 bi-weekly, 22 semi-monthly, 172 monthly, 11 quarterly.—*Post-office.* Besides the general post-office in City hall park, there are 19 sub-stations in different parts.
of the city, and 1000 lamp-post boxes, from which collections are made 7 times daily, except Sundays. Eleven of the sub-stations are designated by the letters of the alphabet, and the remainder by the names of the suburban villages in which they are situated.—

Prisons. Each police-court has connected with it a prison, viz.: the Tombs, or city prison, in Centre street; Essex Market, in Essex street, between Grand and Broome; Jefferson Market, 6th avenue and W. 10th street; Yorkville, 5th street, between 3d and Lexington avenues; Harlem, 125th street, between 3d and Lexington avenues; and Fordham, Ludlow street jail is used for prisoners from the federal and state courts.

The Stock Exchange is a fine white marble building in Broad street, near Wall, extending back to New street, and having an extension to Wall street. Seats in the exchange are now worth $25,000; only members are allowed on the floor. The heirs of every deceased member receive $10,000, without deduction, from the gratuity fund established by the exchange. There are 1056 members: about 300,000 shares of stock are bought and sold daily, and the amount of the business of each day is about $4,500,000, of which one-third is government bonds.—Among the important buildings deserving notice is St. Patrick's (Roman Catholic) cathedral, occupying the block on 5th avenue between 50th and 51st streets. The building was projected by archbishop Hughes about 1850, and the plans drawn by James Renwick: the corner-stone was laid Aug. 15, 1858, and it was dedicated by cardinal McCloskey, May 25, 1879. The architecture is of the 13th century style, the ground plan being in the form of a Latin cross. The dimensions are: interior length, 306 ft.; breadth of nave and choir, 96 ft., with the chapels, 120 ft.; length of transept, 140 ft.; height, 108 ft.; height of side-aisles, 54 feet. The 5th avenue front comprises a central gable 158 ft. in height, with towers and spires, each to be 300 ft. high. The building is of white marble, with a base course of granite. The roof is supported in the interior by white marble columns 35 ft. high and 5 ft. in diameter; the gable is groined and richly ornamented; the organ-loft is 46 ft. wide and 28 ft. long, of ash, richly moulded; the high altar is 40 ft. in height. Total cost about $2,500,000.—The building of the Young Men's Christian association, 4th avenue and 23d street, was erected in 1869, and cost $500,000. It is French Renaissance in style, 5 stories high, 175 ft. front and 86 ft. depth. The association was organized in 1852, and furnishes a reading-room, lectures, concerts, and evening classes in languages and other branches to its members; subscription, $5 per annum.—Castle Garden, originally a fort, and later and for many years a place of amusement, is now used as a depot for emigrants, for which purpose it has been employed since 1855. It is situated in the Battery park, at the extreme southern end of Manhattan island, convenient for foreign steamer and shipping. It contains at times as many as 1000 immigrants. The business of receiving and caring for, and over their destination to their destination to the immigrants is in charge of 7 commissioners of emigration, 5 of whom are appointed by the governor of the state, the other two being the presidents of the Irish and German emigrant societies, ex officio, and these have entire control of the emigrants arriving at this port. During the year ending Dec. 31, 1850, 372,880 persons arrived at this port, of whom 320,907 passed through Castle Garden. Their destinations were: eastern states, 63,398; western states, 112,119; southern states, 6,497; New York state, 137,561; Canada, 16,27.

Law Courts.—The first court of law was established in 1626; and this Dutch court was continued in New York until 1666, when it was abolished by the English governor, and superseded by one composed of the mayor, aldermen, and sheriff, and known as the mayor's court; and this continued in existence until 1821, when it was changed to the court of common pleas. The superior court was created in 1828, with a chief justice and two associates. The assembly which convened in 1691 created the courts of justice of the peace, and the court of general sessions; also the present supreme court, the court of oyer and terminer being the criminal circuit of the latter. The constitution of 1846 created the present court of appeals. The courts now in existence are: the U. S. circuit court, the U. S. district court, the supreme court, court of common pleas, superior court, court of arbitration (established in 1875), the district courts (of which there are ten), oyer and terminer, special sessions, and six police courts. The law department of the city government is in charge of the corporation counsel, who is appointed by the mayor, confirmed by the board of aldermen, and receives a salary of $15,000 per annum. Under him are the corporation attorney, salary $6,000; and the public administrator, $5,000.

Government.—Under the charter passed April 30, 1873, the government of the city is vested in the “mayor, aldermen, and commonalty of the city of New York.” The legislative power is vested in a board of 22 aldermen, holding office for a term of one year from Jan. 1, after election at the general election in November. The executive power is vested in the mayor and heads of departments appointed by the mayor, and confirmed by the board of aldermen, for a term of six years (except in special cases). The mayor is elected at the November general election for a term of two years. The departments are those of finance, law, police, public works, parks, docks, charities and corrections, fire, health, taxes and assessments, and buildings. The salary of the mayor is $12,000, and that of each alderman $4,000 per annum. The finance department is under the direction of the comptroller, who receives a salary of $10,000 per annum. The city chamberlain receives a salary of $50,000, out of which he pays all the expenses of his office. This department has control of all the fiscal concerns of the
corporation. The total cash payments from the city treasury during the year ending Dec. 31, 1880, amounted to $50,734,929.04; leaving a cash balance of $1,870,549.93. The total receipts from taxes for the year were $27,712,846.01; the assessed value of real estate in the city for 1880 was $942,571,690, an increase over that of 1879 of $24,437,310. The total bonded debt of the city outstanding, Dec. 31, 1880, was $133,535,019.87. The total valuation, real and personal, for 1880, was $1,148,765,727.09. The assessments upon the shareholders of banks since 1873 have been as follows:

<table>
<thead>
<tr>

</table>

The number of pieces or plots of real estate upon the assessment rolls was, in 1878, 151,638; in 1879, 151,620; in 1880, 152,400. The number of names on personal books in 1880 was 14,764; the number of shareholders of banks, 39,888. The commissioners of public charities and correction, three in number, appointed by the mayor and confirmed by the board of aldermen, have charge of all applications for relief, or admission to hospitals, almshouses, and nurseries, and voluntary committals to the work-house. The last report of the commissioners is for the year 1878, and shows expenditures for the year, $1,154,619.23. The total number of persons received in the department was 98,184, the average census being 10,454, nearly all passing through the city prisons and Bellevue hospital. The department of docks consists of three commissioners, appointed by the mayor and confirmed by the board of aldermen, for a term of six years, the president of the board receiving a salary of $6,500 per annum, and the other commissioners $3,000 each. The board has charge of renting, building, repairing, etc., the piers and bulkheads along the city water-front. The annual report of the department for the year ending April 30, 1880, shows an expenditure of $599,768.63; the receipts being $899,215.41. The total receipts during the past ten years were $6,128,229.41; the total expenditures for the same period, $7,239,670.17. The city water-front is divided into ten districts, each of which is in charge of a harbor-master, under the supervision and control of the captain of the port; these harbor-masters have charge of the assignment of piers. The port wardens make surveys of vessels deemed unseaworthy, and of damaged cargoes; and also valuations and measurements of vessels and cargoes. Pilots are licensed by the board of commissioners of pilots, and are authorized to demand fees for pilotage, and half-fees where their services are offered, whether accepted or refused.

History.—The history of the city is that of the state until the beginning of the 18th century. See New York, state. At the close of the 17th c. there were not more than 800 dwelling-houses, and about 5,250 inhabitants, white and black, the latter being in the proportion of about one in six. The first Trinity church was built in 1696; and about 5 years later Wall street had been paved; the city was policed by regularly appointed watchmen; and (in 1711) a slave-market was established. The first Presbyterian church was built in 1719; the first newspaper in the city, the New York Gazette, was established in 1725; and a few years later communication with Boston was furnished regularly by stages, which occupied two weeks in making the trip. Severe epidemics of measles and malignant pleurisy are noted as having been very destructive of life during the first quarter of this century; and a pestilential fever, brought from St. Thomas, carried off 1 in 10 of the population in 1702. Zenger's Weekly Journal, which was founded in 1733, was prosecuted for libel two years later, and Zenger himself imprisoned—the first attack on free speech in the country. The trouble grew out of a quarrel about a claim for fees between an outgoing and an incoming governor of the colony. The year 1714 brought pestilence, a great fire, and the extraordinary so-called negro plot. See New York, city, ante. The first theater in the city was established in 1750: five years later St. Paul's church was erected. In that year was the popular excitement over the stamp act, which act was publicly burned, and the colonial congress assembled in the city. The year 1763 saw the organization of the sons of liberty, and the movement for freedom from the mother country was fully begun. In 1770 the statue of George III. in the Bowling Green was destroyed, and the obnoxious duty on tea was resisted; though it was not until 1774 that a ship laden with tea was sent back to England, 18 chests which had been secretly landed being destroyed. Between Aug. 26, 1776, and Nov. 23, 1783, the city was in the hands of the British, See New York, state. In 1780 the population had grown to 29,506, and the city limits extended to the lower corner of the present city hall park. In 1789 there was an epidemic of yellow fever, which carried off more than 2,000 victims. The corner-stone of the present city hall was laid on Sept. 29, 1802, and the building was finished in 1812. The year 1804 brought a great fire in Wall and Front streets, when 40 stores were destroyed. In 1805 the city had 78,770 inhabitants. In 1807 Robert Fulton made his first steamboat voyage to Albany, and 5 years later commenced running the ferries to Long Island by steam. The first experiments with gas-lighting were made in 1812, but gas was not generally used until 1825. The first boat
from the Erie canal arrived in the month of November in the latter year. In 1822 an
epidemic of cholera carried off 3,500 persons, and 2 years later appeared again with a mor-
tality of about 1000. The great fire of 1855 occurred Dec. 16, and destroyed the whole
east side of the city below Wall street, including 648 stores, the merchants' exchange,
and the South Dutch church, the entire loss being $18,000,000. In 1837 a financial
panic brought failures, suspensions, and general loss to the entire country. In 1840 the
population was 312,700. The Astor place riot in 1849, and the cholera epidemic of that
year, which destroyed 5,072 lives, were the important events of the first half of the
present century. The first city railroad was built in 1832, and on July 14, 1853, the
Crystal palace industrial exhibition was opened to the public with striking ceremonies,
the president of the United States officiating. A second financial panic occurred in 1857,
with the usual following of suspensions of banks and business failures. This year wit-
nessed the riotous demonstrations growing out of a conflict between two police organiza-
tions under the majority of Fernando Wood, for whose arrest an order was issued and
resisted, the 7th regiment of militia at length being called in to protect the public peace
and carry out the law. Rioting recommenced on July 4, and 11 persons were killed.
From 1860 to 1865 the city was engaged in patriotic and generous service in behalf of
the union, threatened by the secession of the southern states. In the fall of 1873
occurred the great financial panic which began with the failure of Jay Cooke & Co.,
heavily embarrassed with the affairs of the Northern Pacific railroad. During several
years the period of 1869-79 was marked with various incidents. The "ring," by which,
through malfeasance in office, the city had been plundered of many millions of dollars.
The arrest, trial, and condign punishment of most of the offenders and the death of Tweed himself in prison formed the conclusion of this scheme to despoil the
city.

NEW YORK, COLLEGE OF THE CITY OF, is the only free college supported by city
taxpayers in the United States. It began its existence as the free academy in 1848,
having first received the sanction of a popular vote, and its present title was bestowed
upon it in 1866. Standing at the head of the public school system, its trustees are the
members of the board of education together with the president of the college. It has
had but two presidents, Horace Webster, LL.D., and from 1869, Alexander S. Webb,
LL.D. The other officers comprise 14 active professors and 3 emeriti, and 21 tutors.
Tuition, books, and stationery are free, all expenses being paid on presentation of
vouchers to the comptroller of the city, who disbursed in 1878-79, for this institution,$131,535.48. Candidates for admission to the college must be 14 years of age, have
attended a public school for at least one year, and must pass an examination on the
studies taught in the grammar schools. Students have the option of a five years' clas-
sical or scientific course, the first year being considered introductory; there is also a com-
mercial course for introductory students remaining but one year, and a post-graduate
course of civil engineering. Since its foundation the college has had over 10,000 stu-
dents. The 20 per cent of the students in each year are selected from the intro-
ductive and 523 in the collegiate classes, and the graduating class of 1879 numbered 51.
The buildings and grounds on the s.e. corner of Lexington av. and e. 23d st. are valued
at $190,000; the library of 18,000 volumes at $50,000; the apparatus, cabinets, casts,
models, etc. at more than $20,000; and the institution has library and medal funds
aggregating $40,750.

NEW YORK, UNIVERSITY OF THE CITY OF, was chartered in 1831, and began
to receive students the next year. Its present building on the e. side of Washington sq.
was completed in 1855; it is 180 ft. long by 100 ft. in width, of white freestone. The
medical department is located at the foot of e. 26th st. opposite Bellevue hospital. The
faculty of the four departments of the university consists of a chancellor and 63 instruc-
tors; embracing 15 professors and two adjunct professors in the arts and sciences; a pres-
ident and 4 professors of law; and 20 professors, 5 lecturers, and 16 assistants in medi-
cine. In 1878 the number of students was 725, divided into 138 students of the arts and
sciences, 6 in the school of art, 73 in the law, and 500 in the medical departments.
There were 250 graduates from all the departments the same year. The tuition fee of
$80 a year was abolished for the academical department about 1870, and each student
now pays but $15 annual dues for incidental purposes. The university is supported by
the fees of its law and medical students, the rent of a portion of its main building, and
the interest on an invested endowment of nearly $200,000. Its buildings are valued at
$300,000, libraries at $23,000, and furniture and scientific apparatus at $10,000. The
first chancellor of the institution was the rev. Dr. James H. Matthews, and the rev. Dr.
Howard Crosby has held the office since 1870.

NEW ZEALAND, a British colony in the south Pacific ocean, consists of three islands,
two large and one much smaller, and of a number of islets scattered round the coasts.
These islands, which are named respectively north, south (sometimes also middle), and
Stewart's island, are situated 6,500 m. w. from the coast of south America, and about
1200 m. s.e. of Australia. The group is irregular in form, but may be said to extend
from the s. in a n.n.e. direction, and lie: the peninsula of Italy, resembles a boot in
shape. North island is 500 m. long, and 200 m. in greatest breadth from e. to w.; south
island is 550 m. long, and 210 m. in greatest breadth; Stewart's island is triangular in
shape, and has an area of about 900 square miles. Area of the three islands about 100,000 sq. miles. The north is separated from the south island by Cook's strait, which is 18 m. wide at its eastern and 90 m. wide at its western end; the south is separated from Stewart's island by Foveaux strait, which averages about 20 m. in width. The group extends in lat. from 34° 15' to 47° 30' s., and in long. from 166° to 173° e.; being thus almost the antipodes of the British isles.

Coast Line.—Of the entire coast line of about 4,000 m., nearly 1500 m. is formed by the shores of north island, which are deeply indented, and contain many excellent harbors. Commenc ing from north cape, and going s.e. round the island, the chief harbors are Mongamui, Waingaroa, the bay of Islands, Auckland, Mercury, and Tauranga bays, and the ports of Wellington, Manukau, and Hokianga. On the n. and s. coasts of south island, which are much broken, the harbors are numerous and excellent; on the eastern coast, the principal harbors are Akaroa, Victoria, and Dunedin. On the coast of Stew art's island there are also good harbors.

Surface.—The New Zealand islands are of volcanic origin, and a great portion of the entire area is occupied by mountains, among which are many extinct and a few active volcanoes. In north island, mount Taranaki, the highest summit of the central range, is 9,100 ft. in height, and is capped with perpetual snow. In the same range is Tongariro, an active volcano, 6,500 ft. high. A continuous range of mountains runs along the western coast of south island, and assumes the form of table-lands and isolated peaks toward the east. This range rises in mount Cook to about 13,000 feet. In Stewart's island, the greatest elevation is about 3,000 feet. In north island, the mountains are mostly clothed with evergreen forests of luxuriant growth, interspersed with fernclad ranges, and occasionally with treeless grassy plains; extensive and rich valleys and sheltered dales abound; and in the east of south island there are many expansive plains of rich meadow-land, admirably adapted either for agriculture or cattle-breeding. Water and water-power are found in great abundance in the colony, and the numerous rivers are subject to sudden floods from the melting of the mountain snows. As a rule, however, the streams are short, and are not navigable for more than 50 m. above their mouths. The chief is Waikato river, in north island, which, issuing from the Taupo lake (30 m. long by 20 broad), flows in a northern direction for 200 m., and reaches the sea on the w. coast. In south island, the rivers Clutha, Mataura, and Waiata, all flowing s., are among the chief. Around lakes Rotomahana and Rotorua are a number of grand and beautiful geysers, which throw up water heated to 2° above the boiling-point. The geology of New Zealand is remarkable in a high degree. The mountains, which are of every variety of outline, are chiefly composed of the lower slate-rocks, intersected with basalt, and mixed with primary sandstone and limestone. Beds of coal and lime exist, and the former have been to some extent worked.

Soil, Climate, and Productions.—Of the whole surface-extent of New Zealand (nearly 70,000,000 acres, little short of the combined area of England and Wales, Scotland, and Ireland), one-fourth is estimated to consist of dense forests tracts, one-half of excellent soil, and the remainder of waste lands, scorié-hills, and rugged mountain regions. Nearly 40,000,000 acres are supposed to be more or less suitable for agriculture and cattle-breeding. The soil, although often clayey, has in the volcanic districts more than a medium fertility; but the luxuriant and semi-tropical vegetation is perhaps as much due to excellence of climate as to richness of soil. Owing to the prevalence of light and easily-worked soils, all agricultural processes are performed with unusual ease. The climate of New Zealand is one of the finest in the world. The country contains few physical sources of disease; the average temperature is remarkably even at all seasons of the year, and the atmosphere is continually agitated and refreshed by winds that blow over an immense expanse of ocean. In a word, the climate much resembles that of England, with half the cold of the English winter; while the summer is longer and somewhat warmer, the atmosphere is more breezy and pure, and there are many more fine days throughout the year. In north island, the mean annual temperature is 58°; in south island, 52°. The mean temperature of the hottest month at Auckland is 68°; and at Otago, 58°; of the coldest month, 51° and 40°. The air is very humid, and the fall of rain is greater than in England, but there are more dry days. All the native trees and plants are evergreens. Forests, shrubberies, and plains are clothed in green throughout the year, the results of which are, that cattle, as a rule, browse on the herbage and shrubs of the open country all the year round, thus saving great expense to the cattle-breeder; and that the operations of reclaiming and cultivating land can be carried on all seasons. The seasons in New Zealand are the reverse of ours; January is their hottest month, and June the coldest. All the grains, grass, fruits, and vegetables grown in England are cultivated in this country with perfect success, being excellent in quality and heavy in yield; while, besides these, the vine is cultivated in the open air, and minutie, the taro, and the sweet-potato are cultivated to some extent in the sunny valleys of north island. The entire acreage under crop in New Zealand in 1851 was 29,140; in 1853, it was 141,007; in 1876, 2,330,988, while in 1871 the total acreage fenced was 6,778,733. Of the crops, the principal were wheat, oats, barley, potatoes, and sown grass, which, under ordinary circumstances, are grown to great advantage in New Zealand. Besides a few harmless lizards, a small species of rat is the only indigenous four-footed animal found in either of the great islands. Hawks are numerous. The coun-
try is destitute of snakes, and possesses no insect so noxious as the English wasp. The pig, introduced by Cook, runs wild, and the red and fallow deer, the pheasant, partridge, quail, etc., and the commoner domestic animals introduced by colonists, thrive well. In March, 1874, there were in the colony 99,859 horses, 494,917 cattle, 11,704,835 sheep, 123,921 pigs, and 1,058,198 heads of poultry, besides mules, asses, and goats. Coal in abundance, and of good quality, as well as iron, gold, silver, tin, copper, etc., are distributed over the colony. For statistics of the quantity of gold exported, see article Otago. Valuable timber is in great abundance. In 1877, the revenue (of which the sources are principally customs' receipts, and sale of crown lands, amounted to £3,790,545; the debt of the general government to £20,691,111. In 1875, the debt was under £21,000,000. The exports, consisting principally of wool, corn, gun, preserved meat, and gold, amounted, in 1877, to £6,329,251; the wool of that year being valued at £3,112,469. The total exports of gold from 1857 to 1875 were 7,055,295 oz., in value £20,984,786. The imports, consisting of British manufactures, etc., amounted to £6,973,418 in 1877. At the end of 1877 there were 720 m. of railways in operation, and 427 in course of formation; there were also 7,200 m. of telegraphic wires erected, with 142 stations. The revenue of the post-office in 1876 was £129,563.

The colony was divided into the following nine provinces: Auckland, Taranaki, Wellington, Hawke's Bay, Nelson, Marlborough, Canterbury, Otago, and Westland. The provinces were abolished by the colonial parliament in 1875, and a system of counties substituted. The government is administered by a governor appointed by the crown, and a ministry, a legislative council nominated by the crown, and a house of representatives elected by the people. National schools—maintained by a capitation tax of 10s. per child, and not more than £3 per family—various colleges, and a university in Otago, are the principal educational institutions. A very large proportion of the population of New Zealand are of European extraction, and can read and write; more than one-fifth of the population are the Church of England, predominating in Canterbury; the Presbyterian church, which predominates in Otago and Southland; the Wesleyan; and the Roman Catholic. In 1875 the immigrants into New Zealand amounted to 31,737 persons; the emigrants from it, to 6,467; leaving a balance of 26,270 in favor of immigration. The population in 1858 was 59,328; in 1871, 256,260; and in 1876, 399,075. The New Zealanders, or Maoris (q.v.), estimated, in 1867, at 38,540, and in 1875, at 45,470, are mostly located in North island. The military and civil forces of New Zealand are the volunteers, numbering 6080 of all ranks, and the armed constabulary, consisting of 728 men, of whom 84 are mounted. The hospitals and charitable institutions are numerous.

New Zealand was discovered by Tasman in 1642, and was repeatedly visited by capt. Cook, who surveyed the coast in 1770. After the settlement of Port Jackson, in New South Wales, the English and American whaling ships had recourse to the coast of New Zealand for provisions and shelter. New Zealand flax came also to be an article of traffic, and individual Englishmen began to settle on the coasts, and intermarry with the natives, and acquire land in right of their wives or of purchase. Missionary enterprise began in 1814, favored by various chiefs, and the missionaries not only labored to convert the natives, but introduced improved culture among them, and tried to protect them from the injustice, fraud, and oppression of the Europeans that had acquired settlements. A British resident or consul was appointed in 1833, but without authority. To put an end to the state of anarchy induced by a disputory colonization, and the purchase of lands for a few hatchets or muskets, a lieutenant-governor was appointed in 1840, and a treaty concluded with the native chiefs, whereby the sovereignty of the islands was ceded to Britain, while the chiefs were guaranteed the full possession of their lands, forests, etc., so long as they desired to retain them: the right of pre-emption, however, was reserved for the crown, if they wished to alienate any portion. Thus New Zealand became a regular colony, the seat of Government of which was fixed on the bay Waite-mata, and called Auckland. The previous year an association, called the New Zealand company, had made a pretended purchase of tracts amounting to a third of the whole island, and for a dozen years most of the colonization of New Zealand was conducted under its auspices. The conduct of the company is considered to have been on the whole prejudicial to the prosperity of the colony; and after a long conflict with the government, they resigned, in 1852, all their claims—which the government had never confirmed—on condition of receiving £208,000 as compensation for their outlay. The unscrupulous way in which the company and others often took possession of lands brought on, between 1843 and 1847, a series of bloody conflicts with the warlike natives, whose hostility, after having subsided for some time, in 1861 again broke out in a series of intermittent struggles. These continued until, on the withdrawal of the imperial troops, the colonists, from their knowledge of bush life and intensified earnestness, pronounced the new immigrants incompetent. They have not only to rely upon agriculture and trade. In 1852 constitutional government was established, and in 1855 the seat of government was transferred from Auckland to Wellington, the present capital.

NEW ZEALAND FLAX. See Flax, New Zealand.

NEXT FRIEND is, in English law, the name given to the person in whose name, or rather by whose agency, an infant—i.e., a person under the age of 21—sues in the courts of law and equity. The object is chiefly to have some party responsible for costs in case-
The infant fails in the action. In practice, the father, if alive, is usually the next friend, but any substantial person may be so. In the court of chancery, a married woman sues or appears by the intervention of a next friend, where she is personally interested.

NEY, Michel, a celebrated marshal of the first French empire, was the son of a cooper, and was born at Sacloulis, Jan. 10, 1769. He was a non-commissioned officer in a Hussar regiment when the revolution began, and afterwards rapidly rose to high military rank. For the capture of Mannheim by a coup de main, he was made a general of division in 1790. He was interim commander of the army of the Rhine for a short time, during which he frustrated by a bold diversion an important movement of the archduke Charles against Massena and the army of Switzerland. After the peace of Lunéville, Bonaparte, anxious to win Ney, with other republicans, to his party, brought about his marriage with a young friend of Hertense Beauharnais, and appointed him inspector-general of cavalry. On the establishment of the empire, he was made a marshal. In 1805 he stormed the intrenchments of Elchingen, and was created duke of Elchingen. He afterwards rendered important service in the Tyro; contributed much to the French successes of 1806 and 1807; and served in Spain with great ability in 1808 and 1809, till he was dismissed by Massena, the commander-in-chief, on a dispute about the plan of the campaign. Chagrined by this, and dissatisfied with Napoleon's despotism, he remained for some time inactive; but in 1812 received the command of the third corps d'armée, and greatly distinguished himself at Smolensk and the Moskva, in consequence of which he was created prince of Moskwa. He also displayed great abilities in the French retreat. He had a principal part in the campaigns of 1813 and 1814, but after the capture of Paris, he urged the emperor to abdicate, and submitted to Louis XVIII., who loaded him with favors. On Napoleon's return from Elba, Ney assured the king of his fidelity, and was sent against Napoleon at the head of 4,000 men; but finding the emperor to be received with general enthusiasm, and his own soldiers to be favorable to his cause, Ney went over to his side. In the battle of Waterloo, he commanded the center, and had five horses shot under him. After the capitulation of Paris, he yielded to the entreaties of his family to retire to Switzerland; but a costly Egyptian saber, the gift of Napoleon, led to his being suspected by an official, and arrested. He was condemned to death for high treason, and was shot in the garden of the Luxembourg on the Dec. 7, 1815. He left three sons, who published his Mémoires (2 vols. Par. 1833).

NEZ PERCÉS, a co. in n.w. Idaho, bounded w. by Washington territory; drained by the Clearwater, Salmon, and Lewis or Snake rivers; about 6,000 sq. m.; pop., 1870, 1,607—747 Chief Joseph, one of the prominent Nez Percé, is noted in the world's history for his success in keeping the surface level and adapted to farming. The reservation of the Nez Percés Indians extends further west. Wheat, oats, burley, potatoes, and dairy products, are the staples. Co. seat, Lewiston.

NEZ PERCÉS INDIANS, vs. SABAPTSI, a tribe of Indians now occupying large reservations in Idaho territory and in n.e. Oregon, to which they were removed from Washington territory in 1855; and they have made peace and are friendly, as Lewis and Clarke, who visited them in 1805, reported. From 1892 to 1847 a Christian mission was maintained among them by the Reverend W. H. Fairbanks. The tribe has generally been friendly to the whites, but has not attained a high degree of civilization. In 1854 a treaty was made by a part of the tribe, now known as treaty Indians, but a large number held out against it and these are often engaged in war with the Sioux. Among the reservation Indians' missions have been established, and books have been printed in their language, which have many grammatical peculiarities. They own large droves of cattle and horses. There are now about 1,600 Indians on the reservation.

NGAMI, LAKE. The existence of lakes in the interior of Africa was vaguely known as far back as the days of Herodotus; and the earliest modern maps show at least half a dozen large and small, one of which is about the size, and very nearly in the position of that shallow reservoir of surface drainage which was discovered, or at least first visited, by a European in 1849, when Dr. Livingstone and Mr. Oswell, who were aware of its existence from native report, reached its shores by a circuitous route from the Cape Colony. Although since ascertained to be of little importance in the physical geography of these regions, lake Ngami was at first supposed to be in some way connected with the larger inland seas of Nyassa, Victoria Nyanza, and Tanganyika. It is situated between the 20th and 21st parallels of s. lat., and between the meridians 29° 10' and 29° 30' e. long., at a height of about 2,500 ft. above the level of the sea, and is connected by a series of sinuous, anastomosing streams with the river-system of the Zambezi; its extent as well as depth varies with the fall of rain in the country to the n. of it, but its average size may be taken at 70 m. long, by a breadth of 20 and a depth varying from 3 to 28 feet. In 1853 lake Ngami was reached from the w. coast near Walffish bay by the traveler Andersson, and there is now a well-beaten route for traders between these two places, and a considerable quantity of ivory and ostrich feathers are annually collected in the neighborhood of the lake. The principal characteristics of the region are rivers, with very sluggish current, and often flowing in different directions to and from the lake, large salt pans and extensive dry flats, covered with dense bush, the haunt of elephants and other large animals. The water of Ngami is generally fresh, but in the dry season becomes brackish. The e.
end is much deeper than the western, and it has been inferred that during the last c. the shape and size of the lake have undergone material alterations. The chief tributary, the Tonke or Tioge, coming from the n.w., is deep, and in June, July, and August brings down vast volumes of water. The Suga or Zouga is the main outlet, runs towards the s.e., and finally disappears in a large salt-marsh.

**Niag-an-King**, a large and wealthy city of China, the capital of the province of Ngan-
whi. It stands on the left bank of the great river Yang-tse-Kiang, 190 m. s.w. from Nankin. The surrounding country is highly cultivated and very densely peopled. The mineral riches of the neighborhood are also considerable. Niang-King is a place of busy trade, great part of the goods intended for Nankin passing through the hands of its mer-
chants. The trade is carried on by means of vessels on the river. Porcelain and cloth are among the principal articles of trade.

**Niag-an-Wii**, or **Niag-an-Hei**, an interior province of China; bounded n.e. by Kiang-
sue, s.e. by Chekiang, s. by Kiangsee, on the w. and n.w. by Houpe and Honan; drained by the Hohe-ho and Yang-tse-Kiang rivers and their tributaries; 48,461 sq.m.; pop. 34,-
168,059. The surface is mostly level, but broken to the s. and w. by ranges of hills of no great elevation. It contains a number of lakes, of which Chan-Hu or Nest lake is the most important. There are mines of gold, silver, copper, and other metals. The best
green tea in China is grown in the s.e. portions of this province. Inks, varnish and lan-
terns are manufactured.

**Niagara**, a river of North America, which flows from lake Erie northwards into lake Ontario. It is about 36 m. in length, and its descent from the level of one lake to that of the other is about 354 feet. On issuing from lake Erie it is 40 m. wide; but in a mile it becomes several miles wide, making room for a number of islands, the largest of which, Grand island, is 12 m. long, and from 2 to 7 broad. At the foot of Grand island, which reaches within 1 1/4 m. of the falls of Niagara, the river is contracted to a breadth of 21 m., and grows narrower as it proceeds. By this and by the descent in the channel, which is about 60 ft. in the mile above the falls, are produced the swift currents known as the **Rapids**, in which the river, notwithstanding its great depth, is perpetually white with foam. At the falls, which are 22 m. from lake Erie, the river is divided by an island containing about 35 acres, called Goat island; but in consequence of a bend in the channel, by far the larger portion of the water is sent down by the Cana-
dian side. On this side, therefore, is the grander cataract which has been named the Horseshoe fall, but no longer bears the name appropriately, as the precipice has been worn from a curved into a somewhat angular shape. This process of wearing away goes on greatly still, a large projection on the Canadian bank, known as the Table rock, having partly fallen off in 1863. The Horseshoe fall is above 600 yds. in breadth, and about 154 ft. in height. The water is so deep that it retains its green color for some distance below the brow of the precipice; and it rushes over with such force that it is thrown about 50 ft. from the foot of the cliff. One may thus, having donned an oil-skin dress, enter two or three yards behind the curved sheet of water; but the spray is so blinding, the din so deafening, and the current of air so strong, that it requires a tolerably calm nerve and firm foot. The separation caused by Goat island leaves a large wall of rock between the Canadian and American falls, the latter being again divided by an islet at a short distance from Goat island. This fall is from 8 to 10 ft. higher than the Horseshoe, but only about 220 yds. broad. A little above the fall the channel is divided by Bath island, which is connected by bridges with Goat island and the American shore. A small tower, approached from Goat island, has been built on a rock over the brow of the Horse-
shoe fall; and from this the finest view on the American side may be obtained, the Horsple
rock on the Canadian side giving the closest view of the entire cataract. The falls can two be seen from below on both sides, and every facility is given for viewing them from all the points, while magnificent hotels, Canadian and American, offer their inducements to the tourist to stay till he has received the full influence of the scenery. The river is crossed about 200 or 300 yds. below the falls, where it is 1200 yds. broad. The current is lessened for about a mile, but increases again as the channel becomes nar-
rower and the descent greater. Between 3 and 4 m. below the falls, a stratum of rock runs across the direct course of the river, which, after forming a vast circular basin, with an impassable whirlpool, is forced away at right angles to its old channel. The cele-
brated wire suspension bridge for the Great Western railway, with a road beneath for vehicles and foot passengers, crosses the river 1 1/2 m. below the fall; it is 800 ft. long, 40-
broad, and 200 ft. above the surface of the water.

**Niagara**, a co. in the w. of New York on lake Ontario, traversed by the New York Central railroad and branches and by the Erie canal; 558 sq.m.; pop. 70, 50,457.
The land is, for the most part, level, fertile, and well-cultivated; chief products, wheat, Indi-
an corn, oats, and barley. The number of manufacturing establishments was in 1870, 421. They included flour mills, saw mills, woolen mills, and agricultural-tool works. Co. seat, Lockport.

**Niagara**, chief t. in Lincoln co., in the Canadian province of Ontario, is situated on lake Ontario, at the mouth of the river Niagara, and is distant by water from Toronto 96-
miles. Burned down in Dec. 1813 by the American gen. M'Chure on his retreat, it was
afterwards rebuilt, and promised to be a flourishing town; but its trade has fallen off within the last few years, and its population has decreased to about 3,000.

NIAGARA FALLS, a village in Niagara co., N. Y., on the Niagara river; pop. about 3,000. It contains several small hotels, and depends for its prosperity chiefly on the visitors to the falls.

NIAGARA RIVER AND FALLS (ante), received their name from the Indians, in whose language the word Niagara means the "thunder of water." A record of a voyage in 1535 by a French mariner named James Cartier contains, it is believed, the first printed allusion to either. In 1609 the first map of the district was constructed by a Frenchman named Champlain; and 15 years later the river and the cataract were visited by Father Hennepin and described at some length in a book. The river receives the waters of all the upper lakes—the Erie, St. Clair, Huron, Michigan, Superior, and a number of smaller ones. Freight from the lakes, and the snows of winter or the evaporation of summer, neither rains nor drought, materially affect it. Its waters flow on, full and clear, perpetually the same, with the exception that about once every seven years they have a gradual rise and fall, which is attributed to some undiscovered disturbance that affects Lake Erie. From the foot of the falls to Lewiston, a distance of 7 m., the river descends 104 ft., running between perpendicular walls 250 ft. high; then the height of the chasm gradually diminishes the next 7 m., and during the remainder of its course to Lake Ontario, until it is only about 25 feet. It has long been a theory with geologists that this deep chasm, and consequently the gigantic cataract, has been made by the action of the water on the limestone strata through countless ages. Originally, it is believed, the falls were simply from the plateau that overlooks Lake Ontario at Lewiston. Within the short period even of less than a hundred years many changes have occurred that are significant in connection with this opinion. In 1818 large parts of the edge of the precipice on the American side of the falls broke down; in 1828 fragments descended from the Horseshoe falls; and since 1855 several other pieces have broken away. An able report of prof. James Hall, in 1842, for the state geological survey, also shows that the falls at that time were different in important respects from the description given of them by Father Hennepin, who described a third fall from the Canadian side toward the e., facing the line of the main fall, and caused by a great rock that turned the divided current in this direction. Sir Charles Lyell—in whose work, Travels in North America, may be found the most complete accounts of Niagara—estimates that the falls wear away about one foot of the precipice every year.

NIARE, Bos brachicheros, the wild ox or buffalo of tropical Western Africa, is in size and weight about equal to the smaller breeds of British oxen, but of greater strength. The head is rather small, the muzzle black, the ears long and pointed, and fringed with beautiful silky hair, several inches long. The horns are 10 or 12 in. long, curved backwards, and sharply pointed. The animal is gracefully proportioned, having nothing of the clumsiness of the common buffalo. The body is covered with a coat of thin red hair. The tail is tufted at the extremity with black hair several in. long. Herds of these oxen were seen by Du Chaillu in the open or prairie lands to the s. of the month of the Ogobai. They are sly and fierce; if wounded, they turn upon the hunter with terrible fury. No attempt seems yet to have been made to domesticate this animal, which is probably very capable of it, and might be found more suitable than other oxen for warm climates.

NIAS, an important island belonging to Holland, lies to the w. of Sumatra, in 0° 18' 54"—1° 35' n. lat., and 97°—98° e. long., and has an area of about 1,575 sq. miles. In 1857, when the Dutch had completed the village of the island, the population was reckoned at 170,000. There are several places where ships can anchor and take in provisions, water, etc. On the e. coast is the village of Nias, and on the w. Silorongang. Little islands and coral reefs lie here and there on the coast, which in some places is steep, while mountain-chains run from the s.e. to the north-west. There is a greater breadth of excellent farming-grounds than the population, reduced by internal wars and the exportation of slaves, can properly cultivate. They grow rice, cocoa-nuts, bananas, tobacco, sugar-canes, etc., and annually about 110,000 lbs. of pepper. Cattle and horses have been imported, and they pay great attention to the raising of pigs and fowls. Formerly, about 500 Niassers were carried away annually as slaves to Batavia and other places, and though this traffic has been in a great measure suppressed, it is still to some extent carried on.

The Niassers are of the Malay race, but fairer than the Malays usually are. They are gentle, sober, and peaceful, remarkably ingenious in handicraft, ornamenting their houses with wood-carvings, forging arms, etc. The women labor in the fields, the children weave mats, while the men look after the live-stock, and hunt the deer and wild swine. They worship a superior deity, and fear a powerful one, who pursues them if they do evil. Polygamy is permitted, but is rare. The gift to the bride's family is from 60 to 500 dollars. Divorce is not allowed, and adultery is punished by the death of both parties. Dead bodies are placed in coffins above the ground, and creepers and flowering shrubs planted, which speedily grow up and cover them. Trade is on the increase.—See Malayen Miscellaneous, vol. ii.; Het Eiland Nias, door H. J. Domis; Crawford's Descriptive Dictionary (London, 1856); Tydschrift voor Ned. Indie, 1854, 1860, etc.
NISSA. See NYASSA, ante.

NIBBY, Antonio, a Roman archaeologist of high celebrity, was b. in 1793. He was one of those who, following in the footsteps of Winckelmann, made an elaborately minute investigation of the remains of antiquity their special study. The first work that made him known was his translation of Pausanias, with antiquarian and critical notes. In 1820 he was appointed professor of archaeology in the university of Rome. In the same year appeared his edition of Nardi's Roma Antica; and in 1837-38, his learned and admirable Analisi storico-topografico-antiquaria della carta de' Condotto di Roma, to which was added (1838-40) a description of the city of Rome itself. Among his other writings may be mentioned his La Mara di Roma desginate da W. Gell, and a large number of valuable treatises on the form and arrangement of the earliest Christian churches, the circus of Caracalla, the temple of Fortuna at Prenesti, the graves of the Horatii and the Curiattii, etc. Nibby d. Dec. 29, 1839.

NIBELUNGENLIED, or 'Nibelung Not,' as the words are written in the oldest manuscripts, is one of the most finished specimens of the genuine epic of Germany belonging to the middle ages. There exist twenty more or less perfect manuscript copies of this curious poem, the earliest of which belong to the beginning of the 13th c., from which period till the middle of the 16th c. it enjoyed the greatest popularity among Germans of all classes. Nothing certain is known of the author or authors of the work beyond the fact, that it was put into its present form by a wandering minstrel in Austria about or prior to the year 1210, which is the date of the oldest accredited manuscript. According to W. Grimm and Lachmann's critical analysis of the poem, it is in itself a compilation of pre-existing songs and rhapsodies, strung together into one whole upon a plan remarkable for its grand simplicity, although less skill is shown in some instances in the manner in which the several parts are connected. In the more authentic manuscripts the poem consists of only twenty parts, and it is conjectured that the latter portions of the epic, which are given only in some of the texts, as that of St. Gall, are the composition of later compilers. The epic cycle embraced in the Nibelungenlied may best of all be especially regarded as the fusion of the history of the mythical people, called in the poems the Nibelungen, with five leading groups of myths, in which are incorporated the adventures of some of the most universally popular personages belonging to the semi-historic myths of medieval German folk-lore, as, for instance, the hero Siegfried with his mantle of invisibility, and the lovely Icelandic heroine Brunhilt; King Gunther of Burgundy, and his fair sister, Kriemhilt, the wife of Siegfried; Haco of Norway, Dietrich (Theodoric the great king of the Ostrogoths) of Berne (Verona), and Etzel (Attila), king of the Huns. The loves and feuds, and the stormy lives and violent deaths of these national heroes and heroines, are skillfully interwoven in the Nibelungenlied, and artistically made to center round the mythical treasure of the Nibelungen, which, after the murder of Siegfried, who had brought it from the far north, is secretly buried by his murderer Haco beneath the Rhine, where it still remains. The poem, in its rude but strict versification, tells the tale of Kriemhilt's vengeance for her husband's death with a passionante earnestness that captures the sympathies of the poem. Lachmann's ed. 1839-40 is considered the best. The catastrophe of the fierce battle between the Burgundians and Huns at the court of Etzel, whose hand Kriemhilt has accepted, the better to accomplish her purposes of revenge. The tale of horrors fitly closes with the murder of Kriemhilt herself, after she has satisfied her vengeance by slaying with Siegfried's sword his murderer Haco. This tale, which seemed to echo back the clash of arms and strife of passion which characterized the early periods of German history, kept a firm hold on the imaginations of the people till the taste for polemic writings, fostered, if not created, at the period of the reformation, caused this as well as many other treasures of folk-lore to be almost lost sight of and forgotten. Attention was again, however, drawn to it in the 18th c., by the publication of detached portions of the poem by Bodmer, Criemhilden-Buche (Zurich, 1751), and by Müller in his Sammlung deutscher Gedichte aus dem 12-14 Jhbr. (Berlin, 1789); but it was not until comparatively recent times that the value of the work in an historical and poetical point of view was recognized. Lachmann was made known the result of his investigations in 1826. His views were supported by Müllenhoff and Rieger (1826). Holtzmann (1854), on the other hand, asserted that the longest version is the more ancient, and was followed by Zarneck, Hermann, and Fischer. Pfieffer tried, in 1862, to prove that the author of the present Nibelungenlied was the Austrian Von Kürnberg (circa 1410). See Paul's statement of the case in Die Nibelungenfrage (1877). All the manuscripts in the Nibelungenlied comprise another poem under the title of Die Klage, which treats of the burial of the heroes who fell in the conflict at Etzel's court, and the laments which were composed in commemoration of that event. It is of greater antiquity than the Nibelungenlied, and, like it, the work of an unknown author. A critical analysis of the Nibelungenlied will be found in Carlyle's Miscellaneous Essays.

NIGEA. See NICE.

NICARAGUA, a republic of Central America, bounded on the n. by the republic of Honduras, on the w. by the Carribean sea, on the s. by the republic of Costa Rica, and on the e. by the Pacific; lat. 10° 45' to 15° n.; long. 83° 20' to 87° 30'; area about 48,000 sq.m.; pop. estimated at 250,000, of whom about 30,000 are whites, 10,000 negroes, the rest Indians and Mestizos. Nicaragua is traversed by two ranges of mountains—the
western, which follows the direction of the coast-line, at a distance of from 10 to 20 m. from the Pacific; and the eastern (a part of the great range of the Cordilleras), which runs nearly parallel to it, and sends off several spurs towards the Carribean sea. The former is generally high and volcanic, but sinks at times almost to the level of the plains. Between the two ranges lies a great interior basin, containing the lakes of Nicaragua (q.v.) and Managua. The principal rivers are the Rio Coco, or Segovia, forming part of the boundary between Honduras and Nicaragua; the Escandidio, or BieWFieids; and the San Juan, all of which flow into the Carribean sea. The eastern coast of Nicaragua is called the Mosquito coast. The country is in many places densely wooded—the most valuable trees being mahogany, logwood, Nicaragua wood, cedar, and Brazil wood. The pastures are splendid, and support vast herds of cattle. The chief products are sugar-cane (softer and juicier than the Asiatic variety), cacao, cotton, coffee, indigo, tobacco, maize, and rice, with nearly all the fruits, etc., of the tropics—plantains, bananas, tomatoes, bread-fruit, arrow-root, citrons, oranges, limes, lemons, pine-apples, guavas, etc. The chief vegetable exports are sarsaparilla, aloes, ipecacuanha, ginger, copal, gum-arabic, caoutchouc, etc. The northern part of Nicaragua is rich in minerals—gold, silver, copper, iron, and lead—but the mines are not so carefully worked now as under the Spaniards. The incessant political distractions of the country have notoriously all but destroyed the material prosperity of the country. The trade is chiefly with Great Britain.

In 1876 the exports amounted to $1,400,000; the imports to $1,031,000. The seat of government is Managua, with 8,000 inhabitants; the largest town and former capital is St. Leon, with a population of 25,000. The town of Nicaragua (q.v. in SUPP., Vol. X.) has a pop. of 8,500.

Nicaragua was discovered in 1521 by Gil Gonzales de Avila, and conquered by Pedro Arias de Avila, the governor of Panama in 1522. In 1821—the great year of revolution in Central America—it threw off allegiance to Spain, and after a desperate and bloody struggle, secured its independence by the help of the "liberals" of San Salvador. Nicaragua now became the second state in the federal republic of Central America, but the dissolution of the union in 1839 became an independent republic. In 1847-49 a dispute broke out between Nicaragua and Great Britain about the Mosquito coast, which led to some hostilities, and was only finally settled in 1850. Meanwhile, in 1853, a civil war had broken out between the so-called "conservatives" and "liberals," which resulted in the victory of the latter, who were, however, obliged to call in the help of the since notorious col. William Walker (see FILLISTERNES).

By the constitution of Aug. 19, 1858, the republic of Nicaragua is governed by a president, who is elected by universal suffrage, and holds office for four years. There are two legislative chambers—the senate and the house of representatives. Liberty of speech and of the press exists, but is not absolutely guaranteed. The Roman Catholic religion, however, is the only one publicly tolerated, but the services of other religious bodies may be privately performed.

NICARAGUA LAKE (native, Cocibolca), a sheet of fresh water in the republic of the same name, 110 m. long, and from 80 to 50 broad. Its elevation above the Pacific, from which it is separated by a low range of hills—at one point only 48 ft. higher than the lake itself—is little more than 100 feet. The principal rivers flowing into it are the Mayales and Malacolotia on the N. and the Frio on the s.; the only one flowing out is the San Juan (formerly Usugnadore), which unites it with the Carribean sea. Its islands are numerous, lying mostly in groups; the principal are Ometepe, Zapatero (uninhabited, but with extensive mines and monolithic idols), Nientannai, and the Cordales. It has at last been determined to cut an interoceanic ship-canal through the state of Nicaragua, the route being by way of the San Juan river and lake Nicaragua. The whole distance by this route from ocean to ocean is 180 ft. m.; and, full advantage being taken of lake and river, 61 ft. m. of the total length will fall to the share of the new canal.

NICARAGUA, or Rt'VAS, a t. of the republic of Nicaragua (q.v.), Central America, on the western shore of the lake Nicaragua (q.v.), 35 m. s.s.e. from Granada. It is not a place of much commerce, the commerce of the lake being chiefly carried on by Granada. Pop. 8,500.

NICARAGUA SHIP-CANAL. See INTEROCEANIC SHIP-CANAL.

NICASTRO, a t. of s. Italy, in the province of Calabria, is most beautifully situated w. of the Apennines, on the margin of the coast plains, and commanding views of the sea, 24 m. s.s. of Cosenza. It is the see of an archbishop. There are hot springs in the vicinity. Pop. stated at 7,000 and 10,300.

NICCOLA PISANO, a distinguished sculptor of Pisa, to the influence of whose works the rise or restoration of sculpture in connection with Gothic architecture is mainly attributable. There is no record of the date of his birth, but from an inscription on a chest said to have been made for him and presented by his son Giovanni, it is evident that he was born at the beginning of the 13th century. His earliest work is supposed to be the "Deposition," over one of the doors of the façade of the cathedral at Lucca, dated 1233. He worked on the principle of studying nature, modified or corrected by the ideal of antique sculpture; and it is said that he first adopted this principle from the sculpture on an ancient sarcophagus brought from Greece in the ships of Pisa;
but though most of the finest specimens of Greek sculpture were not discovered till long after Niccola's time, he must have had an opportunity of studying many important remains on the various classic ruins with which Italy abounds. This sculptor's reputation is supported by three important works, which remain and are still admired for their excellence—the pulpit of the baptistery at Pisa, the "arca" or shrine of St. Dominic for the church of that saint at Bologna, and the pulpit of the cathedral at Siena. The first of these was finished in 1310, and is reckoned the most elegant pulpit in Italy. It is of white marble, six-sided, supported by seven Corinthian columns, and adorned with five bas-reliefs of subjects from the New Testament. The second work, the "arca" of St. Dominic, is one of even greater extent. It is composed of six large bas-reliefs, delineating the six principal events in the legend of St. Dominic, and is ornamented with statues of our Savior, the virgin, and the four doctors of the church. The operculum or lid was added about 200 years afterwards. The subjects on the pulpit at Siena, the third of these works, are the same as those on that at Pisa, with the substitution of the "Flight into Egypt" and the "Massacre of the Innocents" for the "Presentation"; and the enlargement of the concluding composition, the "Last Judgment." In these compositions there is great felicity of invention and grouping, truth of expression, and grace in the attitudes and draperies; and in that of the "Last Judgment" the boldness displayed in the naked figures, twisted and contorted into every imaginable attitude, is wonderful, and evinces the skill with which Niccola drew on the antique and on nature. But it must be admitted that there is a degree of confusion or overfullness in the grouping, and that the heads of his figures are often large in proportion to the bodies; faults incidental to all early efforts. In this last work it appears by the contract for its execution that Niccola was assisted by his scholars Lapo and Arnolfo, and his son Giovanni; and this accounts for a certain feebleness that may be observed in portions of it. He died at Pisa in 1276 or 1277, and was buried in the Campo Santo. Niccola's influence on art extended widely: his pupils Arnolfo and Lupo executed numerous works at Rome, Siena, and other cities. His son and heir in reputation, though not his equal in talent, Giovanni Pisano, was constantly engaged on works of importance; in Pisa, where the Campo Santo (for he was also an architect) was erected from his designs; in Naples, which he visited on the invitation of Charles I. of Anjou; at Arezzo, where he executed the marble statue of St. Donato for the cathedral, at Orvieto, where he executed the pulpit for Orvieto cathedral, by many ascribed to Niccola, being by him; at Pistoja, where he executed the pulpit, etc. The year of his death is not ascertained; it was probably about 1320. After Giovanni's death the Pisan school split into two principal branches, Florence and Siena; that of Naples may also be reckoned a branch, from the influence exercised over it by Giovanni.—ANDREA PISANO, the ablest of Giovanni's pupils, was called to Florence to execute in marble the statues, bas-reliefs, etc., designed by Giotto in ornamenting the cathedral of S. Maria del Fiore, then in course of erection. The talent he displayed soon raised him to a high position and important employment. He executed numerous statues for the façade of the cathedral, and a bronze gate for the baptistery, of very great excellence. This gate still exists, along with the later and still more celebrated gates of Ghiberti. Under the influence of Giotto's genius he became completely Giottesque in thought and style; and his works bear so distinctly the impress of that master-mind that the design of many of them, and particularly the baptismal gate, are ascribed to Giotto. He died in 1315, aged 76. See Vasari; Christian Art, by lord Lindsay; Agincourt, Dario Memorie Istoriche; Rosini, Storia, etc.; Cicognara (tom. i.), Monumenti Sepolcreti della Toscana.

NICCOLINI, GIOVANNI BATISTA, a distinguished modern poet, was b. in 1785, in the vicinity of Pisa, of a noble but impoverished family. Niccolini's first literary efforts were full of high promise of the classical and antique beauties which characterize his finest compositions, and in 1810 he was elected by the Crusca academy. Through the influence of the queen of Etruria he was appointed secretary of the academy of fine arts, where he delivered to the young artists lectures on history and mythology; but on the fall of the Bonaparte sovereigns this post was withdrawn from the poet. In 1805 the grand duke Ferdinand appointed him librarian in the Pitti palace, an office he resigned in order to escape the servility of court dependence. By the death of a relative he acquired wealth and the power of exclusively devoting himself to literature, and published several much-admired essays and lectures; and in 1827 appeared his noble work Antonio Foscorini. In 1844 Niccolini published anonymously his best poem—Arnoldo da Brescia—and nothing finer has been written in modern Italian, whether it be viewed as a classical creation, full of life and poetry, or as a work of glowing patriotism. Niccolini lived in the enjoyment of fame and honors to a ripe old age, and died at Florence in 1881.

NICE, or NICEA, formerly a city of Bithynia, in Asia Minor, situated on the eastern shore of lake Ascania. It was built, or rather rebuilt (for an olden town had existed on its site), by Antigonus, the son of Philip (316 B.C.), and received the name of Antigoneia, which Lysimachus changed to Nicea, in honor of his wife. It was a handsome town, and of great importance in the time of the Roman and Byzantine emperors; all the streets crossed each other at right angles, and from a magnificent monument in the center the four gates of the city were visible. It is famous in ecclesiastical history for two
councils held in it—the first and seventh ecumenical councils. The First Council of Nice was held 325 A.D., and was convened by the emperor Constantine, in concert, according to Roman Catholic historians, with the Roman pontiff, for the purpose of defining the questions raised in the Arian (q.v.) controversy. The details of the proceedings, so far as regards Arius, will be found in that article. The supporters of Arius at first are said to have numbered upwards of twenty; but ultimately the decrees condemning him was subscribed by the whole body of the council, the number of dissentients being about according to the highest computation, only five, while the most probable account reduces it to two. The Nicene Creed adopted in this council forms the subject of a separate article. In addition to the Arian question the council of Nice also deliberated on a schism, called the Melitian schism, which at that time divided the church of Egypt, and the particulars of which have formed a subject of recent controversy. The decree of Nice appears to have been founded on a compromise, but did not effectually suppress the schism. The decree of Nice on the celebration of Easter was of wider application, and met with universal acceptance, the few recusants being thenceforward called quartodecimans (q.v.). This council also enacted twenty canons of discipline. For a minute and picturesque description of this council see Dear Stanley's History of the Eastern Church.—The Second Council of Nice, called also the seventh ecumenical council, was assembled under the empress Irene (787), who was regent during the minority of her son Constantine, for the purpose of reconsidering the subject of images. The tenor of the decree on images is detailed under that head. In the west the question of the acceptance of this council was the subject of considerable controversy, arising, in great measure, from a grossly erroneous Latin translation of the acts, which for a time obtained extensive circulation.

NICE (Ital. Nizza), chief town, since 1860, of the department of the Alpes Maritimes, France, is situated on both sides of the river Paglione, 100 m. s.s.w. of Turin, and about the same distance e.n.e. of Marseilles. Pop. 72, 42,363; 76, 46,683. It consists of three principal parts—the Quartier de la Croix de Marbre, or New Town (on the right bank of the Paglione), the Old Town, and the Port. The first of these is much frequented by foreigners, particularly English (whence its name of "English town"). It is close upon the river, has a handsome quay filled with gay shops, and a splendid square called the Jardin public. Two bridges over the Paglione connect it with the old or upper town, which extends back to the foot of a hill called the Castle hill. The old town is excessively dirty, and has narrow, stinking streets, with macaroni and confectionery shops, grocery establishments, slaughter-houses, etc. The port, almost separated from it by the Castle hill, is crowded with a seafaring population. The harbor admits vessels drawing 15 ft. of water, but it is difficult of entrance. The Castle hill, an isolated mass of limestone 800 ft. high, receiving its name from having been crowned by a strong castle, now in ruins, is laid out in public gardens, and affords an extensive and splendid prospect out to sea. The chief public buildings are in the Corso, or in the adjoining streets, in one of which there is an English library and reading-room. There is an Episcopalian, and also a Presbyterian church in Nice, and an English cemetery. The most attractive promenade in the old town is the Terrace, from 15 to 20 ft. high, erected as a protection to the town against a stormy sea. But the most agreeable and fashionable drive and promenade is the Promenade des Anglais, extending for a mile along the shore from the right bank of the Paglione, and skirted on one side by elegant villas and hotels. Beggars are numerous, owing, doubtless, to the great influx of visitors. Fine as the usual winter and spring weather of Nice is, it is exposed to the n. winds, or mistral, which during these seasons often brings a temperature which in England would be considered cold, in April or October. The Quartier Carabassé is the most sheltered part of the place, and therefore the best for an invalid. Dust and bad drainage are the drawbacks to the amenity of Nice; but this is true with regard to most of the places of winter resort in the south. The mean January and February temperature is 47°, equal to that of April in England; March is 52°; April 58°, about the same as June in England, or July in Scotland.

The ancient Ligurian town of Nicea, founded, it is said, by a colony of Phocceans from Massalia (Marseilles), became subject to Rome in the 3d c. B.C. It probably occupied the Castle hill, rather than the site of the present city. Subsequently it passed into the hands of the Goths, Burgundians, Visigoths, kings and counts of Arles, the Angevine sovereigns of Naples, and the dukes of Savoy (1388), in whose family it remained till 1860, when it was ceded to France.

NICE, COUNCILS OF, the first of which, held 325 A.D., is properly called ecumenical. It was convened by the emperor Constantine who, with the invitation sent to each bishop, provided public conveyance for himself, two presbyters, and three servants. The empire had at the time about 1800 bishops, 1000 of whom were in the Greek provinces, and 800 in the Latin. Of these, according to the statement of Athanasius, 318 attended the council, of which only 1 was from the Latin church. The total number of delegates, including presbyters and others, was probably more than 1500. The eastern provinces were largely represented. Many of the members were venerable and illustrious men, among whom were Eusebius, eminent for learning; Athanasius, then only a young deacon, attendant on the bishop of Alexandria, small and insignificant in person,
but conspicuous for intellect, eloquence, and zeal; Arius, a parish-priest of Alexandria, 60 years old, tall and emaciated in person, wild, sometimes almost to madness, in manner ascetic, and negligent in dress, yet having a sweet voice, and fascinating speech; Potamon of Herakles; and Paphnutius, of the upper Thebaid, whose right eye had been dug out with a sword, and the empty socket seared with a hot iron; Paul of Neo-Caesarea, also a hermit by the brand of hot iron which had crippled both his hands; Jacob of Nisibis, who had spent years as a hermit in forests and caves, despisalung objects for sins. Spirition of Cyrus, continuing, even after his ordination, a literal shepherd; Hosius of Cordova, the ablest and best of the western delegates; two Roman presbyters, influential as representing Sylvester, the bishop of Rome, who was kept at home by the infirmities of age; a Persian bishop from the eastern frontier, and a Gothic bishop from the north. Constantine's object in convening the council, as announced in his opening address, was to heal the divisions in the church, the system of which, he said, had surprised and distressed him. There were two principal controversies then raging—one of them doctrinal, relating to the nature of Christ, and the other ritualistic, having reference to the time for the observance of Easter. At the opening of the discussions on the former there seemed little prospect that the emperor's prayer for harmony among the delegates would be answered. Accusations and recriminations were bandied to and fro without regard to his presence. He was unmoved amid the angry voices, turning from one side of the hall to the other, giving attention to the questions proposed, and bringing together the angry partisans. Laying aside his stately Latin he addressed them in broken Greek, praising some, persuading others, shaming a third class, and directing all his energies to the one point of securing unanimity of decision. The first sessions were devoted chiefly to a discussion of the Arian views, accompanied with an examination of Arius himself. He maintained that the Son of God was a creature, though indeed the most exalted of all; that he had been made out of nothing; that there was a time when he did not exist; and that, in his own free will, he was capable of right and wrong. The songs which he had written to popularize his opinions were sung in the council: and, apparently by himself, dancing like an eastern dervish while he uttered their wild, abstract statements in long straggling lines. The first attempt to reach a decision was made by producing an ancient creed of Palestine, the basis of which was ultimately adopted, but opposed by the orthodox—the Arians violently, because the Arians were willing to adopt it. A letter having been read from Eusebius of Nicomedia, in which he declared that to assert the Son to be uncreated would be to say that he was of one substance (δυνατόν with the Father; the expression was laid hold of as furnishing the very test for which they were seeking. The creed, as finally adopted, was as follows: "We believe in one God, the Father, Almighty, Maker of all things, both visible and invisible; and in one Lord, Jesus Christ, the Son of God, begotten of the Father: only begotten—that is to say—of the substance of the Father; God of God, Light of light, very God of very God; begotten—not made—being of one substance with the Father; by whom all things were made, both things in heaven; and things in earth; who for us men, and for our salvation, came down and was made flesh, and was made man; suffered, and rose again on the third day; went up into the heavens; and is to come again to judge the quick, and the dead; and in the Holy Ghost. But those that say, there was when He was not," and "before the principalities and powers," and "He came into existence from what was not," or who profess that the Son of God is a different person or substance; or that he is created, or changeable, or variable, are anathemized by the Catholic church. The second controversy depended at the first council of Nice had reference to the time for observing Easter, and was the most ancient in the church. Its name—the "quarto-decimarum"—or, fourteenth-day controversy, was derived from the Jewish rather than the Christian calendar. The question in dispute was, Ought the Christian passover to be celebrated on the same day as the Jewish—the 14th day of the month Nisan—or on the following Sunday? This fundamental question became entangled with others relating to the fast of 40 days, and to the changes in the vernal equinox. On the one side were the apostolic traditions, and on the other the new Catholic spirit seeking separation from Jewish ideas. At the date of the council the Judaic time was observed by the principal eastern churches; and the Christian time by the western churches, with a part of the eastern. The decision was in favor of the Christian time, but as a matter of course, but as determined by common consent on the principle that the will of the majority should prevail. Some smaller matters also were decided by the council, and 20 canons passed on various subjects pertaining to morality and religion. II. The second council of Nice, incorrectly called the seventh eumenical, convened first in 786 by the empress Irene and her son Constantine, was dissolved, because of the tumults raised by the image-breaking party, and reassembled the following year. Three hundred and seventy-five bishops attended from Greece, Thrace, the isles of the Archipelago, Sicily, and Italy. The council was occasioned by the emperor's ill-judged severity in forbidding the use of images for any purpose, and causing them everywhere to be removed and destroyed; and by the violent opposition to his course. At a council assembled 754, in Constantinople, consisting of 385 bishops, a decree was published against the use of images. To revoke this decree, was the object of a legation with Irene summoned the second council of Nice. At the fifth session this object was accomplished by the passage of an order that images should be restored to their places, and car-
ried in procession as before. At the next session it was affirmed that the enarchist is nowhere spoken of as the image of our Lord's body, but as the very body itself. At the seventh session it was decided that images ought to be exposed to view in order to excite love toward the objects represented by them, and that salutation and adoration of honor ought to be paid to them, but not the worship which belongs to God alone. For a long time this council was not recognized by the French. Their chief objections to it, as contained in the Caroline books, written by order of Charlemagne, were: 1. That no western bishop, except the pope, by his legates, were present. 2. That the decision was contrary to their custom, which was to use images, but not in any way to worship them. 3. That the council was not assembled from all parts of the church: nor was its decision in accordance with that of the Catholic church. These objections were answered by pope Adrian, but with little effect on the Gallican church.

NICENE CREED, a detailed statement of doctrine, which forms part of the liturgy of the Roman, Oriental, and Anglican churches, and is also received as a formulary by many of the other Protestant communions. It was drawn up principally by Hosius of Corduba, and is called by the name of the council of Nice, although nearly one-half of its present clauses formed no part of the original Nicene formulary; while, on the other hand, that document contained a series of anathemas condemnatory of specific statements of Arius, which find no place in the present so-called Nicene creed. The distinctive characteristic of the creed drawn up in the council was the word Homoousian. (See HOMOEOUSIAN.) Its clauses correspond (except in a few verbal details) with those of the modern formulary as far as the words "I believe in the Holy Ghost," after which follow the anathemas referred to above. The remaining clauses of the present creed, although they seem to have been in public use earlier, were formally added in the first council of Constantinople (381), with the exception of the clause, "And the Son," which was introduced in various churches of the west in the 5th and 6th centuries; and ultimately its formal embodiment in the creed, has continued a subject of controversy with the Greeks to the present day. See GREEK CHURCH. This creed appears to have been used in the public liturgy from the latter part of the 5th century. Its position in the liturgy varies in the different rites. In the Roman liturgy it is read on all Sundays, feasts of our Lord, of the blessed Virgin Mary, apostles' days, and all the principal festivals, but not on week-days, or the minor saints' days.

Several Arian creeds, in opposition to that of Nice, were drawn up at Sirmium and elsewhere (see LIBERIUS), but none of them met with general acceptance.

NICEPHORUS, patriarch of Constantinople, 758-828; b. Constantinople. He was the son of Theodore, imperial secretary of Constantius Copronymus. He first held high office at court. In 787 he was present as imperial commissioner at the Nicene council, where, in defense of image-worship, he opposed the Iconoclasts. This zeal for image-worship he inherited from his father. Soon after his return to the capital he retired to a convent, whence, in 863, he was called to be patriarch of Constantiople. Leo the Armenian, who became emperor in 813, passed an edict in 814 against the worship of images. But neither menaces nor entreaties could induce Nicetas to assent to it. He became unpopular at court, and in the ensuing year was deposed, and withdrew to the convent of St. Theodore, which he himself had founded, and remained there till his death. He is sometimes called HOMOEAGUS, or CONFRONT, because of his vigorous opposition to the Iconoclasts, and his subsequent deposition. He published several valuable ecclesiastical works, characterized by great beauty of style. His historical productions are distinguished for accuracy, discernment, and erudition. The most important are Breviarium Historicum, a historical abridgment, published with a Latin translation and notes by father Petran, in Paris, in 1616; and M. Consins has given a French translation of it in his History of Constantinople; Chronographa Brevis, a short chronicle of events from the beginning of the world to the author's time, with the series of kings, emperors, patriarchs, bishops, etc. It was translated into Latin, and published with notes, by father Goar, Paris. Niphonius is numbered among the saints in both the Greek and Roman churches.

NICHIREN, b. at Kominate, province of Awa, Japan, 1222; the founder of one of the largest, wealthiest, and most influential sects of Japanese Buddhists, and the great revivalist of Buddhism in the 13th century. He became a profound student of those Chinese and Sanscrit texts containing the writings of Buddha's first apostles, whose richness and genuineness prof. Max Müller has recently acknowledged. After many years spent in preaching, founding temples, and making missionary tours, he died at Ikegami, near Tokyo. He was several times exiled, wrote several works, still extant, and probably did more than any other man to bring all Japan under the tenets of Buddhism. His place of decease is visited annually by thousands of pilgrims, who come on foot or by railway. The Nichirenites are the 'ranter's' of Buddhism; and probably the grossest form of the
modern degenerate religion of Buddha, finds its expression, among an outward show of great intellectual ability, among the disciples of Nichiren.

NICHOL, JOHN, L.L.D., b. Scotland, 1833; only son of prof. John P. Nichol, late professor of astronomy; received an education at the university of Glasgow, 1848-55. In the latter year he went to Balliol college, Oxford, where he pursued his studies until 1859; and in 1861 he was appointed professor of English literature in the university of Glasgow. In 1873 the degree of L.L.D. was conferred upon him by the ministry of St. Andrews. He has been a successful tutor, having directed the studies of 150 candidates for Oxford; and is popular as a lecturer, having given more than 200 addresses on miscellaneous subjects, and to classes of ladies in special branches of study, in various parts of Great Britain. During the war of the rebellion he espoused the union cause, and, as well by its advocacy as by his Broad church doctrines, made himself a mark for hostile comment in Scotland, and thereby gained much honorable notoriety. He has contributed to the Westminster, North British, and other reviews, a number of valuable essays. He is one of the writers on the Encyclopaedia Britannica; in 1860 he published Fragments of Criticism, a volume of essays; and in 1872, Hannibal, a classical drama.

NICHOL, JOHN PHINGLE, 1804-59; b. Scotland; at first a school-teacher, then a minister. His fondness for scientific studies led him to give up the ministry, and he became a popular lecturer and writer on astronomy. Among his numerous works on this subject may be mentioned The Architecture of Heaven (1838); Contemplations on the Solar System (1844); Exposition and History of the Planet Neptune (1848); The Stellar Universe (1845); The Planetary System, its Order and Physical Structure (1851). He published also A Cyclopaedia of the Physical Sciences (1857). He was professor of practical astronomy at the university of Glasgow.

NICHOLAS, a co. in n.e. Kentucky, intersected by the Kentucky Central railroad; 229 sq.m.; pop. 80, 11,653-11,679 of American birth, 1760 colored. It is drained by Lindsay of its w. boundary; and the South Fork, its s.w. border. Its surface is undulating, rising in the n. into considerable elevations. Blue Lick spring is celebrated for its medicinal qualities. The soil is calcareous and very fertile, producing every variety of grain, dairy products, tobacco, wool, and sorghum. It has distilleries and manufactories of flour, and lumber. Co. seat, Carlisle.

NICHOLAS, a co. in central W. Va., intersected centrally by the Kaney river forming a part of its w. boundary; about 700 sq.m.; pop. 80, 7,223-7,155 of American birth, 58 colored. It is drained by Meadow river and Buffalo creek, also Birch river in the n.e. and numerous riverlets. Its surface is diversified, much of it rising into high hills, in the n.e. is Birch mountain. Its soil is moderately fertile, producing corn, oats, wool, dairy products, and sorghum. Live stock is raised. A large proportion of the surface is covered with forests, and coal and iron are found. Co. seat, Nicholas Court House.

NICHOLAS, the name of five among the Roman pontiffs, of whom the following alone appear to call for separate notice,—Nicholas I. was born of a noble Roman family, and on the death of Benedict III., in 868, Nicholas was elected to succeed him, and was consecrated in St. Peter’s church, in the presence of Ludwig II., emperor of Germany. The earliest incident of importance of his pontificate is his conflict with Photius (q.v.), who had been intruded into the see of Constantinople after the deprivation of Ignatius. Nicholas demanded from the emperor the restoration of Ignatius, as well as the withdrawal of certain unjust enactments of the jurisdiction of the see. On the refusal of his demand, Nicholas excommunicated Photius (see GREEK CHURCH), and that patriarch, in turn, assembled a council at Constantinople, and retorting upon his rival the same sentence, alleged that with the translation of the seat of civil sovereignty from Rome to Constantinople the ecclesiastical supremacy was likewise transferred. The emperor Michael supporting Photius in his claim, Nicholas failed to command submission to his sentence; nor was it till the following reign, that of Basil the Macedonian, that Photius was deposed, and Ignatius restored to his see. Meanwhile, however, Nicholas had been embroiled with the emperor Ludwig. The pope had been appealed to by the unjustly divorced wife of Ludwig’s younger brother, Lothaire, king of Lor­raine, and had appointed legates to inquire into and report upon the case; and the legates having exceeded their powers by giving a sentence in favor of Lothaire, the pope declared their sentence null, and excommunicated them. Ludwig espoused their cause, and marched his troops to Rome, in order to enforce satisfaction. After some hostile demonstrations, the emperor, terrified, it is said, by his own sudden illness and some fatalities which befell his followers, desisted from the enterprise, and withdrew his troops. Lothaire was forced to make submission; the decree of Nicholas was enforced, and Thentberga was formally reinstated in her position as a wife and queen. Nicholas died in 868.—NICHOLAS V. was originally called Thomas Parentucelli. Born at Pisa in 1398, he was educated at Florence and Bologna, and having fixed his residence in the latter city, he was eventually named bishop of that see by the pope, Eugenius IV. During the troubled period of the councils of Basel and Florence, and in the difficult negotiations with the German and other churches which arose therefrom, he conducted himself with such ability and prudence, that on the death of Eugenius IV. he was chosen to succeed him on Mar. 6, 1447. At this time, the anti-pope, Felix V., still maintained
Nicholas, himself, although supported by a very small party; but Nicholas prevailed on him to abdicate, and thus restored the peace of the church in 1449. In the judgment of the literary world, however, the great distinction of the pontificate of Nicholas lies in the eminent service which he rendered to that revival of letters which dates from his age. The comparative repose in which he found the world at his accession, enabled him to employ, for the discovery and collection of the scattered master-pieces of ancient learning, measures which were practically beyond the resources of his predecessors. He dispatched to the great masters, both of the e., and the w., to purchase or to copy every important Greek and Latin manuscript. The number collected by him was about 5,000. He enlarged and improved the Roman university. He remodelled, and may almost be said to have founded, the Vatican library. He caused translations to be made into Latin of most of the important Greek classics, sacred and profane. He invited to Rome the most eminent scholars of the world, and extended his special patronage to those Greeks whom the troubles of the native country drove to seek a new home in the west. Alarmed by the progress of the Turkish arms in Asia, he endeavored to arouse the Christian princes of Europe to the duty of succoring their brethren of the e.; but the age of enthusiasm was past, and he was forced to look on inactively at the fall of Constantinople in 1453. This event, by forcing a large number of learned Greeks to repair to Italy and other countries of the w., contributed powerfully to that progress of learning which Nicholas had deeply at heart; but he scarcely lived to enjoy this result, having died two years later, in 1455, at the comparatively early age of 57.

He must not be confounded with an anti-pope of the same name, Peter de Carboeiro, who was set up, in 1328, by Ludvig of Bavaria, in antagonism to John XXII. (q.v.).

NICHOLAS, SAINT, a highly popular saint of the Roman Catholic church, and revered with still greater devotion by the Russian church, which regards him as a special patron saint, as the name of Myra in Lycia. The precise date of his episcopate is a subject of much controversy. According to the Annals of the Synod, he was elected to the See of Myra in Asia Minor, and had survived until the council of Nice, was one of the bishops who took part in that great assembly. This, however, seems highly improbable. His name does not occur among the signatures to the decrees, nor is he mentioned along with the other distinguished confessors of the faith who were present at the council, either by the historians, or what is more important, by St. Athanasius. He may, with more probability, be referred to a later period; but he certainly lived prior to the reign of Justinian, in whose time several of the churches of Constantinople were dedicated to St. Nicholas. Of his personal history hardly anything is certainly known, and the great popularity of the devotion to him rests mainly on the traditions, both in the w. and in the e., of the many miracles wrought through his intercession. He is regarded, in Catholic countries, as the special patron of the young, and particularly of scholars. In England, his feast was celebrated in ancient times with great solemnity in the public schools, Eton, Sarum cathedral, and elsewhere; and a curious practice founded upon this characteristic of St. Nicholas, still subsists in some countries, especially in Germany. On the vigil of his feast, which is held on Dec. 6, a person in the appearance and costume of a bishop assembles the children of a family or of a school, and distributes among them, to the good children, gilt nuts, sweetmeats, and other little presents, as the reward of good conduct; to the naughty ones, the redoubtable punishment of the "Klaubauf." The supposed relics of St. Nicholas were conveyed from the e. to Bari, in the kingdom of Naples, towards the close of the 11th c.; and it is a curious fact that in the Russian church the anniversary of this translation, May 8, is still observed as a festival.

NICHOLAS, SAINT (ante), regarded also as the patron saint of sailors, of parish clerks, and of thieves or "knights of S. Nicholas." From the nearness in time of the saint's festival day to that of the Nativity, St. Nicholas became connected with the legend, and festivities of Christmas week, and synonymous or nearly so with Santa Claus and the Dutch Kerstman. By the Dutch settlers on New York St. Nicholas was regarded with special favor, and to this day his festival is annually observed with great hilarity by the St. Nicholas society of Manhattan island. The Visit from St. Nicholas is the title of Dr. Moore's well known song, beginning: "'Twas the night before Christmas, and all through the house, etc." In art St. Nicholas is represented as clad in episcopal robes and carrying three purses, three golden balls, or three children, referring to three different stories illustrating the saint's charity.

NICHOLAS I., more properly Nikolai Pauloytch, emperor of Russia, was the third son of Paul I., and was b. at St. Petersburg, July 7, 1796. He was very carefully educated under the eye of his mother, a princess of Württemberg, and subsequently devoted his attention to military studies and political economy, without, however, giving evidence of any natural capacity for these subjects. He visited England and other European countries in 1816, and in the same year made a tour through the Russian provinces. On July 13, 1817, he married Frederika-Louisa-Charlotte-Wilhelmina, the eldest daughter of Frederic William III. of Prussia, and lived in domestic retirement till the death of his elder brother Constantine, when, following to the resignation of his elder brother Constantine, he succeeded to the throne of Russia. A long-prepared military conspiracy broke out immediately after his accession, which he suppressed with
great vigor and cruelty. Capital punishment, which had been abolished by the empress Elizabeth, was revived, for the purpose of inflicting it upon the leaders of the insurrection. The rebels were hunted down with merciless energy, and in no case, even after the rebellion ceased to be in the least degree dangerous, was their punishment commuted. Instead of pursuing the course upon which Alexander had entered—cultivating the mind of the nation, so as to base his government upon education and intelligence—Nicholas, after a brief ebullition of reformatory zeal, reverted to the ancient policy of the czars, absolute despotism, supported by mere military power. His first great measure, the codification of Russian law, was commenced in 1827, and completed in 1846.

Soon after his accession, a war with Persia commenced, but it was concluded on Feb. 28, 1828, by the peace of Turkmansia, which gave a considerable extent of territory to Russia. In the same year he entered upon a war with Turkey, in which victory, though at enormous cost, constantly attended his arms, and the peace of Adrianople (q. v.) obtained for Russia another increase of territory, the free navigation of the Danube, which had been closed for centuries between Russia and the political movements of 1830, in the west of Europe, were followed by a national rising of the Poles, which was suppressed after a desolating contest of nine months, in which the utmost efforts of the whole military resources of Russia were required. Nicholas punished the rebellion by converting the kingdom of Poland into a mere Russian province, and strove to extinguish the Polish nationality. This policy, however, was viewed with great dissatisfaction throughout Europe, and the vanquished Poles were everywhere regarded with general sympathy. Russia, by Nicholas's mode of government, became more and more separated from the fellowship of the western nations. Intellectual activity was, as far as possible, restrained to things merely practical, education limited to preparation for the public service, the press was placed under the strictest censorship, and every means used to bring the whole mind of the nation under official guidance. His Pan-Slavism (q. v.) also promised him to Russia a more and more intimate union of the Slav elements and of the Russian Church, while the conversion of the Albanians and the conversion of Roman Catholics and Protestants to the Russian Greek Church, of which the Czar is the head. The independence of the mountaineers of the Caucasus was inconsistent with his schemes, and war was consequently waged against them with the greatest success and perseverance, although with little success, and at the cost of immense sacrifices both of money and lives. The extension of British influence in Central Asia was also viewed by him with alarm, and was attempted to be counteracted by various means, amongst which was the expedition for the conquest of Khiva in 1839, which failed so signally (see Khiva). Between 1844-46, he visited England, Austria, and Italy. During the political storm of 1848-49 he abstained from interference, watching, however, for an opportunity of doing so with advantage to Russian interests. The opportunity was at last found in the request of the emperor of Austria for his assistance to quell the Hungarian insurrection. This good service rendered Austria, as he thought, a faithful and firm ally. He succeeded at the same time in drawing closer the bonds of alliance between the Russian and Austrian governments, a proceeding fraught with the most mischievous consequences to the latter power. The re-establishment of the French empire still further tended to confirm these alliances, and led Nicholas to think that the time had at length come for carrying into effect the hereditary Russian scheme for the absorption of Turkey; but the unexpected opposition of Britain and France, and his own invincible repugnance to give up his long-planned scheme of conquest, brought on the Crimean war, during the course of which he died at St. Petersburg, Mar. 2, 1855, of atrophy of the lungs; but his death was undoubtedly hastened by chagrin at the repeated defeats which his arms sustained, and by overanxiety, and the excessive labor he underwent to repair his losses. He was remarkable for temperance, frugality, and patriotism, but equally so for vanity and ostentation. He was fanatically beloved by his Russian subjects, and was at the same time regarded by them with feelings of awe, a tribute to his lofty stature and imperial deportment, which gave him the title of Monarch, to some monarchies, to some extent, to have affected his mind, and to have been partly the cause of his political blundering towards the close of his reign.

Nicholas I., Prince of Montenegro, b. 1841; educated in Cettigue, Trieste, and at the Paris military academy, returning to Cettigue when about 20 years old. In 1860 occurred the assassination of prince Danilo the uncle of Nicholas, who was immediately proclaimed prince; and the same year married the daughter of the waywode Peter Valschest, by whom he has an heir, Danilo Alexander, now ten years old, and several daughters. In the first part of his reign he traveled extensively, visiting all the European countries. He introduced many reforms in education, civil administrations, and army organization. On Jan. 19, 1878, the subjects of prince Nicholas captured Dulcigno and by the Berlin treaty of the same year, Montenegro was recognized as an independent power, the sovereignty up to that time having been claimed by the Porte. Various districts of Herzegovina and Albania were ceded to Montenegro by the same treaty. In the complications which followed both with the Albanians and with the Porte, Nicholas showed much political sagacity, but in the seizure of Gusinje (Oct. 1878) his reign was disgraced by pillage and slaughter of women and children. Up to the present time the cession has not been fully carried out, though much pressure has been exercised by the other powers.
NICHOLAS, Grand Duke of Russia, b. Russia, 1831; son of Nicholas I, and brother of the late emperor, Alexander II. He entered the military service in 1847, spent a few days at Sebastopol in 1855, during the siege, and was for two years on the staff of the army in the Caucasus, where he took part in several skirmishes against the seven chieftesses. He was soon made general, and inspector-general of engineers, and commander-in-chief of the army. In the Russo-Turkish war, he was commander-in-chief of the army of the Danube, which invaded Roumania in April, 1877; he resigned in April, 1878, and was succeeded by gen. Todleben. He married, in 1856, princess Alexandra of Oldenburg, by whom he has two sons.

NICHOLAS, George, d. 1799. b. Va., son of Robert Carter, Nicholas chancery judge of Virginia, graduated in 1772 from William and Mary college, Williamsburg, Va. In the revolutionary war he was major of the 2d Va. regiment in 1777, and afterward held the rank of colonel. He was distinguished for bravery in the field, and wisdom in council, and had high reputation as statesman, and jurist. He was a member of the convention which made valid the federal constitution, and wielded a powerful influence in the house of delegates. In 1790 he removed to Kentucky, was the first attorney general of that state, and one of the original framers of its constitution April 1, 1792. He died in Lexington, Ky.

NICHOLAS, Wilson Cary, d. 1890, b. in Virginia, and was educated at William and Mary college. On the outbreak of the revolution he entered the army, became the commander of Washington's life-guard, and continued in that position until its disbandment in 1783. He was a member of the Virginia convention which ratified the U. S. constitution, was U. S. senator 1799-1805, and was elected to congress in 1807; previous to that time he was collector of the ports of Portsmouth and Norfolk. In 1814 he was elected governor of Virginia by the Jeffersonian democrats.

NICHOLS, Edward Tatnall, b. Geo., 1823; entered the navy midshipman in 1836, and was made lieutenant in 1850. He commanded the steamer Wicjina, in 1862, and took part in the bombardment of forts Jackson and St. Philip, the latter of which surrendered to him April 28. The following summer, he was at the passage of the Vicksburg batteries, and fought the confederate ram Arkansas. In 1863 he took command of the steamer Alabama, in the West India squadron, and in 1864 of the Mendota in the blockade squadron in the Atlantic, fighting a confederate battery on the James river in June. He was made captain in 1866, and commodore in 1872.

NICHOLS, Ichabod, 1784-1859, b. Portsmouth, N. H.; educated at Harvard. After graduating he studied theology at Salem and was for four years a tutor in mathematics at the university. In 1809 he became associate pastor of a Portland unitarian church; in 1814 became pastor and remained so for more than 40 years; and in 1855 removed to Cambridge, Mass. His published works are Natural Theology, 1830; Remembered Words from the sermons of the Rev. J. Nichols, 1860; and Hours with the Evangelists, 1861. His doctrinal views were of the evangelical type.

NICHOLS, John, 1745-1826, b. near London; apprenticed when a boy to Wm. Bowyer, the last of the learned printers. He rapidly rose in the favor of his master, in 1766, was taken into partnership, and on the death of Bowyer, about ten years later, was at the head of the business. For the next 40 years he devoted himself to writing and printing a very large number of works (said to have been 57 as early as 1812). These were occupied mainly with literary anecdotes and antiquarian research. His first book was Biographical and Literary Anecdotes of William Bowyer, Printer, F.S.A. (1782), afterwards expanded into six octavo volumes and called Literary Anecdotes of the Eighteenth Century, and supplemented by seven large octavo volumes of the same character. In these books may be found a most extensive collection of literary and biographical anecdote and of correspondence of eminent men. From 1778 until the time of his death Mr. Nichols was editor of the Gentleman’s Magazine, where his taste for minute biographical and topographical research found full scope. He was successful as publisher and printer, though he met the great misfortune of losing his office and warehouses by fire in 1808. At his death his son John Bowyer Nichols succeeded him in his business, and continued the series of Literary Anecdotes of the Eighteenth Century then being published. John Gough Nichols, b. 1807, was the son of John Bowyer Nichols; was for many years previous to 1856 the editor of the Gentleman’s Magazine, and wrote many topographical and genealogical articles, among others The Herald and Genealogist, d. 1873.

NICHOLS, Richard, about 1620-80; b. in England; in 1664 was appointed one of four commissioners to look into complaints made in various parts of New England and to overpower the Dutch of Manhattan. The latter surrendered in the same year and Nichols was recognized as governor of New York and New Jersey. In 1667 he returned to England, resigning the administration of New York to col. Loveche, and that of New Jersey to Carteret.

NICHOLS, William A., 1817-69, b. Penn., educated at West Point and after graduating in 1838 was commissioned in the 2d artillery. In the Mexican war he served as aid-de-camp to Gen. Quitman and was made brevet assistant adj. gen. in 1852 with rank of captain, for his gallant services at Monterey, Churubusco and Molino del Rey. At the outbreak of the civil war he was a lieu.col., was made col. in 1864, and brevetted

U. K. X.—39
brig. gen. in 1864 and maj. gen. in 1865. After the war he was made adj. gen. of the department of the Missouri.

NICHOLSON, Sir Francis, d. 1728; b. England: lieut. gov. of New York under Andros 1687-89. He was governor of Virginia 1690-92, and again 1699-1705. He was governor of Maryland 1694-99; commanded the expedition against Port Royal in 1710, and the unsuccessful expedition against Canada in 1711. He was governor of Nova Scotia 1712-17, was knighted in 1720, and was governor of South Carolina 1731-35, when he was made lieut. general.

NICHOLSON, J. W. A., b. Mass, 1821; midshipman in the navy 1838-44: became passed midshipman, and in 1852 was raised to lieutenant. In 1853-55 he accompanied the Japan expedition in the sloop Vandalia. During the war of the rebellion he was in actions which required great coolness and bravery in a commander. He took part in the engagement at Aquia creek, a branch of the Potomac river near Fredericksburg, Virginia. He commanded the steamer Isaac Smith, of the South Atlantic blockade squadron, in the battle of Hilton Head at Port Royal, Beaufort, S. C., Nov. 7, 1861, with the monitor combined with the land forces under Gen. W. T. Sherman, captured forts Warren and Beauregard. In 1862 he was promoted to commander, and in the same year was in action with the confederate flotilla on the Savannah river. At the battle of Mobile bay Aug. 5, 1864, he commanded the monitor Manhattan, attached to the w. Gulf blockade squadron, under admiral Farragut, destroying and capturing the confederate fleet in a short sharp conflict resulting in the surrender of fort Gaines; he also engaged in the bombardment of fort Morgan. In 1865-66 he commanded the steamer Mohongo in the Pacific squadron, and was promoted to captain in 1866. In 1867-68 he commanded the Wampoonang, and was raised to the rank of commodore in 1873.

NICHOLSON, James, 1737-1804, b. Md.; adopted a sea-faring life as did two of his brothers, who afterward rose to be captains in the navy. He participated in the capture of Havana in 1762, and in 1763 took up his residence in New York. In 1775 he was appointed captain of the Defense, in the American navy, and in 1776, he regained from the British several vessels which they had captured. The same year, he took command of the Virginia, carrying 26 guns, and the next year, he was appointed commander-in-chief of the navy, succeeding commodore Esek Hopkins, and remaining in that position till the close of the war. His vessel being prevented from going to sea by a strict blockade, he volunteered with his crew in the American army, and took part in the battle of Trenton. Soon afterward in putting out to sea, his ship ran aground and was taken, but he succeeded in escaping, and most of the crew was saved. In 1780, in command of the Tennant of 38 guns, he fought for 3 hours with the British ship Wyoming, losing 30 men; neither ship gained a decided advantage. In 1781, off the Delaware capes, after a stubborn resistance, he was captured by the Iris and General Monk. At the close of the war, he returned to New York city, where he was appointed commissioner of loans. He was the father-in-law of Albert Gallatin.

NICHOLSON, John, British general, one of the most distinguished of the later school of Indian soldiers, was born in Dublin, Dec. 11, 1821. His father, a physician of considerable reputation in that city, died when the boy had just completed his 8th year. By his mother, a woman of strong sense and much practical piety, he was carefully educated; and from her he seems to have inherited or imbied a certain religious gravity and earnestness of character which was early noticed in him, and continued to distinguish him through life. Through the influence of her brother, Sir James Weir Hogg, an Indian military career was obtained for him; at the age of 16, he arrived in Calcutta, and was soon after posted to the 21st native Bengal infantry, then stationed at Ferozepore. In 1840, his regiment was ordered to Ghizni in Afghanistan, where two years after, in the disastrous insurrection which avenged our occupation of the country, it was compelled to surrender to the enemy. After a time of miserable captivity, he regained his liberty, and joined the relieving army under gen. Pollock, to be saddened immediately after by the death, in action, of his brother Alexander. A period of inactivity ensued, during which he was stationed at Mcerut, doing duty as adjt. of his regiment. On the breaking out of the Sikh war in 1845, he served in the campaign on the Sutlej, and was present at the battle of Ferozeshah, though, as attached to the commissariat department, without special opportunity of distinguishing himself. After the cessation of the war, through the recommendation of col. (afterwards Sir Henry) Lawrenece, Nicholson, now a lieut. was appointed assistant to the resident at the conquered capital, Lahore, and thus fairly transferred to the political branch of the service, in which most of his future time was passed. But shortly, with the outbreak of the Sikh rebellion in 1848, there came an interlude of military activity, in which he greatly distinguished himself. To Nicholson's daring and promptitude was due the preservation to us of the important fortress of Attock; and soon after, his success at the Margulis pass, in intercepting and defeating a large body of the insurgents, brought his name prominently before the world. Throughout the struggle which followed, he rendered important service; and at the great battles of Chillianwala and Gujrat successively, he earned the special appro. val of lord Gough, to whom he was immediately attached.

The Punjab having finally become a British province, capt. Nicholson was appointed
Nicholson, a deputy-commissioner under the Lahore board, of which sir Henry Lawrence was president. He had now been nearly ten years in India; his strength was somewhat shaken by arduous service, and various illnesses which from time to time had assailed him; and above all, he was anxious to visit and grieve his widowed mother, then prostrated by the death in India, by an accident, of William, his younger brother. In 1850, accordingly, he took his furlough, and returned home, taking Constantinople en route, and visiting, with an eye to professional instruction, the capitals of all the great military powers of the continent. On his return to India, he was again appointed by Lawrence a deputy-commissioner in the Punjab, and for five years subsequently his work lay among the savage tribes of the frontier. His success in bringing them under thorough subjection to law and order, was something marvellous; and such were the impressions of fear and reverence wrought by the force and massive personality of the man, that he became among these rude populations, under the title of "Nikkul Seyn," the object of a curious kind of hero-worship. So far was this carried, that a sect actually arose, of Nikkul Seynists, who consecrated him as their Guru (or spiritual guide), and persisted—despite of severe floggings regularly inflicted by the worthy man, indisposed to accept divine honors—in falling at his feet, and making him an object of express adoration.

With the outbreak of the great mutiny in 1857 came Nicholson's supreme opportunity, and the brief career of glorious achievements in which he developed in the eye of the world the full power and splendor of his military genius. In the saving of the Punjab, virtually India was saved to us; and under sir John Lawrence, who had succeeded his brother, sir Henry, Nicholson—though not without noble coadjutors to divide with him the honor—perhaps did more than any other single man to hold firm our grasp of the Punjab. He it was who suggested the formation of the famous movable column, by which mainly the work was done, and presided over its organization. Shortly, he was appointed to command it; and in his dealings with the suspected regiments of sepoys, he exhibited a particular combination of boldness with subtlety, discretion, and astuteness, scarcely too much to be admired. At Trimmu Ghaut, on the 12th and 14th of July, he brought to bay, and nearly utterly annihilated, a large force of the declared rebels. Things thus made safe behind him, he marched to re-enforce the army of gen. Wilson, engaged in the siege of Delhi, arriving in camp on Aug. 7. His presence and counsels gave new impulse to the operations; and in every way he strove, with fiery and impatient energy, to expedit the delayed assault. A strong body of the enemy having tried to make their way into the British rear, to Nicholson was assigned the task of intercepting and bringing them to battle. This he achieved on Aug. 24, near Nujuffghur—under circumstances of extreme difficulty, in the most masterly manner surmounted—obtaining a most brilliant result in the complete ruin and dispersion of the mutineers. When the assault on the city was at last ordered, gen. Nicholson (for to this rank he had now attained) was selected for the post of honor; and on the morning of Sept. 14, he led the first column of attack. After the troops had forced their way into the city, an unforeseen check occurred, and Nicholson, ever in front, exposed himself in the most fearless manner to animate his men to advance. Conscious by his towering stature, he became the mark of the enemy's bullets, and fell, shot through the body. He lingered for some time in great suffering, and died on the morning of the 23d. Over the whole of India, the victory was saddened by his death; for it was felt that in John Nicholson, to use lord Canning's expression, "a tower of strength" had fallen. During the whole war of the mutiny, though it claimed many noble victims, there fell no man more regretted in his death than Nicholson, or in his death more worthy of regret. Throughout his career, he shone—as opportunity offered—a veritable "king of men;" one of those born to command, who naturally and inevitably rise to it, and however great in achievement, seem to need only the lap of ampler opportunity in the future, to outstrip their great achievements in the past. No one ever seems to have come fairly in contact with him without being strangely impressed with this sense of a magnificent reserve of power in him. It remains only to add, that his nature was on the one side as gentle, tender, and affectionate, as on the other it was strong and brave: and that, by all who had intimate relations with him, he was not less beloved for his mild virtues, than for his sterner gifts honored and admired. To his memory all honor was paid. The queen commanded it to be officially announced that, had he lived, he would have been created a knight commander of the bath; and by the East India company, a special grant of £500 a year was voted to the mother who survived to mourn for him.—For further details of the life of this man of right noble and heroic mold, the reader is referred to the account of him—from which this little sketch is redacted—given in Kaye's most interesting work entitled Lives of Indian Officers (2 vols., Lond., A. Strahan & Co., 1867).

**Nicholson, John B., 1783-1846; b. Va., joined the U. S. navy as midshipman in 1800. In 1812 he was promoted to lieut., and on the breaking out of the war with England was ordered on board the United States, serving as 4th lieut. He was present at the engagement which terminated in the capture of the Macedonian, and was 1st lieut. of the Peacock, bringing in the prize ship Epervier. In 1829 he was promoted capt., and afterward to the rank of commodore.**

**Nicholson, Samuel, 1743-1811; b. Md.; brother of James. He was lieut. under Paul Jones in the Bon Homme Richard, and took part in the fight between her and the**
Serapis. He was promoted to a captaincy in 1779, and in 1782 commanded the frigate Draon, of 32 guns, and made a long cruise, during which he captured a number of prizes, including 3 sloops-of-war. He retained the rank of capt. after the reorganization of the navy, and was the first commander of the frigate Constitution. At the time of his death he was the senior officer in the service.

NICHOLSON, WILLIAM CARMICHAEL, 1800–72; b. Md., entered the navy in 1812. He was attached to the President, under Decatur, and took part in the engagement off Long Island, in Jan., 1813, which resulted in her capture by a British squadron. He was made lieut. in 1821, and commander in 1841. He commanded the sloop Preble in the Mediterranean squadron in 1843, and the schooner Boxer in the Pacific squadron in 1850. He was appointed fleet-capt. of the Pacific squadron in 1855, and commanded the steam-frigate Mississippi in the East India squadron 1858–60. He was stationed at the naval asylum in Philadelphia at the beginning of the rebellion, and soon afterwards was placed in command of the steam-frigate Roxtone. He became commodore in 1862, and was retired in 1864.

NICOIAS, a famous Athenian statesman and gen. during the Peloponnesian war, was the son of Niceratus, a very wealthy citizen, who had acquired his fortune by working the silver-mines at Laurium. Nicias belonged to the aristocratic party, and after the death of Pericles presented himself as the opponent of Cleon, the great popular or demagogic leader. He was not a man of quick, brilliant, audacious genius, like Alcibiades; on the contrary, he was remarkably wary and cautious, even at times to timidity. Success generally accompanied his enterprises against the Spartans and their allies. In 427 B.C. he had saved the island of Melos, and the coasts of Locris; the year following that he obliged the Spartan force in Sphacteria to surrender, and also defeated the Corinthians. In 424 B.C. he made havoc of part of Laconia, captured the island of Cythera, and achieved several other successes. After the death of Cleon he brought about a peace between the Spartans and Athenians, 421 B.C. Six years afterwards the Athenians, at the instigation of Alcibiades, resolved on a great naval expedition against Sicily. Nicias was appointed one of the commanders, although he had strongly protested against the undertaking. In the autumn of 415 B.C. he laid siege to Syracuse, and was at first successful, but subsequently experienced a series of disasters; his fleet was destroyed, and his troops began a retreat towards the interior of Sicily. They were speedily forced to surrender, and Nicias was put to death 414 B.C. See Thirlwall's and Grote's Histories of Greece, and Plutarch's Life of Nicias.

NICKEL (symbol, Ni; equiv. 29.5 — new system, 59 — sp. gr. 8.8) is a grayish-white glistening metal, capable of receiving a high polish, of about the same hardness as iron, and, like that metal, malleable and ductile. It has about the same fusibility as wrought iron, but is less readily oxidized than that metal, since it remains unchanged for a long time in a moist atmosphere, and is very little attacked by dilute acids. It is strongly magnetic, but loses this property when heated to 600°. It dissolves in hydrochloric and dilute sulphuric acid with a development of hydrogen gas, and is very readily oxidized in nitric acid.

Nickel only occurs in the native state in meteoric stones, in which it is always present in association with the iron which forms the principal part of those masses. It is found in tolerable abundance in Saxony, Westphalia, Hungary, Sweden, etc., where it occurs in the form of kupfernickel (so called from its yellowish-red color), which is a combination of nickel and arsenic. The metal is obtained on the large scale for the purpose of making German silver (q.v.) and other alloys, either from this compound or specie, which is an impure arsenio-sulphide of nickel, formed during the manufacture of smalt (q.v.), by somewhat complicated chemical processes. In small quantities it may be obtained by reducing one of its oxides by means of hydrogen at a high temperature, or by exposing the precipitate to a very high temperature in a crucible lined with charcoal.

Nickel forms two compounds with oxygen—viz., a protoxide, NiO, and a sesquioxide, NiO2.5, which is not basic, and may be passed over without further notice. The protoxide occurs as a greenish-gray powder, which exhibits no magnetic properties, and is insoluble in water. It is obtained by heating the carbonate or the hydrated protoxide in a closed crucible. The hydrated protoxide, NiO.H2O, is obtained by precipitation from a solution of one of its salts by potash. The salts of the protoxide and their solutions are of a delicate, very characteristic green color; but in the anhydrous state most of them are yellow. The neutral salts, soluble in water, slightly redden litmus, have a sweetish, astringent, metallic taste, and when administered in moderate doses excite vomiting. The most important of the salts is the sulphate (NiSO4 + H2O), which crystallizes in beautiful green rhombohedral prisms. It is obtained by dissolving the metal or its oxide in dilute sulphuric acid; and is the source from which the other salts of nickel, the carbonate, oxalate, etc., are obtained. The principal use of nickel is in the composition of various alloys, such as German silver (q.v.).

The sulphate of nickel has been prescribed successfully by professor Simpson in cases of severe headache.

NICKEL (aute). Nickel has three sulphides, or sulphuric, a subsulphide, Ni2S, which is formed by reducing the sulphate with charcoal or hydrogen; the protosulphide, NiS, formed by fusing sulphur and nickel, and also found native in the mineral
millitero; and the disulphide NiS₂, obtained by heating the carbonnate of nickel and potash with sulphur to redness. An anhydrous carbonate NiCO₃ is made by heating chloride of nickel with carbonate of potash or soda in a sealed tube. It crystallizes in minute rhombohedrons. A hydrocarbonate, NiCO₃·2Ni(H₂O)₉, also exists as a native mineral, called emerald nickel, and found in mines in the form of incrustations and short stalactites; sometimes massive; pearly luster, emerald-green color, transparent, translucent; hardness 3 to 3.35; sp. gr. 2.57 to 2.69. Occurring in Lancaster co., Penn., associated with serpentine, and also in the Shetland islands. The nitrate Ni(NO₃)₂·6H₂O crystallizes in 8-sided emerald-green prisms, soluble in twice their weight of cold water. It is made by dissolving the metal in nitric acid. Sulphate of nickel, NiSO₄·6H₂O crystallizes in green rhombic prism, soluble in 3 parts of cold water. It is made by the action of dilute sulphuric acid on the metal. When these prisms are exposed to the light they subdivide, without falling apart, into minute regular octahedrons. If the crystallization takes place between 59° and 77°F. it will be octahedral, and instead of 7, there will be only 6 molecules of water. The methods of smelting and working nickel ores are complicated, and some of them are not generally known. The uses of nickel until recently were principally for forming alloys with other metals. In some countries besides the United States, coins of small value have been made of an alloy of nickel, zinc, and copper. The U. S. cent, authorized by the act of Feb. 21, 1857, was composed of 88 per cent of copper and 12 per cent of nickel. The metal is used in the preparation of the alloy called German silver, which contains 2 parts of copper and 1 of zinc and nickel each. White copper, or pakkiing, of China, consists of copper, 40.4; nickel, 23.3; silver, 23.4; iron, 12.9. Recently nickel has been used for plating other metals, and this use has made it one of the most valuable of metals. Chemists and physicists have long time known that a brilliant deposit of nickel could be obtained by electrolysis from solutions of nickel salts, but no advantage was taken of this knowledge till Mr. Isaac Adams of Boston devised a method of rendering nickel-plating practicable and profitable. He employs a double chloride of nickel and ammonium, or of sulphate of nickel and ammonium. See Electrolysis, Electro-Metallurgy, and Electrotype, in art. Galvanism, ant. It is important to have the salt which is used in the process perfectly pure, and it must therefore be made from pure nickel. Mr. Adams found that it was not practical to use a plate of pure metal as the anode, because it would not dissolve sufficiently fast to satisfy the demands of the solution (the deposit of metal on the cathode, and consequently its separation from the salt, being the greater). This was remedied by combining the nickel chloride with carbon, forming a carbide. This causes the metal to dissolve exactly as fast as it is deposited.

**NITROBAR ISLANDS**, a group of islands in the Indian ocean, n.w. of Sumatra, and forming, with the Andamans (q.v.), an extension of the great island chain of which Java and Sumatra are the principal links. Lat. 6° 40' to 9° 20' N., long. 93° to 94° E. They are divided by the Sombrero channel into two groups, of which the principal members are the Great Nitrobar (area 260 sq. m.), and the Little Nitrobar (area 86 sq. m.). The inhabitants, who are not numerous, are distinct from Malays and Burmese, and are said to resemble the hill-tribes in Formosa. The Danes made a settlement here in 1754, were dispossessed by Great Britain from 1807 to 1814, and finally withdrew in 1848. In 1869, the Indian government took possession of these islands, and affiliated the new settlement at Nancowry harbor to the great penal colony at Port Blair in the Andaman islands. The soil is fertile, and the cocoa-nut palm grows abundantly.

**NIC'ODEMUS, a Pharisee, member of the Jewish sanhedrim, or great council of the nation, who, impressed by what he had heard of Jesus, and perhaps convinced that he was the Messiah, came by night for fuller private converse. He may have come in secret through fear or prudence; he may have found it impossible to meet Christ alone without interruption in the daytime. He received memorable instruction, (John iii.) He appears in two scenes afterwards—the first, when at the sitting of the great council he ventured in a few words to defend Jesus against the unjust suspicions of the Jews; the second, when he united with his colleague Joseph of Arimathea in rendering the last honors to the crucified of him. Tradition relates that having declared himself a follower of Christ, and been baptized by Peter, he was removed from his office and expelled from Jerusalem; that he found refuge in a country-house of Gamaliel his cousin, with whom he remained until his death. The so-called *Gospel of Nicodemus or Acts of Pilate* is undoubtedly spurious, and of no value.

**NICOL, Henry, 1846-81. b. England; completed what education he received at school before he was seventeen, being then obliged to take a clerkship in a merchant's office, and which he continued to hold until failing health necessitated his relinquishing it a year before his death. He devoted his leisure from business to the study of philology, and with such success that he eventually gained a European reputation for his wide range of knowledge in that department of research. He particularly attached himself to the study of old French; and concerning this *The Academy* said at the time of his death: "England has lost its first romance and old-French scholar, and one of its foremost English and general philologists."

**NICOLA, Christoff Friedr., a celebrated German author, bookseller, and publisher, was b. Mar. 18, 1783, at Berlin, where his father was also a bookseller. He
devoted himself very earnestly to literary and philosophical studies, and early distinguished himself by his Briefe über den jetzigen Zustand der schönen Wissenschaften (Berl. 1756), in which he exposed the errors of both Gottsched and Bodmer, then carrying on a controversy which was agitating the literary world of Germany. He became the associate of Lessing and Moses Mendelssohn. Jointly with the latter he edited for some time the admirable Bibliothek der schönen Wissenschaften (Leip. 1757–58); and with Lessing, he gave to the world Briefe, die neueste deutsche Literatur betreffend (24 vols. Berl. 1759–65). By this he was led to conceive the plan of the Allgemeine deutsche Bibliothek (106 vols. 1765–92), a periodical which he edited for many years, and which contributed much, particularly in the early period of its existence, to the progress of literature and improvement of taste in Germany, but was too frequently characterized by an undue acerbity of tone. Nicolai's hostility to the new schools of literature and philosophy, which sprang up in Germany, exposed him to attacks from the pens of Herder, Goethe, Schiller, and Fichte. His death took place Jan. 8, 1811.

Among Nicolai's works may be mentioned his Topographisch-historische Beschreibung von Berlin und Potsdam (Berl. 1799, 3d edit. 1786); Charakteristischen Anecdoten von Friedrich II. (Berl. 1788–92), both of permanent value; some novels, as his Leben und Meinungen des Magisters Sebastian Nathaner (4th edit. Berl. 1799); Geschichte eines dicken Mannes, a sharply satirical performance (2 vols. Berl. 1794); Beschreibung einer Reise durch Deutschland und die Schweiz (Berl. 1781; 3d. edit. 1788–90); an autobiographical work entitled Über meine gelehrte Bildung, über meine Kenntniss der Critischen Philosophie und meine Schriften dieselbe betreffend (Berl. 1799).

NICOLAI, Otto, a German musical composer of note, b. at Königsberg in 1809. His early life was a struggle with poverty and difficulties. He studied for three years in Berlin under Klein; and in 1835 went to Rome, where he went through three more years of study under Baini. After traveling for ten or twelve years over Europe, he became, in 1847, Kapellmeister at Berlin, a post which he soon resigned. He appeared as a composer of dramatic music as early as 1831; but his first work of importance was Il Teatro, founded on Scott's romance of Ivanhoe, which, produced at Turin in 1841, attained a high and permanent reputation. In 1848 he wrote at Berlin Die Lustigen Weber von Windisch, on which his renown as a musician is founded, a work charming for its clear design and lively vigorous tone, whose overture is almost worthy of Weber. Two months after the production of this his chef-d'œuvre, its composer died at Berlin.

NICOLAIANTS, a class of persons, spoken of Rev. ii. as found in the churches of Ephesus and Pergamos, whose doctrine and deeds were hateful to Christ. Irenæus, who wrote near the close of the 2d c., and is the earliest author who mentions them, says that they were followers of Nicolas of Antioch, one of the seven deacons chosen at Jerusalem. As there was a traitor among the "twelve," there may have been an immoral man among the "seven;" but in the absence of all contemporary evidence a statement made a hundred years after the writing of the Revelation has no force against the presumptive evidence that a man who was one of seven selected from the whole church of Jerusalem as of "tested character, full of the Holy Ghost, and of wisdom," did not afterwards become notorious as a teacher and perpetrator of abominable crime. As to the particular character of the offenses taught and practiced by these persons, many vain conjectures have been made. The supposed connexion suggested by Michaelis is not improbable; that those thus condemned by Christ were of similar character with "the followers in the way of Balanan" described by Peter in his second epistle; and that Nicolaitans is simply the Greek translation of the Hebrew "Balanan," both signifying conquerors or masters of the people. This theory is supported by the fact that in the Revelation, while the church of Pergamos is censured for tolerating within it persons who held the doctrine of Balaman, after the special character of the crimes he had taught Israel to commit has been described, it is added "even so thou also hast those who hold the doctrine of the Nicolaitans."

NICOLAS, Nicholas Harris, 1799–1848; b. England; entered the navy as a midshipman in 1806, and after some years of active service was promoted to the rank of lieutenant. Shortly afterwards, however, he retired from the service and devoted himself to the study of English law and antiquarian literature, and in 1829 was called to the bar. He soon distinguished himself as a peace lawyer and a writer on antiquarian subjects. In 1826 he became joint editor of The Retrospective Review; and in 1831 he was made a knight of the Hanoverian Guelphic order. Among his numerous works, those which are best known are, Synopsis of the Peverage of England (1825); Testimonia Vetusta (1826); Chronology of History (1835); History of the Battle of Agincourt; Dispatches and Letters of Lord Nelson (1844); and Memoirs of Sir Christopher Hatton (1847).

NICOLE, Pierre, 1625–95, b. Chartres, France; at an early age attained unusual proficiency in philosophy and classical studies, and when but fourteen began at Paris a course of philosophical and theological study. Here he came much under the influence of Anthony Arnauld (q.v.), and was deterred from taking orders by his views on the Jansenist discussion and his dislike of the Jesuit power. He attached himself to the recusants (solitaires) of Port Royal (q.v.) at Les Granges, and became an instructor in the Jansenist schools, while continuing the study of theology at the Sorbonne. From this
time he devoted his pen to extending and expanding the doctrines of Jansenism, though he did not fully agree with the extreme advocates of that system. The number of his moral, religious, and controversial treatises is large, all characterized by purity of style, facility of discrimination, and a broad and generous humanity. To him more than any other writer is the Port Royal logic (La Logique, ou l'Art de Penser, 1665) to be attributed. Others of his works are: Perpétuité de la Foi; Les Visionnaires; Essais de Morale, in 6 volumes, 2 published posthumously; his philosophical reputation rests mainly on the essays and logic. Personally, he was a man of great humility and modesty, and was so far from seeking public applause that in more than one instance he did not deny the belief that a work of his own was written by others of the Port Royal brotherhood. He labored incessantly in his chosen work till, worn out by the controversy which was so little suited to his natural disposition, in 1693 he was compelled by increasing illness to desist, and 2 years afterwards was followed to his grave by the most distinguished men of his time.

NICOLET, a co. in s. Quebec, having the St. Lawrence river for its n. and n. boundary, drained by the Becancour river, the Nicolet and West Branch, which form part of its s.w. border; 596 sq.m.; pop. 71, 28,362. It is traversed by the Three Rivers division of the Grand Trunk railway. It has several flour and saw mills, boot and shoe factories, and an extensive trade in lumber. Its soil is fertile along the rivers, and its surface is covered with immense forests, diversified with plains adapted to the cultivation of grain. Co. seat, Becancour.

NICOLET, a co. in s. Minnesota, having the Minnesota river for its e. s., and w. boundary, drained by the Winona and St. Peter, and the St. Paul and Sioux City railroads, forming a junction at St. Peter. It is drained by numerous lakes, the largest, Swan lake, nearly 9 m. long. Its surface is extensively covered with forests, but a large proportion stretches out into broad prairies. The foundation of the soil in some portions is silurian limestone. Its products are grain, potatoes, wool, sorghum, the products of the dairy, and live stock. Its leading industries are the manufacture of brick, furniture, leather, and flour. Co. seat, St. Peter.

NICOLET, Jean Nicolas, 1788-1848, b. France; studied under Laplace, and in 1817 was appointed librarian of the Paris observatory. In 1802 he came to this country on a scientific expedition, and explored the territory drained by the Missouri, Arkansas, and Red rivers, and the upper Mississippi. He obtained much valuable information on the natural history of the districts which he visited, and on the languages and customs of the Indian tribes. Soon after his return he was sent, with John C. Fremont, to the western territories, to make a general report of their resources and draw up a map of them. He published Mémoire sur la mesure d'un arc de parallèle moyen entre le pôle et l'équateur; and Lettre sur les assurances qui ont pour base les probabilités de la durée de la vie humaine.

NICOMACHUS, a Greek painter in the 4th c. B.C., a son and scholar of Aristodemus. Little is known of his life. Phintarch compares his paintings to the poems of Homer, and Cicero ranks him with Protogenes and Apelles. Pliny notices the following of his works: The Rape of Proserpine, in the temple of Minerva, on the capitol; Victory riding in a four-horse chariot, also in the capitol; Apollo and Diana, Cybele on a Lion, Female Barchandals, and Ségula. He was celebrated for the swiftness with which he executed. Among his scholars were several great painters, such as his brother Aristides, his son Aristocles, Philoxenus of Eretora, Nicophanes, and Corybar.

NICOMEDEIA, the capital of ancient Bitbinya, was situated at the north-eastern angle of the gulf of Aestus, in the Propontis, now called the bay of Ismir; was built about 284 a.d. by Nicomedes I., who made it the capital of his kingdom, and it soon became one of the most magnificent and flourishing cities in the world, and some of the later Roman emperors, such as Diocletian and Constantine the great, selected it for their temporary residence. It suffered greatly both from earthquakes and the attacks of the Goths. Constantine died at a royal villa in the immediate vicinity. Hunnilab committed suicide in a castle close by. It was the birthplace of the historian Arrian. The small town of Ismir or Isoiknid now occupies its site, and contains many relics of ancient Nicomedea.

NICOPOLIS, recently a Turkish fortress, but since 1878 a city of the newly-constituted principality of Bulgaria, is on the Danube, about 56 m. w. of Rustchin. The fortifications, though extensive, were not of much importance, and the Berlin congress of 1878 provided for their demolition. The city used to be divided into two portions; the fortress and Turkish town, defended on every side by batteries and ramparts, and the eastern quarter, comprising the dwellings of the Bulgarians, Wallachs, and Jews. Nicopolis is widely built, most of the houses being surrounded by gardens. It is an important market for Wallachian wares, but otherwise is not a great center of trade. Wine is produced in the vicinity. Pop. 16,000.

Nicopolis, the ancient Nicopolis ad Istrum, was founded by Trajan, and fragments of the old wall still remain. Here the Hungarians, under their king Sigismund, were defeated by the sultan Bajazet I. in 1396. The city gives title to a Greek archbishop and to a Catholic bishop.
NICOPOLIS in Epirus, one of the many cities bearing the same name—"city of victory"—founded by Augustus to commemorate his victory over Antony in the battle of Actium; immediately after which he inclosed and dedicated to Neptune the space where his tent had been pitched, on a height which commanded a view of both the land and sea forces. Here he afterward built the city, and made it a Roman colony. "Some of the finest parts," Josephus says, "were the work of Herod, who was one of the greatest builders of his day." His connection with it, added to the well-known wide diffusion of the Jews into all the principal countries and cities, renders it probable that many of them lived there. Paul, in his letter to Titus, announced his purpose to pass the winter at Nicopolis; the subscription to the epistle asserts that Paul wrote it at Nicopolis of Macedonia, implying that it was there that he intended to pass the winter. But his language shows that he had not yet gone to Nicopolis, and the subscription to the epistle has no authority. Jerome's opinion is generally adopted, that it was the Augustan Nicopolis to which Paul referred. Its situation was convenient as a central point, in some of his journeys east and north. He had, long before, preached at Illyricum, and one of his last official acts was to send Titus—probably after he had joined him at Nicopolis—on a mission to Dalmatia. Possibly he was arrested at Nicopolis soon afterward, and taken finally to Rome. At this time the city, though only about 30 years old, had become the chief place in western Greece. As it owed its origin and importance to war, so it was destroyed by hostile armies. Julian, finding it in ruins, rebuilt it. Again destroyed by the Goths, Justian restored it a second time. During the middle ages a new city was built at the point of the promontory, and the "city of victory" was deserted. The ruins, covering a large portion of the isthmus, still show its original grandeur and size. Wordsworth thus speaks of them: A lofty wall spans a desolate plain; to the north of it rises a hill; on the shattered stage of a theater; and to the west, the extended though broken line of an aqueduct connects the distant mountains with the main subject of the picture—the city itself." There are also ruins of a mediæval castle and other buildings on the low, marshy, and now desolate plain.

NICOSIA, a city of Sicily, in the province of Catania, 70 m. s.w. from Messina. It is situated on the crest of a steep, conical hill between two head-branches of the Salsó. It has scarcely any manufactures, but carries on some trade in corn, wine, oil, and cattle. Near it are beds of alum, ochre, a rich mine of rock-salt, and springs of petroleum. Pop. 14,230.

NICOSIA. See LEFKOSIA, ante.

NICOT, Jean, 1530-1600, b. France; a diplomatist appointed by Francis II. ambassador to Portugal. During his residence at Lisbon he obtained, from a Flemish trader, some seeds of the tobacco plant from Florida. Nicot subsequently introduced tobacco into France, and it was called, in his honor, Nicotiana. He wrote a treatise on navigation, and Treasury of the French Language, one of the earliest French dictionaries.

NICOTIANA. See TOBACCO.

NICOTINE, or NICOTYLINE (C_{10}H_{14}N_{2}), is one of the natural volatile oil bases desti-
tated of oxygen, and constitutes the active principle of the tobacco plant, in the leaves, roots, and seeds of which it occurs in combination with malic and citric acids. It is like menthol, contains in the burning leaves, a colorless, intensely poisonous liquid, of specific gravity 1.027 at 60°, which boils at 480°, evolves a very irritat-
ing odor of tobacco, especially on the application of heat, is very inflammable, and burns with a smoky flame. It is moderately soluble in water, and dissolves readily in alcohol and ether. If exposed to the air, it absorbs oxygen, and becomes brown, and ultimately solid. The quantity of nicotine contained in tobacco varies from 2 to 8 per cent; the coarser kinds containing the larger quantity, while the best Havana cigars seldom contain more than 2 per cent, and often less.

A remarkable case of poisoning by nicotine,—that of the count Bocarmè, who was tried and executed in Belgium for the murder of his brother-in-law,—is recorded in the Annales d'Hégène 1851, and was the occasion of Orfila's publishing his Mémoire sur la Nicotine. A distinguished student of the college of chemistry subsequently employed it for the purpose of suicide. The deaths that have taken place from the use of tobacco in the form of injection,—of which several cases are on record,—were doubtless due to the action of this substance.

NICOYA GULF OF, opens into the Pacific ocean from n.w. Costa Rica, lying between the main land and the peninsula of Nicoya, which terminates in cape Blanco; this cape being situated at the w. side of the gulf of Nicoya, at its mouth, and cape Herradura on the east. It is about 55 m. long, lying n. and s., and 30 m. wide at its mouth. Punta Arenas, the sole port of entry on the Pacific side of Costa Rica, is situated on the s. side of the gulf. In it are a number of small islands among which are San Lucas, Bejuca, Chirr, and Venado. Several streams empty into it, the chief of which are the Tempisque, Rio Grande, and Nicoya rivers.

NIEBUHR, Barthold George, one of the most acute historians, critics, and philolo-
gists of modern times, was b. Aug. 27, 1776, at Copenhagen, where his father, Karsten Niebuhr (q.v.), then resided. The aptitude for learning which Niebuhr displayed, almost from infancy, led him to be regarded as a juvenile prodigy, and unlike many
other precocious children, his powers of acquiring knowledge kept pace with his advancing years. After a carefully conducted preliminary education, under the superintendence of Dr. J. W. Smith; he spent a year at Göttingen, and then proceeded in his 19th year to Edinburgh, where he devoted himself more especially to the natural sciences. On his return to Denmark, he became private secretary to the finance minister, Schimmelmann, and from that period till 1804 held several appointments under the Danish government, which, however, he was led to resign in consequence of his strongly pronounced political tendencies, which made him enter heart and soul into the feeling of hatred of Napoleon, which was at that time agitating the minds of Germans. In accordance with these views, Niebuhr entered the Prussian civil service in 1806, and during the three succeeding years he shared in the vicissitudes which befell the government of his chief, count Hardenberg, after the disastrous battle of Jena, and the consequent pressure of the Napoleonic influence on the management of the state. The opening of the university of Berlin in 1810 was a new era in the life of Niebuhr, who was now assigned the task of articulating in the new institution the results of the researches on Roman history, which, by making known the results of the new and critical theory which he had applied to the elucidation of obscure historical evidence, established his position as one of the most original and philosophical of modern historians. His appointment, in 1816, to the post of Prussian ambassador at the papal court, where he remained till 1823, gave him an opportunity of testing on the spot the accuracy of his conjectures in regard to many questions of local and social bearing. On his return from Rome, Niebuhr took up his residence at Bonn, where, by his admirable lectures and expositions, he contributed very materially to the development of classical and archaeological learning. He was thus employed when the revolution of 1830 roused him from the calm of his literary pursuits. Niebuhr's sensitive nature, unstrung by physical debility, led him to take an exaggerated view of the consequences of this movement, and to anticipate a recurrence of all the horrors of the former French revolution, and the result was to bring about a state of mental depression and bodily prostration, which ended in his death in January, 1831. Niebuhr's attainments embraced a more extensive range than most men are capable of grasping, for he was alike distinguished as a shrewd man of business, an able diplomatist, an accurate scholar, and a man of original genius. He had mastered 29 languages before the age of 30, while the mass of facts which his tenacious memory retained, and the intuitive sagacity that enabled him to sift true from false historic evidence, and often to supply by felicitous conjecture the link wanting in some imperfect chain of evidence, exhibit the extraordinary scope of his intellect. It is not to be denied, however, that he is often arbitrary and unhistorical in his conjectures, and the stricter sort of skeptical critics, like the late sir George Cornewall Lewis, even go so far as to regard his effort to construct a continuous Roman history out of such legendary materials as we possess as, on the whole, a failure. Among the many important works with which he enriched the literature of his time, the following are some of the most noteworthy: *Römische Geschichte* (3 Bde. Berl. 1811–22, 2d edit. 1827–42; 1833–58), the first two volumes have been translated by J. C. Hare and C. Thirlwall, and the third by Dr. W. Smith and Dr. L. Schmitz; *Grundzüge für die Verfassung Niederlands* (Berl. 1833); *Griech. Heroengeschichte* (Hamb. 1842), written for his son Marcus; the *Kleine historischen und philosophischen Schriften* (2 Bde. Bonn, 1838–43), contain his introductory lectures on Roman history, and many of the essays which had appeared in the transactions of the Berlin academy. Besides these, and numerous other essays on philological, historical, and archaeological questions, Niebuhr co-operated with Becker and other learned annotators in re-editing *Scriptores historiae Byzantinae*; he also discovered hitherto unprinted fragments of classical authors, as, for instance, of Cicero's *Orationes* and portions of Galien, published the *Inscriptiones Nabonians* (Rome, 1821), and was a constant contributor to the literary journals of Germany See Miss Winkworth's *Life and Letters of Niebuhr* (3 vols., 1852); Chassen's *Niebuhr* (1876).

NIEBUHR, Karsten, a distinguished geographer and traveler, was b. in 1733, in the Hanoverian territory of Hadlen, on the confines of Holstein. Being early thrown on his own resources, he spent several years of his youth in the position of a day-laborer; but his natural energy having led him to apply himself to the study of geometry, and having acquired a small property, he went to Göttingen, where he attended the classes at the university until his resources were wholly exhausted. At this period he entered the Danish service, and in 1761 he joined the scientific expedition which king Frederick V. sent to explore certain portions of Arabia, with a view of illustrating some passages of the Old Testament. The expedition reached Cairo at the close of the year 1761, and after having carefully explored the pyramids, and crossed the desert to mount Sinai and Suez, proceeded to Arabia Felix. Here, however, the various members of the expedition, which included the eminent naturalist Forskål, all perished with the exception of Niebuhr, who had himself suffered severely from fever. After the untimely death of his companions, he adopted the diet and dress of the natives—a measure to which he was probably indebted for the good health which he enjoyed during the rest of the travels, which he prosecuted with extraordinary resolution for more than six years. He proceeded as far as India, visiting also Persia and Asotic Turkey, and continued the observations and researches of his late colleagues in addition to his own special geographical
investigations. On his return to Denmark, in 1767, Niebuhr at once devoted himself to the task of publishing the results of his important mission, which appeared in German under the following titles, Beschreibung von Arabien (Copenb., 1772), and Beschreibung von Arabien und andern umliegenden Ländern (Copenb., 1774-78, 2 vols.); the publication of the third volume of this work was unfortunately delayed, in consequence of the pressure of numerous other engagements arising from his professional and official duties, and it was not till more than 20 years after his death that the book made its appearance under the supervision of Niebuhr's daughter, and through the liberality of the eminent bookseller Perthes of Hamburg. In addition to these valuable observations, Niebuhr edited and published at his own cost the natural-history notes of his deceased friend and fellow-traveler, P. Forskål, which he arranged in two works, Descriptiones Animalium, etc. (Copenb., 1775), and Flora Egyptiano-Arabica (Copenb., 1776). The accuracy of detail, fidelity of delineation, and careful avoidance of all exaggeration, which characterize Niebuhr's geographical and social descriptions of Arabia and other Asiatic countries, have made his works classical text-books for all who deal with the subject. Although Niebuhr's acceptance, in 1778, of a civil post, which fixed his residence in the remote provincial town of Meldorf, in the Ditmarsh district of Holstein, where he devoted himself during the rest of his life to the fulfillment of his official duties, he never relinquished his interest in scientific inquiry, and contributed several valuable papers on the geographical and political history of the nations of the East to the Deutshe Museum, and other periodicals. He died in 1815, leaving a character of being at once one of the most truthful and scientifically exact travelers of modern times.

NIEDERMeyer, LOUIS, 1802-61, b. in Switzerland; when very young showed a strong taste for musical composition; afterward studied under Moscheles and other eminent masters at Vienna and Rome. His first opera was produced at Naples, but of several composed by him, Storvella (1836) was the only one which had much success. He also set to music a number of songs by Victor Hugo, Lamartine, and Manzoni. Perhaps the best of his works are his religious compositions which display great originality.

NIEL, ADOLPHE, 1802-69; b. France, having studied at the École polytechnique in 1821, and received a military education at the military academy of Metz, in 1827 he was made lient. of engineers, in 1835 was promoted to capt., and accompanied the expedition against Constantine in Algeria, under generals Damrémont and Vallé in 1836-37. Gaining much distinction for bravery, he was raised to chef-de-bataillon and placed in command of the engineering corps in Algeria. He was raised to the rank of col. in 1846. In 1849, as the head of the staff of engineers he took part in the suppression of the revolutionary movements at Rome then defended by Garibaldi who surrendered after a siege of two months. He was then promoted to the rank of brig.-gen. and accomplished the official duty delegated to him, of carrying the key of the city to the pope at Gaeta. Returning to Paris he was appointed director of the engineering department in the ministry of war, and in 1853 was raised to the rank of gen. of division, and in 1854 to the rank of inf. div. He conducted the siege, which desolated the important Russian fortress of Bomarsund in Aug., 1854. He planned the operations through which Sevastopol was overcome, by the allied armies of England and France, in 1854-55, after a siege of 11 months, and commanded the engineers in the Crimea. He was aid-de-camp to the emperor, and after the taking of the Malakoff was decorated with the cross of the legion of honor. In 1859 he was sent as ambassador to the court of Victor Emmanuel, to demand the hand of princess Clothilde for prince Napoleon. He distinguished himself in the campaign in which occurred the battle of Solferino, June 24, 1859, and was made a marshal of France. In 1867 he was minister of war, and throughout his career sustained a high reputation as a scientific military officer.

NIELLO WORK, a method of ornamenting metal plates by engraving the surface, and rubbing in a black or colored composition, so as to fill up the incised lines, and give effect to the intaglio picture. It is by no means quite certain when this art was originated; Byzantine works of the 12th c. still exist to attest its early employment. The finest works of this kind belong to the former half of the 15th c., when remarkable excellence in drawing and grouping minute figures in these metal pictures was attained by Maso di Finiguerra, an eminent painter, and student of Ghiberti and Massacio. In his hands it gave rise to copper-plate engraving (see Engraving), and hence much interest attaches to the art of niello-cutting. Genuine specimens of this art are rare, some of those by Filippo Caroli are beautiful and effective, the black pigment with the lines giving a pleasing effect to the surface of the metal, which is usually silver. Those of his works best known are some elaborately beautiful pattines wrought by him for the church of San Giovanni at Florence, one of which is in the Uffizia, and some are in various private collections. In the collection of ornamental art at South Kensington, there are no less than 17 specimens of this art.

NIEIMANN, ALBERT, b. Germany, 1831; at first a singer in the chorus at Dessau. The magnificence of his tenor voice attracted the attention of the king of Hanover, who took him into his service. Wagner selected him to sing in Tannhäuser on its first production in Paris in 1861.
NIEMBSCH VON STREHLENAU. See NIEAU, NIKOLAUS, ante.

NIEMCEWIECZ, JULIAN URSAIN, 1757-1841, b. Poland; entered the army as an adjuvant at the age of 20, and became an intimate friend of Kosciuszko. After a tour in England and on the continent, he left the army in 1788, and entered the Polish diet as a deputy from Liwonia, and became an advocate of the patriotic party. In 1791 with his colleague Weysenhoff, he began the publication of the National and Foreign Gazette, and he also encouraged the spirit of nationality by his poems and dramas. He drew up the so-called "constitution of the 9th of May," which changed Poland from an elective to an hereditary monarchy, and abolished many of the privileges of the nobility. In 1795 the revolution caused by the second partition of Poland, Niemcewicz was the adviser and aide-de-camp of Kosciuszko; and he was wounded and taken prisoner at the disastrous battle of Maciełowice. During his imprisonment of 2 years, at St. Petersburg, he familiarized himself with the English poetry of the 18th c., and translated Pope's Rape of the Lock. On his release he came with Kosciuszko to this country, where in 1800, he married Mrs. Livingston-Keen of New York. Among his acquaintances in America, were Jefferson, and the exiled duke of Orleans, who afterwards became king Louis Philippe. In 1802 he was allowed to return to Poland on the death of his father. He came back to the United States for a brief period; but when Napoleon entered Poland in 1806, he sailed for Europe, and on the establishment of the grand-duchy of Warsaw, the king of Saxony made him secretary of the senate, inspector of schools, and member of the supreme council of public instruction. After Poland again passed under the power of Russia, though retained by the emperor Alexander in his office of perpetual secretary, he kept alive the memories of Polish nationality, in his Historical Ballads, 1816. He delivered a funeral oration over Kosciuszko in 1817, and in 1822 began the publication of his Collection of Memoirs on Ancient Poland, celebrating the national heroes of Poland. He took part in the unsuccessful revolution of 1830, and spent the rest of his life in exile. Besides the works already named, he published novels, comedies, and tragedies. His Notes on My Captivity in St. Petersburg, appeared in 1843, and was translated into English, the next year. A volume of memoirs of his own time was published at Paris, in 1848.

NIEMEN (called by the Germans mmeil) a river in Prussia, rises a few miles s. of the city of Minsk, flows westward to Grodno 180 m., at. w. along the frontiers of the Polish province of Augustowo, and w. through East Prussia to the Kurische Haff. Entire length, 640 miles. It is navigable for large craft at Grodno, 400 m. from its mouth, and is free of ice from March to November. Between Grodno and Kovno there are 55 rapids and shallows, and pilots are therefore required for the navigation of the river. At Winge, 4 m. below Tilsit, the Niemen divides into two branches, of which the northern, the Ros, reaches the Kurische Haff by nine months; and the southern, the Gilge, by seven months. The delta is traversed by several canals. The Niemen is of considerable commercial importance. Large barges bring down the produce of Lithuania and of a portion of Poland to Königsberg and Memel. Corn, hemp, flax, hides, and bacon, are the principal articles brought from the interior. Its principal affluent is the Vilna on the right.

NIEPCE, JOSEPH NICEPHORE, 1765-1833, b. France; entered the army, but resigned on account of ill-health, and in 1795 became civil administrator of the district of Nice. He resigned in 1801, and thenceforward pursued the study of chemistry and mechanics. In 1813 he made researches in regard to the production of pictures upon metallic plates by means of light. In 1824 he was able to fix images by light upon plates of glass, and afterwards of copper, and of silver covered with a thin coating of bitumen. He entered into a partnership with Daguerre in 1829.

NIEPCE DE ST. VICTOR, CLAUDE-FELIX-ABEL, a French chemist and photographer, was b. at Saint Cyr, near Chalon-sur-Saone, July 26, 1805. He served for some time in the army; but having made an important chemical discovery in connection with dyeing, he was permitted to exchange into the municipal guard of Paris, that he might pursue his scientific studies with more facility. This was in 1845, at which time his attention having been forcibly attracted to the production of photographs which had been made by his associate, Napier N. Niepce (see PHOTOGRAPHY), he resolved to devote his energies to this subject. He was led, in 1847, to the discovery of methods for obtaining images on glass, coated with albumen, starch, or gelatine, and for reproducing designs by the use of vapor of iodine. His investigations were for a time interrupted by the revolution of 1848, but he soon resumed them, directing his attention more especially to the obtaining of photographic images in colors; and before the close of 1852, he had succeeded in obtaining faithfully colored images of flowers, natural and artificial, colored engravings, gold and silver face, etc., upon silvered plates which had been sensitized by a chloride of copper. In obtaining these pictures, both photographic printing and the camera were employed; but to his intense disappointment, he found that the colors soon began to fade, and after a time disappeared. This process he named "heliochrome." His third and most important invention, that of the art of "heliography," or the production of engraved steel-plate photography, was first communicated to the academy of sciences in May, 1853. He does not deserve the credit of having originated the idea; for his uncle, previous to 1850, had communicated an imperfect sketch of a similar invention to M. Arago; and Mr. Talbot and others had succeeded by a similar process in
obtaining images of simple objects on steel plates; but to Niepe belongs the credit of having removed the almost insurmountable manipulative difficulties, and rendered the process of much more general application, thus making it practically serviceable. He afterwards employed himself in improving and perfecting his various discoveries.

In 1855 he published the various memoirs in which he had at different times communicated his three great discoveries to the academy of sciences, under the title of *Recherches Photographiques*, which was followed, in 1856, by *Traité Pratique de Gravure sur Acier et sur Verre*. He presented to the academy a number of memoirs on the action of light on a variety of substances, the last being *Sur l’Action de la Lumière et de l’Électricité* (Feb., 1860). Niepe’s scientific studies did not interfere with his military promotion, as he was successively appointed chef-d’escadron, and (1854) commandant of the Louvre. He died in April, 1870.

**NIEBERG**, a market village (pop. 2,600) of Hessen-Darmstadt, in the province of Rhein-Hessen, and 9 m. s.s.e. of Mayence, gives name to a well-known and highly-prized variety of Rheinish wine, which is produced in the neighborhood.

**NIESCHIN**, a t. in Russia, on the Ostr river, 35 m. s.e. of Tchernigov; pop. 21,590. It contains a monastery, a cathedral, churches, an hospital, schools, and a gymnasium. The chief production and export is tobacco.

**NIEUWER AMSTEL**, a t. of the Netherlands, in the province of North Holland, 5 m. s.w. by w. from Amsterdam. Pop. 5,066. A few miles to the e. of it is the village of Ouder Amstel, with about 3,000 inhabitants, on the Amstel, one of the smaller mouths of the Rhine, which passes through the city of Amsterdam, and falls into the Zuider Zee.

**NIEUWVELD MOUNTAINS**, a portion of the most northerly of the three ranges of mountains in Caper Colony, which at various distances from the southern coast all run parallel to it. Of these three ranges, the most northern attains the greatest altitude, having an average height of 7,000 feet. The portion known as the Nieuwveld mountains extend in lat. 31° 40’ to 32° 30’ s., and are intersected by the meridian of 32° e. longitude. From their southern slopes, the Gambia or Lion river draws its head waters; and from their northern, the Gariep or Orange river obtains an important tributary in the Upper Zak.

**NIEVRE**, a central department of France, occupies a portion of the watershed between the Loire and the Seine, and is bounded on the w. by the rivers Allier and Loire. Area, 2,630 sq. m.; pop., 1876, 546,822. Mountains occupy the eastern border, and extend in a line of heights from s.e. to n.w., dividing the department into two great declivities. The soil is generally rocky and sandy, cut up by ramifications, almost always wooded, of the mountains of Morvan. There are several plateaus more or less fertile, a number of hills covered with vines, and valleys productive in pastures; but the principal wealth of the department consists in its forests and minerals. The Nièvre, whence the name of the department, is an inconsiderable affluent of the Loire from the north. The three chief rivers—the Allier, Loire, and Yonne—are navigable, and the Yonne, entering at the left bank of the Seine, is connected with the Loire by a canal leading across the watershed. Of the entire area, more than 392,000 acres are cultivable land, and more than a third of the whole surface is covered with forests, the timber from which, forming one of the principal sources of wealth, is conveyed by water in great quantities to Paris, etc. About 6,000,000 gallons of wine are made yearly. From the mines of Nièvre iron of good quality is obtained in abundance; lead, copper, and silver are also found; and there are coal mines, and quarries of marble and granite. Arrondissements, Nevers, Châlons-Chinon, Clamecy, and Cosne; capital, Nevers.

**NIPHEIM** (from the same root as Lat. *nepeta*, cloud, and Eng. *home*), meaning the abode of clouds, was one of the nine separate abodes or homes, of which the old Scandians conceived the world as consisting in the beginning of time. It is the kingdom of cold and darkness, and is separated from Muspelheim, the kingdom of light and heat, by a huge chasm (Ginnungagap, yawning gap). Here flows the spring Hvergelir, watched by the dragon Nithhugger; this spring sends out twelve ice-rivers, from the drops of which, thawed by sparks from Muspelheim, sprang the chaotic giant Ymir and the cow Audhumla. Nithheim was also the abode of Hel (q.v.), the godness of death, who here received all who died of sickness or old age.

**NIGELLA**, a genus of plants of the natural order *ranunculaceae*, having five colored spreading sepals; five or ten small two-lipped petals, with tubular claw; the carpels more or less connected together, many-seeded; the leaves divided into threadlike segments, the flowers solitary at the top of the stem or branches. They are annuals, natives chiefly of the countries near the Mediterranean and the warmer temperate parts of Asia. Some of them, occasionally seen in gardens in Britain, are vulgarly known by the names *Devil-in-a-bush* and *Devil-in-a-mist*. The seeds are aromatic, and somewhat peppery. Those of *Nigella sativa*, a species common in cornfields in the s. of Europe, are supposed to be the Black Cumin of the ancients, and perhaps the Cuminum of the Bible. The seeds of a species of Nigella are much used by the Afghans for flavoring curries.

**NIGER**, the great river of western Africa. Its name, according to Dr. Barth, is a contracted form of one of the native names, *Neghirrin*, which, as well as all the other
names, Dhiilidé (Joliba), Mayo, I Against, Kwara (Quorra), and Baki-n-warra, means simply "the river." The principal head-water rises on the slopes of mount Lonna, a peak of the Kasi mountains, in a barren, desolate, and treeless region, in lat. 9°-25° N., long. 9°-45° W., about 1,600 ft. above sea-level. It flows n.e. to Timbuktu, where it bends eastward, and after flowing in that direction for about 250 m., it curves toward the s., and proceeds in a general s.e. course, until arriving at the head of its delta, in lat. about 5° 3' n., it separates into many branches, and enters the gulf of Guinea, between the islands of Benin and Biafra. It is called the Timbiri for the first 70 m. of its course, after which it receives the name of the Joliba, or more correctly Dhiilidé; and after passing Timbuktu, it is known principally as the Quorra. Little is known of its course until it reaches Sego (lat. 12° 30' N.), a distance of 350 m. from its source, but from that point it has been explored throughout nearly the whole of its course. From Sego to Timbuktu it flows through a fertile country, producing rice, maize, and vegetables, and abounding in good pasturage. In lat. 14° 10' N., the river separates into two branches; the western is called the Jolibu or Malay, the eastern the Barala. These, as they proceed, are known as the White and Black rivers respectively; and they unite after including the island of Jinhalla, 220 m. in length, and from 2 to 30 m. in breadth. The river again bifurcates before arriving at Timbuktu, and after passing that town, the two branches, on one of which—the northern—Cabra, the port of Timbuktu is situated, again unite. In the district of union in the s.w. of Timbuktu, the country far and wide is intersected by numberless streams, forming a complicated net-work of water-courses. The river then flows e., sending off many creeks and branches to Bamba; its banks here are low and marshy, and during the rainy season are overflowed. In this region, rice, tobacco, wheat, and even barley are grown. The river then passes the town of Burring, where it curves to the s.e., and from this point—called from the bend, the Kene of Burring— it bears the name of Kwara or Quorra until it reaches the delta. Immediately below Burring the river does not present an imposing appearance. Its bed resembles a broad marshy valley, inclosed by ridges of low or high dunes, thickly overgrown with reeds and sedges, and cut up by numberless streams and creeks. At the ferry of Burring (lat. 15° 55' N.), the breadth of the river is from 800 to 900 yards; and here the whole valley, about 10 m. broad, is fruitful, carefully cultivated, and well peopled. Further s., the towns of Garr and Sandu are passed, and here the bed is rocky and the navigation dangerous. At the town of Say, the Niger, after reaching a breadth of from 2,500 to 3,000 paces, is narrowed to a width of 1,000 paces, flows at the rate of three miles an hour, and is inclosed by rocky banks. From Say to Wara, the course of the Niger remains still unknown. From Wara it flows e.s.e. to Rabbah; and from this town to its mouth, the course of the river is comparatively well known. In lat. between 8° and 7° 30' n., it flows round the eastern shoulder of the Kong mountains (2,000 to 3,000 ft. high), and here the banks of the Niger are extraordinarily beautiful. In lat. 7° 40' n., it receives the Beame from the e. The delta consists of an immense mangrove forest, cut up into islands by the numerous branches (22 in number) of the river. The principal months are the Bonay, Mari, and Nun.

The existence of the Niger seems to have been first made known in ancient times by travelers from the s. shores of the Mediterranean, who, crossing the great desert, came upon the upper course of a great river flowing toward the rising sun. This river Herodotus supposed to be a branch of the Egyptian Nile. Pliny speaks of the Niger of Ethiopia, but he also thought that it flowed into the Nile. No definite notion on the river had been formed until it was visited by Mungo Park in July, 1796, when this traveler explored its banks for a distance of 100 m. See PARK, Mungo. Caillié explored the river from the town of Jenne to Timbuktu; and the English expedition of 1832, under Landry and Allen, proved that the Quorra was navigable from Boussa to the sea: information, however, which was obtained at an immense cost of human life from the unhealthiness of the climate. Subsequent expeditions have had with similar results. In 1854, Dr. Barth followed the course of the river from Timbuktu to Say, and much of what is now known about the Niger is due to his labors. The entire length of the river is estimated at upwards of 2,500 miles.—Barth's Travels in Central Africa.

NIGHT-HAWK, Chordeiles Virginianus, a bird of the goatsucker family (caprimulgidae) very common in America, from the Arctic islands to the West Indies. It is a bird of passage, visiting the north in summer. It is about nine inches in length, and 23 inches in expanse of wing. The gape is destitute of bristles. The tail is slightly forked. The general color is brown, but it is much mottled and marked with white; and there is a white mark on the throat, in shape like the letter V. The night-hawk is seen pursing its insect prey in the air, chiefly before sunset, and before dawn, and attracts attention by its rapid repetition of a sharp impatient cry, which has gained for it the name Peren- "Oh dice. It produces also in its flight a remarkable hollow booming sound, ‘like blowing into the bung-hole of a barrel,’ in the moments of its perpendicular descent through the air. Its movements in the air are extremely beautiful and rapid. When fat and plump, as it usually is on its southward migration, it is esteemed for the table, and great numbers are shot.

NIGHT HERON, Nycticorax, a genus of ardea (See HERON), intermediate in form between bitterns and herons, but with shorter and thicker bill than either, and legs
shorter than in herons. The **Common Night Heron** (*Aonides* or *Eurypsocus*) is found in Europe, Asia, Africa, and North America, chiefly in the warmer temperate regions. It is most abundant in America, and is partly a bird of passage. It is a very rare visit-ant of Britain. Its length, from the tip of the bill to the end of the short tail, is fully two feet. It weighs nearly two pounds. Its plumage is soft, the general color ash-gray, passing into black on the neck and head, and into white on the breast and belly. The back of the head is adorned with three very long white feathers, which hang down on the neck. The nests are built in trees, and in general many together, forming a *heronry*. The night heron feeds chiefly by twilight or at night; and is never seen standing motionless, like herons, but walks about in search of prey, by the sides of ditches, ponds, etc.; its food consisting chiefly of fishes, frogs, and other aquatic animals. Its cry is very loud and hoarse.—Other species of night heron are found in Africa and Australia.

**NIGHTINGALE, Philomelus**, a genus of birds of the family *sylvirnae*, approaching in character to the *morulata*, the young having their first plumage mottled, as in the thrushes, and the legs being shorter than in the *lauvea* and other *sylvirnae*, with which they are commonly classed. The bill is straight, slender, not quite as long as the head; the wings do not much pass beyond the base of the tail; the first quill is very short, the third is the longest; the tail is slightly rounded.—The **Common Nightingale** (*P. borealis*) is well known as the finest of songsters. It is rather larger than the hedge-sparrow, with about the same proportionate length of wings and tail. It is of a rich brown color above, the rump and tail reddish, the lower parts grayish-white. The sexes are alike. It is a native of many parts of Europe and Asia, and of the north of Africa; and is a bird of passage, extending its summer migrations in the continent of Europe as far north as the south of Sweden, but in Britain it has scarcely ever been seen further north than Yorkshire. It is plentiful in some parts of the south and east of England, but does not extend to the western counties, and never appears in Ireland. It frequents thickets and hedges, and low damp meadows near streams. The extensive market-gardens near London are favorite haunts for it. It feeds very much on caterpillars and other larva. It arrives in England about the middle of April, the males ten or fourteen days before the females. It is at this season, and before pairing has taken place, that bird-catchers generally procure nightingales for cage-birds, as they then become easily reconciled to confinement, whilst, if taken after pairing, they fret and pine till they die. The nightingale makes its nest generally on the ground, but sometimes on a low fork of a bush. The nest is loosely constructed of dead leaves, rushes, and stalks of grass, with a lining of fibrous roots. The eggs are four or five in number, of a uniform olive-brown. The song of the male ceases to be heard as soon as incubation is over. In captivity, however, it is often continued through a more considerable period. The nightingale usually begins its song in the evening, and sings with brief intervals throughout the night. The variety, loudness, and richness of its notes are equally extraordinary; and its long quivering strains are full of plaintiveness as well as of passionate ecstasy. The nightingale has been a favorite from most ancient times; and is often mentioned in the poetry of India and Persia, as well as Greece and Rome. It is favorite of the rose as a fanciful theme in which eastern poets delight. The nightingale much resembles the redbreast in manners, and is equally pugnacious. It has been known to breed with the redbreast in captivity.—There is another and rather larger species of nightingale in the east of Europe, faintly mottled on the breast.

**NIGHTINGALE, Florence**, famed for her labors in reforming the sanitary condition of the British army, is the daughter of William Shaw Nightingale of Embly park, Hampshire, and Leigh Hurst, Derbyshire, and was born at Florence in 1823. Highly educated, and brilliantly accomplished, she early exhibited an intense devotion to the alleviation of suffering, which, in 1844, led her to give attention to the condition of hospitals. She visited and inspected civil and military hospitals all over Europe; studied with the sisters of charity in Paris the system of nursing and management carried out in the hospitals of that city, as well as of Greece and Rome; and in 1850 went into the lowest grades of Protestant deaconesses at Kaiserswerth, on the Rhine. On her return to England, she put into thorough working order the sanatorium for governesses in connection with the London institution. Ten years was the term of apprenticeship thus served in preparation for the work of her life. In the spring of 1854 war was declared with Russia and a British army of 25,000 men sailed to the east. Alma was fought Sept. 20, and the wounded from the battle were sent down to the hospitals prepared for their reception on the banks of the Bosporus. These hospitals were soon crowded with sick and wounded, and their unhealthy condition became apparent in a rate of mortality to which the casualties of the fiercest battle were as nothing. In this crisis Miss Nightingale offered to go out and organize a nursing department at Scutari. The late lord Herbert, then at the war-office, gladly accepted, and, within a week from the date of the offer—viz., Oct. 21—she departed with her nurses. She arrived at Constantinople Nov. 4, the eve of Inkermann—the beginning of the terrible winter campaign—in time to receive the wounded from that second battle into wards already filled with 2,300 patients. Her devotion to the sufferers can never be forgotten. She has stood twenty hours at a stretch, in order to see them provided with accommodation and all the requisites of their condition. But she saw clearly in the bad sanitary arrange-
ments of the hospitals the causes of their frightful mortality, and her incessant labor was devoted to the removal of these causes, as well as to the mitigation of their effects. In the spring of 1855, while in the Crimea organizing the nursing-departments of the camp-hospitals, she was prostrated with fever, the result of unintermitting toil and anxiety; yet she refused to leave her post, and on her recovery remained at Scutari till Turkey was evacuated by the British, July 28, 1856. She, to whom many a soldier owes his life and health, had expended her own health in the physical and mental strain to which she had subjected herself. It is known that for years Miss Nightingale has been an invalid. It is not so well known that her sick-room has been the scene of the most arduous and constant labor for the improvement of the health of the soldier. In 1857 she furnished the "commissioners appointed to inquire into the regulations affecting the sanitary condition of the British army" with a paper of written evidence, in which she impresses, with the force and clearness which distinguish her mind, the great lesson of the Crimean war, which she characterizes as a sanitary experiment on a colossal scale. Her experience in the Crimea, the results obtained by the labors of the sanitary commission, results accumulated under her own eyes, showing that the rate of mortality among soldiers could be reduced to one-half of what it was in time of peace at home, turned the attention of Miss Nightingale to the general question of army sanitary reform, and first to that of army hospitals. In 1858 she contributed two papers to the national association for the promotion of social science, on hospital construction and arrangements, afterwards published, along with her evidence before the commissioners, by J. W. Parker and son. The Notes on Hospitals, from their clearness of arrangement and minuteness of detail, are most valuable to the architect, the engineer, and the medical officer. In 1859 she published her Notes on Nursing, a little volume which is already among the best books of many a medical student. In the Crimean war a fund was subscribed for the purpose of enabling her to form an institution for the training of nurses. The interest of the fund amounts to $1490 per annum; and though no separate institution has been formed, it is spent in training a superior order of nurses in connection with St. Thomas's and King's college hospitals. In the year 1863 was issued the report of the commission on the sanitary condition of the army in India. The complete report, with evidence, occupies two folio volumes of nearly 1000 pages each. The second of these huge folios is filled with reports from every station in India, occupied by British and native troops. These reports were sent in manuscript to Miss Nightingale, and at page 347 of vol. i. are inserted her observations upon this immense mass of evidence. In these observations, the facts are brought together in an order, and with an incisive force of statement, which render it one of the most remarkable public papers ever penned. That report is likely to inaugurate a new era in the government of India; for the views of Miss Nightingale extend not only to the sanitary reform of the British army, but to that of the towns of India. In 1871 Miss Nightingale published Notes on Lying-in-Institutions, together with a proposal for organizing an Institution for training Midwives and Midwifery Nurses; in 1873, Life or Death in India, and (in Fraser's Magazine) "A 'Note' of interrogation," which attracted a good deal of attention, mainly on account of the way she handles religious beliefs and life.

NIGHTSHADE. See Goat'sucker.

NIGHTMARE, Lucidus, Ephelites, consists in a horrible dream, the terror being inspired by a sense of weight or oppression referred to the pressure of mountains, giants, hags, serpents, upon the breast. It is attributed to acceleration or irregularity of the circulation in the chest or in the brain. It has been traced backward to plethoric, posturc, heavy suppers; and forward as a prognostic of heart disease or hydrothorax. It differs from ordinary dreams in possessing always the same characteristic of fear of some object in contact with the body, in a recognized inability to move or speak while there is a strong desire to do both, and in the presence of a semi-consciousness of the real source of the apprehension. The affection is recorded to have been epidemic; and modern instances have occurred where large communities have been agitated by night panics. A regiment of French soldiers, quartered in a ruined monastery, were awakened, at the same hour in two successive nights, by a black dog leaping on the breast of each. These veteran warriors, inured to danger, unsuccessful to superstition, could not be prevailed upon to make a third trial. Such frightful impressions occur during the day, and during mere somnolency or drowsiness, but more generally at the moment of awakening during the night. The time, the distinct recollection retained of the circumstance, and the bodily perturbation which remained when conscious was re-established, all conspired to convert these visions into the objective holgoblins, the omens and supernatural revelations of past ages; and which still linger as matter of belief where the temperament or situation of the individual resembles those of our ancestors. In a very large number of instances such dreams represent, or are continuations of, the previous waking thoughts and emotions. They are so far voluntary that indigestible food or excess may induce them. Puscell, for artistic purposes, created "chimeras dire" in sleep by supping on pork chops.

NIGHTSHADE, the English name of certain plants of the natural order Solanacea (q.v.), possessing the narcotic properties frequently developed in that order. Among
there are some species of *solanum* (q.v.), particularly the common *nightshade*, or black *nightshade* (*S. nigra*), an annual or biennial, with erect angular stem, ovate, siminate-determinate leaves, drooping lateral umbels of white flowers, and globose black berries; a frequent weed in waste places in England and in most parts of the world. Few plants are more widely diffused. It is only slightly narcotic. The leaves, in a fresh state, are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries, although generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid *solanine* found also in the shoots of the potato.—*Woody nightshade*, see Bittersweet.

For *deadly nightshade*, see Belladonna. For *enchanter's nightshade*, see Circe.a.

**NIGRITIA.** See Sudax, *ante.*

**Nihilism** is a term used of certain philosophical or half-philosophical systems of "negative" tendency, especially such as deny God, the soul, and the moral distinction between good and evil. Of late, however, it has become familiar throughout Europe as applied to the hyper-revolutionary programme of a Russian organization in various ranks of society. The young men at the universities seem to be largely addicted to Nihilism, and are equated in their zeal by the "fair girl graduates" of Russia. The Nihilists are said to have adopted many of the socialist views of Proudhon (q.v.); but while their scheme is in other respects vague and ill-compactcd, their foremost principle is the belief that society may be and ought to be regenerated by a sudden and sweeping overthrow of most existing social and political institutions. Towards preparation for this extensive undertaking, their bold propagandism is especially directed. While violently opposed to Pan-slavism (q.v.), as supporting old and obsolete notions of nationality and patriotism, cosmopolitan Nihilism is yet so far purely Russian as apparently not to have established direct relations with the socialist organizations of western Europe. Herzen (q.v.), as an admirer of west European culture, widely to be distinguished from the Nihilists, gave powerful impetus to the Russian movement. But the great leaders of the Nihilistic movement were the indefatigable agitator Michael Bakunin (born 1814) and the journalist Tchernyschevski. In 1869, during certain students' demonstrations, revolutionary manifestoes were distributed. Much was done for promoting revolutionary opinions through the medium of Sunday-schools, etc., these were suppressed by government. Young men of good birth adopted menial callings in order to understand the grievances and burdens of their poorer brethren, and to enter with fuller sympathy into their feelings. Nihilist associations began to display organized activity, and considerable funds were collected. Government now began numerous prosecutions. In 1871 there was a lengthened trial, and numerous condemnations to Siberian exile. In 1875 an actual rising took place under a red banner, amongst the students at Kazan. In 1875-76, 139 persons, mostly young men and women, were tried, and many condemned. The unanimous acquittal by a St. Petersburg jury of the lady assassin, Vera Soutenshchin, who attempted to shoot Tchernyschevski, displayed a dangerous condition of public feeling, and led to the significant, though "temporary," withdrawal of the trials for political crimes from juries, these being now assigned, to courts-martial. The assassination, by Nihilists especially commissioned, of the general at the head of the secret police of Russia and of the governor of Kharkov, in 1878 and 1879, show the boldness and persistency of the Nihilistic propaganda.

**Nihilists** (from Latin nihil, "nothing"), a revolutionary organization in Russia, aiming at the destruction of all existing laws, religions, and political and social systems, while preparing to replace them with nothing. It is stated that the term was first employed by the Russian novelist, Ivan Turgeneff, in his stories of Russian society. It was, however, accepted by the organization itself, as will appear in the following quotation from a speech by a member, and which may be accepted as fairly significant of the doctrines with which the minds of the advanced radicals of Russia have become imbued.

"Nothing, in the present state of social organization, can be worth much, for the simple reason that our ancestors instituted it. If we are still obliged to confess ourselves ignorant of the exact medium between good and evil, how could our ancestors, less enlightened than we, know it? A German philosopher has said: "Every law is of use. It rules the conduct of individuals who feel for one another and appreciate their respective wants. Every religion, on the other hand, is useless; for, ruling as it does, our relations with an incommensurable and indefinite Being, it can be the result only of a great terror or else of a fantastic imagination. Now, we Nihilists say, no law, no religion—nihil! The very men who instituted these laws ruling their fellow-creatures have lived and died in complete ignorance of the value of their own acts, and without knowing in the least how they had accomplished the mission traced for them by destiny at the moment of their birth. Even taking it for granted that our ancestors were competent to order the acts of their fellow creatures, does it necessarily follow that the requirements of their time are similar to those of to-day? Evidently not. Let us then, cast off this garment of law, for it has not been made according to our measure, and it impedes our free movements. Hither with the axe, and let us demolish everything. Those who come after us
will know how to rebuild an edifice quite as solid as that which we now feel trembling over our heads." Two points will be observed in this manifesto: the one being its positive antagonism to all existing things—because they exist; the other the sophistry with which the accepted position is reasoned out to a logical conclusion. And this brings us naturally to the starting points of Russian nihilism: in the influence of the Russian history; in the nature of the Russian people; and in the exceptional character of the Russian political system.

The present autocracy of Russia was originally an oligarchy, and not until Ivan I. (III.) founded the existing Russian empire in the 15th c. was the power of the grands, true oligarchs, destroyed. Autocracy was cemented by his immediate desendant, Ivan the terrible, by Peter I., Katherine II., and finally by Nicholas. Under the changed political condition instituted by these monarchs, there came to be two orders or classes among the Russian people: the czar, the nobility and aristocracy, and the serfs: there was no bourgeoise or middle class. This anomalous condition is supplemented by another; the existence for centuries of the mir, an actual democracy, which has outlived tyranny and spoliation, and by which each village community has kept alive the ideas of socialism and equal rights. The mir is in fact a co-operative association of the local peasantry, under a head elected by themselves, who exercises parental authority in conjunction with the village parliament which is convened, in cases of emergency. This institution is primitive in its origin, which was Slavonic, is patriarchal in discipline, and preservative of the socialistic element in rural economy. Through its means exists the veritable commune in Russia; since the arable land and pasturage belong not to individuals, but are the collective property of the commune, which enjoys unlimited authority in making allotments and in the redistribution of the soil. These village communities contain about five-sixths of the population, and are opposed to a centralized bureaucracy on the one hand, and centralization of power on the other. When to this extraordinary combination of factors is added that of the persistent tendency of the Russian aristocracy toward anarchy—which is a historical fact—it will be seen what a readiness there is for socialistic ideas and positive revolutionary principles. After Ivan the terrible, a period of actual anarchy existed in Russia, when the boiars (barons) succeeded in fastening still more strongly the chains of servitude upon the unhappy serfs. The ascension of Michael Romanoff to the throne, and the foundation of a new dynasty, proved to be the death-blow to their hopes for ascendency in the realm, and there was nothing for them, and for all the petty potentates and government officials in the empire, but to continue an iron grasp on the lower order, for the increase of their wealth and power, if not of their dignity. A reviewer in Blackwood has epitomized the situation: "Under We have the monarch who rules, the courtiers who assassinate, and the peasants, serfs who obey. Gladstone wrote, so late as 1880, of what he called "the oligarchic, diplomatic, and military class": "This class, or rather this conglomerate of classes, ever watchful for its aims, ubiquitous yet organized, standing everywhere between the emperor and the people, and oftentimes too strong for both, is at work day and night to impress its own character upon Russian policy." Under Ivan the terrible was organized the oprichnina (elect, or covenanted), a body of guards, selected sometimes from the lowest of the people, who swore implicit obedience to the czar, and in return were chartered libertines, robbers, and assassins. Each of them exercised a despotism as odious in its sphere as that of the czar, and they became the nucleus of a new kind of nobility, the nobility of function and government employ, which for all practical purposes nearly superseded the hereditary nobility. It is to be remembered that Nicholas ascended the throne over the ruins of a conspiracy which only his personal majesty and invincible courage enabled him to control; and this by such a massacre of those engaged in the uprising, that in one day 15,000 persons were slain, whose bodies were thrown by torchlight into the Neva. But before the accession of Nicholas, in 1821, when all Europe was convulsed with revolutionary disorder, Russia began to feel the influence of the new ideas which pervaded the political atmosphere of the entire continent, and did not escape the infection of secret societies which had been brought back by the armies from France. It is not unreasonable to suppose that it was this influence which brought about the insurrection of Dec., 1825; since one of the leaders in the outbreak was Alexander Hertz, who with Bakunin, is considered a founder of the nihilist organization; and who continued throughout his life (he died in 1870) to disseminate the most advanced radical opinions. As an illustration of the tendency of his writings, we have the following: "Despotism itself lives behind wooden walls, and has no stability. A conservative government like that of Austria has never been possible in Russia: we have nothing to conserve, because there is nothing stable among us. Every government policy brings into question the existing rights and institutions; what was ordered yesterday is countermanded to-day. Because there is no historical basis, we love novelties to distraction."

Alexander II. ascended the throne under circumstances which, though less sanguinary than those of his father's accession, were yet essentially untoward. Apparently everything was in ruins: the military system had broken down; the Crimean war had been a disaster; the administrative machinery of the state had almost collapsed. In closing the Crimean war, the new emperor uttered a manifesto which was significant of his hopes and designs for the future of Russia. Among other expressions in it was the desire that "by the combined efforts of the government and the people, the public admin-
Nihilists.

istration would be improved, and that justice and mercy would reign in the courts of law." The beginning of his reign was signalized by the copious use of the pardoning power; and in its second year he began to move in his vast enterprise of emancipating the serfs, by submitting the question to the nobles of the empire. The number of serf-owners in Russia was about 110,000, having under their control 23,000,000 peasants. In 1857 the emperor issued a ukase which was the beginning of the tremendous change which he had undertaken; and on Feb. 19 (March 3, n.s.), the emancipation law was completed, and the signature of Alexander II. gave freedom to 23,000,000 men. By the agrarian, or land law, which followed, the peasants of a commune were enabled to buy their holdings by a cash payment of about three years' rent, the state advancing four-fifths of the full payment, which was to be repaid, with 6 per cent interest, in 49 years. In the outset, under this act, Russia paid $500,000,000 to the landlords to settle the newly emancipated serfs upon their own holdings, comprising farms extending over 300,000,000 acres. And as the peasants, from time to time, failed to meet their payments, the government advanced the amount. The final result of the land-law will be that the peasant, by paying four-fifths of his rent for 49 years to the state instead of to his landlord, will, at the expiration of that period, have become absolute owner of his farm. It is to be observed that by the enforcement of the emancipation act and the land act, the landlords lost first, their serfs, and then 20 per cent of their rentals. The third great act of Alexander II., was to extend the system of the mir, or local self-government, so as to give the peasants entire control as to this, with a very complete organization of elected officials. As the emperor also reformed the judiciary; introduced trial by jury, and the system of public and private indemnity; made education compulsory, to promote education, so that between 1860 and 1870 the number of children who could read multiplied five-fold; and finally destroyed most of the existing class distinctions, and relaxed the severity of the censorship of the press; the continued existence of nihilism, and its potency, as shown in the recent assassination of this very czar, present a most difficult social and political question. The anomaly of the union of many of the wealthiest and most aristocratic Russians, men and women, with students and other educated persons, with the peasant class, in a wide revolutionary movement, having for its avowed object the destruction of all existing institutions, would be inexplicable, but for the peculiar characteristics of Russian history—as already set forth; with other reasons now to be indicated. Mr. Gladstone has said of Alexander II.: "The present emperor of Russia has, during a reign now approaching a quarter of a century, given ample evidence of a just and philanthropic mind. No greater triumph of peaceful legislation is anywhere extant. He has revolutionized the Russian empire.... Of these very serfs, or peasants, he has said: "They are a peaceful and a submissive race, whose courage in the field is that of a determined and uncalculating obedience." We have referred, as one of the starting points of Russian nihilism, to the nature of the Russian people. This is not what has been generally supposed, particularly by Americans, who have received their conclusions ready-made from always antagonistic and contemptuous English sources—to whose utterances those of Mr. Gladstone stand as a relief. The current opinion as to the result of "scratching a Russian," derived from the emperor Napoleon I., who had no great cause to love the race, has been that this would be to disturb the Tartar savage beneath, and bring to light a disposition cruel, vindictive, and stubborn; and a temperament stolid and lethargic; a combination of the merciless Asiatic, and the boorish and phlegmatic Hollander of the picture-books. This conception is far from truth. The race is probably similar to the Irish in some characteristics; and to the French in its mercurial nature; while in strange combination it resembles the German in its boldness for abstract philosophical reasoning, and the Spaniard or Italian in its sensuousness and indolence. These latter characteristics give it an oriental stamp. As to the psychological tendencies of the Slave mind, Moritz Kaufmann writes that it is "singularly sensitive to the seductive influences of grand misty conceptions, while at the same time inclined to indolence and melancholy dejection"—again an oriental tinge. Keeping in view this fact; and remembering that in Russia there has been for centuries a struggle between the educated (aristocratic) class and the emperor; that while the individual administration of the government by the latter may have been excellent; that of his officials, from the highest to the lowest, has, confessedly, been infamous; that vast reforms were projected into the Russian system en masse, which elsewhere would have been the slow work of centuries; that these reforms, while they alienated from the emperor and autocracy the favor of the upper class, did not gain that of the lower; it may well appear that Russia needed only to be infused with an element powerful enough and insidious enough, to become distended to any madness, the tendency of the emancipation act and the land act, however noble and beneficent these were in themselves, has been to undermine the confidence of the Russian peasant, by removing from him the only sure foothold that he knew. As the prisoner, long confined, pleads to return to his dungeon, the serf under his new condition of freedom, combined with that of proprietorship, is prostrated beneath an endowment which is an actual burden. For the peasant has to a certain extent merely changed owners—since as to his payments for land, he is obliged to depend on some principal man in the village. And, meanwhile, the old commune principle is being slowly eaten away, and that of
individualism with its consequent responsibilities and antagonisms—both utterly foreign to the experience and taste of the Russian peasant—assumes its place.

Michael Bakunin, supposed by some to have formulated nihilism out of the Hegelian philosophy, but whose theories are more naturally traceable to an utter materialism acting on the revolutionary ideas afloat in Europe during the first half of the 19th century, was born in 1814, and died in 1876. He was of a family high in rank and position, a near relative being aid-de-camp general to the late czar, and another governor-general of Siberia; was educated in the school for cadets in St. Petersburg; and on graduating was appointed an ensign in the artillery. In 1841 he went to Berlin and studied Hegel, where the master had taught a dozen years before; removing afterwards to Dresden, where he continued his studies with Arnold Ruge, and where he began to write on philosophical subjects. In 1843 he was in Paris, and by this time had become closely associated with the Polish refugees; and from there he visited Switzerland, where he was introduced into the communist and socialist societies. In 1847, in a speech made in Paris, he advocated a general Russian and Polish uprising against the emperor; this occasioned a request from the Russian government which procured his expulsion from France. A reward of 10,000 rubles was offered by the Russian government for his apprehension, and he fled to Brussels, but returned to Paris after the revolution in 1848.

He attended the Slavic congress at Prague, and was involved in the revolutionary movement which followed; was one of the organizers and leaders of the riots in Dresden, from which city he fled after their suppression; and on May 10 was captured at Chemnitz. He was now tried, condemned, and sentenced to death in three countries—Prussia, Austria, and Russia; his punishment being in each instance commuted to that of imprisonment for life. He was confined for several years in the fortress of St. Petersburg, and then transported to e. Siberia, where he remained for several more years as a penal colonist, when he was permitted to settle in the Russian territory of the Amoor.

Thence escaping by an American vessel, he proceeded by way of Japan and California to London. Here he was active in endeavors to incite the Russians and Poles to revolution, with the view of forming a great Slavic federal republic. In 1863 he went to Stockholm to aid the expeditions against the Baltic provinces. This enterprise failing, he proceeded to Switzerland, where he united with the internationals; but his attempt to create a secret society within their own, with the purpose of bringing about a condition of general anarchy, brought him into conflict with their leaders; and in 1872 he, with some of his friends, was expelled from the organization, when he retired from public action. In the meantime societies had been formed in Russia to promote the views of Bakunin and Hertzgen, the “Young Russia,” “Land and Freedom,” etc.; and newspaper organs—the Sortamentnik and Ruskoie Slovo, were established and industriously circulated in the same interest. As presenting the strangely self-contradictory theories which dominated the new revolutionary order at this time, the following is quoted from a speech made at Geneva, in 1868, by Michael Bakunin—“the father of nihilism, the arch-conspirator: “Brethren, I come to announce to you a new gospel which must penetrate unto the very ends of the world. This gospel admits of no half-measures and hesitations. The old world must be destroyed and replaced by a new one. The lie must be stamped out and give way to truth. It is our mission to destroy the lie; and to effect this we must begin at the very commencement. Now the beginning of all those lies which have ground down this poor world in slavery is God. For many hundred years monarchs and priests have inoculated the hearts and minds of mankind with this notion of another world. They have taught, for the sake of their own advantage, the notion of another world, in which their God is to punish with eternal torture those who have refused to obey their degrading laws here on earth. This God is nothing but the personification of absolute tyranny, and has been invented with a view of either frightening or alluring nine-tenths of the human race into submission to the remaining tenth. If there were really a God, surely he would use that lightning which he holds in his hand to destroy those thrones to the steps of which mankind is chained. He would, assuredly, use it to overthrow those altars where the truth is hidden by clouds of lying incense. Tear out of your hearts the belief in the existence of God; for as long as an atom of that silly superstition remains in your minds, you will never know what freedom is. When you have got rid of the belief in this priest-begotten God, and when, moreover, you are convinced that your existence and that of the surrounding world are due to the conglomeration of atoms, in accordance with the laws of gravity and attraction, then, and then only, you will have accomplished the first step toward liberty, and you will experience less difficulty in ridding your minds of that second lie which tyranny has invented. The first lie is God. The second lie is right. Might invented the fiction of right, in order to insure and strengthen her reign—that right which she herself does not heed, and which only serves as a barrier against any attacks which may be made by the trembling and stupid masses of mankind. Might, my friends, forms the sole groundwork of society. Might makes and unmakes laws, and that might should be in the hands of the majority. It should be in the possession of those nine-tenths of the human race whose immense power has been rendered subservient to the remaining tenth by means of that lying fiction of right before which you are accustomed to bow your heads and to drop your arms. Once penetrated with a clear conviction of your own
might you will be able to destroy this mere notion of right. And when you have freed your mind from the fear of a God, and from that childish respect for the friction of right, then all the remaining chains which bind you, and which are called science, civilization, property, marriage, morality, and justice, will snap asunder like threads. Let your own happiness be your only law. But in order to get this law recognized, and to bring about the proper relations which should exist between the majority and minority of mankind, which exists under the shape of state or social organization. So educate yourselves and your children that, when the great moment constituting the new world arrives, your eyes may not be blinded by the falsehoods of the tyrants of throne and altar. Our first work must be destruction and annihilation of everything as it now exists. You must accustom yourselves to destroy everything, the good with the bad; for if but an atom of this old world remains, the new will never be created. According to the priests’s fables, in days of old a deluge destroyed all mankind; but their God specially saved Noah in order that the seeds of tyranny and falsehood might be perpetuated in the new world. When you once begin your work of destruction, and when the floods of enslaved masses of the people rise and engulf temples and palaces, then take heed that no ark be allowed to rescue any atom of this old world, which we consecrate to destruction.

Here, the very "right" whose existence is denied is invoked as the basis of action.

In one nihilist speech it is asserted that the deeds of political assassins and incendiaries are not the offspring of any sentiment of personal hatred or vengeance. They know full well that one emperor killed will merely be succeeded by another, who in his turn will again nominate the chiefs of police and of the third section. Such deeds are justified by the necessity of rooting out from men’s minds the habitual respect for the powers that be. The more the attacks on the czar and his officials increased, the more would the people come to understand the absurdity of the veneration with which they have been regarded for centuries. In March 1876, several nihilist proclamations on their way to Russia were seized by the Prussian authorities at Königsberg. Paragraph xvi. of one of the documents ran thus: "You should allow yourselves to be influenced (in the selection of your victims) only by the relative use which the revolution would derive from the death of any particular person. In the foremost rank of such cases stand those people who are most dangerous and injurious to our organization, and whose sudden and violent death would have the effect of terrifying the government, and shaking its power by robbing it of energetic and intelligent servants. § xxiii.—Having this object in view, the revolutionary committee does not propose to subject the people to any directing organization. The future order of things will doubtless originate with the people themselves; but we must leave that to future generations. Our mission is only one of universal, relentless, and terror-striking destruction. § xxvi.—The object of our organization and of our conspiracy is to concentrate all the forces of this world into an invisible and all-destrcgying power. Among the papers found on the nihilist felon, Dubrowin, who was hanged for complicity with the regicide Solowjew, was a letter containing the following passage: "Our battalions are numerically so weak, and our enemies, on the other hand, are so mighty, that we are morally justified in making use of all attainable methods of proceeding which may enable us to carry on successfully active hostilities whereas it may become expedient." Again the inevitable attempt at justification on the basis of the "right" whose existence is denied.

When one reads such propositions and declarations, and finds it difficult to conceive a sufficient reason for the existence of the sentiments and determination expressed, even in the most untutored and illy balanced, it is to be remembered that in Russia any tendency toward revolutionary expression has ever been met with instant and severe punishment. The knot and perpetual punishment at hard labor have been the modes in which autocracy has visited its displeasure on any movement against itself. While the czar of his own suggestion gave freedom and large actual possessions to 28,000,000 of his poorest and most unhappy subjects, he followed the traditions of the throne of Russia by sternly refusing to the higher classes anything resembling a constitution, or a national legislative. Attempts to gain these, and there were many such, served to people the penal colony of Siberia, precisely as did the more savage and wanton attempts of the lower order in a similar direction. During many years the average number dispatched to Siberia, for all offenses, has been from 8,000 to 10,000 persons per annum; and of these, probably a large majority were for political crimes; very many of them educated, wealthy, and of high birth; among them not a few refined, cultivated, and gentle ladies. Siberia has the reputation among Russians of being a much worse place than it really is, and the officials in charge of the convicts are accused of a general line of cruelties which is foreign to their customary behavior. Recent visits to the Siberian penal settlements by intelligent travelers of different nationalities, have shown that the ill-treatment of convicts and the dismal character of existence in Siberia have been greatly exaggerated, and that both compare favorably with those in such settlements elsewhere. But to the prevailing Russian belief as to such matters may be laid somewhat of the revengeful and desperate frame of mind which results in nihilism. Again, the slight allusion which has been here made to
the course pursued by government officials in Russia, has in no wise fully presented the enormities committed by these wretches in the name and by the authority of the emperor, who could not possibly control or even direct in such instances. The outrages and brutalities committed by agents of the government in distant parts of the empire, were done in perfect security, and went unpunished. It was hardly to be wondered at that the rude and illiterate Russian peasant, robbed of all that he held most dear, by the highest government official in his neighborhood, should accept from the learned the proposition: that there was no God. Neither should it appear so astonishing that the educated and cultivated Russian whose sister or sweetheart was subjected to the knout, for the expression of liberal opinions, or sent by imperial order into that Siberia of whose horrors he had heard, should view not unwillingly the possibility of a regeneration of society which began with the assassination of emperors.

After Bakunin, the one who did most to propagate nihilistic ideas in Russia, was the novelist Tschernyschewsky, who edited a radical monthly until it was suppressed in 1863, and afterward wrote What is to be Done, a remarkable novel, which was forbidden circulation in Russia, but was printed in Berlin and in Switzerland. Disseminated thus through broadsides, periodicals, newspapers, handbills, and even fiction, the nihilist views have found many readers. The students in the universities have been apt and eager scholars in the new dispensation, mainly on account of misadministration of their various colleges; but also from that volatile temperament and tendency to advanced speculative opinions which generally characterizes students everywhere. An absurd rule, that a knowledge of Greek and Latin should be the test in university and civil-service examinations, drove many students from the universities and into nihilism. In Russia the only field for the young man of education who is not noble, is the civil-service: commerce, the industries, and agriculture, offer them nothing; the priesthood is despised; there is little or no business for the lawyer, and the army positions are reserved for nobility. Thus, to make a classical education a sine qua non for entrance to the university, was set up an impenetrable barrier; since the students, for the most part, are the sons of poor trades-people, priests, and small government officials, to whom Greek and Latin are impossible as preliminaries to a university education. Thrown out of their destined career, these young men had neither position, means of existence, nor prospects: and in very desperation they grasped at the delusive subleties of nihilism. There are no means of knowing the number of nihilists; the organization seems wide spread, but careful investigators incline to consider the number as comparatively very small.

There remains only to recapitulate a few of the leading events in the history of the various revolutionary attempts made by this organization since its foundation. As early as 1859 nihilistic societies began to be formed in Russia among the students of the agricultural college of Perovskii, near Moscow, who had adopted the materialistic views taught by Büchner in his From and Matter, and those on socialism set forth by the German, Max Stirner in his Property and the Individual; and who had read also, it is said, Buckle's History of Civilization. It was in this institution that the first political assassination occurred, when one of the students named Ivanoff was killed by the notorious Netchaieff, who though an emissary of Bakunin, and of the chief committee of the nihilists, is accused of having been a common scoundrel, while he certainly proved himself to be an informer. This assassination, which did not happen until 1873, caused intense excitement, in the midst of which the perpetrator escaped to Switzerland, but only to be given up by the Swiss to the Russian government. He was tried in Moscow in 1874 with closed doors, and would have been executed, but that on account of the information which he afforded, his sentence was commuted to transportation for life and penal servitude in the mines of Siberia. By his confessions 183 persons were implicated, and these were all seized on the same day, May 29, 1875. Their trial lasted 18 months, terminating in Dec., 1877, when 99 of the accused were sentenced to penal servitude in Siberia, 36 subjected to police supervision for a certain number of years, and the remainder acquitted; those accused were chiefly sons and daughters of priests, trades-people, Jews, and small officials, and were charged with seeking to propagate nihilism among the lower classes. Many of them were young girls. The nihilists began to attract attention as a really formidable association about the time of the trial of Vera Sassulitch in 1878. Vera Sassulitch, a young woman 28 years of age, who had been under the surveillance of the government on account of the suspicion that she was concerned with the nihilists, attempted the assassination of gen. Treppoff, one of the chief of secret police, in July, 1877. The officer in question had ordered a political prisoner to be haggled for some act of disrespect to him personally, and Vera Sassulitch, as she averred, committed the act in order to force the government to take note of the fact. She was tried by a jury of educated men, eight of whom held government positions, and to the general astonishment, was acquitted, a result with which the Russian law and stable institutions of the country, which had taken immediate and full agreement. Gen. Treppoff was removed from his position, but was made gen. of cavalry. Vera Sassulitch left the country after the trial in 1878, but her case was brought before the supreme court of revision, and the acquittal canceled on the ground of informality. In Aug., 1878, gen. de Mezentoff, the successor of gen. Treppoff, was stabbed at St. Petersburgh while walking, and died the same day. This and other similar attacks were ascribed to the nihilists, who were manifesting remarkable activity in all directions. A secret association called the "National Government" issued a circular in
April, 1878, containing a revolutionary programme, and calling upon the people to take up arms. Assemblages of the people in public places were now prohibited by a ministerial order. In a letter from Odessa to a Vienna newspaper, it was stated that there were several thousand members of the nihilist society in that city alone; that the organization had powerful supporters in the highest ranks of society; and that a lady who was one of the Russian fashionable leaders, had been arrested for being in correspondence with the head of the nihilist institute at St. Petersburg. During Sept., 1878, a pamphlet entitled Life for Life, which was considered a manifesto of the nihilists, was published in St. Petersburg. Among other passages, it contained the following: "We are socialists. Our purpose is the destruction of the present economical organization and inequality which constitute, according to our convictions, the root of all the evils of mankind. The question of the political form is entirely indifferent to us." . . . "Our daggers will never be sheathed until our oppressors, who strangle and gag us, are expelled from the country; and a terrible vengeance will be taken if the Russian nation do not put an end to this medieval barbarism." This declaration of socialism as a theory of governmental order, thus opposing the fundamental principle of nihilism, shows the heterogeneous elements and the blind fury of the whole movement. The assassination of Gen. Mezentzoff was in fact avowed by the nihilists in their journal Land and Liberty, in which they alleged that he deserved death because he had trampled right under foot; had tortured his prisoners; persecuted the innocent; and in his official capacity had murdered by brutal ill-treatment, by hunger, thirst, and the rod, a number of persons whose names were given. On Feb. 22, 1879, prince Krapotckin, governor of Kharkov, was assassinated by shooting; according to a nihilist circular, on account of certain inhuman acts against prisoners in his charge. Heyking, commander of gendarmerie at Kiev, was also among the victims of the nihilists, and on March 23, 1879, gen. Dreuteln, chief of the gendarmerie or third section, was shot at, and being missed, was warned that he could not long escape. The number and character of the persons assassinated or attacked by order of the committee of the nihilists was so great in the several towns of the empire, as to cause general alarm. The period of murders was followed by one of confabulations. In the month of June alone, in 1879, 3,500 fires broke out in St. Petersburg, Orenburg, Koslow, Irkuts, and Uralsk, destroying property to the amount of 12,000,000 rubles. Only 900 of these fires could be properly accounted for, and the remaining 2,600 were attributed to nihilist incendiaries. On April 2, 1879, an attack to assassinate the emperor Alexander was made by Solovieff, who fired four shots from a revolver, but missed his aim. Solovieff was captured and afterward hanged. In Nov., 1879, an attempt was made to blow up the train by which the emperor was expected to arrive at Moscow; this attempt failed from a change of programme on the part of the emperor, who was not on the train that was actually blown up by a mine fired by one Hartman, who escaped. In 1867 an attempt had been made on the emperor's life while he was in Paris, riding in the Bois de Boulogne with the emperor Napoleon III. The assassin fired at him but missed him. The third effort was that of a man who entered the imperial apartments in disguise. The fourth, the terrible explosion at the Winter palace which killed several persons. The fifth and last occurred on the afternoon of Sunday, Mar. 13, 1881, and was a successful assassination. The emperor was returning from a parade in the Michel mange, and when near the Winter palace, a bomb was thrown beneath the imperial carriage, and exploded, breaking through the back of the vehicle, but without injuring the czar, who alighted to examine the extent of the damage. At that moment a second bomb was exploded close to his feet, shattering both his legs, and otherwise injuring him so that he died in less than two hours. The two assassins were immediately arrested, and those who threw the first bomb were killed. Within a few days others were apprehended for complicity in the affair. The funeral of Alexander II. took place on March 20, 1881. His son, the czarovich, assumed the crown under the title of Alexander III. The assassination, which chilled the civilized world with horror, was openly rejoiced in at socialist meetings in various countries.

A proclamation of the executive committee of the nihilists, drawn up shortly after the attack on the emperor by the assassin Solovief or Solowfew, sums up the latest known published demands of nihilism as follows:—"A representative democratic form of government; permanent parliaments, with full powers to regulate all matters of state; extension of self-government in the provinces; complete autonomy of rural communes; the land to be put into the possession of the people; means to be found for placing the factories in the hands of the artels or artisan guilds; transformation of the army into a militia; liberty of the press, and industrial combination. This ceases to be nihilism proper, and attempts reconstruction. It may mark a change in the direction of the movement. Nihilism, too incoherent to be more than a blind frenzy, must soon destroy itself; but none can predict into what shape of revolution its fragments may be organized in some near future.

NIIGATA, a sea-port on the w. coast of Japan, at the mouth of the Shinano river, seat of the ken or prefecture of the same name, which comprises the island of Sado and the province of Echigo (6,000 sq.m.; pop. 1,503,174); pop. of city, 78, 34,000. Petroleum, coal, various minerals and metals abound. The soil is good; rice, silk, tea, and the lacquer tree are cultivated. The city was founded in 1655, and opened as a port of foreign commerce by the treaties of 1858. It is well provided with schools, banks, news-
papers, post-offices; and its streets, which cross each other at right angles, are lighted at night. A rich inland trade is done on pack horses; and river steamers, sea-junks, and the native coasting-steamships, make this port an active place.

NIJMEGEN, Nijmeguen, the Noemagwyn of the Romans (magnum or magen being a Celtic word for a fixed dwelling), called by Tacitus Batavorum oppidum, in the middle ages Novagum, is the principal city of the district of Nijmegen, or the Betuwse, in the Netherlands province of Gelderland. Pop. 29,509, of whom three-fourths are Roman Catholic. It is pleasantly situated, 9 m. s. of Arnhem, on the several little hills, on the left bank of the Waal. Several of the streets are steep and narrow, passing up the Hoenderberg (Hunnerberg, or hill of the Huns), on which the Romans had a permanent camp in order to keep in subjection the country of the Bataviers, which lay between the Rhine and the Waal; others are broad and well built. On a height stood, till 1707, when it was demolished by the French, the castle of Valkenburg, said to have been built by Julius Caesar. Here Charlemagne built a palace, and made the castle his residence. The site is now planted with trees, and forms a pleasant public walk overlooking the river and quay. On the brow of the hill there is a little sixteen-sided chapel or baptistery, which some think was originally a heathen temple of the Bataviers, and converted into a Christian church by Pope Leo III. in 799. On another eminence, where the chateau of the duke of Alva once stood, is a modern tower called Belvidere, from the summit of which there is an extensive view, including the rivers which branch off at the delta of the Rhine—viz., the Rhine, the Waal, and the Yssel, with the Maas flowing in the south. Nijmegen is strongly fortified and well garrisoned. The town-house, founded in 1554, is beautifully and antiquely fitted up within, and externally ornamented by several statues of emperors and kings of the Romans. St. Stephen's, or the great church, standing on the highest part of the city, is a handsome Gothic edifice in the form of a Greek cross, and before the reformation contained 90 altars. Nijmegen is a large market for cattle and agricultural produce, especially grain. Beer is extensively brewed, eau de cologne distilled, and there are factories for spinning and weaving; tin goods and earthenware stoves are manufactured.

Nijmegen is celebrated for the great peace congress of the European powers which was held here, and Aug. 10, 1678, concluded a treaty between Spain and France; on Sep. 17, between France and the United Netherlands; and between the German empire and France, and the same empire and Sweden, Feb. 5, 1679.

NIJNIOVGOROD, an important government in the e. of great Russia, between the governments of Vladimir on the w. and Kazan and Simbirsk on the east. Area (according to the Almanach de Gotha), 19,390 sq.m.; pop. '70, 1,271,564. The surface is divided into two distinct portions by the Volga with its tributary the Oka. On the left, the northern bank of the river, the surface is flat; on the right bank it is hilly. As the soil is not very fertile, and there are few rich meadow lands, neither agriculture nor cattle-breeding is pursued extensively. The inhabitants are principally engaged in manufactures. The chief rivers are the Volga, Oka, and their numerous tributaries. There is communication by water with 24 governments, and with the Baltic, the White, and the Caspian seas. The northern districts of the government abound in forests, and here wooden utensils and tools are manufactured for the adjoining governments. There are several large iron-works, and the town of Goriatof is the Sheffield of its district. Leather, especially that variety called Russian leather, is largely manufactured, and sheep and lamb skin dressing is a staple employment. On the right bank of the Oka are several ship-building and dock yards. The towns and villages are all ill-cased, with an industrious and thriving manufacturing population. Capital, Nijni-Novgorod (q.v.).

NIJNIOVGOROD (Lower Novgorod), a famous commercial and manufacturing t. in the e. of great Russia, capital of the government of the same name, is situated at the confluence of the Oka with the Volga, 715 m. c.e. of St. Petersburg. The fortified portion of the town occupies a hill overlooking the Volga, and is surrounded with a wall. It contains the kreml or citadel, 2 cathedrals, and the palaces of the governors. The manufactures of Nijni-Novgorod include cloth, leather, steel goods, wax candles, tobacco, beer, pottery, etc., and ship-building. The trade of the town is of great commercial importance, especially during the great annual fair which brings buyers and sellers from all climes between Germany and China. For the convenience of those frequenting the fairs, an enormous market-hall has been built, and sixty blocks of buildings for booths, containing 2,530 apartments separated by fire-proof walls. The numerous churches of the citizens are supplemented by a mosque and an Armenian church for the visitors. There are three annual fairs, two of them of minor account. The third, beginning at the end of July and continuing into September, is by far the greatest in the west. The normal population (44,100 in 1871) is then increased to near 350,000; and the value of the goods sold at the great fair of 1674 was about £24,000,000. Nijni-Novgorod, which is favorably situated for purposes of commerce, carries on a brisk trade during the whole season of navigation.

Nijni-Novgorod, founded in 1221, was devastated on several occasions by the Tartars; and in 1612, when it was on the point of falling a prey to Poland, Minin, the famous butcher of Nijni-Novgorod, collected an armed force here, which, under prince Pjarsky, drove the invaders from the capital. See MOSCOW. The prosperity of this town
dates from the year 1817, when the great fair was removed to Nijni-Novgorod from Makariat, on account of the destructive fire which broke out in the latter place.

**NIJNI-TAGILSK, a town of Russia, in the government of Perm, amid the Ural mountains, 150 m. e. of Perm. It is one of the most important mining towns in Russia, or in the world. The soil in the immediate vicinity is everywhere rich in iron, copper, gold, and platinum; not far off is the famous magnetic mountain Bliagodat, 1422 ft. high. Akimfit Demidoff (q.v.) established the first foundry here in 1725. The yield both of iron and copper is immensely large. Pop. 35,000.**

**NIKKO, the seat of the mortuary shrines of Ieyasu-u, and of Iyemitsu, the founder and the third of the line, respectively, of the Tokugawa family of shoguns (tycoons) who ruled Japan from 1603 to 1688. The wonders of nature and art combine to make it the goal of many thousands of pilgrims annually, and of all foreign tourists who have time to spare. As a holy place, it began to win reputation even in the 8th e., but the present magnificent shrines, masterpieces of Japanese art, date from 1617. Hachi-ishi is the village of hotels at the mountain foot. Nantaizan is the loftiest peak of the range. The lake Chizuzenji and the lofty water-fall of Kiri-furi (rumbling mist) are striking features famous in literature and art. The chief priest of the shrines was always a prince of the imperial blood, and an annual envoy was sent by the mikado to pay honor to the memory or Ieyasu. Works of art in wood carving, bronze, granite, and other stone, and gifts from daimios and pilgrims, from Holland, Loo Choo, Corea, etc., make this one of the historic spots for travelers of every nation.**

**NIKOLAEVSK, chief town of the Amoor territory, in s. Siberia, situated on a well-wooded plateau on the left bank of the Amoor, and 25 m. from its mouth, 6,750 m. e. of St. Petersburg. The approaches to the town are defended by four batteries. The Amoor is here a mile and a quarter broad, but the landing place is available only for small craft, all large vessels being compelled to lie in mid-stream. Pop. 67, 972.**

The approaches to the town are defended by four batteries. The Amoor is here a mile and a quarter broad, but the landing place is available only for small craft, all large vessels being compelled to lie in mid-stream. Pop. 67, 972.**

**NIKOLSURG, or Nikulov, a town of Austria, in the s. of Moravia, 27 m. s. of Brunn, lies at the foot of the Pohlar hills, famous for their rich red wines. The town belongs to the princely family of Dietrichstein. It has several steam-mills, and cotton and silk factories. In the middle of the town, upon a rock, stands the castle of the Dietrichsteins, with a library of 20,000 volumes, and a vat in the cellars capable of containing 2,000 cimers (more than 30,000 gallons). Pop. 69, 7,173, of whom more than half are Jews.**

**NIKON, Patriarch of the Russian church, 1665-81; b. near Nijni-Novgorod, Russia, of humble parentage; received his education from a monk in the monastery of St. Macarius. He afterward became a priest, but was so much attached to the monastic life that he entered the hermitage of Anserche, on the island of Solowetz, in the White sea. He separated from his wife, with whom he had lived ten years, and persuaded her to enter the convent of St. Alexis at Moscow. His fellow-monks desiring to exchange their wooden church for one of stone, Nikon and Elizar (the founder and head of the hermitage), were sent to Moscow to procure contributions for the purpose. Elizar appropriated the money obtained to his own use, Nikon remonstrated; his associate became his enemy. Nikon, unable to endure his persecution, left the island in a small boat, and after exposure to great peril he reached the island of Kj, at the mouth of the Onga. Here he erected a wooden cross, and vowed to build a monastery on the spot, which vow he fulfilled. In 1666, having occasion to go to Moscow on business for the monastery of which he was abbot, the czar Alexis Micailovid appointed him archimandrite of the Novospasky convent at Moscow. He used his influence with the czar in behalf of poor widows, orphans, the persecuted, and oppressed. In 1648 he was made metropolitan of Novgorod, and became much endeared to the people. In 1650 he quelled a violent popular insurrection at the peril of his own life, and then obtained permission to go to the prisons and release those who had been unjustly incarcerated, as well as real criminals who were sincere penitents. He showed great kindness to the poor. He preached to crowds, revised the liturgy of the Russian church, and caused the clergy to perform divine service with more devotion. On the death of the patriarch Joseph, Nikon in 1653 was appointed patriarch. In 1654-55 he called a council of the church to take measures for making the church books conform to the Greek originals. The council compared with the Septuagint the Slavonic versions, some of which were five centuries old, and found them correct, and that the errors in the books in common use were owing to the carelessness of transcribers. A new edition, made at Moscow and set forth by Nikon, created a division in the church. Nikon endeavored to root out all abuses of the hier-
archy, to promote temperance, setting the people an example of abstemious habits. Sacred pictures to which he believed the people paid idolatrous veneration he removed. The baptisms of the western church, then as now considered by the Greek church invalid, he sanctioned. Education, begun by Ivan the terrible, but interrupted by war, he encouraged. The printing press was again set up. Greek and Latin were now for the first time taught in the schools. He made also many useful changes in the church service. The greatest reform was the revival of preaching. From Nikon was first heard, after many centuries, a living, practical sermon. These changes greatly agitated the church, but the czar’s favor did not fail, until in 1658 his enemies succeeded in alienating the czar from him, and Nikon retired to the monastery of the Resurrection of Christ that he had himself built. The misunderstanding between him and the czar increasing, and Nikon refusing to return to Moscow, a council was called in 1667 to consider his case, under the presidency of the eastern patriarch; and on Dec. 13 of that year he was deposed, and banished as a common monk to the Bielvozsky Therapontic monastery. The czar Feodor Alexievitch allowed him to remove to the monastery of the Resurrection of Christ, but on the journey thither he died. He was buried in that monastery in the presence of the czar; his absolution was obtained from the eastern patriarch and he was again enrolled in the list of Russian patriarchs. "Nikon," says Stanley, "rests all but canonized in spite of his many faults, and in spite of his solemn condemnation and degradation by the nearest approach to a general council which the eastern church has witnessed since the second council of Nicaea. He rests far enough removed from the ideal of a saintly character, but yet having left behind him to his own church the example of a resolute, active, outward leader; to the world at large, the example, never without a touching lesson, of a sincere reformer recognized and honored when honor and recognition are too late." Many historians think that with more prudence he might have saved the Russian church from a schism which still exists, and that he lacked the wisdom and policy which are essential to men in high places of trust. In 1664 Nikon sent to the east more purchased than 500 000 copies of Greek books dating from the 11th to the 17th century. He also made a collection of the Russian chronicles, the Slavonic books, and the Greek chronologists, which reaches to the year 1630, and is known by the name of the Chronicle of Nikon. The academy of sciences of St. Petersburg published a fine edition of this in 8 vols. in 1767-92. He wrote also several theological treatises, of which the following are the most important: A Table of Dogmatic Studies; Sermons; The Intellectual Paradise, containing a description of the monasteries of mount Athos and of Valdiar; A Canon, or book of prayers. Stanley in his History of the Eastern Church, Palmer in the Patriarch and the Tsar, Eckardt in Modern Russia, and the London Review, have given a particular account of the patriarch Nikon.

NIKOPOL, a thriving t. of s. Russia, in the government of Ekaterinoslav, on the right bank of the Dnieper, about 200 m. from its mouth, in lat. 47° 33’ north. Nikopol is the center of an extensive agricultural district, the produce of which is here shipped to Odessa. Between Nikopol and the port of Odessa there is regular communication by steamer. The natural advantages of Nikopol promise to make it one of the principal centers on the Dnieper. Pop. ’67, 8,538.

NILE (Nilus), called by the Egyptians Ἱψιθ ὁ Μυ (the genius of the waters), and by the Hebrews שור (the black), the river of n.e. Africa formed by the union of the Bahr-el-Abiad (the White or true Nile) and the Bahr-el-Azrek (Blue Nile). Capt. Speke and Grant discovered that the first of these, the true Nile, flowed out of the lake Victoria Nyanza, which extends from about lat. 0° 20’ n., to 3° 40’ s., and from long. 31° 40’ to 35° e., and is 3,800 ft. above the level of the sea; and the river Shimiyu, the largest tributary of this lake, flowing into its southern extremity, must now be regarded as the most southerly source of the Nile. The second, the Blue Nile, has its source in Abyssinia, in lat. 10° 59’ n., and long. 36° 55’ east.

The White Nile, from its outlet from the Victoria Nyanza at the "Ripon falls," lat. 0° 20’ n., long. 33° 30’ e., flows n.w. and w. for about 250 m., till it enters the lake Albert L., and broadens in 30 m. of its northern extremity, where the river again emerges. On issuing from the Victoria Nyanza the Nile rushes down n.e. like a mountain-torrent, running off at last into long flats, and expanding so as to form what is called Ibrahim Pasha lake. In this part of its course the river is navigable, and continues to be so until it reaches the Karuma falls. From these falls to the Murchison falls (120 ft. in height), near the Albert Nyanza, the river forms a series of rapids. Between the two Nyanzas the Nile is known as the Victoria Nile, or Somerset river.

After leaving the Albert Nyanza, the Nile begins its northward course to the Mediterranean. But the Nile, after the Nyanzas, is still without a regular and uniform course. Between the Albert Nyanza and Gondokoro (Isamalia), in 4° 55’ n. lat., and 31° 51’ e. long., 1,500 ft. above the sea, the Nile river descends several hundred feet in a series of rapids and cataracts. For about 500 m. after Gondokoro the Nile flows very tortuously; first in a north-westernly and then in a north-easterly direction, and is joined, in about lat. 9° 15’ n., long. 30° e. by its first great and important tributary the Blue Nile, which joins the Nile from the west, with hardly any perceptible current. The second tributary is the Giraffe river, about one-third the volume of the Nile at its point of junction, long. 31° east. From the Bahr-el-Gazal the Nile flows in a due easterly direction for about 80 m., then s. for 30 m., when it is joined by its third
tributary, the Sobat river, from the east. The Sobat is full and navigable. Between this and the town of Khartoum, a distance of about 400 m., the Nile runs in a northerly direction, with a width of from one to two m., and is joined by several streams from the e. side.

Khartoum, the capital of Nubia, is situated at the confluence of the Bahr-el-Atzrek (Blue Nile) and the Bahr-el-Abiad (White Nile), 1188 ft. above the sea level, in lat. 13° 35' S. and long. 30° 30' E. the Bahr-el-Atzrek, long supposed to be the main branch of the true Nile, is formed by the junction of the Abai and the Blue river. The Abai has its source in Abyssinia, 50 m. from lake Dembea, which it enters from the s.w.; emerging on the s.e. of the lake, it flows for about 90 m. in that direction, when it describes a semicircle round the peninsula of Godjam, and continues north-westerly for about 150 miles. It is here joined by the Blue river from the s., and from this point the Blue Nile flows n.w. to Khartoum, receiving from the e. two large rivers running nearly parallel to each other, the Dender and the Rahad or Shima. From Khartoum, the united stream flows n. for about 60 m., passing the town of Halfaia and the ruins of Meroë to the first cataract, and thence n.e. past Shindy (q.v.) to its junction with the Atbara, which enters the Nile at El Damer, lat. 17° 45' n., long. 34° east.

The Atbara, also called Bahr-el-Aswad, or Black river, because it carries down with it the greatest amount of the black mud and slime that manures and fertilizes Egypt, is the last tributary received by the Nile. The Geum seems to be the direct source of the Atbara. It rises in the heights to the n. of lake Dumbia. About 150 m. from its source it receives the Baslam river, and about 30 m. further on, the Takazze or Setti river, both from the east. The Takazze has a far greater volume of water than either of the preceding rivers. It rises in the Semen mountains, round which it flows first easterly, then n., till in about lat. 13° 30' n., long. 38° 50' e., it turns n.w., and then almost due w., joining the Atbara at right angles. It has many tributaries.

From its junction with the Atbara the Nile continues to flow northerly through the populous and fertile district of Berber, full of villages, and then enters the desert. Turning westward in lat. 19° n., it forms the large island of Mograt, and makes a curve to the south-westward, known as the "great bend," in which there are two cataracts. Entering Nubia, the Nile resumes its northwesterly course, with narrow strips of cultivated land on each bank. Here it forms another cataract, and bends round to the n.e. with a fifth cataract, in lat. 21° 40' n. After this the valley of the Nile narrows, and at Assouan, in lat. 24° 10' n., the Nile is reduced to the last cataract in its course.

From Assouan to the sea the average fall of the Nile is two inches to a m., and its mean velocity about three m. an hour. It waters and fertilizes the whole length of the land of Egypt. The delta of the Nile extends from lat. 30° 10' n. to 31° 30' n., and has a base on the Mediterranean of about 150 miles. In it the Nile spreads out into numerous streams, the two principal being those of Rosetta and Danietta. The total length of the Nile, from its exit from the lake to the sea, is about 3,300 m., measured along its course, or about 2,200 m. direct distance.

A feature peculiar to the river of Egypt is that from its junction with the Atbara, to its mouth, a distance of upwards of 1500 m., it receives no affluent whatever, and yet it is able to contend with the burning sun, and scarcely less burning sands of Nubia. With the ancient Egyptians the river was held sacred; the god Nilus was one of the lesser divinities. Its annual overflow is one of the greatest marvels in the physical geography of the globe; for it has risen to within a few hours of the same height and to within a few inches of the same height, after years for unknown ages. At Khartoum it begins to increase early in April, but in lower Egypt the inundation usually begins about the 25th of June, and attains its height in about three months. It remains stationary about twelve days, and then subsides. The cultivable soil of Egypt is wholly dependent on the rise of the Nile, and its failure causes a dearth; for, virtually, the country has no rain. Continuous south wind brings a good, and north wind a bad year. During a good inundation the rise is about 40 ft. on the tropic of Capricorn, 36 ft. at Thebes, and 4 ft. at the Danietta and Rosetta mouths in the Delta. If at Cairo the rise is only 18 or 20 ft. there is a scarcity; up to 24 ft., a deficiency; 25 to 27 ft. is good; more than that causes a flood, and fosters plague and murrain. During the inundation the whole valley is covered with water, from which the villages rise like islands, protected by dikes. Of late years the overflow has been greater than the average of many centuries. The rise and fall of the trunk stream of the lower Nile is owing to the periodicity of the rains on the mountains of Abyssinia and in the basin of lake Nyasa. In the rainy season the equator, it rains, Moreover, in 12 months round, most copiously during the equinoxes. The banks of the Nile swarm with birds, among which are vultures, cormorants, geese, pelicans, quails, and the white ibis; and its sweet, soft waters teem with fish. The average amount of alluvium brought down by the river is estimated at a deposit of 44 inches in a century—by some it is made as high as 6 inches; the greater part of it is brought down by the Atbara.

The question of the source of the Nile is at once the oldest and the most recent of geography. That the sources of a river, at whose mouth one of the earliest and most civilized peoples was established, should have been so long veiled in obscurity is unparalleled in geographical research. The want of success in exploring the upper basin of the Nile may be attributed to the great length of the river, to the difficulties which beset the

Niles.
traveller in the physical nature of the countries he must pass through, the climate, and the jealousy, ignorance, and barbarism of the native tribes. This problem of centuries may now be regarded as satisfactorily solved; for the question whether there may not yet be found important feeders of the White Nile carrying back its source to a still greater distance in the interior is practically excluded by Stanley's exploration of the Lualaba or Congo basin. The journeys of Kräf t and Rebmann to the foot of Kilimandjar o and the other snowy mountains in the e. of Africa, believed by them to be the ancient "mountains of the moon," and the explorations of the White Nile, pointed to the conclusion that it was among these mountains that the sources of the great river would ultimately be discovered.

There was, however, another theory. Rumors gathered from the natives pointed to lakes in the regions s. of the equator as the true sources of the Nile. To explore this country the distinguished traveler, capt. Richard Burton, accompanied by capt. Speke, started from the Zanzibar coast in 1857. Their enterprise was so far successful that they discovered lake Tanganyika, in lat. 5° s., long. 35° e. and a large crescent-shaped mass of mountains overhanging the northern half of the lake, and 10,000 ft. high, considered by capt. Speke to be the true Mountains of the Moon. On the shores of lake Tanganyika Burton was laid up by illness, and his companion, after surveying the northern portion of the lake, left him there to recruit his health, while he (Speke) proceeded northwards to discover another huge "nyanza" or lake, of the existence of which he was informed by the natives. This he accomplished on Aug. 3, 1858, when he discovered the southern end of the Victoria Nyanza (q.v.). In his journal he says of this immense sheet of water: "I no longer felt any doubt that the lake at my feet gave birth to that interesting river, the source of which has been the subject of so much speculation and the object of so many explorers."

In 1861 capt. Speke, taking with him capt. Grant, returned to the lake region. The expedition approached the Victoria Nyanza again from the coast of Zanzibar; and the first place from which they obtained a view of it, during the second expedition, was the town of Mashonde on its western side. Thence they pursued their way along the shore northwards. Crossing the equator, they reached streams which are said to flow out of the lake, and further on, in the center of its northern coast, what they considered to be the parent stream of the Nile, 150 yards in breadth, flowing over rocks of an igneous character, and forming falls 12 ft. high, which capt. Speke christened the "Ripon falls," in honor of the president of the royal geographical society at the time of his starting on the expedition.

In the kingdom of Karagwe capt. Speke found a very superior negro race, much better disposed to strangers than any of the tribes he had formerly passed through. The country occupied by this race, and that of Uganda, stretches along the Nyanza, and covers half of its western and northern shores, the Uganda being bounded on the e. by the main stream of the Nile. North of it lies the kingdom of Unyoro, where the dialects belonging to the language of s. Africa, and which up to this point are used by the various tribes, suddenly cease, and give place to those of the language of n. Africa.

At Gondokoro Speke and Grant were met by Mr. (now Sir Samuel) Baker, who had come from Cairo to their relief. Baker, accompanied by his heroic wife, pushed still southwards, and had the happiness of discovering, in 1864, another great lake, which he called the Albert Nyanza. In 1860 he undertook a second expedition, of a much greater character, at the expense of the pasha of Egypt, to suppress slavery in the upper regions of the Nile; and has reduced under the sway of that ruler the whole valley of the river as far as the Victoria Nyanza. Sir Samuel returned in Sept., 1873.

Meanwhile Dr. Livingstone had been working for many years, from another quarter, at the solution of the great African problem—the true source of the Nile. In 1866 he began the great journey from which he was destined never to return. Starting from the Rovuma river, in the far s., he passed round the s. end of lake Nyassa, proceeded northward, exploring the lakes Bangweolo and Mocro; and in 1869 reached lake Tanganyika, now known to send its outflow towards the Congo, but which he sought in vain to connect with the Victoria Nyanza. In 1871 he was found by Mr. Stanley at Ujiji, on lake Tanganyika, and it was then his opinion that neither Tanganyika, nor the Albert Nyanza, nor the Victoria Nyanza was the true source of the Nile, nor any of the feeders of these lakes; but that It was to be sought in a basin lying westward of them, the three large lakes, all called Lualaba, and which unite to form another great lake, which he called Lincoln. Out of this a river runs northward, which he conceived to be the main branch of the Nile. Geographers at home generally believed that Livingstone was mistaken, and had struck instead upon the source of the Congo; but the death of the great traveler before the completion of his explorations left the problem unsolved. It was not until Mr. Stanley in 1876-77 followed the course of the Lualaba to its mouth that this stream was definitely proved to be identical with the Congo. Mr. Stanley's explorations in 1875, ere he struck the Lualaba, have given us more accurate information as to the size and shape of the Victoria Nyanza (see NYANZA), and as to its affluent, the Shimiyu.

NILES, a city in Berrien co., Mich., on the St. Joseph river, at the head of navigation; on the Michigan Central railroad, 93 m. e. of Chicago; pop. of city, '74, 4,502.
Niles was settled in 1828; it is furnished with water-power by a dam built across the river. There are numerous mills of various kinds, foundries, and machine-shops, a national bank, public schools, weekly newspapers, and 8 churches. The outlying districts produce large quantities of lumber, grain, and fruit, which are brought here for shipment.

NILES, Hezekiah, 1777-1839; b. Penn.; received an ordinary education and learned the printer's trade. In 1800 he became a member of the firm of Bonsall & Niles, printers and publishers, in Wilmington, Del. The business was not successful, and Niles for several years was a newspaper contributor and editor, being for six years the managing editor of a Baltimore daily. In 1811 he began the publication of Niles's Register, and continued it for 25 years. This weekly paper contained very valuable articles on political and financial subjects, and historical papers of great importance. Niles republished this work in book form (52 vols.) in 1828, and it was continued after his death by W. O. Niles, Jeremiah Hough, and George Beattie until 1849. Niles also published Principles and Acts of the Revolution, 1822. He was a strenuous advocate of a protective tariff.

NILES, John Milton, 1787-1856; b. Hartford, Conn., and was in early life a farmer. His education was mostly self-acquired, and before he was of age he began the study of law. After his admission to the bar he spent two years in Vermont, New York, and Pennsylvania, but in 1817 returned to Hartford and there founded the Times, a democratic newspaper, with which he was connected as editor and contributor for 30 years. He was for some years a county judge, was a member of the general assembly, and in 1829 was made city postmaster by president Jackson, resigning the position on his appointment to fill a vacancy as U. S. senator, 1835-39. He was made postmaster-general in 1840, and in 1843 was elected U. S. senator for a full term. He published, besides many addresses, orations, and speeches: History of South America and Mexico, and a View of Texas (1839); Life of Commodore Oliver H. Perry (1839); and other books.

NILES, Nathaniel, 1741-1828; b. R. I.; after graduating at the college of New Jersey in 1766, studied medicine and law, and afterwards theology with Dr. Bellamy, and taught school in New York city. He obtained a license to preach in Congregational churches, and settled in Norwich, Conn. He was confined to no pastorate, but preached as occasion offered, and was accounted earnest and zealous. He was versed in mechanics, and invented a process by which bar-iron could be made into wire by the use of water-power; first employed in a wool-carding factory. He was speaker of the house of representatives of the legislature of Vermont in 1784, having removed to West Fairlee, Orange co., in that state, and was prominent in the politics of his time. At the close of the revolutionary war he was a candidate for national honors, and was member of congress, 1791-97, and a judge of the supreme court. He was chosen presidential elector for six successive administrations, and was appointed one of the censors on the revision of the state constitution. During the revolutionary war he composed a war-song, The American Hero, which became very popular. He contributed a number of valuable essays to the Theological Magazine, and published several sermons, lectures, and essays. In 1773 he published Two Discourses on Confession of Sin and Forgiveness, and Four Discourses on Secret Prayer. In 1777 there appeared two sermons entitled The Perfection of God the Fountain of Good. In 1809, a Letter to a Friend. He wrote a History of the Indian Wars.

NILES, Samuel, 1674-1762; b. on Block Island, R. I.; graduated at Harvard university, 1699; became a Congregational minister; preached in Kingston, R. I., from 1702 till 1710; was installed in May, 1711, as pastor of Second church, Braintree, Mass., where he remained till his death. He published A Brief and Sorrowful Account of the Present Churches in New England, 1745; God's Wonder-working Providence for New England in the Reduction of Lombardy, a poem, 1747; Vindication of Divers Important Doctrines, 1752; Scripture Doctrine of Original Sin, 1757; and was the author of an unfinished History of the French and Indian Wars, published in Massachusetts historical collection. 2d series, vol. vi.

NIL-GHIAU. See Nyl-Ghau, ante.

NILOMETER (the measurer of the Nile), the name of two buildings existing in Egypt, one in the island of Rhoda, opposite to Cairo, the other at Elephantine, close to Asswan, in 24° 5' 23" n. lat. The first consists of a square well, in which is placed a graduated pillar of marble, and is called a nilometer; or measure; the pillar has 24 steps, each of which represents 21,386 cu., according to Greaves, 1823 fr., and contains 24 digits; but in its present state it does not appear to have been intended to mark a rise of more than 16 cubits. This pillar is exceedingly slender. The building formerly had a dome, bearing a Cufic inscription, dated 847 A.D., and is said to have been erected by the caliph Mamun, or his successor, Wathik Billah. The first-mentioned monarch is said to have erected another nilometer at the village of Banbenouda, in the Saced, and to have repaired an old one at Ekhim. The caliph El Motawukkel built the present one. The mode of calculating the increase at the nilometer is rather complex, and to a certain extent arbitrary, political and financial reasons rendering the process a mystery even to the natives. At the present day the Nile is supposed to have
risen to 18 cubits when the canals are cut; this is the height of the lowest inundation; 19 cubits are considered tolerable, 20 excellent, 21 adequate, and 22 complete: 24 are ruinous. In the time of Edrisi, however, 16 cubits were considered sufficient. The object of these nilometers was to measure the amount of taxation to be imposed on the country. The nilometer at Cairo is, however, much more recent than that existing at Elephantine, which consists of a staircase between two walls descending to the river. One of these walls has engraved on it a series of lines at proper intervals marking the different elevations to which the river rose under the Cesars. The cubits here are divided into 14ths or double digits, and measure 1 foot 8.625 inches. This nilometer is described by Strabo. The probability is that many nilometers existed in the days of the Pharaohs, probably one in each city. In the days of Meris 8 cubits were sufficient, but 15 or 16 were required in the time of Herodotus. 456 B.C., and this was the mean under the Romans. According to Pliny, if the inundation did not exceed 12 cubits it produced a famine. 13 starved the country, 14 rejoiced it, 15 was safety, and 16 delight, and this number is symbolically represented by the number of children playing round the river god on statues of the Roman period. The oldest nilometer appears to have been erected at Memphis, and it was transferred by Constantine to a church in the vicinity of the Serapeum; but Julian sent it back to this temple, where it remained till its destruction by Theodosius. At the present day the rise is watched for with anxiety, and proclaimed by four criers.—Herodotus, ii. 13; Strabo, lib. xvii.; Wilkinson, Topogr. of Thebes, pp. 311-17. Heckeyan Bey, Scriialie Monuments (Lond. 1863), p. 145.

NILS SON (ROUAUD), CHRISTINE, b. Sweden, 1843. At an early age showed a taste for music, and although her parents were in humble circumstances, became quite proficient on the violin, learned the flute, and attended fairs and other publics of public resort, at which she sang, accompanying herself on the violin. While performing in this manner at a fair at Ljunghsby in 1857, her voice attracted the attention of F. G. Tornérhjelm, a gentleman of influence, who sent her to Stockholm, where she received instruction from Franz Berwald. She made her début at Stockholm in 1860, and then went to Paris to continue her musical education, under Masset and Wertel. In 1864 she appeared at the Théâtre Lyrique of Paris, as Violette in Traviata, with such success that she was engaged to sing for three years. She made her first appearance in London in 1867, where she immediately became a favorite. In 1868 she sang the part of Ophelia in the opera of Hamlet, by Ambrose Thomas, at the Grand Opera in Paris. During the same year she sang in England at the Handel festival at the Crystal palace. In 1870 she came to America, appearing in concerts and operas, and achieved popularity wherever she was heard. She was married at Westminster abbey, in 1872, to Auguste Rouaud, a merchant of Paris. After creating great enthusiasm at St. Petersburg, she returned to America with the Strakosch Italian opera troupe, containing such artists as Campanini-Maurel, Capoul, Del Puerto, and Annie Louise Cary. She appeared as Elsa in Wagner's Lohengrin, and sang during the same season in opera with Pauline Lucca. Her remarkable voice and unusual dramatic gifts have combined to make her one of the foremost singers of the time.

NIMBUS, in art, especially in sacred art, is the name given to the disc or halo which encircles the head of the sacred personage who is represented. Its use is almost universal in those religions of which we possess any artistic remains—the Indian, the Egyptian, the Etruscan, the Greek, and the Roman. In the Hebrew scriptures we trace, in the absence of representations, the same symbolized idea in the light which shone upon the face of Moses after his return from Sinai (Exod. xxxiv. 29-35), and in the light with which the Lord is clothed as with a garment, Ps. ciii. 1, Vulg. (civ. 1, auth. vers.); and in the New Testament in the transfiguration of our Lord (Luke xxi. 31), and in the “crown” of the just, to which allusion is so often made (2 Tim. iv. 8; 1 Peter v. 4; Apoc. iv. 4). Nevertheless, the nimbus, strictly so called, is comparatively recent in Christian art, appearing first toward the end of the 5th century. Later, in Christian art, it became almost a necessary appendage of all representations of God or of the saints. Its ordinary form is the circular or semicircular, and therefore, in which later symbolists discover an emblem, the perfection and height of eternity; but the nimbus of the Virgin is sometimes a simple ring, and sometimes a crown or diadem; occasionally it is encircled by an ornamental border, on which twelve stars are sometimes represented. Her nimbus, as well as that of the divine persons, is commonly of gold; but that of the Virgin Mary is occasionally in colors, as blue, red, purple, or white. The nimbus of the saints is ordinarily the semicircle or humula. Dedron mentions the curious instance of a picture of the traitor Judas with a black nimbus! In later art the nimbus became lighter and more aerial, melting, as it were, into the picture; and in Raphael's saints it occasionally fades into the very faintest indication of a golden tinge around the head. In connection with the nimbus may also be mentioned two analogous forms—the aureole and the glory. The former is an illumination surrounding not the head only, but the entire figure. If the figure be upright, the aureole is commonly oval, when it is called the reva aureole, and is supposed to contain an allusion to the ictus. With a seated figure it becomes circular, and is occasionally divided by radiating bands, in the form of a
wheel; sometimes it takes a quatrefoil form. It is commonly of gold, but occasionally also is in colors. The glory is a combination of the nimbus and the aureole, and is chiefly seen in Byzantine pictures, and those of the early South German school.

NIMEGUEN. See NIMEGEN.

NIMES (anc. Nemausus), a t. of France, capital of the department of Gard, stands in a fertile plain surrounded by vine-clad hills, 30 m. n.e. of Montpellier, with which it is connected by railway. It consists of the town proper (ill built and dirty), and of three handsome suburbs. In the vicinity are the beautiful remains of the Roman aqueduct called Nébo, Pont du Gard. The chief of the modern edifices are the Palais-de-Justice, the theater, and the hospitals. The Grande Place is embellished with one of the most magnificent fountains in France. Nimes contains numerous and variously-constituted educational institutions, an important public library, Maria Theresia's museum (in the Maison Carrée), a museum of natural history, etc. It is the general entrepot for the silks produced in the south of France, and its manufactures are principally silk and cotton fabrics. More than 10,000 looms are constantly in operation in the city, and about 6,000 in the immediate vicinity. Shawls, handkerchiefs, lace, brandy, wines, etc., are made. Within the town are numerous and beautiful Roman remains, the chief of which are the amphitheater; the Maison Carrée (square house), a fine specimen of Corinthian architecture; a temple and fountain consecrated to Diana; La Tour Magne (great tower); the baths, and two Roman gates. See Menard's Antiquités de Nîmes (1833), and his Histoire de Nîmes (? vols. 1875). Pop. 78,594.

The department of Nîmes—mentioned in the Itinera of the Medes—was the site of the Roman city of Nîmes—known by a colony from Massilia (Marseille)—was the chief city of the Volcae Arocomii. It flourished under the Romans, and was one of the great cities of Gaul. It surrendered to the rule of the Visigoths between 465 and 553, and afterwards to that of the Franks. Subsequently it became a possession of Aragon, but was finally restored to France in 1259 by the treaty of Corbeil. The inhabitants adopted Calvinism in the 16th c., and on many occasions suffered severely for their religious principles. In 1791 and 1815, bloody religious and political reactions took place here.

NIMROD. See BABYLON.

NIMRUD. See BABYLON.

NINEVEH, or Ninéus, a very ancient and famous city, the capital of the great Assyrian empire, said in scripture (Gen. x. 11) to have been founded by Ninus or Nimrod. It was situated on the e. bank of the Tigris, about 30 m. below Mosul, thought by many to be Calah spoken of in Gen. x. It is one of a group of cities which anciently were known as Nineveh, or which clustered around the metropolis of that name. The ruins are in the fork formed at the junction of the Tigris and the Zab, are about 5 m. in circumference, and were inclosed by a wall, having towers and gates, the remains of which extend around nearly the whole distance. Excavations made by Layard, Rassam, Loftus, and George Smith, laid open the following buildings: 1. A tower on the n.w. corner of the mound, extending more than 100 ft. and faced with stone to the height of 20 ft.; 2. Temples around the tower; 3. The n.w. palace, 350 ft. square; 4. The center palace, s. of the former; 5. The s.w. palace, built with materials from the n.w. and center; 6. The s.e. palace; 7. The temple of Ishtar. According to the inscriptions the city was built b.c. 1390, and having been destroyed in troublous times, was afterwards rebuilt, and continued a royal residence about 170 years. Shalmaneser II., who became king, b.c. 860, conquered the country of the Euphrates, and advancing into Syria met and defeated a confederacy of kings among whom were Benhadad of Damascus, Ahab of Israel, and Baasha the Ammonite. About 720 B.C. Calah ceased to be a capital of the empire, and was finally destroyed by the Medes and Babylonians when they conquered Assyria.

NIMROD, Birs. See BABEL, TOWER OF, ANTE.

NINEVEH, or Ninéus, a very ancient and famous city, the capital of the great Assyrian empire, said in scripture (Gen. x. 11) to have been founded by Ninus or Nimrod. It was situated on the e. bank of the Tigris, opposite to the present Mosul. According to the accounts of the classic writers, the city was of vast extent, 480 stadia, or more than 60 m. in circumference. Its walls were 100 ft. high, broad enough for three chariots, and furnished with 1500 towers, each 200 ft. in height. In the Book of Jonah it is described as an "exceeding great city of three days' journey," and one "wherein are more than six-score thousand persons that cannot discern between their right hand and their left hand" (children or infants are probably meant). After having been for many centuries the seat of empire, it was taken after a siege of several years and destroyed by the united armies of the Medes under Cyaxares, and the Babylonians under Nabopolassar, about 625 B.C. When Herodotus, not quite 200 years afterwards, and Xenophon visited Nineveh, the remains were ruinous. Tradition continued to point, pretty accurately, to the site of Nineveh; but it is only of late years that actual explorations have been made. For an account of these see ASSYRIA.

NINGPO, a department in the province of Chekiang, China, comprising the city of that name, the Chusan group of islands, and the cities of Tsike, Punghua, Chinhai, and Tsingshan. The port of Ningpo is situated at the confluence of two small streams, in lat. 29° 55' n., long. 121° 22' e., 12 m. from the sea, on an alluvial flat of extreme fertility, intersected by a net-work of rivulets and canals. Its walls are 5 m. in circumference, about 25 ft. high, 22 ft. wide at the base, and 13 at the top, with six double gates.
As is the case with all the cities in this part of China, Ningpo is permeated by canals communicating with a most nearly surrounding the walls, and with the adjacent country. In one part of the city they expand into basins, and receive the name of lakes—the Sun lake and Moon lake. In the former is an island devoted to temples, and accessible by bridges. These bridges—good specimens of those aerial stone edifices which adorn this part of China—are required to sustain little more than their own weight, as the roads here are all mere footpaths, and no wheeled vehicles are found. One of the rivers is crossed by a bridge of boats 200 yds. long. The entire city is well paved; the streets are wider than those of most Chinese cities, and the display of shops is indicative of wealth and luxury. Nowhere, save at Hanchan, are such extensive and beautiful temples to be found. The most elegant and costly of these is dedicated to the queen of heaven; the goddess being the daughter of a Fukien fisherman, the people of that maritime province are her more special votaries. Elaborate stone sculpture, exquisitely fine wood carving, and a profusion of gilt and tinsel show that no expense has been spared to honor the popular goddess.

The center of the city is ornamented with an elegant seven-storied hexagonal tower—the heaven-bestowed pagoda, 160 ft. in height. A spiral flight of steps within the walls of the tower lead to the summit, from which the gazer beholds a splendid scene; innumerable villages dot the plain, which is reticulated by silvery water-courses, replete with evidence of successful commerce and agriculture. The population of the city is about 300,000; that of the plain, about 2,000,000. On many of the hills which envelop these cities, green tea is successfully cultivated; while the mulberry, the tallow-tree, and numerous other stimulants of industry abound. Two crops of rice are procured annually from the fields; while the fisheries of the rivers and adjacent coast give employment to a numerous class of the population. Ice-houses close to the river give the banks a picturesque appearance; the ice is used for curing fish. Ningpo has an extensive coasting trade; but no considerable foreign trade has been developed, owing mainly to portages on the inland water-communications, and to the proximity of Shanghai, where no such obstructions exist. The district city of Chinhai, at the mouth of the Ningpo river, is also a port. A walled town, containing about 80,000 inhabitants, 10 miles by 5, of great beauty, the Kingsborough called it Chinhai, and the Chishan, chieftain. Tinghai is the district city of the island of Chusan, which is 20 m. long, from 6 to 10 wide, and 51 in circumference. It is mountainous, with fertile valleys in a high state of cultivation. It has an excellent harbor. Tinghai was garrisoned several years by her majesty's forces from 1841, and was again temporarily occupied by the allied forces in 1860.—Dr. Maegowau's Lectures.

NINIAN, SAINT, the apostle of the Picts, lived in the latter half of the 4th and the beginning of the 5th century. Whether Christianity had been introduced among the Picts before the time of Ninian has been a subject of controversy; but although the details of the legendary account are uncertain, it seems, beyond all question, that some Christians were to be found, at least among the southern Picts, in what is now known as the lowlands of Scotland, from the end of the 2d century. Nevertheless, either their number was originally very small, or the rising church had fallen away under adverse circumstances; and it is certain that when Ninian appeared among them, the Picts were in the main a pagan people. He was a Briton, and of noble birth; but had been educated at Rome, and there ordained a bishop. The exact time of his preaching in Scotland is unknown. His labors appear to have commenced in Cumbria, and to have extended over the greater part of the district as far n, as the Grampian hills, his see being fixed at Candida Cas, or Whithorn, in the modern Wigtownshire. His death is placed by the Bollandists in 432; his festival is Sept. 16.

NINIGRET, about 1610-77; a Narragansett chief who figured in the Pequot war of 1632, and as an ally of the colonists in 1637. A visit to the Dutch on the island of Manhattan caused him to be suspected by the Connecticut colony of plotting against the English colonists. The commissioners of the united colonies in 1653 declared war against him while he was making war on the Indians of Long Island. A summons was sent him from Hartford to appear there, which he failed to comply with; whereinof maj. Simon Willard was sent against him, and forced him to leave the country. In 1660-62 the colonists bought his lands.

NINON DE LENCLOS, a celebrated French woman, one of those characters that could have appeared only in the French society of the 17th c., was born of good family at Paris in 1615. Her mother tried to imbue her mind with a love of the principles of religion and morality, but her father, more successfully, with a taste for pleasure. Even as a child she was remarkable for her beauty and the exquisite grace of her person. She was carefully educated, spoke several foreign languages, excelled in music and dancing, and had a great fund of sharp and lively wit. At the age of ten she read Montaigne's Essays. Six years later, she commenced her long career of licentious gallantry by an amour with Gaspard de Coligny, then comte de Chatillon. To Coligny succeeded innumerable favorites, but never more than one at a time. Among Ninon de Lenclos's lovers were may mention the marquis de Villareux, the marquis de Sevigné, the marquis de Gersay, the great Condé, the duc de Larocheforgue, marshal d'Albret, marshal d'Estrees, the abbe d'Effia, Gourville, and La Châtre. She had two sons, but never
showed in regard to them the slightest instinct of maternity. The fate of one was her
rible. Brought up in ignorance of his mother, he followed the rest of the world, and
consumed a passion for her. When she informed him of the relation that subsisted
between them, the unhappy youth was seized with horror, and blew out his brains in a
frenzy of remorse. Even this calamity did not seriously affect Ninon de Lenclos; she
was too well-bred to allow it to do that. Ninon de Lenclos was nearly as celebrated for
her manners as for her beauty. The most respectable and virtuous women sent their
children to her house to acquire taste, style, politeness. So great was her reputation,
that when queen Christina of Sweden came to Paris, she said she wished particularly
to visit the French academy and Ninon de Lenclos. We may gather some idea of her wit
and sense from the fact that Larochefoucauld consulted her upon his maxims, Mollière
upon his comedies, and Scarron upon his romances. She died Oct. 17, 1706, at the age
of 90, having preserved some remains of her beauty almost to the last.—See Guyon de
Sardière’s Vie de Ninon de Lenclos; Saint-Evremond’s Œuvres; Doumenau’s Mémoires
pour servir à l’Histoire de Mlle. de Lenclos.

NINTH, in music, the next interval above the octave, being the same interval which
an octave lower is termed the second. See INTERVAL.

NIÔBÉ, in Greek mythology, the daughter of Tantalus and (according to the most
popular version of the story) the sister of Pelops. She was the wife of Amphion, king
of Thebes, and bore him six sons and six daughters. Proud of her children, she
despaired Leto or Latona, who had only two children, Apollo and Diana, and prevented
the people from the worship of these deities: whereupon Latona, enraged, moved her
children to destroy all the children of Niobé with their arrows. They lay nine days in
their blood unburied, when Jupiter changed them into stone, and on the tenth day they
were buried by the gods themselves. Niobé wandered about in distress, and at last
was changed into stone on mount Sipylos, between Lydia and Phrygia, retaining, howev-
er, even as stone a sense of her woe. Such is the Hомерic legend, which, however,
was afterwards much varied and enlarged. Niobé was a favorite subject of the ancient
artists. A group representing Niobé and her children was discovered at Rome in 1588,
and is now in Florence. Some of the sculptures are very beautiful. Even the ancient
Romans were in doubts whether the work proceeded from Scopas or Praxiteles.

NIÔBIUM (symbol, Nb) is a rare metal discovered by H. Rose in the mineral tantalite.
It is obtained by reducing the double fluoride of niobium and potassium with sodium;
and forms a black powder insoluble in nitric acid, but readily soluble in a mixture of
nitric and hydrochloric acids. With oxygen it forms two compounds, niobic acid,
\( \text{NbO}_5 \), and niobic acid, \( \text{Nb}_2\text{O}_5 \); and chlorine, bromine, fluorine, and sulphur compounds
corresponding to these acids have been prepared and examined. Neither the metal itself
nor any of its compounds are of any practical importance.

NIÔBIUM (vented) is now understood to be no separate metal, but the same with
 columbium. Pelopium, another supposed new metal, is merely the oxide of niobium or
columbium.

NIÔBRA’RA, a diocese of the American Protestant Episcopal church, including the
greater part of Dakota, and bounded by the Missouri river, the line between Dakota and
Nebraska, the 104th degree of w. long., and the 46th degree of n. lat. Yankton agency
is the episcopal residence.

NIÔBRA’RA RIVER, or L’ÈAT qui COURT, rises in Laramie co., e. Wyoming terri-
tory, and flows in a generally c. course through n. Nebraska, entering the Missouri about
36 m. s.w. of Yankton, Dakota; length about 450 miles. The stream is shallow, not
navigable, and very rapid in its course. In the upper part it flows through a very deep
cañon, afterward passes through a sandy desert, but in the lower part winds through a
fertile and well-watered region.

NIORT, a t. of France, capital of the department of Deux-Sèvres, on the Sèvre-
Niortaise, is situated in an agreeable country, occupying the slope of two hills and the
valley which intervenes, 110 m. n. of Bordeaux. Its principal edifices are the church of
Notre-Dame, the town-hall, the theater, and the old castle. Besides these, the beautiful
fountain du Vivier, the promenades, the library, and the college are worthy of notice.
The dressing of chamois and the manufacture of gloves are the principal branches of
industry. Dyeworks and tanneries are in operation. Pop. ’76, 20,336.

Niort is an ancient town. In the 14th c. it was taken by the English, and held by
them for 18 years.

NI’PA, a genus of endogenous plants referred by some botanists to the order pandana-
ecor, and by others to palms. \( \text{N. fruiticosa} \) is very common in the Eastern archipelago,
and northwards as far as the Mergui river, but becomes rare further north. It flourishes
with the mangrove in places inundated when the tide rises. It abounds in saccharine
sap, from which a kind of palm wine is made, and also excellent sugar. The leaves are
much employed for roofing houses, and large quantities are sent from the Teneserim
provinces northwards for this use.

NI’PADITES, a genus of fossil palm fruits found in the eocene clays of the island of
Sheppey, in Kent. They are referred to \( \text{nipa} \) as their nearest living ally, and are con-
sidered to have resembled in habit that genus, and to have grown on the banks of an immense river which flowed from the tropical regions of a continent lying to the southward, and entered the sea at Sheppey, where it deposited the fruits and leaves borne down with the current, by the side of the starfishes and mollusca which inhabited the estuary. Some 13 different kinds have been described.

NIPIGON, or NEPIGON, LAKE, 55 m. n. of the most northerly part of lake Superior, in lat. 50° n., long. 88° w., about 70 m. long from n. to s., and 40 m. from e. to west. A coast sinuous, with bold headlands, and deep bays, gives a total length of shore of 580 miles. Its surface is 813 ft. above lake Superior. A great number of mountain streams flow into it, and its waters flow out through the Nipigon river, 40 m. in length, southward, to Nipigon bay of lake Superior. The lake is very deep, studded with islands, and well stocked with fish.

NIPISSING, a c. n. Ontario, Canada, having the Ottawa river for its e. boundary; having lake Nipissing (50 m. long and 35 m. wide), containing many islands, and numerous other lakes; its streams include French and Sturgeon rivers; 3,722 sq. m.; pop. '71, 1791. Its surface is hilly, the portion s. of the lake being 1100 ft. above the level of the sea.

NIPISSING, or NEPISSING, LAKE, in c. central Ontario, Canada, not far n. of the Ottawa river; length about 45 m.; greatest breadth, 28 miles. Its waters are mostly received from the n. by Sturgeon river, which connects it with a chain of smaller lakes. The only outlet is French river, by which the lake discharges into Georgian bay, an inlet of lake Huron. There are a number of small islands, and the vicinity is inhabited mostly by Indian tribes.

NIPISSINGS, an Indian tribe formerly living about the lake of the same name in the province of Ontario. They were known to Cartier and other French adventurers, and by them regarded as a peculiarly superstitious race. In the contests between the Hurons and Iroquois the latter drove the Nipissings n. and w. to the small lakes n. of lake Superior. They were accompanied by French priests who had already founded missions among them. After the conclusion of hostilities between the other tribes they returned eastward, and with other Algonquin tribes joined the Sulpician mission established near the lake of the Two Mountains. Their numbers have been greatly reduced.

NIPON, or NIPON, the largest by far of the group of islands forming the empire of Japan (q.v.). It is the main-land—the England and Wales—of Dài Nipon, or Great Nipon, the Japanese name for the empire as a whole. Nipon is included between 33° 80' to 41° 30' n. lat., and 130° 50' to 142° 20' e. long. The inland sea of Seto separates it from the islands of Kiussin and Sikofp, and the strait of Sangar on the n. e. from the island of Yesso. On the n. it is bounded by the sea of Japan, and on the s. and e. by the Pacific ocean. The length of Nipon is 900 m., and its breadth 240; and it has an estimated area of 42,000 sq. miles. Yedo (q.v.) or To-Kei, the capital of the empire, and the present residence of the mikado; Miako (q.v.), his former residence; and O-aka (q.v.) are the largest towns. The chief treaty-ports are Hiogo—the outlet for the trade of Osaka—Yokohama (q.v.), and Kanagawa (q.v.). The ports of Yedo and Niégata, in the northern part of the island, on the sea of Japan, the official capital of the province in which it is situated, are situated near the great mineral region of Aksun, but unfortunately possess a wretched harbor. Important meteorological observations, which give a good idea of the climate of the country generally, were made by Dr. Hepburn at Kanagawa, the shipping port of Yedo, in 1860. These are exhibited in a condensed form in the following table:

Bracing sea-breezes make the heat of summer very endurable. The spring and autumn months are delightful.

NIRUKTA, or "Explanation," is the name of one of the six Vedāngas (see VEDA) which explains difficult Vedic words. That there have been several works engaged in such a task, even at a very remote period of Hindu antiquity, and that they bore the name of Nirukta, is probable, for "Nirukta authors" are quoted either generally or by name in several Sanskrit authors; but the work which is emphatically called Nirukta, and which,

U. K. X.—41
for the present, is the only surviving representative of this important Vedaṅga, is that
of Yāska, who was a predecessor of Pāṇini (q.v.). His work consists of three parts—the
Nyāgahātra, where, for the most part, synonymous words are taught; the Yājñavāla,
which contains words that usually occur in the Vedas only; and the Bīdevāla, which
contains words chiefly relating to deities and sacrificial acts. A commentary on this work
has been composed by the same Yāska, and it likewise bears the name of Nirukta.
In the latter, Vedic passages are quoted in illustration of the words to be explained, and
the comment given by Yāska on these passages is the oldest instance, known at present
to Sanskrit philology, of a Vedic gloss. Besides the great importance which Yāska's
Nirukta thus possesses for a proper understanding of the Vedic texts, it is valuable also
on account of several discussions which it raises on grammatical and other questions,
and on account of the insight it affords us into the scientific and religious condition of
its time.—Text and Commentary of Yāska's Nirukta have been edited by prof. R. Roth
(Göttingen, 1832).

NIRVĀNA (from the Sanskrit nir, out, and vāna, blown; hence, literally, that which
is blown out or extinguished) is, in Buddhist doctrine, the term denoting the final
deliverance of the soul from transmigration. It implies, consequently, the last aim of
Buddhist existence, since transmigration is tantamount to a relapse into the evils or
miseries of samsāra, or the world. But as Hinduism, or the Brahmanical doctrine, pro-
fesses to lead to the same end, the difference between nirvāna and moksha, apāvartana,
or other terms of Brahmanism designating eternal bliss, and consequent liberation
from metempsychosis, rests on the difference of the ideas which both doctrines connect
with the condition of the soul after that liberation. Brahman, according to the Brahman-
ical doctrine, being the existing and everlasting cause of the universe, eternal happiness
is, to the Brahmanical Hindu, the absorption of the human soul into that cause whence
it emanated, never to depart from it again. According to this doctrine, therefore, the
liberation of the human soul from transmigration is equivalent to that state of felicity
which religion and philosophy attribute to that entity (see Indra—Brahman). As, how-
ever, the ultimate cause of the universe, according to Buddhism, is the void or non-entity,
the deliverance from transmigration is, to the Buddhists, the return to non-entity, or the
absolute extinction of the soul. However much, then, the pious phraseology of their
oldest works may embellish the state of nirvāna, and apparently deceive the believer on
its real character, it cannot alter this fundamental idea inherent in it. We are told, for
instance, that nirvāna is quietude and identity, whereas samsāra is turmoil and variety;
that nirvāna is freedom from all conditions of existence, whereas samsāra is birth, dis-
case, decrepitude, and death, sin and pain, merit and demerit, virtue and vice; that nir-
vāna is the shore of salvation for those who are in danger of being drowned in the sea of
samsāra; that it is the free port ready to receive those who have escaped the dungeon of
existence, the medicine which cures all diseases, the water which quenches the thirst of
desires, etc.; but to the mind of the orthodox Buddhist, all these definitions convey
but the one idea, that the blessings promised in the condition of nirvāna are tantamount
to the absolute "extinction of the human soul," after it has obeyed, in this life, all the
injunctions of Buddhism, and become convinced of all its tenets on the nature of the
world and the final destination of the soul.

Although this is the orthodox view of nirvāna, according to the oldest Buddhist doc-
true, it is necessary to point out two categories of different views which have obscured
the original idea of nirvāna, and even induced some modern writers to believe that the
final destination of the oldest Buddhist doctrine is not equivalent to the absolute annihil-
ation of the soul.

The first category of these latter, or, as we may call them, heterodox views, is that
which confounds with nirvāna the preparatory labor of the mind to arrive at that end,
and therefore assumes that nirvāna is the extinction of thought, or the cessation to
thought, of all difference between subject and object, virtue and vice, etc., or certain
speculations on a creative cause, the conditions of the universe, and so on. All these
views the Buddha himself rejects, as appears from the work Lankāvatāra (q.v.), where
relating his discourse on the real meaning of nirvāna, before the Bodhisattwa Mahā-
mati. The erroneousness of those views is obviously based on the fact, that the mind,
even though in a state of unconsciousness, as when ceasing to think, or when speculat-
ing, is still within the pale of existence. Thus, to obliterate the mistaken notion that such
a state is the real nirvāna, Buddhist works sometimes use the term nirupadheka nir-
vāna, or "the nirvāna without a remainder of substratum" (i.e., without a rest of exist-
ence), in contradistinction to the "nirvāna with a remainder," meaning by the latter
expression that condition of a saint which, in consequence of his bodily and mental
anomalies, immediately precedes his real nirvāna, but in which, nevertheless, he is still
an occupant of the material world.

The second category of heterodox views on the nirvāna is that which, though acknow-
ledging in principle the original notion of Buddhist salvation, represents, as it were, a
compromise with the popular mind. It belongs to a later period of Buddhism, when
this religion, in extending its conquests over Asia, had to encounter creeds which abhor-
red the idea of an absolute nihilism. This compromise coincides with the creation of a
Buddhist pantheon, and with the classification of Buddhist saints into three classes,
each of which has its own nirvāṇa; that of the two lower degrees consisting of a vast number of years, at the end of which, however, these saints are born again; while the absolute nirvāṇa is reserved for the highest class of saints. Hence Buddhistic salvation is then spoken of, either simply as nirvāṇa, or the lowest, or as parinirvāṇa, the middle, or as mahāparinirvāṇa, or the highest extinction of the soul; and as those who have not yet attained to the highest nirvāṇa must live in the heavens of the two inferior classes of saints until they reappear in this world, their condition of nirvāṇa is assimilated to that state of more or less material happiness which is also held out to the Brahmanical Hindu before he is completely absorbed into Brahmā.

When, in its last stage, Buddhism is driven to the assumption of an Adi, or primitive, Buddha, as the creator of the universe, nirvāṇa, then meaning the absorption into him, ceases to have any real affinity with the original Buddhistic term. See Budhism and Lamaism.

NISARD, Jean Marie Napoleon Désiré, b. France, 1806. In 1828 he became a contributor to the Journal des Débats, assuming a vigorous opposition to the government of Louis XVIII. After the revolution of 1830, for a short time he gave a warm support to the Louis Philippe government, then joined the opposition, and as one of the editors of the National was co-laborer with Armand Carrel in the most vigorous attacks upon the sinister divergence of Louis Philippe's administration from the path marked out for it by Lafayette. But soon changing, for the remainder of his life he was a champion of the past in politics, literature, art and cut to the quick, in his criticisms, the works of Hugo and other poets and dramatists of his own time. His works secured attention by their profuse and graceful diction, and an agreeable expression of imagination. Guizot, prime minister of Louis Philippe, made him supervisor of normal schools in 1835, and promoted him to higher positions each year, until he loved the government better than his former opinions, and supported Louis Philippe as warmly as he had before satirized him. He sat as deputy in the chambers, 1842-48; and in his literary work, which was continued, plainly avowed that the French spirit was in its decadence, and looked back to the age of Louis XIV. for its brightest exemplars. Left in the shade by the revolution of 1848, he recovered place and power, political and literary, under the reign of Napoleon III. As lecturer in the college of France in 1855, he made such service use of his opinions to defend the perjures of the emperor that the students refused to listen, and gave him a châvocor, which resulted in the imprisonment of 15 students, and the protection of subsequent lectures by a strong police force. Napoleon rewarded Nisard by naming him commander of the legion of honor in 1856, and director of the normal school in 1857. He failed to acquire the respect of the higher order of students, and used repressive measures against the free expression of opinions in the schools and colleges of France. Among his principal works are Histoire de la littérature française, Poètes latins de la décadence, and an early article in the Débats entitled De la littérature facile, et de la littérature difficile.

NISBET, Charles, d.d., 1736-1804; b. Scotland; graduated at Edinburgh university, 1754; was for some years a prominent Presbyterian clergyman at Montrose, and by his wit and power in argument won considerable influence in the general assembly. He openly avowed his sympathy with the American colonies, and having accepted the presidency of Dickinson college, Pennsylvania, came to America in 1785, where he delivered lectures on logic, philosophy of the mind, belles-lettres, and systematic theology, and endeavored to bring the system of education up to his high standard. He was a great scholar, and possessed a wonderful memory. He died at Carlisle, Penn., and his posthumous works were published two years after his death; his memoirs, by Dr. Miller, in 1840.

NISCEMI, a t. of Sicily, in the province of Caltanissetta, 10 m. n.e. from Terranova, and on the right bank of the river Terranoya. In 1790 this town was visited by an earthquake, and during seven shocks, the ground gradually sank in one place to the depth of 30 feet. Fissures opened, which sent forth sulphur, petroleum, hot water, and mud. Pop. 10,750.

NISCH, or Nissa, one of the principal towns of Servia, in the district added to the principality by the Berlin congress of 1878, 122 m. s.e. from Belgrade. It stands on the river Nissawa, a branch of the Morava. The town is ill built; but many new houses and a well supplied bazaar attest its present prosperity. Nisch has long been noted as the point of meeting of many roads, of both military and commercial importance. Its importance would be greatly increased by the proposed construction of a railway from Belgrade to Constantinople and Thessalonica. In ancient times, Nisch bore the name of Naissos, and was a flourishing town of upper Moesia; in it the emperor Constantine the great was born. It was Slavonic in the 6th c., was taken by the Tartar Bulgarians in the 8th, by the Servians again in the 12th, and by the Turks in 1839. Near Nisch, in 1689, the Markgraf Louis of Baden, with 17,000 men, destroyed a Turkish army of 40,000. Pop. 13,000.

NISHAPUR, or Nushapur, a t. of Persia, province of Khurassan, 58 m. w.s.w. of Meshid, is situated in a most beautiful and fertile valley. Pop. about 8,000. It is surrounded by a rampart and trench, and has a considerable trade in turquoises, which are obtained from mines in its vicinity.
NISI PRIUS is the name (borrowed from the first two words of the old writ which summoned juries) usually given in England to the sitting of juries in civil cases. Thus a judge sitting at nisi prius, means a judge presiding at a jury trial in a civil case, and the nisi prius settings are the jury settings.

NISI PRIUS (nisi), originally the clause in the writ which commanded the sheriff to bring a jury to Westminster, "unless before" (nisi prius) a justice of assizes should come to the county where the cause of action arose. In course of time the phrase was used to designate a large class of business transacted at the assizes before superior courts, and the phrases nisi prius judge, nisi prius law, and nisi prius courts, came into use. At present, in England and the United States, nisi prius courts are those courts, or terms of courts, held for the trial of civil causes, with the presence and aid of a jury; and a nisi prius sitting is to be distinguished from a sitting of the court in banco, in full bench, for the hearing of appellate cases.

NISIBIS, the capital of ancient Mygdonia, the north-eastern part of Mesopotamia. It was situated in a fertile district, and was of importance, both as a place of strength and as an emporium of the trade between the east and west. Nisibis was a city of very great antiquity, but of its remote history nothing is known. In the time of the Macedonian-Syrian kings it was also called Antiochus Mygdoniae. It was twice taken by the Romans (under Lucullus and Trajan), and again given up to them by the Armenians; but being a third time taken by Lucius Verus, 163 A.D., it remained the chief bulwark of the Roman empire against the Persians, till it was surrendered to them by Jovian after the death of Julian in 363. The name Nisibis is retained by a small village in the Turkish ejahet of Diirbekr, round which are numerous remains of the ancient city.

NITER, or SALTPETER, as it is frequently called, is the nitrate of potash (KNO₃). It usually occurs in long, colorless, striated, six-sided prisms; its taste is cooling, and very saline; it is soluble in seven times its weight of water at 60°, and in less than one-third of its weight of boiling water, but is insoluble in alcohol. When heated to about 600° it fuses without decomposition into a thin liquid, which, when cast in moulds, solidifies into a white, fibrous, translucent mass, known as sal prunelle. At a higher temperature, part of the oxygen is evolved, and nitrate of potash is formed. Owing to the facility with which niter parts with its oxygen, it is much employed as an oxidizing agent. Mixtures of niter and carbon, or of niter and sulphur, or of niter, carbon, and sulphur, delagrate on the application of heat with great energy; and if niter be thrown on glowing coals, it produces a blue scintillation. Touch-paper is formed by dipping paper in a solution of niter and drying it.

Niter occurs as a natural product in the East Indies, Egypt, Persia, where it is found sometimes as an efflorescence upon the soil, and sometimes disseminated through its upper stratum. The crude salt is obtained by lixiviating the soil, and allowing the solution to crystallize. A large quantity of niter is artificially formed in many countries of Europe, by imitating the conditions under which it is naturally produced. The most essential of these conditions seem to be the presence of decaying organic matter whose nitrogen is oxidized by the action of the atmosphere into nitric acid, which combines with the bases (potash and lime) contained in the soil. "The method employed in the artificial production of niter consists in placing animal matters, mingled with ashes and lime rubbish, in loosely aggregated heaps, exposed to the air, but sheltered from rain. The heaps are watered from time to time with urine or stable runnings; at suitable intervals the earth is lixiviated, and the salt crystallized. Three years usually elapse before the niter bed is washed; after this interval a cubic foot of the debris should yield between 4 and 5 ounces of niter. As there is always a considerable quantity of the nitrates of lime and magnesia present, which will not crystallize, carbonate of potash, in the shape of wood-ashes, is added so long as any precipitate occurs. The nitrate of lime is decomposed, and the insoluble carbonate of lime separated:"

\[ \text{Carbonate of Potash. Nitrate of Lime. Carbonate of Lime. Nitrate of Potash.} \]
\[ \text{KO}_2\text{CO}_3 + \text{CaO}_2\text{NO}_3 = \text{CaO}_2\text{CO}_3 + \text{KO}_2\text{NO}_3 \]

The clear liquor is then evaporated and crystallized. It has been found that the earth in which niter has once been formed furnishes fresh niter more readily than on the first occasion. Care is taken that the niter plantations, as they are termed, shall rest upon an impervious flooring of clay, so that the liquid which drains away from them may be collected and preserved."—Miller's Elements of Chemistry, 2d ed. vol. ii. p. 359.

Niter does not occur in any living members of the animal kingdom, but it is found in the juices of various plants, amongst which may be named the sunflower, nettle, goose-foot, borage, tobacco, barley, etc.

All the niter used in this country comes from the East Indies. The common varieties, which have a dirty yellowish appearance, are termed rough or crude salt-peter, while the purer kinds are called East India refined. The purification or refining of niter is effected by dissolving it in water, boiling the solution, removing the scum, straining it while hot, and allowing it aside to crystallize. The nitrate of potash, chlorides of sodium and potassium, and nitrate of lime. Chloride of barium will detect the first of these impurities, nitrate of silver the second, and oxalate of ammonia the third.
Niter is employed in the manufacture of sulphuric acid, in the preparation of nitric acid, as an oxidizing agent in numerous chemical processes, as an ingredient of fireworks, and especially in the manufacture of gunpowder. It is extensively used in medicine. In moderate doses (from ten grains to a scruple) it acts as a refrigerent, diuretic, and diaphoretic, and hence its use is indicated when we wish to diminish abnormal heat, and to reduce the action of the pulse, as in febrile disorders and hemorrhages. In acute rheumatism it is given in large doses with great benefit. Some physicians prescribe as much as one, two, or three ounces, largely diluted with water, to be given in the course of 20 hours; but as in several cases a single ounce has proved fatal in a few hours, the effects of such large doses should be carefully watched. It is a popular remedy in sore throat, either in the form of niter balls, or powdered and mixed with white sugar. In either case the remedy should be retained in the mouth till it melts, and the saliva impregnated with it gently swallowed. The inhalation of the fumes produced by the ignition of louch-paper often gives speedy relief in cases of spasmodic asthma.

Niter of potash is sometimes called prismatic niter or potash saltpeter, to distinguish it from nitrate of soda, which is more generally in commerce as cubic niter or soda nitrate.

Cubic niter, or nitrate of soda (NaNO₃), occurs abundantly on the surface of the soil in Chili and Peru. It derives its name from its crystallizing in cube-like rhombohedrons.

In most of its properties it resembles ordinary niter, but in consequence of its greater deliquescence it cannot be substituted for that salt in the preparation of gunpowder. Being considerably cheaper than the potash-salt, cubic niter is often substituted for it in the manufacture of nitric and sulphuric acids; and it is used in agriculture as a top-dressing for wheat and oats. In several experiments it has been found that one cwt. per acre has produced an increase of 12 bushels in the wheat crop, and of 4 or 5 sacks in the oat crop.

NI TI-GHAUT, a pass of the Himalaya, between the British district of Kumaon and Thibet. It takes its name from the village of Niti, in Kumaon, 13 m. s. of the pass, in lat. 30° 47' n., and long. 79° 56' east. The pass is 16,814 ft. above the level of the sea. This is regarded as the easiest pass between Kumaon and Thibet, and is consequently one of the principal channels of trade between Hindustan and Chinese Tartary. The Bhotias of Niti subsist chiefly by the carrying of goods in this trade. The articles of merchandise are conveyed on yaks, goats, and even sheep. Travelers often suffer much from difficulty of respiration on the pass of Niti-Ghaunt, on account of the rarefaction of the air.

NITRATE OF POTASH. See Niter.

NITRATE OF SODA. See Niter.

NITRATES are salts formed by the union of nitric acid with bases. Some are found in a natural mineral condition, as saltpeter and cubic niter. They are distinguished for their solubility in water. On being heated, they undergo decomposition, being converted either into free nitric acid and a base, or into oxygen and a nitrite. For potassium nitrate and sodium nitrate, see Niter, ante. In many respects, one of the most important nitrates is the nitrate of silver, or lunar caustic (q.v.); see also Silver, ante. It is made by dissolving a small quantity of the salt in water, and then the solution is boiled down, the nitric acid being driven off, leaving a rather superficially, producing a white slough, which blackens soon on exposure to the light. It is used in a solid state, or in solutions of all strengths. If dissolved in pure water, it remains colorless; but the smallest particle of organic matter will cause the solution to turn dark. On this account it is employed for making marking-fluids for linen. Indelible ink is usually made by dissolving 1 part of nitrate of silver and 4 parts of gum-arabic in 4 parts of water, and adding a little India ink to give it color, so that it may be seen when the mixture is applied. The place which is to receive the impression is first moistened with a solution of carbonate of soda and dried. After the application of the ink, the writing is exposed to the sunlight. Lunar caustic markings may be readily removed by applying a few drops of tincture of iodine, and dissolving out the iodide of silver thus formed by a solution of hyposulphite of soda, or a dilute solution of caustic potash. Nitrate of silver is used in photography (q.v.). Nitrate of ammonia, or nitrite, is a name given to a substance resembling modern nomenclature, ammonium nitrate), NH₄NO₃, or, according to later views, NO₂NH₄, may be formed by the action of the galvanic current on a mixture of nitrogen and oxygen with an excess of hydrogen; but the common method is to add a slight excess of aqua ammonia to nitric acid. If crystallization is conducted slowly, six-sided prisms, like those of nitrate of potash, will be formed, having a specific gravity of 1.665. It melts at 226° F., and at 482° decomposes into water and nitrous oxide, or laughing-gas. See Nitrogen, ante. Nitrate of baryta, or baryta saltpeter, is made by treating the native carbonate of baryta with nitric acid. It crystallizes in anhydrous regular octahedrons, having a specific gravity of 3.184. When heated strongly it is converted into baryta, or baric oxide, with evolution of oxygen and nitrogen. Nitrate of bismuth and also sub-nitrate are important salts in the arts and medicine. See Bismuth, ante. Nitrate of cobalt, prepared by the action of nitric acid on the oxide, crystallizes from solutions in beautiful pink-red deliquescent crystals, having a specific gravity of 1.88. It is much used in the chemical laboratory, particularly as a blow-pipe reagent. With magnesium compounds, it yields a pink color; with those of zinc, green; and with aluminium compounds a beautiful blue; for this reason it is
much used in coloring porcelain and earthenware. Nitrate of copper is made by the action of diluted nitric acid on copper turnings. Nitric oxide gas is given off during the operation. It crystallizes from cold solutions in beautiful blue, deliquescent, rhomboidal prisms, containing four molecules of water. From solutions above 50° it crystallizes with three molecules of water in needles, having a specific gravity of 2.047, soluble in alcohol. Nitrate of copper is converted, by moderate heat, into an insoluble basic nitrate. By raising the heat, the acid is completely driven off, leaving only the black oxide of the metal. Nitrate of copper is sometimes useful in surgery, as an application to certain ill-conditioned ulcers. The nitrates of iron are important salts. The proustite, or ferrons nitrate, is formed by digesting iron-turnings in very dilute nitric acid. It crystallizes in pale green rhombohedrons, having the formula Fe(NO₃)₂.₆H₂O. It is much used in dyeing. The pernitrate, or ferric nitrate, is made by dissolving iron-turnings in nitric acid of 5–9 gr. between 1.2 and 1.3. It is used in surgery. Nitric acid forms several salts with lead, the principal of which is the common nitrate, or plumb nitrate, Pb(NO₃)₂. It crystallizes in anhydrous regular octahedrons, usually milk-white and opaque. It dissolves in 7/4 parts of cold water. It is decomposed by heat, with evolution of peroxide of nitrogen. Nitric acid forms a greater number of salts with mercury than with any other metal, one of which is used in medicine (see Mercury, 116), and the other for the manufacture of corrosive sublimate.

**NITRIC ACID** is the most important of the five compounds which oxygen forms with nitrogen (q.v.). Until 1849 it was only known in the hydrated form (the aquafortis of the older chemists), but in that year Deville showed that anhydrous nitric acid, or nitric anhydride (NO₃), might be obtained in transparent colorless crystals by the action of perfectly dry chlorine gas on well-dried crystals of nitrate of silver, the reaction being exhibited in the equation:

\[
\text{Nitrate of silver.} \quad \text{Chlorine.} \quad \text{Chloride of silver.} \quad \text{Nitric anhydride.} \quad \text{Oxygen.}
\]

\[
\text{AgNO}_3 + \text{Cl} = \text{AgCl} + \text{NO}_3 + \text{O}.
\]

It is a very unstable compound, and sometimes explodes spontaneously. It dissolves in water with evolution of much heat, and forms hydrated nitric acid.

**Hydrated nitric acid** (symb. H₂O⁺NO₃⁻, equiv. 63, sp. gr. 1.021), when perfectly pure, is a colorless, limpid, fuming, powerfully caustic fluid, possessing an acrid, acid reaction, as shown by its action on litmus. It boils at 184°, and freezes at about 40°. It parts very readily with a portion of its oxygen to most of the metals, and hence is much used in the laboratory as an oxidizing agent. Its mode of action on the metals requires a few remarks. In order that a metal should unite with nitric, or any other acid, it is necessary that it should be in the form of an oxide. This oxidation is, however, effected at the same time that the metal and nitric acid are brought in contact, by one portion of the latter becoming decomposed and converting the metal into an oxide, while the remaining portion combines with the oxide thus formed, to produce a nitrate. The exact nature of the decomposition varies in the case of different metals.

Nitric acid, whether in the concentrated or in a more dilute form, acts energetically on organic matters. As examples of such actions, we may refer to its power of decolorizing indigo; of staining the skin and all albuminous tissues of a bright-yellow color; of coagulating fluid albumen; and of converting cotton fiber into an explosive substance. See _Gum-Corrosol._

The monohydrated acid (H₂O⁺NO₃) is by no means a stable compound. If it be exposed to the action of light it is decomposed into hypoueric acid (NO₂) (the peroxide of nitrogen of Graham) and oxygen; and mere distillation produces a similar effect. When it is mixed with water it emits a sensible amount of heat, owing to the formation of a much more stable hydrate, H₂O⁺NO₃ + 3Ag, which distils at 250° without change, and is unaffected by exposure to light. Its specific gravity is 1.424; and it is found that a weaker acid when heated parts with its water, and a stronger acid with its acid, till each arrives at this density. The existence of this hydrate has, however, been recently called in question by Roscoe.

The so-called _fuming nitric acid_ is merely a mixture of the pure acid with hyponitric acid.

Nitric acid does not occur naturally in a free state; but it is found tolerably abundant in combination with potash, soda, lime, and magnesia; and after thunder-storms traces of it, in combination with ammonia, are found in rain-water. It may be formed in small quantity by passing a series of electric sparks through a mixture of its component gases in the presence of water, which is a mere imitation, on a small scale, of the mode in which it is produced in the atmosphere by a storm. It is usually prepared in the laboratory by the application of heat to a mixture of equal weights of powdered niter (nitrate of potash) and oil of vitriol (hydrated sulphuric acid) placed in a retort. A combination of sulphuric acid and potash remains in the retort, while the nitric acid distils over, and is condensed in the receiver, which is kept cool by the application of a wet cloth. The reaction is explained by the equation:

\[
\text{Niter.} \quad \text{Sulphuric acid.} \quad \text{Nitric acid.} \quad \text{Bisulphate of potash.}
\]

\[
\text{KO,NO}_3 + 2(\text{HO,SO}_3) = \text{HO,NO}_3 + \text{KO,HO,2SO}_4.
\]
During distillation red fumes appear, arising from the decomposition of a portion of the nitric acid and a formation of some of the lower oxides of nitrogen. In this operation two equivalents of oil of vitriol are taken for one of niter, these being the proportions found by experience to be most suitable. If they are taken, equivalent for equivalent, a very impure red fuming acid is the result. In the manufacture of nitric acid on the large scale, the glass retort is replaced by a cast-iron cylinder coated with fire-clay, and the receiver by a series of earthen condensing vessels connected by tubes; and nitrate of soda, found native in Peru, is substituted for niter, in consequence of its being a cheaper salt, and of its containing 9 per cent more nitric acid.

Nitric acid combines with bases to form nitrates, some of which, as those of potash, soda, oxide of ammonium, silver, etc., are anhydrous, while others combine with a certain number (often six) equivalents of water of crystallization. Most of them are soluble in water, crystallizable, and readily fusible by heat; and at an elevated temperature they are all decomposed, usually leaving only the oxide of the metal. If paper be soaked in a solution of a nitrate, allowed to dry, and ignited, it burns in the smoldering mode characteristic of touch-paper. This property is, however, shared by a few other salts.

The tests for this acid when it is present in small quantities are less satisfactory than those for the other ordinary mineral acids. All its compounds are so soluble that no precipitant for this acid is known. The best method for its detection is mixing the fluid to be tested with a little concentrated sulphuric acid, and then pouring a strong solution of protosulphate of iron upon it, so as to form a separate layer. If much nitric acid be present, a black color is produced; if only a small quantity is present the liquid becomes reddish-brown or purple; the dark color being due to the formation of nitric oxide by the deoxidizing action of a portion of the iron salt on the nitric acid.

The applications of this acid in the arts, in manufactures, and in chemical processes are very extensive.

NITRIC ACID. THE MEDICINAL USES OF. In the British pharmacopoeia there is both a strong and a dilute acid. The strong acid has a specific gravity of 1.3, and is represented by the formula $3\text{H}_2\text{NO}_3$, while the dilute acid is prepared by mixing two ounces of the former with thirteen of distilled water, and has a specific gravity of 1.101.

The dilute acid is used internally as a tonic in conjunction with bitter infusions. In many cases of chronic inflammation of the liver, and in syphilitic cases in which the employment of mercurials is inadmissible, it may be prescribed with great benefit, either alone or in conjunction with hydrochloric acid, externally as a bath or lotion, or internally in doses of about 20 minims properly diluted. The strong acid is useful as an escharotic; as to destroy warts, some kinds of polypi, the unhealthy tissue in sloughing ulcers, etc., and as an application to parts bitten by rabid or venomous animals. Largely diluted, as 50 or 60 drops of the strong acid to a pint or more of water, it forms an excellent stimulative application to torpid ulcers.

NITRITES, salts produced by the action of nitrous acid on bases. The principal metallic nitrates are those of potassium, sodium, barium, ammonium, copper, lead, and nickel. The common mode of preparation is to reduce the nitrates by heat. The alcoholic nitrates or nitrous ethers are of more practical interest than the metallic nitrates. Nitric of anhydrous is an inflammable liquid having the odor of pears; sp.gr. 0.977; boiling point, 196° F. It is formed by the action of nitric acid upon anhydric alcohol. Its inhalation greatly increases the action of the heart, followed by loss of power. If has the power of suspending respiration and producing a condition of trance, which may stop short of death. In experiments upon animals, the appearances after death differ with the mode of administration. When given rapidly the lungs and brain are not congested; left side of heart empty, but right side filled with blood. When given slowly, both sides of the heart contain blood, and the lungs and brain are also congested. For nitrite of ethyl see NITRIOUS ETHER, ante.

NITRO-BENZOL, or Nitro Benzide ($\text{C}_6\text{H}_5\text{NO}_2$), is a yellow oily fluid, of specific gravity 1.2, which may be distilled without decomposition, crystallizes in needles at 37°, and boils at 315°. It has a sweet taste, is insoluble in water, but dissolves freely in alcohol and ether. Its odor is very similar to that of oil of bitter almonds, which has led to its use in perfumery; under the name of essence of nirbane. It is obtained by treating benzol ($\text{C}_6\text{H}_6$) with warm fuming nitric acid, when 1 equivalent of the hydrogen is replaced by 1 of hyponitric acid, so that the benzol ($\text{C}_6\text{H}_5\text{H}$) becomes converted into nitro-benzol ($\text{C}_6\text{H}_5\text{NO}_2$).

NITRO-BENZOL. [From Supplement.] This substance has recently taken a prominent place amongst the narcotic poisons. Under the name of essence of nirbane, it is largely employed as a substitute in perfumery and confectionery, for oil of bitter almonds, which it closely resembles in smell, and to confectionery it gives the smell, but not the agreeable taste of that oil. It is a pale, lemon-colored liquid, with a pungent, disagreeable taste, and distinguishable by its odor from all other liquids except oil of bitter almonds, from which it differs in the following reaction: Pour a few drops of each on a plate, and add a drop of strong sulphuric acid. The oil of almonds acquires a rich crimson color with a yellow border, while the nitro-benzol produces no such color. In 1859 prof. Casper of Berlin published an account of this liquid under the name a "A New Poison," and described its effects on dogs and rabbits. In 1862 and since that date
various cases of human poisoning have been published, both in this country and abroad. We shall briefly notice three cases, in two of which the patient died after swallowing a portion of the fluid; while in the other the inhalation of the vapor proved fatal. A boy aged 17, while drawing off some nitro-benzol by a siphon, swallowed a portion of the liquid. There were no immediate symptoms; but he soon felt sleepy, and when at dinner ate but little, and said he felt as if he was drunk. This was between two and three hours after he had swallowed the liquid. He fell into a stupor, which became deeper and deeper, until death took place, without vomiting or convulsions, twelve hours after the ingestion of the poison. In the case of a man aged 43, who spilled a quantity of nitro-benzol over his clothes, and went about for several hours breathing the vapor, the effects were nearly the same. The progress of each of these cases, both of which are described by Dr. Letheby in the *Proceedings of the Royal Society* for 1888, was much the same as that of slow intoxication, excepting that the mind was perfecting clear until the coming on of the fatal stupor, which was sudden, as in a fit of apoplexy. From that moment there was no return of consciousness or bodily power; the sufferer lay as in a deep sleep, and died without a struggle. The duration of each case was nearly the same, about four hours intervening between the swallowing or inhaling of the poison and the beginning of stupor or coma, which lasted five hours. Nitro-benzol, as well as aniline, into which it seems to have been partly converted in the body, was detected in the brain and stomach. It is unnecessary to describe the steps to be taken for the detection of the poison in all these cases, no one but a professed toxicologist should be intrusted with an investigation on the result of which the life and character of a human being may depend. It is satisfactory to read Dr. Taylor's opinion, that "there is no probability that this liquid will be successfully employed for the purposes of murder without the certainty of detection."—Principles and Practice of Medical Jurisprudence, p. 911. It is worthy of notice that the vapor of this substance, as it is evolved from almond glycerine soap, has seriously affected females; and Dr. Taylor mentions the case of a gentleman who, from using a cake of the soap in taking a warm bath, fainted from the effects of the vapor, and was ill for some months afterwards. The mode of treatment that should be adopted in poisoning by this substance is essentially the same as that which should be adopted in poisoning by opium.

**Nitrogen** (symbol, N; equiv. 14; sp. gr. 0.9713) derives its name from the Greek words nitron, after, and gen., to produce, in consequence of its being an essential constituent of that salt. It is frequently termed azote (Gr. a, priv., zoi, life), especially by the French chemists, in consequence of its being a gas incapable of supporting life, and for the same reason the German chemists term it stick-stoff ("choking substance"). It was discovered by Rutherford in 1772. Long regarded as a "permanent" gas, it was liquefied by Cailletet in 1878.

Nitrogen is a colorless, tasteless, inodorous, permanent gas, which in its appearance in no way differs from the atmospheric air, of which it is the main ingredient. It is somewhat lighter than atmospheric air, 100 cubic in. at 60° F., and barometer 30 in., weighing 30.119 grains, while the same volume of air weighs 30.953 grains. It is characterized rather by negative than by positive properties. It is not combustible, nor is it a supporter of combustion (a lighted taper being immediately extinguished if immersed in it); nor is it poisonous, although it is not positively poisonous; for when it is mixed with respirable gases (as with oxygen in atmospheric air) it may be breathed without injury. It is very slightly soluble in water, and hence may be collected over that fluid. Its combining powers are very slight, and although it unites with oxygen, hydrogen, chlorine, and many other substances, the union is never effected by the direct action of the elements on one another, but only by complicated processes, and many of the resulting compounds are of an exceedingly unstable nature.

Nitrogen is one of the most widely diffused elementary substances. It forms about four-fifths of the bulk of the atmosphere; for air, after having been freed from the small quantities of carbonic acid and aqueous vapor which it contains, consists, according to the experiments of Dumas and Boussingault, of 20.81 per cent of oxygen and 79.19 per cent of nitrogen by volume, or 23.01 of oxygen and 76.99 of nitrogen by weight; the two gases in this case being uniformly mixed, but not in chemical combination with one another. It occurs, however, in combination with oxygen in the form of nitric acid (\(H_2NO_3\)) in various nitrates, which are found as natural products in many parts of the globe. In combination with hydrogen it is abundantly found as ammonia, and combined with oxygen, hydrogen, and carbon, and sometimes additionally with sulphur and phosphorus, it forms the most important constituents of the solids and fluids of the animal body, and occurs in many vegetable products, especially in the alkaloids, such as morphia, strychnia, quina, etc.

The ordinary methods of preparing and exhibiting this gas are based upon the removal of the oxygen from atmospheric air. This may be done: (1) By setting fire to a small piece of phosphorus placed in a capsule that floats on the water of the pneumatic trough, and by inverting a glass-receiver filled with air over it. The phosphorus combines with the oxygen of the air to form phosphoric acid, which dissolves in the water, while the nitrogen is left, and must be transferred to another vessel. (2) By placing a stick of phosphorus in a jar of air which is standing over water. In two or three days there will be the same results as in the former experiment—viz., phosphoric acid and nitrogen. (3) Or
by passing air through a tube containing heated copper filings, which absorb the oxygen. In the above cases a little carbonic acid is present, which may be removed by passing the gas through a solution of potash. Pure nitrogen may be directly obtained by the action of chlorine gas on a solution of the nitrogenous substance, ammonia.

Nitrogen forms with oxygen no less than 5 distinct compounds, containing, respectively, 1, 2, 3, 4, and 5 equivalents of oxygen, with 1 equivalent of nitrogen. These compounds are thus named and constituted: Protoxide of nitrogen (known also as nitrous oxide and laughing gas), NO; binoxide (or deutoxide) of nitrogen (known also as nitric oxide), \( \text{NO}_2 \); nitrous acid, \( \text{NO}_2 \); hyponitric acid (known also as peroxyde of nitrogen), \( \text{NO}_3 \); nitric acid, \( \text{NO}_3 \).

Protoxide of nitrogen is a transparent, colorless gas, with a sweetish taste and smell. It is much more soluble in cold than in hot water, and therefore should be collected over the latter. Under a pressure of 50 atmospheres at 45° it is reduced to a colorless liquid, and it may be frozen into a transparent solid at about —150°. This gas is about half as heavy again as atmospheric air, its specific gravity being 1.527. It supports the combustion of many bodies, such as carbon, sulphur, phosphorus, and iron, with a brilliance similar to that which they exhibit in oxygen; and, like oxygen, when mixed with hydrogen, it forms a mixture which explodes on the application of a flame. The most remarkable property of the gas is its intoxicating power on the animal system. It may be inhaled for a short time if quite pure, or if only mixed with atmospheric air, without danger or serious inconvenience. The intoxication is frequently accompanied with an irresistible propensity to muscular exertion, and usually with uncontrollable bursts of laughter, and hence the gas has received the name of laughing gas. It is best obtained by heating ammonia in a glass retort, when it is converted into protoxide of nitrogen and water. It has recently come into frequent use as an anaesthetic in dentistry and similar cases. It is less suited to protracted operations, as the effects are transient. It produces much less disturbance of the system than chloroform.

Binoxide of nitrogen is a colorless gas, very slightly soluble in water, and having a specific gravity of 1.089. Its taste and smell (if any) are unknown, since, in the presence of atmospheric air, it instantly becomes more highly oxidized, and forms yellowish-red fumes of hyponitrous acid. As it is of little importance, it is unnecessary here to describe the mode of obtaining it.

Nitrous acid, or nitrous anhydride, is a substance of which, in its uncombined state, very little is yet known further than that it is a dark-blue, very volatile fluid, which boils at 32°, and is then converted into an orange-red gas.

Hyponitric acid presents a remarkable example of a body within comparatively small limits of temperature, occurring in a solid, a fluid, and a gaseous form. At a temperature of —4° it occurs in the form of colorless prismatic crystals, which are converted at about 9° into a fluid which, till the temperature reaches about 30°, is colorless; but at a higher temperature becomes yellow and orange, and at about 80° boils, and is converted into a brownish-red vapor. It is chiefly the vapor of hyponitric acid that forms the orange fumes that are produced when binoxide of nitrogen comes in contact with the air. It possesses a very disagreeable suffocating odor, and a caustic action, and colors the skin yellow, like nitric acid. It does not enter into combination with bases but is immediately decomposed by them into nitric and nitrous acids; and it is in consequence of its not possessing this essential character of an acid that Graham has given it the name of peroxyde of nitrogen, a term that has since been adopted by Miller and other chemists.

Nitrie acid is described in a special article.

Nitrogen combines with hydrogen in four proportions, but none of these compounds can be formed by the direct union of the component elements, and only one of them, viz., ammonia, has been obtained in the isolated form. They are—imidogen \( \text{(NH)}_2 \), amido- gen \( \text{(NH}_3 \), ammonia \( \text{(NH}_4 \), and ammonium \( \text{(NH}_4 \). Of these, the first two will be noticed under Organic Bases, while the last two are sufficiently described under AMMONIA.

Nitrogen combines with chlorine, bromine, and iodine. The chlorde of nitrogen is a heavy, oily, orange-colored fluid, insoluble in water, and evolving a vapor of a highly irritating nature. It is one of the most dangerous compounds known in chemistry, as it explodes with extreme violence when brought in contact with phosphorus, arsenic, potash, ammonia, caoutchouc, numerous oily matters, etc., at ordinary temperatures, and spontaneously when heated to above 200°. It has occasioned so many serious accidents that we shall omit all details regarding its mode of preparation. Its exact formula is unknown. Binoxide of nitrogen is an oily-looking detonating liquid, resembling the chlorde in appearance and properties. Iodide of nitrogen occurs as a black powder, which when dry explodes upon the slightest touch, and often without assignable cause.

Nitrogen enters into combination with various metals, as mercury, copper, titanium, molybdenum, and vanadium, forming a class of compounds to which the term nitrides is applied. Their most marked characteristic is that, like the preceding set of compounds, they are highly explosive, resolving themselves when struck, or at a high temperature, into their constituent elements.

**Nitro-glycerine** \( \text{C}_4\text{H}_8\text{N}_3\text{O}_1\text{s} \), or \( \text{C}_6\text{H}_8\text{(NO}_2\text){}_3\text{O}_3 \), known also as glomin or glomin oil, is a compound which is produced by the action of a mixture of strong nitric and ac-
Nitro-glycerine.

phoric acids on glycerine at low temperatures. Two methods of preparing it are given in Watts's Dictionary of Chemistry, vol. ii., pp. 890, 891, to which we must refer the reader who seeks for details on this subject. According to whatever method it is prepared, it is obtained as a light yellow oily liquid, of specific gravity varying from 1.235 to 1.6, inodorous, but having a sweet, pungent, aromatic taste; a single drop, however, if placed on the back of the tongue, produces headache and pain in the back, which last for many hours. It is only slightly soluble in water, but dissolves readily in ether, alcohol, and methylated spirits. This substance was discovered in 1847 by Sobrero, then a student in the laboratory of Pelouze in Paris, and afterwards professor in Turin. But though its discoverer ascertained its remarkable properties as an explosive, it remained simply an object of scientific interest till 1864, when it began to be manufactured on a large scale for blasting purposes by Nobel, a Swede resident in Hamburg. If ignited in the open air, nitro-glycerine burns rapidly and with a brisk flame, without any explosion; if poured out in a thin sheet, it ignites with difficulty, and burns incompletely. But it explodes at once if it is exposed to a moderately strong blow or concussion, to the concussion due to the explosion of gunpowder, to contact with red-hot iron, and especially to the action of detonating mixtures and fulminates; it likewise explodes on exposure to a high temperature (see below); the explosion, however, it is produced, being in all cases excessively rapid, and unaccompanied by smoke. It is this explosive power that renders this compound a useful agent in blasting. According to Dr. Kundolf Wagner, the distinguished Bavarian technologist, it may be cooled down to 4° without becoming solid; but this statement probably refers to the chemically pure compound; for, indeed, the compound of commerce, which was patented by the first maker, under the name of Nobel's Patent Blasting Oil, becomes solid if exposed for a considerable time to a temperature of 46°, crystallizing in long needles, which are most dangerous to handle, since they explode, even on being gently broken, with appalling violence. At 320°, nitro-glycerine begins (according to Dr. Adriani) to decompose, giving off red vapors; and if the heat be suddenly applied, or slightly raised above this point, the substance explodes with great violence; while, according to other observers, it is liable to explode at 240°, or a little higher; and if exposed for a length of time to half that temperature, explosion may take place at 180° or less. It is obvious from the formula for nitro-glycerine that it may be assumed to consist of glycerine, C₃H₅O₃, in which three atoms of oxygen are replaced by three of peroxide of nitrogen, NO₂. The products of the complete combustion of 100 parts of pure nitro-glycerine are—water, 20 parts; carbonic acid, 93; oxygen, 3.5; and nitrogen, 18.5; and hence it has been calculated that one volume (say, a cubic inch) of this compound, at a specific gravity of 1.6, yields, on combustion or explosion:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Volume (say cubic inches)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aqueous vapor</td>
<td>534</td>
</tr>
<tr>
<td>Carbonic acid</td>
<td>469</td>
</tr>
<tr>
<td>Oxygen</td>
<td>39</td>
</tr>
<tr>
<td>Nitrogen</td>
<td>236</td>
</tr>
</tbody>
</table>

According to Nobel, these gases expand, on explosion, to 8 times their bulk; in which case, one cubic measure (say, one cubic inch) of nitro-glycerine will yield 10,384 cubic measures (say, cubic inches) of gases; while one cubic measure of gunpowder will only yield 800 cubic measures of gases. Hence, it follows that, for equal bulk, nitro-glycerine is 15 times as strong as gunpowder, while for equal weights it is 8 times as strong.

The danger of using this compound in mining, etc., is greatly increased by its instability. Even when pure, it is liable, at a heat of 70° or less, to undergo slow, spontaneous decomposition into glycerine, oxalic and hydrocyanic acids, ammonia, etc., with a continuous escape of gaseous products, which, exerting pressure on the liquid, renders it so prone to explosion that a slight concussion is attended with danger; and the impure commercial compound decomposes far more rapidly than the pure nitro-glycerine; indeed, impure nitro-glycerine may, from this cause, be regarded as "dangerously self-explosive even while standing quietly" (Adriani, op. cit.).

Many of our readers doubtless recollect the history of a terrific explosion that took place on board the ship European, when lying in harbor at Colon, Panama, on April 3, 1866. Amongst the cargo put on board at Liverpool were 70 cases of nitro-glycerine, and one case containing 70,000 percussion caps. At 7 A.M., on the 3d, a most tremendous explosion occurred in the after part of the ship. It was described as most rapid, without smoke, but with a great flame, and the ship was immediately after seen to be on fire. The whole of the deck and cabin aft were carried away, and the ship was also much damaged, the plates above the water line being blown away, and the parts below it being much injured. For fear of further explosion, the ship was towed into the bay, where she shortly sank. Nor was the injury confined to the European; the jetty was nearly blown away, and a vessel lying on the other side of it was much damaged. Houses in the town were also partially destroyed, the floors in many cases being torn up; and altogether about 50 lives were lost. When the bodies were recovered, they presented no sign of smoke nor any symptoms of scalding; and hence it was inferred that the explosion could not have been produced either by the percussion caps or by
steam. On these and other grounds, the conclusion was irresistible that the explosion was due to the nitro-glycerine. An action was (Aug. 1867) brought at Liverpool by the owners of the European against the shippers of the nitro-glycerine, on the ground that no due notice of the dangerous properties of that compound had been given; and at this trial, several of the important points regarding the explosive properties of nitro-glycerine, which we have noticed, were elicited from prof. Abel, chemist to the laboratory at Woolwich; col. Boxer, superintendent of the Woolwich laboratory; and prof. Roscoe, who appeared as scientific witnesses. To give some definite idea of the explosive force of this substance, prof. Roscoe stated that one case of it would have sufficed for the destruction of the European. It is used to a considerable extent in the slate quarries in Wales, and in mining operations. A workman at one of these quarries described how he had been set to clean a wagon which had held some of it, which he did by scraping it with a piece of slate; and inadvertently throwing the piece of slate into the wagon when he had finished, the percussion exploded the remnants of the oil, and the wagon was blown to pieces. He states that it is regarded as ten times as powerful an explosive agent as gunpowder.

We learn from a number of the Nevada Gazette (quoted in the Chemical News, Aug. 16, 1867), that this substance was very advantageously employed in the blasting necessary for the construction of the summit tunnel on the Central Pacific railway. The operation is said to have been carried on 25 per cent faster than if powder had been used. The small holes required for the oil can probably be drilled in less than one-third the time required for the larger ones necessary in using powder. The oil does much more execution than powder, as it always breaks the rock from 2 to 16 in. beyond the hole, and also throws the pieces in a larger quantity. The oil was estimated as having, in hard rock, a strength five times greater than powder. It was made upon the spot, and was considered much stronger as well as safer than the imported compound. After having been used for several months, there had been no accident, nor had a single blast missed fire since the Chinamen commenced filling the cartridges. Col. Schaffner of the U. S. army published an official report on this compound, to which he gives the name of "nitroleum," which confirms the fact that its explosive properties are far greater than those of gunpowder. From a report on the same subject by capt. Grant, R.N., it appears that it is exploded by percussion, and apparently, under ordinary circumstances, by nothing else—neither by friction nor fire. Generally a trifling blow is sufficient to explode it. Its explosive force is about ten times that of gunpowder. It has all the appearance of common oil, and is usually carried in tin cases, each of which holds 25 lbs. Each can is packed in a wooden case for carriage. In a paper on this subject by M. Kopp, that chemist holds the view already noticed, that accidents are mainly due to the presence of impurities. He states that, by means of charges of 1500 or 2000 grams of oil, from 40 to 80 cubic meters of a hard rock may be detached.

We have already noticed Richter's observations on the slight inflammability of this compound; and as the employment of this explosive agent seems to be increasing, we shall give his other chief results, so as to bring up our knowledge to the latest possible date. The shaft in which the experiments were made was being sunk 30 ft. long by 8 ft. wide, in hard gray gneiss with occasional joints, which facilitated the working. From these experiments it appeared not only that its power was four or five times greater than that of the nitrate-of-soda gunpowder commonly used for mining purposes in Germany, but that other advantages accrued from its use, which may be summed up as follows. (1.) Fewer men are wanted for working out a certain-sized piece of ground, and fewer holes have to be bored than at present. (2.) Nitro-glycerine does not take fire easily (see above). (3.) The amount of smoke after a blast is small, as compared with that of gun- powder; and workmen can return at once to the spot when the blast has taken place. (4.) Holes that have missed, or only partly torn, can be retapped and shot off, which, with the present arrangements, is impossible, or very dangerous. Against these advantages must be set off the following disadvantages: (1.) The gases formed during the explosion of nitro-glycerine have an injurious effect on the organs of sight and respiration. (2.) Nitro-glycerine explodes on being struck smartly, and easily freezes. (3.) The masses of rock which it removes are mostly very large, and considerable time has to be spent in breaking them up.

In another set of experiments, the relative cost of blasting by nitro-glycerine and gunpowder was compared, and it was found that a cubic fathom of ground could be removed by the former for £4 6s. 4d.; the cost amounted to £5 9s. 9d., when the latter was used. In sinking a shaft in clay-slate by means of nitro-glycerine, the cost was under £2 per cubic fathom. For further details regarding these experiments the reader is referred to the Chemical News, Nov. 13, 1867, which contains a translation of Richter's valuable memoir.

Dynamite, called by the miners of Colorado and Nevada the "giant powder," has of late years superseded the nitro-glycerine which is its principal component. Induced by the calamitous and inexplicable accidents that so often attended the use of nitro-glycerine, and which it seemed impossible to guard against, Nobel sought, by soaking various inert substances with nitro-glycerine, to obtain some composition which should have the valuable powers of the explosive oil without its deadly risks. In 1867 he gave the name of dynamite to the successful outcome of his experiments. Dynamite, as generally
manufactured, consists of infusorial earth, porcelain earth, coal-dust, siliceous ashes or the like, saturated with about three times its weight of nitro-glycerine—though the proportion varies with different makers. According to its elements, it is to the eye a grayish-brown, reddish, or blackish powder, damp and greasy to the touch, and without smell. In the open air it burns quietly, and gives off fumes of carbonic acid and nitrogen with a watery vapor. If properly made, it ought not to be exploded by heat up to 212°, by a spark, or by any ordinary shock; though cases are said to have occurred where one of these causes singly has sufficed. In order to take advantage of its enormous blasting power, it is pretty tightly packed in paper or parchment cartridges, and exploded by means of a fulminating fuse or cap. It leaves a white ash, with little or no smoke. In the hands of careful workmen who know what they are about, its use is comparatively free of danger, and it may be easily transported. Over gunpowder it has the advantage that it is not injured by damp; it also saves labor, fewer and smaller holes sufficient in blasting operations. It costs about four times as much as gunpowder, but performs eight or ten times as much work. The violence and rapidity of its explosion renders dynamite unfit for use in fire-arms. It is reckoned that in 1875 at least 100,000 cwt.s of dynamite were manufactured in Europe.

Various other nitro-glycerine powders or compounds have been patented. Dualline is said to consist of wood gunpowder soaked with the oil; or of nitro-glycerine, fine saw-dust, and a little niter. The improved Ludofreudeur contains 52 parts of nitro-glycerine, 90 of silex, 12 of coal-dust, and 2 of sulphur. Colonia powder, fulminating, lignose, selastine, heracine, are all names for compositions in which nitro-glycerine is the chief ingredient, and are all more or less valuable as explosives.

Nitro-Muriatic Acid, is a mixture of nitric and hydrochloric acids. On account of having the power of dissolving gold, the king of metals, it was called aqua-regia. Hydrochloric acid does not possess the power of dissolving gold, or in other words the metal has not sufficient power to take the chlorine from the hydrogen. In the presence of nitric acid, however, the oxygen of which appears to have a decomposing influence upon the hydrochloric acid, the gold steps in, so to speak, and bears off the chlorine. Platinum also requires the action of aqua-regia to enable it to combine with chlorine. Chlorine in a nascent state (just liberated from combination) has more power to combine with gold or platinum than after it has been collected; its power is also increased by the polarized condition of the molecules of all the elements present. It is not only useful in chemistry, but has been employed in medicine with great benefit in certain cases of disease of the liver, administered internally, and also as a bath, diluted with large quantities of water.

Nitrous Acid. See Nitrogen, ante.

Nitrous Ether, or Nitrite or Oxide of Ethyl, is represented by the formula C₂H₅O₂N₂O₃, or AcO₂N₂O₃, the symbol being for ethyl (C₂H₅). It is a pale yellow fluid, having a specific gravity of 0.947, and evolving an agreeable odor of apples. On evaporation, it produces a great degree of cold, it boils at 63°, and it is very inflammable. It does not mix with water, but is readily miscible with alcohol. When kept in contact with water it soon decomposes, and an acid mixture of a very complicated character is produced by mixing equal parts of starch and 10 of nitric acid in a capacious retort, which must be gently heated. The vapor of nitrous acid which is evolved by the action of the starch on the nitric acid, is conducted into alcohol, mixed with half its weight of water, contained in a two-necked bottle, which is to be plunged into cold water. The second neck of this bottle is connected with a good cooling apparatus; and the vapor combining in its passage through the alcohol with the oxide of ethyl, forms nitrous ether, which distils in a continuous stream. This, which is known as Liebig's method, is the best process, but it is usually prepared by the direct action of nitric acid on alcohol, in which case the nitric acid is deoxidized by the hydrogen and carbon of the ethyl of part of the alcohol.

The spirit of nitrous ether, or sweet spirit of niter, used in medicine, is a mixture of nitrous ether with about four times its volume of rectified spirit. Its specific gravity should not exceed 0.85. It is used, in conjunction with other medicines, as a diuretic, especially in the dropsy which follows scarlatina; and it is employed, in combination with acetate of ammonia and tartarized antimony, in febrile affections. The dose in febrile cases is from half a dram to a couple of drams, and if we wish it to act as a diuretic, two or three drams should be given. It is a rather expensive medicine, and consequently is extremely liable to adulteration. In the new British pharmacopoeia it is recommended that this substance should be directly obtained by the distillation of nitrite of soda (five ounces), sulphuric acid (four fluid ounces), and rectified spirit (two pints)—a process open to many practical objections.

Nitrous Oxide, or Laughing Gas. See Nitrogen (protoxide) ante.

Nitschin, Karl Immanuel, one of the most distinguished theologians that modern Germany has produced, was b. Sept. 21, 1787, at Borna. He studied for the church at Wittenberg, where he took his degree in 1810, and where, in 1813, he became parish minister. Here his religious opinions underwent a great modification, through the influ-
ence of Schleiermacher and Daub, and he awoke to a clearer perception of the essence of religion. From this time forward Nitzsch is to be regarded as one of that new school of which Nozicola is the greatest representative—who endeavored to reconcile faith and science, not by forced and unnatural methods, but by pointing out their distinctive spheres, and by exhibiting in their own spiritual life that union of reason and reverence for which they argued in their writings. In 1822 Nitzsch was called to Bonn as ordinary professor of theology and university preacher, where he labored with great diligence for more than twenty years, not only in theology, but in all matters affecting the welfare of the Prussian church. In 1847 he succeeded Marheinecke at Berlin, and as professor, university preacher, and upper consistorial councilor, he exercised with prudence and moderation a wide ecclesiastical influence. In his political (perhaps also in his religious) views he may be classed with the late chevalier Bunsen. The high Lutheran party having denounced liberal politics as irreligious, Nitzsch and Bunsen and others have vindicated them on the ground of Christianity, not without success. In theology his position will be best understood when we say that he subordinated dogma to ethics, or rather that he subordinated ethics to dogma. To himself and to himself alone are those that result from an ethical apprehension of Christianity. Besides numerous smaller treatises on dogmatics, the history of dogmas and liturgies, three larger works call for special mention. These are his System der Christlichen Lehre (Bonn, 1829; 6th ed., 1851); his Praktische Theologie (Bonn, 1847-48); and his Predigten, or sermons, of which several collections have appeared, and which are remarkable for their extraordinary richness of thought. He died in 1868. Nitzsch, Gregor Wilhelm (born in 1790), brother of the preceding, acquired a high reputation as a philologist, and was professor of archeology at Leipsic till his death in 1891. He was considered one of the ablest opponents of Wolf’s Homeric theories. His chief work is Die Sagepoesie der Griechen (Brunswick, 1832).

Nivelles (Flem. Nyôò), a t. of Belgium, in the province of Brabant, 18 m. s. of Brussels. It has a fine church, called the church of St. Gertrude (built in the Romanesque style of architecture, 1048 A.D.), which claims to contain the relics of St. Gertrude, daughter of Pepin, Maire du Palais. They are deposited in a shrine placed over the high altar. Nivelles has manufactures of linen, cotton, lace, etc. Pop. in 1870 about 9,300.

Nivernais, formerly a province in the middle of France, nearly corresponding to the present department of Nièvre. It was divided into eight territorial districts, and its towns enjoyed municipal privileges at a very early period. The principal landowners were the counts, afterwards dukes, of Nevers, who held under their vassalage more than 1800 fiefs.

Nix, in the masculine, and níve in the feminine (Old High Ger. níbhus; Anglo-Saxon, níor; Dutch, nikker; Old Norse, níkr; Swed. nök, nök; Dan. nôk, nök—whence our name for the devil, Nick, not as some absurdly suppose, from Nikolaios Machiavelli), the common name for all water spirits in the Teutonic mythology. They are represented as of human form, or sometimes as passing into that of a fish or of a horse. They love music and dances, and possess the gift of prophecy, like the Greek muses, sirens, and other water-gods. The nix taught, in return for a good gift, the art of playing on a stringed instrument; and often in the evening sunshine the nixes, combing their long hair, were wont to mingle in the dances of mortals; but their company was dangerous, for though sometimes wearing a mild appearance, they were more frequently cruel and malignant. The water-kelpie of Scotland must be reckoned a member of the genus nix, but in him the evil element alone exists. He generally, if not always, assumed the form of a water-horse; frequented fords and ferry-places, especially during storms; allure travelers to mount him, and then dashed furiously with them into the stream which he had flooded by his devilish power, and submerged them in the roaring currents.

Nizam’s Dominions, an extensive territory in the interior of Southern India, lying to the n.w. of the presidency of Madras, in lat. 15° 10’ to 21° 42’ n., and long. 74° 40’ to 81° 32’ east. Length from s.w. to n.e. 480 m.; extreme breadth, 340 miles. Area, 90,000 sq.m., and population estimated at 9,000,000. The surface is a slightly-elevated table-land. The principal rivers are the Godavari (Godavery), with its tributaries the Tudhla, Manjera, and Pranhita; and the Kistna (Krishna), with its tributaries the Bimah and Tungabhadro. The soil is naturally very fertile, but poorly cultivated; yet, wherever it receives moderate attention, it yields harvests all the year round. The products are rice, wheat, maize, mustard, castor-oil, sugar-cane, cotton, indigo, fruits (including grapes and melons), and all kinds of kitchen vegetables. The pasturages are extensive, and sheep and horned cattle are numerous. Marsh and jungle, however, occupy a great space, and originate fevers, agues, diseases of the spine, etc., though the climate is quite healthy where these do not abound. The mean temperature of the capital, Hyderabad, in January is 74° 30’, and in May 95°. The inhabitants manufacture for home use woolen and cotton fabrics, and export silk, dressed hides, dye-stuffs, gums, and resins. Good military roads traverse the territory. The revenue of the nizam is reckoned at £1,550,000 yearly. The ruler is a Mohammedan, but his subjects are mostly Hindus.

In 1687 the territory, now known as the Nizam’s Dominions, became a province of the Mogul empire; but in 1719 the governor or viceroy of the Deccan, Azof Jah, made
himself independent, and took the title of nizam-ul-mulk (regulator of the state). After his death, in 1748, two claimants appeared for the throne, his son Nazir Jung, and his grandson Mirzapah Jung. The cause of the former was espoused by the East India company, and that of the latter by a body of French adventurers under gen. Duplex. Then followed a period of strife and anarchy. In 1761 nizam Ali obtained the supreme power, and after some vacillation signed a treaty of alliance with the English in 1768. He added them in the war with Tippoo, sultan of Mysore, and at the termination of that war, in 1799, a new treaty was formed, by which, in return for certain territorial concessions, the East India company bound itself to maintain a subsidiary force of 8,000 men for the defense of the nizam's dominions. The nizam remained faithful to the British during the mutiny of 1857-58. The territory is frequently called Hyderabad or Haidarabad. A British resident advises the nizam.

NIZIJNI-NOVGOROD. See NIZI-NNOVGOROD, ante.

NIZIJNI-TAGILSK. See NIZI-N-Tagilsk, ante.

NOAH, 3115-2065 B.C., a son of Lamech, remarkable in character, deeds, and history. He was just in his dealings with men, pious in his relations to God, and preserved his uprightness in the midst of abounding and dequant wickedness. The great things in his life are recorded only in outline, and as such are familiar to all readers of the Bible. 1. He was a preacher of righteousness. 2. He built the ark (see Ark). 3. He and his family were brought safely through the flood, in which all the rest of mankind were drowned. 4. After the flood he commenced anew the work of cultivating the ground and planted a vineyard, the wine from which led to the one sin recorded against him, producing dishonor to himself and occasioning transgression and punishment among his descendants.

NOAH, MORDECAI MANUEL, 1755-1851; b. Philadelphia; studied law, removed to Charleston, S. C., was appointed consul at Riga 1811, and at Morocco 1813. Returning to the United States in 1816, he edited the National Advocate, a New York democratic paper, till 1826, when he founded the New York Enquirer, afterwards merged in the Courier and Enquirer. He established the Evening Star in 1854, but soon withdrew from connection with the daily press, and became one of the founders of the weekly Sunday Times. He held at various times the offices of sheriff of New York co., surveyor of the port of New York, and judge of the court of sessions. He was a Jew, adhered to the Jewish religion, and attempted to found a Jewish colony on Grand Island in the Niagra river. He wrote a number of dramas and other works.

NOAILLES, LOUIS MARIE, Vicomte de, 1756-1804; of an illustrious French family, b. in Paris, and associated with Lafayette (their wives were sisters) in the aid given to the American colonies in their struggle for independence. In 1789, at the opening of the French states-general, he was a deputy among the nobles representing Nemours, and on Aug. 4 made the memorable proposition for the abolition of titles and feudal privileges of all kinds, the interdiction of liveries, and the abolition of slavery in the dominions of France. During the excesses of the Jacobins he came to the United States, but returned to France as soon as the persecution of the old nobility ceased, and a few years later was made brig. gen. in San Domingo, where he died from wounds received in the capture of an English ship of war near Havana by one of the most remarkable feats of naval vase and daring on record.

NOBLE OFFICUM, the term used in the law of Scotland to denote the high prerogative right of the court of session to exercise jurisdiction in certain cases—as, for example, to appoint a judicial factor to young children or to lunatics.

NOBILITY, that distinction of rank in civil society which raises a man above the condition of the mass of the people. Society has a tendency to inequality of condition, arising from the natural inequality, physical, moral, and intellectual, of those who compose it, aided by the diversity of external advantages, and of the principles and habits imbibed at an early age. This inequality is apt to increase; the son, inheriting the faculties of his father, is more favorably situated than his father was for making use of them; and hence, in almost every nation, in every the early stages of civilization, we find something like a hereditary nobility. Privileges originally acquired by wealth or political power are secured to the family of the possessor of them; and the privileged class come to constitute an order, admission into which requires the consent of society or of the order itself.

The ancient Romans were divided into nobles and ignobles, a distinction at first corresponding to that of patricians and plebeians. A new nobility afterwards sprung out of the plebeian order, and obtained (536 B.C.) the right to rise to high offices in the state; and in course of time the descendants of those who had filled curule magistracies inherited the jus imaginum, or right of having images of their ancestors—a privilege which, like the coat-of-arms in later ages, was considered the criterion of nobility. The man entitled to have his own image was a nobile homo, while the ignobilis could neither have his ancestor's image nor his own.

The origin of the feudal aristocracy of Europe is in part connected with the accidents which influenced the division of conquered lands among the leaders and warriors of the nations that overthrew the Roman empire. Those who had acquired a large share of
terrestrial possession, and their posterity to whom it was transmitted, were naturally looked on as the fittest persons to occupy the great offices of state and wield political power. The Frankish kingdom in Gaul was divided into governments, each under the authority of a chieftain called a count or comes—a designation derived from the comes of the Roman empire—whose Teutonic equivalent was graef. A higher dignity and more extensive jurisdiction was conferred on the edel or duke, a term also of Roman origin, and implying the duty of leading the armies of the country. In the Lombard kingdom of Italy, the same term was applied to the great officers who were intrusted with the military and civil administration of cities and their surrounding provinces. The marqueses were guardians of the frontier marches. In the subinfeudations of the greater nobility originated a secondary sort of nobility, under the name of vaavassours, castellans, and lesser barons; and a third order below them comprised vassals, whose tenure, by the military obligation known in England as knight’s service, admitted them within the ranks of the aristocracy. In France the allegiance of the lesser nobles to their intermediary lord long continued a reality; in England, on the other hand, William the conqueror obliged not only his barons who held in fief of the crown, but their vassals also, to take an oath of fealty to himself; and his successors altogether abolished subinfeudation.

The military tenant who held but a portion of a knight’s fee participated in all the privileges of nobility, and an impassable barrier existed between his order and the common people. Over continental Europe in general, the nobles, greater and lesser, were in use, after the 10th c., to assume a territorial name from their castles or the principal town or village on their demesne; hence the prefix “de,” or its German equivalent “von,” still considered over a great part of the continent as the criterion, of nobility or gentility. Britain was, to a great extent, an exception to this rule, many of the most distinguished family names of the aristocracy not having a territorial origin. See Name.

Under the feeble successors of Charlemagne, the dukes, marqueses, and counts of the empire encroached more and more on the royal authority; and in course of time many of them openly asserted an independence and sovereignty with little more than a nominal reservation of superiority to the king. By the end of the 9th c. the Carlovingian empire had been parceled into separate and independent principalities, under the domination of powerful nobles, against whom, in Germany, the crown never recovered the full ascendancy. In France, however, the territory gradually parceled under the Capetian race, the great fiefs of the higher nobility being one by one absorbed by the crown. In England, where the subjection of the feudal aristocracy to the crown always was, and continued to be a reality, the resistance of the nobles to the royal encroachments was the means of rearing the great fabric of constitutional liberty. All those who, after the conquest, held in capite from William belonged to the nobility. Such of them as held by barony (the highest form of tenure) are enumerated in Domesday. Their dignity was territorial, not personal, having no existence apart from baronial possession. The Comes was a baron of superior dignity and greater estates; and these were in England the only names of dignity till the time of Henry III. The rest of the landholders, who held by tenures other than barony, also belonged to the nobility or gentry.

After the introduction of heraldry, and its reduction to a system, the possession of a coat of arms was a recognized distinction between the nobility and the plebeian. In the words of Sir James Lawrence (Nobility of the British Gentry): “Any individual who distinguishes himself may be enabled to enoble himself. A prince judging an individual worthy of notice gave him patent letters of nobility. In these letters were blazoned the arms that were to distinguish his shield. By this shield he was to be known or nobilitus. A plebeian had no blazonry on his shield, because he was ignobilis, or unworthy of notice. Hence arms are the criterion of nobility. Every nobleman must have a shield of arms. Whoever has a shield of arms is a nobleman. In every country of Europe, without exception, a grant of arms, or letters of nobility, is conferred on all the descendants.” On the continent the term noble is still generally used in this sense; in England it is now more common to restrict the words noble and nobility to the five ranks of the peerage constituting the greater nobility, and to the head of the family, to whom alone the title belongs. Gentility, in its more strict sense, corresponds to the nobility of Sir J. Lawrence and of continental countries. This difference of usage is a frequent source of misunderstanding. Sir Walter Scott, in his Ivanhoe, after Sir Henry Cotton courts the united member of an English family of ancient and distinguished blood and lineage has sometimes been postponed to a recently-created baron or “herz von,” who has received that title, and the gentility accompanying it, along with his commission in the army. It has been taken for granted that the latter belongs to the “adel” or nobility, and not the former.

The original higher nobility of Germany consisted of the dynasty nobles, i.e., the electoral and princely houses of the realm, with those counts and barons who had a seat in the diet or estates of the realm. These last have, since 1815, all been elevated to higher titles; most of the counts, in recompense for their acquiescence in the abolition of the German empire, receiving the diploma of prince, a title to which our dukes, marqueses, and earls have also an undoubted right. The lower German nobility, corresponding to our gentry, were the merely titular counts and barons (i.e., those who had no seat in the diet), the edel-herren and banner-herren (something like our banneters) the knights of the holy Roman empire, the “edlen von” (who now take the style of
Nobility.

baron), and the common nobles distinguished only by the prefix "von." Throughout
the middle ages the lesser nobility of Britain preserved a position above that of most
continental countries, being, unlike the corresponding class in Germany, allowed to
intermarry with the high nobility, and even with the blood-royal of their country.

The higher nobility, or nobility in the exclusive sense of England, consist of the five
temporal ranks of the peerage—duke, marquis, earl, viscount, and baron—in the restricted
signification of the word), who are members of the upper house of parliament.
Formerly all the barons or tenants-in-chief of the sovereign were bound to attend his coun-
cils; but after the reign of Edward I. only a select number of them were summoned,
the rest appearing by representatives. The former were considered the greater, the latter
the lesser nobility. In the latter half of the fourteenth century the barons ceased to
sit in parliament till a much later period; and after the minor barons attended only by
representatives from their body, these representatives sat in the same house with the
greater nobility, and, up to the union, their votes were recorded as those of the "small
baronies." By the act of union between England and Scotland the Scotch peers elect
16 of their number to represent their body in the house of lords in each parliament.
The peers of Ireland, in virtue of the Irish act of union, elect 28 of their number to sit
in the house of lords for life. The act of union with Scotland has been understood to
debar the sovereign from creating any new Scotch peerages; all peers created in either
England or Scotland between that date and the union with Ireland are peers of Great
Britain; and peers created in any of the three kingdoms subsequently to the union with
Ireland are peers of the United Kingdom, with this exception that one new peerage of
Ireland may be created on the extinction of three existing peerages. When the Irish
peerage was reduced to 60 at the union, all exceptions to the peerage system were eliminated.
All peers of Great Britain or of the United Kingdom have a seat in the house of lords.
A Scotch peer, though not one of the 16 representative peers, is debarred from sitting in
the house of commons, a disability which does not attach to Irish peers. The peerage
is, from time to time, recruited by new additions, the persons selected being in general
peers of Scotland or Ireland; younger members of the families of peers; persons distin-
guished for naval, military, political, or diplomatic services; eminent lawyers promoted
to high judicial appointments; persons of large property and ancient family, noble in
the more extended sense; and occasionally, but rarely, persons who have by commerce
acquired large fortunes and social importance. At present the peerage comprehends
about 555 individuals—the number of peerage titles being much greater, as several titles
often merge in one person. Five royal dukes are included in this enumeration, as also
87 peers of Scotland and 183 of Ireland. Only 35 of the present Scotch and 89 Irish
peers are without seats in the house of lords, in consequence of there being, besides the
representative peers, 40 peers of Scotland and 80 of Ireland who are at the same time
peers either of England, Great Britain, or of the United Kingdom. The privileges
belonging to peers as members of parliament will be explained under PARLIAMENT; as
peers, they also possess the following immunities: They can only be tried by their peers
for felony, treason, or misprision of treason when the whole members of the peerage
are summoned, and the accused is acquitted or condemned by the voice of the majority,
given not on oath, but "on honor." This privilege, which extends to peeresses, either
in their own right or by marriage, is in Scotland further regulated by act 6 Geo. IV. c.
66. A peer answers to bills in chancery upon his honor, and not on oath; but when
examined as a witness in civil or criminal cases, or in parliament, he must be sworn.
He cannot be bound over to keep the peace elsewhere than in the court of queen's bench
or of chancery. Scandal against a peer is "secundum magnatum," a more heinous
offense than slander against another person, and subjects the offender, by various Eng-
lish acts, to statutory punishments. All the privileges belonging to the English peers,
except the right of sitting in the house of lords, were extended to the peers of Scotland
by the treaty of union. A peer who has different titles in the peerage takes in ordinary
parlance his highest title, one of the inferior titles being given by courtesy to his eldest
son. Certain courtesy titles (q.v.) belong also to the daughters and younger sons of a
peer, but do not extend to their children.

In France a limited body of the higher nobility, styled the peers, were, in the enjoy-
ment of privileges not possessed by the rgs. The title of duke was subject to strict rule,
but many titles of marquis and count, believed to be pure assumptions, were recognized
by the courtesy of society. The head of a noble family often assumed at his own hand
the title of marquis; and if an estate was purchased which had belonged to a titled
family, the purchaser was in the habit of transferring to himself the honors possessed by
his predecessor—a practice to which Louis XV. put a stop. Immediately before the
revolution 80,000 families claimed nobility, many of them of obscure station, and less
than 2,000 of ancient lineage. Nobles and clergy together possessed two-thirds of the
land. Practically the estimation in which a member of the French nobility was held
depended not so much on the degree of his title as on its antiquity, and the distinction
of those who had borne it. The higher titles of nobility were not borne by all members
of a family; each son assumed a title from one of the family estates—a custom produc-
tive of no small confusion. Unlike "roturier" lands, which divided among all the chil-
dren equally, noble fiefs went to the eldest son. The revolution overthrew all distinc-
tion of ranks. On June 18, 1790, the national assembly decreed that hereditary nobility
was an institution incompatible with a free state, and that titles, arms, and livery should be abolished. Two years later the records of the nobility were burned. A new nobility was created by the emperor Napoleon I. in 1808, with titles descending to the eldest son. The old nobility was again revived at the restoration. All marquises and viscounts are of pre-revolution titles, none having been created in later times.

Commercial pursuits have more or less in different countries been considered incompatible with nobility. In England this was less the case than in France and Germany, where for long a gentleman could not engage in any trade without losing his rank. A sort of commercial "Bürger-Adel," or half gentleman class, was constituted out of the patrician families of some of the great German cities, particularly Augsburg, Nuremberg, and Frankfort, on whom the emperors bestowed coats-of-arms. In semi-feudal Italy there was on the whole less antagonism between nobility and trade than north of the Alps. The aristocracy of Venice had its origin in commerce; and though untilled, they were among the most distinguished class of nobles in Europe. On the other hand, in Florence, in the 14th c., under a constitution purely mercantile, nobility became a disqualification from holding any office of the state. In order to the enjoyment of civil right, the nobleman had to strike off the rolls of nobility. An unpopular plebeian was sometimes ennobled, in order to disfranchise him. A little later there grew up, side by side with the old nobility, a race of plebeian nobles—as the Ricci, the Medici—whose pretensions were originally derived from wealth, and who eventually came to be regarded as aristocrats by the democratic party.

Italian nobility has this peculiarity, that it does not, for the most part, flow from the sovereign, but from the municipal authorities of the towns acting in entire independence of him. The municipalities can confer nobility on whom they please, by inscribing his name in their respective Libri d'oro. The registers of nobility of most of the Tuscan towns are deposited in the Archivio della Nobilita, or herald's office, at Florence—an institution created by the first sovereign of the house of Lorraine. The municipalities have, however, no power to confer titles, though at one time several persons, a few Englishmen included, on the strength of their names being in the Libro d'oro of Fiesole, assumed the titles of marquis, count, and marquis, and an abuse put to a stop in the late grand duke of Tuscany. Ascertti, Romanos, Ruffi, there is a small number of noble families of Capitoline extraction, Orsini—who hold their fiefs as sovereign princes; the rest of the nobility, many of them of very ancient lineage, are municipal, the power of creation being vested in the senator, himself a nominee of the pontiff, and the Conserverati, chosen by lot from the Capitoline nobles. In last century so many undistinguished persons had been added to the roll of nobility, that pope Benedict XIV, found it necessary to prohibit by a bull the admission of any one whose ancestors had not filled certain high offices in the state. The same decree limited the number of noble families to 187, designed the Patriziato Romano, out of whom 60 of the oldest and most illustrious were chosen as Nobili Conservati, otherwise called the capitoline nobles, and restricted the admission to the patrizio for the future to persons who had rendered important services to the city, and whose names were approved by the Congregazione araldica, an exception being made in favor of members of the reigning pontiff's family. As the families of the conscritti became extinct, other palatine families, called nobili senza titoli, were added to the list of conscritti. The number of nobles, who have added to their names the title of nobili, was reported to be 130. The titles at present borne by the Roman nobility are: 1. Prince or duke, generally so called, but officially designated "barone Romano"—a title acquired by the Borghesi, Rospigliosi, and others from popes of their respective families; in the case of the Colonna, Doria, Odscalchi, etc., from royal or imperial erection; and in other instances—as the Caetani and Massimi—from investiture by the pope as a temporal sovereign.

2. Marquis and count; many of these are provincial nobles, with titles generally derived from small feudal tenures, of which, in some instances, it would be difficult to show the diploma, or point out the period of creation. In some parts of the Papal States it is understood that every head of a noble house is a marquis; and in the march of Ancona, Sextus V. conferred the right to bear the title of count on all who were of noble blood at the period.

3. Knights (cavallier), a designation given to all who wear a Roman order, to knights of Malta, and generally to younger sons of the titled nobility. 4. Princes, who may be the purchase of an office of an ancient corporation that carried with them ducal or princely titles, most of them nobili romani, as the Torlonias. Titles do not descend to the younger members of the family; it is the general usage for the head of the house to bear the most ancient title, while the eldest son, on his marriage, assumes the second in point of antiquity. The title is sometimes the family name, sometimes the name of a feudal possession. The proper designation of the younger branches of titled families is "dei principi," "dei duchi," "dei marchesi," etc.

The nobility of Spain boasts of a special antiquity and purity of blood, a descent from warriors and conquerors alone, without the infusion of any of the elements derived from the church, law, and commerce that are to be found in other countries. "Hidalgo" (hijo d'alga, son of somebody, not filius nullius) is a term which implies gentility or nobility. The hidalgo alone has in strictness a right to the title "don," which, like "sr," requires the adjunct of the Christian name. When the Christian name is omitted, the title is prefixed with the addition of "do."

"Don" has latterly been used by persons who have no proper claim to it about as extensively as "esquire" in England. Hidalguia, till recently, conferred important privileges
and immunities. The higher nobility are styled grandees; formerly the title was "ricohombre," and the ceremonial of creation consisted in granting the right of assuming the penon y caldron (penón y calderón)—the one the rallying ensign of command, the other of the other of the vanities of followers. In contradistinction from the grandees, the class of nobility below them are called "los Titulados de Castilla." Red blood is said to flow in the veins of the hidalgo, blue in that of the grandee. Formerly there were three classes of grandees, whose mark of distinction was this—that a grandee of the first class was entitled to put on his hat in the royal presence before the king spoke to him; the second, after the king spoke to him; the third, after the king had spoken and he had replied. The second and third classes are now absorbed into the first. Of the grandees, some bear the title of duke, some of marquis, some of count; but it is the ambition of every grandee to unite in himself as many grandeeships, or have as many hats, as the phrase is, as he can. This is effected by the marriage of heiresses through whom grandeesunts descend, and whose names and titles are assumed by their husbands. An enormous number of titles is sometimes found in the person of one grandee. Titles as well as estates go only to heirs of entail. The titulars of Castille are designated "vuestra señoría," in common parlance, "ucla." The title of baron is little used in Spain. Physically and mentally, the grandees have degenerated from their ancestors, and they have not the influence at court and in the country which landed property ought to give them. Most of them reside at Madrid, clinging to their nominal rank and real nullity, while they are practically excluded from all the functions of state.

In Russia what nobility existed before Peter the Great was of a patriarchal not a feudal kind; but in his anxiety to assimilate everything to a western standard, the czar took the existing aristocracies of states quite differently situated as the model to which to approximate the fortune of his own subjects. The Russian nobles have ever since been enlarging their privileges by encroachments on those under them. Before Moscow was burned, the mass of the nobles connected with the court lived there in great splendor, and along with their domestic servs constituted half the population of the city. In the Revolution of 1700 nothing was untouched but their privileges, has often been reckoned a matter of much moment. In Spain most of all this purity of lineage has been jealously guarded. In the German empire no succession was allowed to fees holding immediately of the emperor, unless both parents belonged to the higher nobility. In France the offspring of a gentleman by a plebeian mother was noble in a question of inheritance or exemption from tribute, but could not be received into any order of chivalry. Letters of nobility were sometimes granted to restate persons in this position. It is in Germany still important for many purposes to possess eight or sixteen quarterings, i.e., to be able to show purity of blood for four or five generations, the father and mother, the two grandmothers, the four great-grandmothers; and also, in case of the sixteen quarterings, the eight great-great-grandmothers, having all been entitled to coat-armor. Among the higher grades of the peerage in England, a considerable number may be pointed out who do not possess this complete nobility. It is in Scotland more usual and more regarded, both among peers and untitled gentry, where the eight or sixteen quarterings are still in use to be displayed on the funeral escutcheon. At some of the minor German courts, the sixteen quarterings were not frequently an illusion, diplomas being granted in the absence of a full pedigree, to declare the parties as noble as if they had had sixteen ancestors.

NOBLE, a co. in ne. Indiana, intersected by the Lake Shore and Michigan Southern railroad, the Grand Rapids and Indiana, and the Chicago division of the Baltimore and Ohio railroad, with junctions at Kendallville and Avilla; 430 sq. m.; pop. '90, 25,007—21,496 of American birth, 47 colored. It is draining by Elkhart river and Blue creek. Its surface is largely prairie, with groves of building timber and sugar maple trees. Its soil is fertile and produces live stock, grain, dairy products, fruit, and maple sugar. Its most important industries are the manufacture of carriages, furniture, iron castings, leather, cigar, and harnesses. It has flour and saw mills, woolen factories, foundries, and machine shops. Co. seat, Albion.

NOBLE, a co. in se. Ohio, intersected by the Marietta, Pittsburg and Cleveland railroad, drained by Seneca and other small creeks; 400 sq. m.; pop. '90, 21,137—20,592 of American birth, 94 colored. Its surface is well timbered, and undulating; its mineral products are coal, limestone used for building purposes, petroleum, iron ore, and salt. Its soil is fertile. Live stock is raised; also tobacco, wool, grain, dairy products, and sorghum. It has flour and saw mills, and its most important industries are the manufacture of saddlery and harness, sashes, doors and blinds, and woolen goods. Co. seat, Caldwell.

NOBLE, Louis Legrand, b. in Otsego co., N. Y., 1811; educated in the Episcopal theological seminary of New York; rector in North Carolina till 1844; and afterward at Catskill on the Hudson. He was literary executor of Thomas Cole, the landscape painter, and published a memoir of that artist, New York, 1853. In 1854 he was called to Chicago, in 1858 to Jersey City; in 1860 he went to Washington and the painter Church to the opposite regions; and published After Icebergs with a Painter in 1861. In 1874 he was made professor of the English language and literature at St. Stephen's college at Amandale on the
Hudson. A collection of his poems has been published under the title of The Hours and other Poems, 1857.

NOBLES, a co. in s.w. Minnesota, has the state line of Iowa for its s. boundary; 720 sq. m.; pop. 80, 4,435—3,384 of American birth. It is intersected by the Sioux City and St. Paul railroad. It is drained by the head-waters of the Des Moines, Rock, and Little Sioux rivers, and several lakes, Lake Graham and Okabena lake being the largest. Its surface is rolling, poorly timbered, and has a soil adapted to the cultivation of grain. It embraces some of the highest land in the state, being in its s. portion 1607 ft. above the level of the sea. Some attendance is paid to the raising of stock. Co. seat, Worthington.

NOBUNA/GA, 1532—82; b. Japan; a member of the Ota family, and son of a great landed proprietor. A civil war was raging in Japan at the beginning of his career, and he at first adhered to the shogun, but afterwards fought against and deposed him. He governed Japan, as vice-gerent of the mikado, till 1582, when he was attacked by one of his generals in his own residence, and committed suicide. He was bitterly hostile to Buddhism, and favored the Portuguese Jesuit missionaries, who came to Japan for the first time in his reign. Nobunaga was really hostile to the Jesuits also; but he used them to reduce the power of the bonzes. The Japanese Buddhist sects were then rich and powerful; they hired armies, and continually interfered in politics. In 1571 Nobunaga destroyed the great Buddhist monastery of Hiyoezan, where he burned several hundred temples, and killed all the bonzes and their adherents and families. Soon afterwards the fortified monastery of Ozaka surrendered to him. This persecution broke the power of Japanese Buddhism.

NOCERA, or NOCERA DEI PAGANI, a t. of s. Italy, in the province of Salerno, 8 m. n.w. of the town of Salerno, and on the highway from that town to Naples. It carries on linen and woolen manufactures. Pop. 8,519.

NOCTIES AMBROSIANAE, the fanciful name of a long series of critical, political, and poetical disquisitions in dialogue published in Blackwood's Magazine, and purporting to be the verbatim report of the meetings at Ambrose's tavern, Edinburgh, and elsewhere, of several of the literary celebrities of the day. They were almost entirely the work of "Christopher North," John Wilson (q.v.). The only foundation for the thread of connection and assumption of different personalities is that the first of the papers was written by Lockhart, after some such meeting at Ambrose's as is described. This was in 1832, and in 1835 Wilson began to publish the Noctes in regular succession. Of the seventy printed up to 1836, at least sixty are by his pen. For the part supposed to be taken by Hogg, the Etrick Shepherd, there was no foundation in fact. The work is described by lord Cockburn as "a most singular and delightful outpouring of criticism, politics, and descriptions of feeling, character, and scenery. ... It breathes the very essence of the bacchanalian revel of clever men." The papers are not, however, free from the charge of coarseness, are very personal, bitterly and abusively tory, and have, of course, lost much of their interest from their local and ephemeral nature.

NOCTILIONIDAE, a family of insectivorous bats, inhabiting tropical regions of both hemispheres. Their habits are not well known. The members of the genus noctulae of South America are commonly known as "bull-dog bats" on account of their short thick muzzles, which in some species are cleft like the lip of a hare. The membrane connects the hind legs, and the claws of the hind feet are large and strong. The length of the body is 4 or 5 in., and the spread of the wings about 18 inches. An Indian genus, dysocus, has a spread of wing of two feet, and the hinder thumb is placed at a distance from the rest of the toes, similar to the arrangement in the quadrumanus. In this genus the tail is short and the membrane connecting the hind legs is very small. The choeropera are variously classified. M. Lessen placed the noctiliones as a sub-family of vespertilionidae, under the name noctilioninae, consisting of ten genera—noctilo, dysopen, collossus (q.v.), chiroptes, noctinomus, dimorphus, stenoferus, cebano, alto, and scotopterus. The frugivorous (fruit-eating) bats were also placed as a sub-family of vespertilionidae (see Bar) by M. Lessen and others; but they are now usually classed apart, the order choeropera being divided into two sections, insectivora and frugivora, the insectivora comprising four families: vespertilionidae, rhinolophidae, noctilionidae, and phyllostomidae (see Phyllostoma in art. Vampire; also Specter Bat, ante). The frugivora embrace only one family, the pteropidae (q.v.), or the fox bats, including several genera. In the classification of Linnaeus the vespertilionidae were equivalent to our choeropera.

NOCTILUCINE, an organic substance supposed to be the cause of many of the phenomena of phosphorescence in fish, insects, and decaying matter. The name was given by Dr. Phipson, after a long series of investigations. Some of his earlier observations are mentioned in this work. See Luminosity of Organic Beings, ante. Noctilucine has a syrupy consistence at ordinary temperatures, and a whitish color. It is said to be secreted in a pure form by the luminous centipede. Its spectrum is nearly monochromatic. Its luminosity appears to be owing to oxidation, and it is more luminous in ozone or allotrope than in normal oxygen. When moist it gives off carbonic acid as the result of oxidation. It is slightly soluble in water, but insoluble in alcohol and ether.
**Noctule.** *Vespertilio noctula,* the largest British species of bat (q.v.), being nearly three inches long without the tail, which is fully an inch and a half. The ears are oval-
triangular, shorter than the head: the muzzle is short and blunt. The noctule is only seen on the wing during a short part of the year, retiring early in autumn to hollow
trees, caves, or under the eaves of buildings, where many are sometimes found together.

**Nocturn (Lat. *nocturnum,* recited "by night").** Under the head Breviary (q.v.) has been explained the general order of the services of the canonical hours in the Roman Catholic church. The service of Matins on Sundays and festivals is divided into three
nocturns, each of which consists of three (or more) psalms and three lessons. The lessons are either from the Scriptures, from the life of a saint, or from a homily of some father.
The name is derived from the recitation of the service "by night."

**Nodaway, a co. in n.w. Missouri, has the state line of Iowa for its n. boundary; intersected by the Nodaway river, forming its s.w. boundary; 900 sq. m.; pop. 80, 29,560—27,936 of American birth, 113 colored. It is drained by the One Hundred and Two and Little Platte rivers, and traversed centrally by the Kansas City, St. Joseph's, and Council Bluffs railroad. Its surface is uneven, having a good supply of timber, and
lumber is one of its chief commodities. Its soil is fertile, and its inhabitants are principally engaged in farming and the raising of live stock. Its productions include Indian corn, wheat, oats, wool, pork, honey, and sorghum. Its leading industries are the manufacture of saddlery and harness, metallic ware, and bricks, and it has saw and grist
mills. Co. seat, Maryville.

**Nodal Points, Lines, and Sections.** When a string or metallic cord, under strong
tension, is made to vibrate, we hear, besides the principal sound, several secondary and
shriller sounds: these are denominated harmonic sounds, and are produced each by a
certain portion of the cord which vibrates independently. Further investigation has shown that every vibrating string is divided into a number of portions alternately vibrat-
ing in opposite directions, and that the points which separate these portions from each
other are known as nodal points, and their situation may be found by placing small pieces of paper on an extended string, and causing it to vibrate; the points from which the pieces of paper have not been displaced are the nodal points. If
a plate of glass or metal be held in the hand, and a well-resined fiddle-bow be drawn
across the edge, particles of fine dust, previously placed on the plate, will arrange them-
selves in lines, showing that along these lines no vibration has taken place: these lines are
nodal lines, and are found in most cases to group themselves together into geometrical
figures, and occasionally to present the most beautiful designs. The arrangement of the
nodal lines depends on the point by which the plate is held, and on the form of the plate
itself. Similarly, if a column of air in a wholly or partially closed tube be acted upon by the
force of the breath applied through a hole at any point in its length, the column will
divide itself into cylindrical portions each in a state of vibration, and separated from one
another by transverse sectional portions in which the air is at rest; these latter sections are
known as nodal sections.

**Noddy, Megaloperna or Anous, a genus of birds of the family laridae, differing from
terms in having the bill slightly angular, thus exhibiting an approach to gulls, and the
bill not forked but somewhat wedge-shaped. Only one species is known (M. or A. stoli-
dius), a bird widely diffused both in the northern and southern hemispheres, and familiar
to sailors, not only as often seen skinning over the water in quest of fishes, but also as
not unfrequent alighting on vessels, and particularly during the night, and being at
least sometimes to be taken by the hand. At its breeding-places also, where not accustomed to the
visits of man, it scarcely gets out of the way, and the female sits undisturbed on the nest.
Hence it commonly shares with the booby the reputation of unusual stupidity. It is
about 15 or 16 in. long, from the tip of the bill to the end of the tail, the general
color being a brownish-black. The noddy is a rare visitant of the British shores,
but is very abundant in warmer latitudes; and on some of the keys of the West Indies,
and other islets of different parts of the world, it breeds in immense numbers. Partic-
ular islets seem to be specially selected as the breeding-places of noddies; and there their
nests are sometimes so closely placed that it is not easy to walk among them. Each nest
generally contains three eggs about two inches long, which are very good to eat, and are
in some places collected in great numbers.

**Nodes, in astronomy, are the two points in which the orbit of a planet intersects the
plane of the ecliptic, the one through which the planet passes from the s. to the n. side of
the ecliptic being called the ascending node (§), and the other the descending node (§). As all
the bodies of the solar system, whether planets or comets, move in orbits variously
inclined to the ecliptic, the orbit of each possesses two nodes, and a line drawn joining
these two points is called the line of nodes of each body. It is scarcely necessary to add
that, as the earth moves in the plane of the ecliptic, she has no nodes. The places of the
nodes are not fixed points on the plane of the ecliptic, but are in a constant state of
fluctuation, sometimes advancing (eastward), and at other times receding (moving west-
ward). This motion is produced by the mutual attractions of the planets, which tend to
draw each of them out of the plane of its orbit; and it depends upon the relative posi-
tions of the planets with respect to another planet whether that planet's nodes shall
advance or recede. On the whole, however, the majority of possible \* relative positions,\* or configurations, as they are called, is in favor of a retrograde motion; and we find by observation that, in an average of many revolutions round the sun, a constant retrogradation of the nodes takes place. The determination of this retrogradation in the case of the planets is a most complicated problem, as the separate action of each on the others has to be taken into account; but in the case of the moon's nodes, the immensely preponderating attraction of the earth, and its great relative magnitude as compared with the moon, enable us to throw out of account any other disturbing influence, and at the same time to exhibit clearly the cause of this motion of the nodes. Suppose the moon to have attained her greatest n. latitude, and to be descending towards the ecliptic, and the earth to be in longitude between her and her previous descending node, then the earth's attraction will tend to depress the moon's orbit, and cause her to descend to the plane of the ecliptic sooner than she would otherwise have done; in this case we have a retrogradation of the node. Again, supposing the moon placed as before, but the earth in advance of the line of nodes, then the earth's attraction will tend to draw the moon forward in her orbit so as to meet the ecliptic in a point beyond the previous descending node; in this case, the moon's node has advanced. As in the case of the planets, however, the retrograding tendency preponderates. The average annual retrogradation of the nodes is very small in the case of the planets, but considerable in that of the moon. See Moon. In calculating the courses of the planets, the \* length \* of the ascending node, or its distance in longitude from the vernal equinox, is a most important element. See Orbit.

NODES, in botany. See STEM.

NODES are swellings, most commonly of an oblong form, which occur on superficial bones, such as the tibia, ulna, clavicle, and frontal bone, and are due to a syphilitic taint, to scrofula, or to rheumatism. Their immediate cause is the infiltration of lymph or serum into the periostea, and between it and the bone. The treatment depends so essentially on the constitution of the patient, and the primary cause of the swelling, that it would be inexpedient to enter into any detail regarding it.

NOJIER, CHARLES E., an eminent French litterature, was b. at Besançon, April 29, 1783; other authorities give 1780 and 1781. His father was a distinguished lawyer, who warmly embraced the side of the revolution, and brought up his son in the same principles. At the age of 12 he was a member of the famous society of Amis de la Constitution, and hated tyranny with a most ideal and classical hatred: but he soon afterward became a royalist; then again, under Napoleon, a republican; and indeed during his whole career showed a want of that robust opinionativeness without which it is impossible for a man to become a genuine politician. He died—after a life of the hardest literary work, in which time, and even admirable talents, were wasted on inferior subjects—Jan. 27, 1844. Besides editions of the French classics, grammatical, lexicographical, and poetical works, he wrote numerous tales and memoirs. A portion of his writings was collected and published in 12 vols. at Paris, 1833-34, under the incorrect title of Œuvres Complètes.

NOÉ, AMADÉE DE. See CHAM.

NOEL, BAPTIST WRIGHTESLEY, The Honorable, 1759-1873; b. England; educated at Cambridge, and ordained in the church of England. He was appointed chaplain to the queen, and as pastor of St. John's chapel, London, became one of the most popular preachers in England. In 1848, having become a believer in immersion, he left the English church and was baptized, and became a Baptist minister. He defended his course in his Essay on the Union of Church and State, and in his treatise on Christian Baptism. Among his numerous works may be mentioned: Sermons on the First Five Centuries of the Church, 1839; Protestant Thoughts in Rhyme, 1845; Christianity Compared with Unitarianism, 1851; Essay on the Duty of Englishmen to the Hindus, 1858; and Freedom and Slavery in the United States of America, 1863.

NOÉ TIAN, See PATRIPASSIAN.

NOGENT LE ROTROU, a t. of France, in the department of Eure-et-Loir, is situated in a pretty vale on the Huisne, 32 m. w.s.w. of Chartres. It is a station on the Great Western railway from Paris to Rennes in Brittany. Pop. '72, 6,884. Nogent le Rotrou is a long, well-built town, with a ruined castle in the Gothic style, the residence of the great Sully.

NÖGGING. Brickwork built in the panels of a timber-framed house. Noggings-pieces are horizontal timbers, introduced to strengthen the brickwork.

NÖGRÁD, a co. in n.w. Hungary, touching the Danube on the s.w., and drained by the Eipel, which empties into the Danube, and the Zygyva, a tributary of the Theiss; 1885 sq.m.; pop. 70, 198,369, partly German. It is mountainous in the n. and, excepting a few fertile valleys, generally barren. Lumber, sheep-raising, and the manufacturing of wooden goods are the principal interests. Capital, Balassá-Gyarmath.

NOILS, a technical term employed for the short and broken hairs which are removed from wool in the process of combing and preparing it for worsted manufactures. The noils are used for making inferior yarn, and are valuable for felting purposes, in which they are largely employed.
NOISE. See DEADING OF NOISE.

NOLA, an episcopal city of s. Italy, in the province of Caserta, 16 m. n.e. of Naples, is built on the site of one of the oldest cities of Campania. The ancient Nola was founded by the Ausonians, and fell into the hands of the Romans in the Samnite war, 313 B.C. For its protection, Marcellus in the second Punic war fought in its vicinity the first battles in which the Romans were victorious over Hannibal. Augustus died at Nola, 14 A.D. The first bells for Christian churches are said to have been cast here in the 5th century. See Bell. Numerous coins, and beautiful vases made of a pale-yellow clay, with figures painted in crimson and maroon, and supposed to have been manufactured here by potters from Corinth, have been found in the vicinity. Nola was a flourishing city in the middle ages, and has (1871) a pop. of 9,128; or with suburbs, 10,771.

NÖLDEKE, Theodor, 1836-75: b. Germany; educated at Göttingen, where he manifested a taste for oriental studies, in which he soon became proficient. He was appointed professor in the university of Kiel in 1864, and remained there till 1872, when he was called to a chair at Strasburg. His studies were directed mainly to the Hebrew and Syriac languages, and to Arabian literature, and the history of Islamism. Among his works may be mentioned a History of the Koran, 1860; Life of Mohammed, 1863; Contributions to a Knowledge of Ancient Arabian Poetry, 1864; The Literature of the Old Testament, 1868; Critical Researches on the Old Testament, 1869; and The Inscription of King Mose of Moab, 1870.

NOLI ME TANGERE, a popular name for one form of the disease which has been already described under the term lupus (q.v.).

NOLLE PROSEQUI, a term used in English law to denote that the plaintiff does not intend to go further with the action, or part of the action, in which case he enters or files a memorandum, called a nolle prosequi, after which the action or part of the action is at an end on that point, and the defendant is entitled to his costs thereon.

NOLLE PROSEQUI, an entry upon the records of a court by the plaintiff in a civil, or the prosecutor in a criminal cause, declaring that the proceedings against the defendant shall be discontinued. In a criminal case a nolle prosequi may be entered at any time before a jury is impanelled without the defendant's consent, but not afterwards without his consent. A nolle prosequi is not equivalent to an acquittal, but acts merely as a stay of proceedings, and the defendant is liable at any time to be re-indicted. It may be entered as to one of several defendants, and is often done so to allow his testimony to be introduced against the others. It is generally in the discretion of the prosecuting officer to enter a nolle prosequi, but in some states leave must be obtained from the court.

NOLLEKENS, Joseph, was b. in London in 1737. His father, who was from Antwerp, and by profession a painter, died when he was young, and his mother, a Frenchwoman, not remaining long a widow, he received but little education. Being placed in the studio of Scheemakers, the sculptor, in Vine street, Piccadilly, he worked hard and made such progress that in 1759 the society of arts awarded him fifteen guineas for a group in clay; in 1760 thirty guineas for a bas-relief; and during the same year, ten guineas for a model in clay of a dancing faun. Soon after this Nollekens set out for Rome. He was then in his 33d year, his purse was light, he had no patron to support him; but he was independent in spirit, and had been trained to habits of economy. A bas-relief he carved in stone brought him ten guineas from England, and the society of arts voted him fifty guineas for his group in marble of Timoeclae before Alexander. But one of the most important events for him, after settling in Rome, was his meeting Garrick in the Vatican, who immediately recognized his countryman as the young sculptor to whom the prizes had been awarded by the society of arts, sat to him for his bust, and paid him handsomely for it. This was the first bust he had been commissioned to model, and it gave him the opportunity of proving where his strength lay. He also executed in Rome a bust of Sterne in terra cotta, which added greatly to his reputation. After residing 10 years in Rome he returned to London, took a lease of extensive premises in Mortimer street, where he set up his studio, and the reputation he had acquired in Rome was such that he immediately had full employment, and within a year (1771) was elected an associate of the academy, and a royal academican the following year. His forte was in modelling busts. Into these he infused much truth and character, and he has handed down the likenesses of most of the important personages who figured in this country in the end of the last and at the commencement of this century—of Samuel Johnson, who was his friend and frequent visitor—of Fox, Pitt, and other political characters. George III. also sat to him; and his manner, which exhibited pretty strongly what is popularly set down as blunt and manly English character, made him a great favorite with the king. Besides busts, Nollekens executed numerous commissions for public monuments and statues. He was selected by the academy, with whom the choice lay, to execute the government commission of a monument to the three captains, Manners, Bayne, and Blair, who fell in Rodney's great battle of April 13, 1782; but in this he did not rise above the allegations of Neptune and his sea-horse, and Britannia and her lion. His statue of Pitt for Cambridge was much praised at the time. He also executed, either in the course of his studies, or to meet the views of those connossseurs.
who advocate high art, a considerable number of classical and mythological statues and groups, a fauna, a Bacchus, five Venuses, Cupid and Psyche, Petus and Arria, etc. He died in London, April 23, 1823. His wife, to whom he had been long married, and who had brought him some fortune, died a few years before him. He had no children, and his great wealth, upwards of £200,000, was left to certain friends, burdened with some legacies and annuities to his old assistants and servants.—See Cunningham's Lives of British Artists, etc.

**Nomads** (Gr. νυεωιν, to tend or feed), the name given (originally by the Greeks) to those tribes which, depending chiefly on their flocks and herds, have no fixed habitation, but move about for convenience of pasture. The nomad tribes are of a higher grade of civilization than those that live by hunting and fishing, but much inferior to those engaged in agriculture and manufactures. They are very generally addicted to robbery, and readily engage in aggressive war, so that they have frequently become conquerors of extensive cultivated countries, as in the instances of the Huns, Arabs, and Tartars. There are now few nomads in Europe, and these only in the steppes near the Black sea, and the regions of the utmost north, where cultivation is impossible. Almost all the Finnish, Mongolian, and Turkish tribes, and the tribes formed by mixture of these races, in the steppes and deserts of central and northern Asia are nomads, also the Kurds and the Bedouins; many of the tribes of Africa, and the Genchos and some of the other Indian tribes in North and South America.

**Nombré de Dios,** a t. of Mexico, 35 m. s.e. from Durango, in a mountainous district. Near it are rich silver mines. Pop. 7,000.

**Nombril Point,** in heraldry. See Escutcheon.

**Nome,** a term used in the ancient Greek music to denote any melody determined by inviolable rules.

**Nomeclature,** Chemical. See Chemistry, ante.

**Nominalism.** This word refers to a celebrated controversy of the middle ages, respecting the nature of our general or abstract ideas. It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called realism. Those that held the opposite view were called Nominalists, because they maintained that there is nothing general but names; the name 'circle' is applied to everything that is round, and is a general name; but no independent fact or property exists corresponding to the name. There is general idea of a forms; they say, but a declaration of resemblance among a number of things; all things that the name is applied to, resemble one another in some point, which point of resemblance the mind can consider apart from the points of difference; this act of isolated consideration being what is called the power of abstraction.

We can be engaged in thinking of the smell of a rose, we can compare it with other sweet odors, and speculate as to the nature of the material that gives the odor, or as to the pleasure that we derive from it; all this is a process of abstract thinking; but it would not of itself suffice to prove that the odor has a separate existence. We might also confine our attention to the mere form, or outline of the rose, and compare it with other forms; but we should be still less able to affirm the independent existence of this particular form.

Realism must be traced back to Plato's system of ideas, or the eternal and independent existence of general attributes, from which the concrete embodiments were derived. There existed in the Divine Mind, according to Plato, patterns, models, or archetypes, according to which individuals were formed. The archetype circle was the original of all actual round things. Aristotle denied the separate existence of these general forms, and held that they existed only in connection with matter, or with objects in the concrete. The Stoics repudiated universals in both senses. The Aristotelian view constituted the scholastic realism, and prevailed until the 11th c., when a re-action took place in favor of the Stoical doctrine, headed by Roscelin of Compiègne and John the sophist. This was the commencement of Nominalism. The celebrated Abelard was a disciple of Roscelin, and induced large numbers to depart from the realistic notions, which were identified at the time with religious orthodoxy. The controversy raged with great violence through the 12th century. Thomas Aquinas and Duns Scotus, in the following century gave their powerful adhesion to realism. In the 14th c. William Occam, an English Franciscan friar, and a pupil of Scotus, revived the advocacy of Nominalism, which was once more maintained by a number of eminent men, in spite of the hostility of the church, which carried the length of persecution. The controversy subsided at the reformation.

A middle view between Nominalism and Realism was held by a few persons when the contest was at its height; which was, that although general properties have no separate existence in nature, they can be conceived in the mind apart from any concreta embodiment. Thus we may form an idea of a circle, irrespective of any individual round body. This view is specious, and is tacitly implied in many opinions that have never ceased to be held. See Generalization.

**Nominate.** See Declension.

**Non-appearance,** the term used in the law of England to denote that a party against whom an action or suit has been commenced has not entered an appearance.
which is the way by which he comes before the court to defend is right. In many cases, if he does not appear, the suit will go on in his absence, provided he was duly served with the writ of summons or bill.

**NON ASSUMPSIT** is in English law the usual plea or defense to an action for breach of a contract not by deed, and means that the defendant denies that he broke the contract, or that there was any contract.

**NON COMMISSIONED OFFICERS**, in the British army, constitute a numerous and very important class in the regimental system between the commissioned officers and the men. As the former are not permitted to mix with the private soldiers, lest familiarity should diminish the sway of absolute discipline, it is necessary to have an intermediate class to overlook the men in their barracks and at all times when off the parade. None are so suited for this duty as the best conducted of the men themselves, who are provided by selected step to denote the serum ranks, and hold many privileges and powers unattainable by the privates. The non-commissioned officers comprise the sergeants-major, all the sergeants, the trumpeters, drummers, and buglers, and, in the life guards, and royal horse guards only, the corporals. They can be reduced to the ranks by sentence of a court-martial, or by their colonel-commandant; but not by a lieut.col. nor by any junior officer. Non-commissioned officers are entitled to quarters for their wives, or lodging-money in lieu of quarters. Accustomed themselves to obey, the non-commissioned officers are admirable assistants in preserving discipline; veterans, to whom military life is a second nature, they are looked up to by their comrades as examples, to lead in battle or to teach in drill. The non-commissioned officers have a mess (q.v.) to themselves. In a battalion of infantry at home, there were, in 1874, 58 non-commissioned officers to 520 rank and file; in India, 66 to 820: but the rank and file may be greatly augmented without affecting the number of non-commissioned officers. In the whole British army (European) for the year 1874-75, there were 20,940 non-commissioned officers in rank and file. This rank is a necessity in all armies; in France, the non-commissioned officers are termed sous-officers; in Germany, unter-offizieren.

**NON COMPOS MENTIS**. See INSANITY, BEFORE THE LAW.

**NONCONFORMISTS**, a name sometimes given generally to all sectaries who, at any period in English history since the establishment of Protestantism, have refused to conform to the doctrine and practices of the Episcopal church. It is, however, more frequently used by restricted sense to denote the 2,000 clergymen who in 1662—two years after the restoration—left the church of England rather than submit to the conditions of the act of uniformity, which required of every beneficed minister, every fellow of a college, and even every schoolmaster, unfeigned assent to all and everything contained in the book of common prayer. The ejected ministers swelled the ranks of the Presbyterians and Independents, the latter of whom are sometimes called Nonconformists.

**NONE** (Lat. *nona*, "ninth "), one of the lesser canonical hours (q.v.), so called from its recitation being primitively fixed at the ninth hour.

**NON-EFFECTIVE** (Fr. *non-activité*), is the term applied to the portion of the personnel of the army or navy not on active service or in immediate readiness for active service. It thus comprises all officers on retired or half-pay, pensioners, and supernumerary officers. In force liable to frequent augmentations and reductions, the non-effective charge must be considerable, and a large retirement is necessary, in order to rapid promotion. The great French war, also, with the reductions following it, bequeathed to the British an annual non-effective charge of several millions, which is not yet wholly expunged. In 1878-79, the non-effective charges were £2,314,912 for the army, and £1,887,571 for the navy, being upwards of 16 per cent on the gross cost of the two services.

**NON ENTRY**, in the law of Scotland, means that state of a feudal estate when the last vassal has died, and his successor has not been invested or seized of the land. On such an occasion, the superior is entitled to call it a casualty of non-entry, which consists of the rent of the feu.

**NONEs**. See CALENDARS.

**NON EST INVENTUS**, a technical term used in that part of the law where, after judgment, the sheriff endeavors to arrest a party. If after a reasonable search he cannot find the debtor, he makes a return to the court that he has not been able to find the debtor, which is shortly called a return of *non est inventus*, and his duty is then discharged until a fresh writ is issued to him.

**NONFEASANCE**, in certain parts of the law of England, means the not doing what one is bound to do.

**NONJOINER**, in English law, is the omitting to join all the parties to the action or suit.

**NONJURORS**, the name given to that portion of the Episcopal clergy of England who at the coronation of William and Mary refused to take the oath of allegiance to these sovereigns, believing that they had unlawfully possessed themselves of the throne abdicated by James II. They were great champions of the doctrine of passive obedience on the part of subjects towards kings; and as the triumph of the prince of Orange was obtained at the expense of that doctrine, it was impossible that they could, consistently
with their antecedents, acknowledge him as their rightful king. The house of commons allowed them six months longer than laymen to make up their minds, but declined to adopt the amendment of the lords, viz., that the oath should not be imposed on the clergy. They refused, and were consequently deprived of their sees and benefices. The non-jurors comprised Archbishop Sanacroft, 8 bishops, and about 400 of the inferior clergy.

NON-RÉSIDENCE, the name given in church law to the offense of a person holding a spiritual benefice, who absents himself, without legal justification, from the local precincts within which the duties attached to the benefice are prescribed to be performed. The obligation of residence follows clearly from every principle of law; and, from the constant tendency to relaxation on the part of the clergy, has been an unfailing subject of legislation, ecclesiastical and civil, from the very earliest times. The council of Nice in 325, of Antioch in 332, and of Carthage in 401; the constitutions of the popes from the earliest genuine document of that class, the novels of Justinian, the capitularies of Charlemagne— all speak the same language, and enforce it by the same penalties. During the medieval period, and especially during the unhappy contest of the western schism, great abuses prevailed. The whole substance of the legislation of the Roman church on the subject, however, is compressed in the decrees of the council of Trent, which are mainly contained in the decrees of the XXII. and following sessions, "On Reformation." The decrees of the council regard all church dignitaries, and others charged with the care of souls. Without entering into the details, it will suffice to say that for all the penalty of absence without just cause, and due permission, consists in the forfeiture of revenues, in a proportion partly varying with the nature of the benefice, partly adjusted according to the duration of the absence. For each class, moreover, a certain time is fixed, beyond which, during twelve months, absence cannot be permitted. The duty is imposed on persons named in the law of reporting to the ecclesiastical superiors cases of prolonged absence. The same legislation has been confirmed by most of the recent concordats, and is enforced by the civil law of each country. In England the penalties for non-residence are regulated by 1 and 2 Vict. c. 106. Under this act an incumbent absenting himself without the bishop's license for a period exceeding three, and not exceeding six months, forfeits one-third of the annual income; if the absence exceed six, and does not exceed eight months, one-half is forfeited; and if it be of the whole year, three-fourths of the income are forfeited. The persons excused from the obligation of residence by the canon law are sick persons, persons engaged in teaching the theological sciences in approved places of study, and canons in immediate attendance upon the bishop ("canonici a latere"), who ought not to exceed two in number. By the act 1 and 2 Vict. c. 106, heads of colleges at Oxford and Cambridge, the wardens of Durham university, and the head-masters of Eton, Westminster, and Winchester schools are generally exempted, and temporary exemptions from residence are recognized in other cases, which it would be tedious to detail. In the Roman Catholic church, besides the general legislation, most of the provincial and diocesan statutes contain special provisions on the subject of non-residence.

NONSUIT is a legal term in England, which means that where a plaintiff in a jury trial finds he will lose his case, owing to some defect or accident, he is allowed to nonsuit, instead of allowing a verdict and judgment to go for the defendant. The consequence is that the plaintiff has to pay the defendant's costs: but he can bring a fresh action if he can get over the difficulty that rendered a nonsuit necessary or expedient.

NONSUIT (ante), may be voluntary, as where the plaintiff purposely absents himself in order to abandon his cause and allow a judgment for costs to be entered against him; or involuntary, when, on being called on the trial of the case, plaintiff fails to appear. A nonsuit is no bar to another action for the same cause. In many of the states, and in the U. S. courts, nonsuit cannot be given against a plaintiff who has already given evidence to support his claim, or against his consent, but in others, like New York, where there has been a final submission of the cause, and the evidence is not sufficient to uphold the action, nonsuit may be ordered; while in Alabama the courts cannot enter a nonsuit unless specially authorized to do so by statute. If a nonsuit be rendered on insufficient ground, plaintiff may move to have it set aside.

NOOR-ED-DEEN' MAHMOOD. See NOUREDDIN MAHMUD, ante.

NOSSA. See MULUCAS.

NOOTKA DOG, a large kind of dog, common in a domesticated state among the natives of the vicinity of Nootka sound. It has erect, pointed ears. It is chiefly remarkable for the extreme abundance of its long woolly hair, which, when shorn off, holds together as a fleece, and is spun and woven into garments. The introduction of this wool-bearing dog into other countries has been suggested, but not yet attempted.

NOOTKAS, or Ahnts, a family of Indian tribes, in a province of the Dominion of Canada, on Vancouver island: they gave the name to Nootka sound, on the w. side of the island. They occupy a portion of the main-land near the island. The Ahnts proper live on the w. side of the island, and number 5,500. Those called Nootka by capt. Cook are now said to be the Moouchahls. There are also the Quakewth, subdivided into many tribes, on the w. and e. sides of the island, and on the main-land, which amount
to as many more, ana on the e. side of the island the Cowichans number 7,000. The
god of the Ahts proper, and the one whom they worship as their progenitor, is Quawte-
ahl; they also worship the sun and moon, and a bird, Totooch, which they believe to be
endowed with supernatural powers. The laws governing the tribe are strict and pecul-
lar, especially in regard to consanguinity. A brave cannot marry in his own clan, and
the children are claimed by the mother’s clan. One member of a clan cannot invite a
member of the same clan to a feast; this rule applying to the male sex only, the squalows
not being considered in society. They live in houses, the posts of which are set perma-
nently in the stations habitually visited. The posts are set in a row for a distance of
about 100 ft. In this line a hollow, 20 ft. from the ground, are two other rows attached
by string-pieces. These are covered with cedar slabs and mats, adjusted at will. Their
canoes are convenient dug-outs, capable of transporting houses and household
goods. Their chief occupation is fishing—catching salmon, herring, halibut, and
occasionally whales. They travel for long distances to go on the hunt in the season, and
add to their store by collecting shell-fish, camash roots, and sea-weed. They are ingen-
ious in the manufacture of clothing, making capes of white pine bark, hats of cedar and
pine bark, and blankets of cypress bark. They make their own dishes and dippers, of
wood, and are accomplished in the art of carving. They wear masks on the war-path,
which they carve out of wood, and they ornament their door-posts. They place their
dead in boxes and hang them up in the trees or lay them on the ground, and cover them
with mounds of sticks and stones. They have a bad reputation among the whites, who
have greatly increased since the discovery of gold on the main-land. Their allies, the
Cowichans, are partially civilized, doing their own farming and working for the whites;
missionaries have been encouraged to visit them, and have made a study of
their language. A vocabulary of the Aht language is contained in Sprout’s Scenes and
Studies of Savage Life.

NOOTKA SOUND, an inlet on the w. coast of Vancouver island, British North
America, in lat. 49° 53’ n., long. 126° 35’ west. Its entrance is protected by an island
of the same name, and the sound can be entered on both sides of the island. It extends
in a north-westerly direction; but the greatest breadth of water is not more than
500 yards. Numerous small coves and inlets are found around the rocky shores.
It affords good anchorage.

NORD, the most northerly department in France (whence its name), corresponding
with the former province of French Flanders, and bordering on Belgium and the Strait
of Dover. Area 2,185 sq. m.; pop. ’76, 1,519,385. It is composed of two parts, or at
least two, near the middle at Armentieres, on the Lys, almost to a line. It is
watered by the Scheldt and the Sambe, with their affluents, and by numerous canals.
Next to that of the Seine, it is the most densely peopled department in France. The
soil is fertile, well cultivated, and yields more abundant harvests than any other part
of the country: 888,606 acres are arable. The principal products are wheat, hemp, beet-
root, vegetables, tobacco, and fruits. Manufactures of lace, cambric, linens, and beet-
root sugar are extensively carried on. It has a much larger proportion of railways, roads,
and canals than any of the other departments, as well as the most important coal and
iron mines. No other department has so many populous towns and strong fortresses;
none adds so much to the national revenue; in none are the people so intelligent, so sus-
ceptible of culture, or so industrious. In respect of its educational and benevolent
institutions, as well as of its learned societies, it ranks next to the department of
the Seine. The arrondissements are Lille, Douai, Cambrai, Valenciennes, Avesnes, Haze-
brontck, and Dunkerque. The chief town is Lille.

NOR DEN, a t. of Prussia, in the province of Hanover. 72 m. n.w. from Oldenburg,
and a few miles from the North sea, with which it is connected by a canal. Pop. ’75,
6,130.

NORDENSKJÖLD, Adolf Eric, b. Finland, 1832; educated at Borgo and Hel-
singsfor, and was appointed director of the faculty of mathematics and physics at the
latter university, but removed for political reasons in 1855. In 1858 he became state
mineralogist at Stockholm. He went with Torell in the Arctic expeditions of 1859 and
1861, and himself led expeditions in 1864, 1868, 1873, and 1875. The expedition of
1868 resulted in accurately fixing the position of Spitzbergen. In 1870 he made a
scientific exploration of Greenland. His most important expedition was undertaken in
1878, for the purpose of exploring the n. polar sea from the mouth of the Yenisei e. to
Bering Strait. He left Gothenburg in July, 1878, and reached Yokohama in Sept.,
1879. Nordenskjöld believes that his last voyage has demonstrated that communica-
tion by sea for commercial purposes may easily be had between Europe and the Obi-
Yenisei; that the voyage from the Atlantic to the Pacific, in the Siberian sea, is practi-
cable, but useless to commerce, and that further exploration is necessary to determine
whether sea communication between the Pacific and the mouth of the Lena can be
established.

NORDERNEY, a small island of the Prussian province of Hanover, lies 3 m. off the
coast of East Friesland, and forms one of a string of islands that line that coast.
Area about 4 sq. m.; permanent pop. 1770. It has enjoyed, since 1797, a great reputation as
a place for sea-bathing, and in the summer season has from 1600 to 2000 visitors. The little village at the w. end of the island has a very tastefully built conversations-haus, 130 ft. long. Trees do not grow here.

NORDHAUSEN, a flourishing t. of Prussian Saxony, pleasantly situated at the southern base of the Harz mountains, on the Zorge, 38 m. n.n.w. of Erfurt. The surrounding country is very fertile in corn, and in the vicinity commences the Goldene Aue (golden plain), a fertile valley watered by the Harz. Its beautiful gymnasium, numerous churches, one of which, St. Blasius, contains two pictures by Luke Cranach. It carries on a thriving general trade, is the depot from which the Harz mountains are supplied with necessaries, and has most extensive distilleries and considerable manufactures of tobacco, sucrery, chemicals, cloth, leather, etc. Its spirit distilleries, of which there are 60 in almost constant operation, produce annually for export upwards of 100,000 hogsheads of corn-brandy. Pop. ’75, 23,676.

NORDHEIMER, ISAAC, PH.D., 1809-42; b. Memel-dorf, Germany, of Jewish parents. Having acquired the rudiments of education at a Jewish school, he entered the gymnasium of Würzburg, to fit himself, by the study of the classics, theology, and philosophy, for a Jewish public teacher. After studying two years at the gymnasium, he was transferred to the university, from which, in 1832, he went to the university of Munich, taking his degree of doctor of philosophy in 1834. Two American students who took private lessons of him in 1832 having informed him that there were favorable openings in America, he left his home in 1833, and soon after his arrival in New York was appointed professor of Arabic and other oriental languages and acting professor of Hebrew in the university of New York. Soon afterwards he was appointed instructor in the Union theological seminary; he was one of the most eminent Hebrew scholars of modern times. He was intimate with Dr. Addison Alexander, Dr. Robinson, and prof. Stuart. On his way to this country he began a Hebrew grammar on a historical basis. In 1838 he published the first volume, and in 1841 the second, Prof. Alexander reviewing it, says, “This new work requires no painful effort of memory to keep its parts in order; the perusal in it of the most thorny part of Hebrew grammar opens a vista superior in clearness, extent, and beauty to that exhibited by any other writer. Nothing but the fear of being thought to deal in sweeping panegyrict prevents our speaking in the highest terms.” Horne styles it “the most elaborate and philosophical Hebrew grammar in the English language.” Besides this he published A Grammatical Analysis of Select Portions of Scripture, or a Chrestomathy; The Philosophy of Ecclesiastes, being an Introduction to the Book of Ecclesiastes, in the Biblical Repository. He contributed other valuable articles to the Biblical Repository. He left also the following works in manuscript: A Chaldee and Syriac Grammar, in German; Arabic Grammar, in German; A Larger Arabic Grammar, in English; A Translation and Exposition of the Book of Ecclesiastes, in German; Hebrew Concordance, incomplete; Philological Memoranda; etc. Dr. Nordheimer continued through life in the Jewish faith.

NORDHOFF, CHARLES; b. Prussia, 1830; came with his parents to the United States in 1853, attended school at Cincinnati, and was apprenticed to a printer at the age of 13. He shipped in the U. S. navy in 1844, and during his service of three years made a voyage around the world. He stayed at sea till 1858, finding employment in the merchant service, whaling, and lumbering, and entered the fishery service. He was then engaged in Philadelphia, and afterward in Indianapolis in a newspaper office. From 1857 to 1861 he was employed by Harper & Brothers in an editorial capacity, and from 1861 to 1871 he was on the staff of the New York Evening Post. He visited California in 1871, and on a second trip in 1872 visited the Hawaiian islands. Since then he has been the Washington correspondent of the New York Herald, which position he still holds. Among the books he has written are Man-of-War Life; The Merchant Vessel; Whaling and Fishing (1856); Stories of the Island World; Cape Cod and All Along Shore (1868); California for Health, Pleasure, and Residence; Northern California, Oregon, and the Sandwich Islands (1874); Politics for Young Americans (1875); and The Communist Societies of the United States. His books have been well received in America; some of them have been reprinted in England, and translations of them have been published in Germany.

NORDKÖPING. See NOERDKÖPING, ante.

NORDLINGEN, a t. in the w. of Bavaria, is situated on the river Eger, 44 m. n.n.w. of Augsburg by the Munich and Nuremberg railway. It has a Gothic church, with a high tower and fine organ, and manufactures of Tyrolese carpets, linens, and woollens, besides a large trade in feathers. Pop. ’75, 7,224. Nordlingen is historically interesting as the scene of several battles, the most famous of which was fought, Sept. 6, 1634, between 24,000 Swedes, under count Horn and duke Bernhard of Saxe-Weimar, and 45,000 imperialists under king Ferdinand. The former were defeated with the loss of 12,000 killed and wounded, 300 banners and standards, 80 cannons, and several thousand prisoners, among whom was Horn himself.

NORE, a sand-bank in the estuary of the river Thames, 4 m. n.e. of Sheerness, on which there is a floating light, called the Nore light, in lat. 51° 29' n., long. 0° 48' west.
The name, however, is more commonly applied to the portion of the estuary in the vicinity of the Nore light and sand-bank.

NORFOLK. a co. in e. Massachusetts, bounded on the n.e. by Massachusetts bay; drained by the Charles and Neponset rivers; on the Old Colony, the Boston and Providence, and the Boston, Hartford, and Erie railroads; 300 sq. m.; pop. '80, 96,462—76,316 of American birth. The surface is diversified and hilly, and much of it heavily wooded with ash, elm, hickory, oak, and other timber trees. The soil is rocky, but fertile, in many portions, producing Indian corn, oats, potatoes, etc. The Quincy quarries afford excellent granite. A large capital is invested in manufactures, and among the largest finished goods are boots, shoes, leather, woolen, and straw goods, forged and rolled iron, carriages, harness, and metal wares. Co. seat, Dedham.

NORFOLK, n.e. Virginia, adjoining North Carolina, bounded on the n. and n.e. by Hampton roads and Chesapeake bay; drained by Elizabeth and North rivers and Deep creek; on the Atlantic, Mississippi and Ohio, and Seaboard and Roanoke railroads, and the Dismal Swamp canal; 450 sq. m.; pop. '80, 58,651—57,047 of American birth, 29,423 colored. The surface is level, and heavily wooded with cypress and other trees. A large part of the Dismal swamp lies within this county. The soil is sandy, and the principal productions are Indian corn, potatoes, and sweet potatoes. There are flour and saw mills, and manufactories of machinery, carriages, cars, and metal wares. Co. seat, Norfolk.

NORFOLK, a co. in s. Ontario, Canada; bounded on the s. by lake Erie; drained by tributaries of that lake; situated on the Canada Southern railroad; 633 sq. m.; pop. '70, 30,760, chiefly English, with a considerable admixture of Germans, Scotch, and Irish. The surface is mostly even, and the soil fertile. Co. seat, Simcoe.

NORFOLK, a large and important maritime co. of England, bounded on the n. and n.e. by the North sea, and on the s. by the county of Suffolk. Area 1,356,173 acres; pop. '71, 458,511. Its coast-line, extending from Yarmouth, on the e., to the mouth of the Nen in the Wash, is about 100 m. in length. From Yarmouth to Happpisburgh the coast is low and sandy; from Happisburgh to Weyburne it is skirted by low cliffs; and w. of Weybourne to the entrance to the Wash, where the banks are in great part dry at low water, and where a considerable extent of land has been reclaimed from the sea (see Wash), it is low, and covered with sand or shingle. The surface of the county is level, or nearly so, none of the rising grounds being considered worthy of being called hills. The principal rivers are the Ouse, the Yare, with its affluents the Wensum and the Waveney, and the Bure. Communication is kept up by the navigable rivers, and by the Great Eastern railway. The climate is affected in spring particularly by cold n.e. winds, but the air is in general dry and healthy. The soil consists chiefly of light sands and loams, and comprises a great extent of land, which though naturally not fertile, has been made so by judicious management. The agriculture of the county is in an advanced condition, and all the usual crops are extensively grown; while that of barley is especially celebrated. Half the acreage is devoted to rearing food for cattle, and thus the necessary supply of manure is secured. Geese and turkeys are extensively reared for the London market. The county is divided into three parts, n., s., and w. Norfolk, each returning two members to the house of commons. The capital is Norwich.

NORFOLK, a city and port of entry of Virginia, 88 m. s.e. of Richmond, and 32 m. from the ocean. The city is irregularly built on low ground, and contains a city hall, military academy, mechanics' hall, court-house, jail, custom-house, 6 banks, 26 churches. Its large deep harbor is defended by fort Calhoun and fortress Monroe, the largest fortress in America. A government navy-yard, dry dock, and marine hospital are in the suburb of Gosport. Norfolk was built in 1738; in 1776 it was burned by order of lord Dunmore, the British colonial governor. In 1835 a large number of the inhabitants died of yellow fever. In 1874 the exports of Norfolk (including Portsmouth) amounted in value to $3,906,318; and, in the same year, the number of vessels belonging to these ports was 376. The pop. in 1870 was 19,229.

NORFOLK (ante), the co. seat of Norfolk co., Va., on the Atlantic, Mississippi and Ohio, and the Seaboard and Roanoke railroads, and the Dismal Swamp and the Albemarle and Chesapeake canals; pop. '80, 21,966. It is connected by steamer with New York, Boston, Philadelphia, and Richmond; is the second city in Virginia, has the largest foreign trade of any place in Virginia, and with Portsmouth, on the other side of the river, is the chief U. S. naval station.

NORFOLK, DUKE OF. See Howard, Thomas, ante.

NORFOLK ISLAND lies in the Pacific ocean, 1100 m. e.n.e. of Sydney in Australia, in lat. 29° 10' s., and long. 167° 58' east. Length, 5 m.; breadth, 214 m.; area, 8,960 acres. It is the largest of a smaller cluster of islands, comprising Norfolk, Nepean, and Phillip islands, together with several rocky islets. The coasts are high and steep, and the surface generally uneven, rising in Mount Pitt to upwards of 1000 ft. in height. The soil is fertile and well watered, and the climate healthy. In 1825 Norfolk island was made a penal settlement by the British government for the worst class of convicts sent out to New South Wales; but the experiment was a failure, and the establishment was broken up in
In 1856 the inhabitants of Pitcairn Island (q.v.)—194 in number, descendants of the mutineers of the Bounty—were transferred thither by the British government. In 1871 the pop. was 481, the Pitcairn community numbering 297.

**NORIC ALPS.** See Alps.

**Noricum,** a province of the Roman empire, corresponding to Bavaria and other parts of the Austro-Hungarian empire; bounded n. by the Danube, e. and s. by Pannonia; also s. by Illyricum and alpine Gaul; w. by Vindelicia. The region is mountainous, the Noric Alps stretching through the center of the province; the chief rivers were Ænus (modern Inn), Dravae (Drave), and Murius (Mur). The chief town was Norcia, mentioned by Caesar in his Commentaries. The province was subdued by the generals of Augustus about 13 B.C. The Romans obtained iron and salt from the region, and, it is said, gold.

**Norium** is the name assigned by Svanberg to a metal, whose earth (or oxide) is associated with zirconia in certain varieties of the mineral zircon. Its existence is not yet definitely established.

**NORMAL SCHOOLS,** institutions where teachers are instructed in the principles of their profession and trained in the practice of it. The name of normal school is of French origin (École Normale, from Lat. norma, a rule or model), and is that generally used in Scotland; such institutions, in England, are often called, "training colleges;" and in Germany, "seminaries." That in acquiring knowledge the mind follows certain processes, the application of knowledge should be in harmony with these processes, are truths which seem sufficiently obvious. It is only recently, however, that they have secured much attention; and they are even at this day deliberately denied by some men of thought, and of the highest educational position. The recognition of these truths has, however, been sufficiently extensive to secure the institution, in Great Britain, America, France, Germany, and Switzerland, of schools in which the principles of teaching form the subject of study, and in which model specimens of the art are given. Italy, and even Russia, are following in the wake of the countries named. These schools also afford a thorough course of instruction in the subjects which are taught in elementary schools. The only normal school for training the higher class of teachers for colleges and academies exists in Paris.

One of the earliest, if not the earliest, normal school in Great Britain was the sessional school of Edinburgh (1830); afterwards developed into the "general assembly's normal institution." The first attempt of a similar kind in England was that of the Babes's training college, instituted by Mr., afterward sir J. P. K. Shuttleworth and Mr. Tunnell. Sir J. P. K. Shuttleworth subsequently, acting as secretary to the committee of privy council on education, suggested measures which have resulted in the institution of about fifty colleges for the training of teachers in Great Britain in connection with the Established and Dissenting churches. These turn out hundreds of male and female teachers annually, who having, after a two years' course of training, received government certificates of merit, become teachers of elementary schools.

There has been for some years a reaction against the necessity of normal schools, and their maintenance at the public expense. But this reaction can only be temporary, and the great facts will survive, that every subject of instruction is best taught according to a certain method, and that all methods are based on the study of the human mind. This is a position which it is impossible permanently to shake. The real founders of normal schools are those men who, with more or less clearness and width of view, have brought prominently forward these principles. Such were Plato and Quintilian, in ancient times; in more recent years, the most prominent names have been Comenius, Pestalozzi, Rousseau; and, in our own country, Ascham, Milton, Locke, prof. Pllans, and Dr. Arnold.

**NORMAL SCHOOLS (ante).** The establishment of these schools in the United States is due, it is said, to a suggestion by prof. Denison Olmsted in an oration delivered in New Haven, Conn., in 1816, and to various recommendations in the official messages of De Witt Clinton while governor of New York. In 1838 a gentleman in Massachusetts, Mr. Edmund Dwight, offered $10,000 for the purpose of establishing such a school on condition that the state would appropriate an equal amount. This was accepted and the first school was established at Lexington in July, 1839. Others soon came into existence in Massachusetts and elsewhere; and now nearly every state in the union has one or more either sustained by a county, city, or the state itself. In 1853 the total number of these schools was reported to be 119, the number of instructors connected with them about 900, and the students 17,000. They usually embrace the model or pattern school together with the academical features of the ordinary school. The conditions of admission are about the same in each, and require that the candidate be not less than sixteen years of age, and that he be able to pass a satisfactory examination in reading, spelling, writing, arithmetic, and the elements of English grammar. He must also intend to teach after graduating during a certain specified time. The courses of study are principally limited to the branches required to be taught in the public schools, together with a thorough theoretical and practical preparation for the special duties of a teacher. In some of the schools, however the classics and modern languages are taught. In the accounts of the various states mention will be found of these schools individually.
NORMAN ARCHITECTURE. As its name implies, this style was originated and chiefly used by the Normans. Soon after their conquest of the north of France, they began to erect churches and cathedrals in memory of their victories. Their conquests supplied them with the means for making their edifices. They were not contented with the small churches then common in France, but desired to erect monuments worthy of their great conquests. They accordingly expanded the dimensions, while to a great extent retaining the style of the buildings they found in France. They seem also to have borrowed some of their ideas from the Rhine. See Gothic Architecture.

The leading characteristics of their style were size and massiveness. They adopted the old Roman plan (derived from the Basilica) of central and side aisles; and at the east end, they invariably placed a semicircular apse. They seized on the tower as a distinguishing feature, and developed it as their style progressed. The ornaments are simple and of great variety; but the most common and distinctive are the zigzag, billet, chevron, nail-head, etc. The windows and doors are simple, with semicircular arched heads—the former without tracery. The tympanum of the door-arch is occasionally filled with sculpture.

The nave arches are carried sometimes on single pillars, but more frequently, especially as the style advanced, on piers with shafts. The shafts are almost always recessed in nooks (or ‘nook shafts’). Owing to the great size of the buildings, the architects were unable at first to vault the main aisle, which, accordingly, had usually a wooden roof, the side aisles only being vaulted.

The masonry is rude; the joints being large, and the stones generally unheun. The style prevailed from about the beginning of the 10th c., till the death of William the conqueror, near the end of the 11th century. There are many examples in Normandy, the churches at Caen being well-known buildings of the date of William.

This style of architecture was brought into England by the Normans at the conquest, 1066. They there extended the scale of the buildings, as they had done in Normandy, preserving, however, many local peculiarities of the Saxon style, which they found in the country. The chapel in the white tower of the tower of London is the earliest example of pure Norman work in England. There are, however, Roman buildings, both in England and Scotland, which date from before the end of the 12th c., when the pointed style began to be used. Durham, Lindisfarne, Canterbury, Dunfermline are partially Norman, besides many other churches and castles. The Anglo-Norman is heavier than the French-Norman, the cylindrical nave piers of the above buildings being much more massive than those of French works. To relieve this heaviness, the chevron, spiral, and other groovings were cut in the piers. The mouldings and forms of doors, windows, etc., are the same as those of Normandy. There is one remarkable difference in the plans of the early Norman churches in the two countries: in France, the apse at the east end is always semicircular; in England, this form was gradually given up; and towards the end of the style, the square east end was universally adopted.

NORMANY, CONSTANTINE HENRY PHIPPS, Marquis of 1797-1863, b. England; son of the first Earl Malgrave. He was educated at Harrow and Cambridge, and returned to Harlamin for Norforkborough in 1818. He met with the liberal party, of whose family he had always been a tory; his first speech was in favor of the political claims of the Roman Catholics, and his second advocated lord John Russell's proposals for parliamentary reform. He left parliament, which he re-entered after a residence of two years in Italy. While in the commons, he secured the abolition of the sinecure office of joint postmaster-general, and advocated the extension of the suffrage in the great manufacturing towns. He succeeded to the title in 1831, and soon after was made governor of Jamaica, where he successfully carried the act for the emancipation of the slaves, and suppressed without loss of life a mutiny of the soldiers. Returning to England, he succeeded the earl of Carlisle as lord privy seal in 1834. He was lord-lieutenant of Ireland, 1835-39, displaying an impartiality which won the approbation of O'Connell himself. He was made a marquis at the coronation of Victoria, and was colonial secretary for a short time in 1839, but was soon transferred to the home department, where he remained till 1841. From 1841 to 1852, he was ambassador to France, and from 1852 to 1858, to Russia. He published A Year of Revolution, 1857, containing his personal observations at Paris, and a number of novels, including Malinda, Yes and No, and The Contrast.

NORMANDY (Fr. Normandie), formerly a province in the north of France, bordering on the English channel; now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is in general a very fertile, richly-cultivated land, resembling a garden in many districts. Its chief agricultural products are corn, flax, and fruits (from which cider is largely made); its fisheries and manufactures of great importance, and its horses the best in the kingdom. The inhabitants are for the most part descendants of the old Normans, and bear the stamp of their splendid ancestors. They are intelligent, strongly built, and of a noble and energetic character; warm-hearted and patriotic, they produce the boldest sailors, the most skillful fishermen, agriculturists, cattle-rearers, and gardeners in all France. In the north-eastern and more level part (formerly Upper Normandy), the principal towns are Rouen, Dieppe, Havre-de-Grace, Hambourq, Honfleur, Lisieux, Evreux, Yvetot; in the south-western and hilly
In the time of the Romans, the country bore the name of Gallia Lugdunensis II. Under the Frankish monarchs it formed a part of Neustria, and was first called Normandy after Charles the simple, in 912, had given it to Rolf or Rollo, the leader of a band of Norse rovers (see Normans), to be held by him and his posterity as a fief of the French crown. From Rolf (baptized into Christianity under the name of Robert) and Gisela, the daughter of Charles, sprung the latter dukes of Normandy, of whom Richard I., grandson of Rolf, vigorously maintained his authority against his liege lords Louis IV. and Lothaire. William II., son of Robert II., became duke of Normandy in 1066; and in 1086, established a Norman dynasty on the throne of England (see William the Conqueror), thereby politically uniting Normandy with the latter country. In 1077 his eldest son, Robert, wrested Normandy from him, but it was again united to England under Henry I. in 1105. With this monarch, Rolf’s male line became extinct. Henry II., the son of Henry I.’s daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the government of England and Normandy; but in the reign of his son, John Lackland, it was conquered by Philippe Auguste (1203-04). It remained a portion of the French monarchy for more than 200 years; but after the battle of Agincourt (1415) it was reconquered by the English, who held it till 1449, when it was finally wrested from them by Charles VII. See Liqueet’s Histoire de la Normandie (1869); Palgrave’s History of Normandy and of England (1851-04).

NORMANDY, CUSTOMARY LAW OF (Fr. Contumier de Normandie). The ancient provinces of France were governed principally by a system of laws called Coutumes, which had originated in local usages, and been in the course of time reduced to writing and formally sanctioned by the sovereign. Coutume was distinguished both from loi, which originated with the king, and from us, or usage not reduced to writing. Of the codes of customary law, one of the oldest and most famous was the Contumier de Normandie. It was divided into the ancient and modern coutumes. The former was first issued in a written form, in 1229 under St. Louis; the latter was the ancient coutumier, modified and reformed in 1385 by commissioners appointed by Henry III., with the concurrence of the three estates of the nobility, clergy, and people of Normandy. The ancient coutumier treats principally of the duties of the judicial officers, the proceedings in the different courts, and the rights and obligations of the kings of France, the dukes of Normandy, the feudal lords, and the people. In the modern coutumier are minute regulations regarding the transmission of property by will and inheritance. Each of the 29 vicomtes, into which Normandy was divided, had a different mode of devising real property. The law by which the Channel islands are still governed is based on the customary law of Normandy. The chief judge in Jersey, Guernsey, and Aldernay retains the Norman name of bailli or bailiff, and his authority is much the same as that officer possessed under the Norman law. One of the most remarkable remnants of the coutumier still subsisting in the Channel islands is the Glameur de Haro. Any one who considers that his lands or property are interfering with his rights in the presence of two witnesses, and calling out thrice the word “Haro” (said to be a way of invoking duke Rollo, noted for his justice), summons the trespasser to desist. He then applies to the authorities, relating what he has done, and proceeds to the record office, where note is taken of the circumstances; all which ceremonial must be gone through before bringing an action of trespass. The decision is generally referred to une vue de justice, and the losing party is subjected to a fine, and liable in costs: he had formerly also to undergo un regard de château, or twenty-four hours’ imprisonment, for having implored the aid of the prince without cause.

NORMAN-FRENCH. The well-known “oaths of Strasburg” a.d. 842, though by no means showing any pronounced dialects, are indicative of the state of the Romance languages when the Northmen first began their incursions into France. Rollo (Hrolf, whether contracted for Harulf, Hraudulf, or Hroarulf, that is, high, red, or fierce wolf, is hard to say) received Neustria as a fief in 911. The number of his men was evidently much exaggerated by the monkish chroniclers of the time, and though the Saxons had long possessed settlements there, though there had once been a ruling Frank population, and though the Northmen must, in their usual fashion, have continued a desultory immigration for years, yet the proportion of Teutonic words (except sea-terms) is little larger than in the other Languedoili dialects, and by the third generation, except at Bayeux, only Norman French was in general use. The northern Romance, or langue d’oil, ultimately counts five dialects, Walloon, Picard, Norman, Fracois, and Basque. The fifth of these is spoken in extreme France, yet, until the Italian campaigns of Francis I., there is, from the modern point of view, no French language. Each man writes his own patois, and it follows, from varying influences and successive dynasties, that French, the ultimate survivor, will contain a certain admixture of other dialects. It happens that many of the Normand peculiarities have appeared in modern French, and this is it which gives a certain color to those works which institute comparison between English and modern French, a process applicable to a certain number of technical and scientific words which, in truth, are neither French nor English, hardly even Latin. The rule of transformation from Latin to any neo-Latin dialect is, the accented syllable (tonic) is preserved, unaccented syllables (toneless) are dropped or contracted; precession is
applied sparingly, but later generation of secondary mutes takes place throughout. Vowels undergo changes which vary with the dialects. The only apparent exceptions to these rules are formed, not from the Latin, but from a rustic word, usually derivative, and with its accent corresponding to the French. The infliction of Norman-French upon English, little in the 12th c., becomes overbearing in the 13th. From 1220 to 1290 at least one-seventh of the Teutonic words are lost, including the power of compound. The gaps are filled by French importations. In examining Norman-French from the stand-point of its bearing on English, it is particularly necessary to direct our attention to this century, to the spelling and form of Norman words at that time; the changes in English since are the secondary. The Norman-French alphabet, already called identical with the Latin, is, in two-syllabled words, on the first, if the word is female (poetically speaking), on the second if male. The English throws back (and the process was evidently only half finished in the time of Shakespeare) this accent to the first syllable, and it is this retrogression which makes it difficult to distinguish between a modern and hybrid word from the French, and an old though wrongly accented word from the Norman. We have, besides, applied a cumbersome and arbitrary system to indicate secondary mutes, notably y and j, and have, under the influence of the pedants of the 17th c., restored many letters, dropped or contracted in passing from Latin to Norman. These are the rules of change from Latin to old French, most examples being either Norman or Frankes (Ile de France); the particular distinctions for Norman will follow:

I. Toneless Syllables after the Accent.

a. Paroxytons:—disappear: frustrus—frucht; dàmmum—dam; —or change to mute e: 
rosa—rose; granum—grain; b. Proparoxytons:—contract—ángulus—anguus—angle. Both syllables become e mute; dómina—dome; or disappear entirely; dòminus—dom—Eng. dan. (Blasphénium, in lingua Rustica blasphēmum, blasphme, Engl. blame. Encàustum, pronounced like Greek égauston, enque—Eng. ink; Fr. encre.) c. Formative terminations, two-syllabled and toneless: iénum—iénum; i drops, e processed—fábica—farge and forge; grúíaca—granche, grange; díones, contracted first into age: missúticus:—message; iénum—iénum= mute—públicus: poype, not public; scolástica: esclastrée, scollard. Terminant wholly dropped: lácus—lace or lay (bárca, Fr. Gr. bárís, barge, modern barge; phantasticus, fantasque, mod. fantasque). There are a few exceptions, liturgical words or technical: iénum, i long = ie or i; iénum = iénumus, amicus, ami; iénum—i drops, e is softened or precessed—pactánicum, pance, paunch; iénum—i long = is, isis, icus—cornèiche, corniche; idus, idis, ida. i drops, d final should be l—vápidus, fade; víridis, vert. Without final d—pláidus, pale, pale; idis, Idos, ida. Contraction—áquila, aigle, eagle; átis, utc, not utc; átus—avíril, April; gentilis, gentil, greated: átus, alta, alima. Dropping of u, and contraction—tabula, table, etc. Vocalization of the consonant: bajulus, bail; mâcula, mail; ádulus, adulus, ádulus—trubalicuim, travel, travel. Change of t to r: Reflex action of u in the peaufl; régula, ructule, rule: ónus, ó drops, d = tr in French, but remains in English—apostolus, apostle, Fr. apotre; ínus, í drops, final e mute—décimns, disme, dînce; ínus, ínem. As before, and u drops—áinus, âsne, Angl. ass; n changes to m—consuctuim, consumme; n changes to r—cophinus, coffre; n drops—imaginem, image; énum, etc., ónum, um, acucíuem, acucíerne, Fr. concombre; ûm, etc.; i drops—ecuérbita, goourds, gound. Without e mute: acéppus, prevost. (Spíritus, made in Norman espr, though in Fr. esprit, which is contrary to rule. The English word is later.) íros, íos (a. un.). The short vowel becomes j, or ch—calmin, calange, the vowel becomes liquid in Fr., but not in Eng.; tófilm, foll, Fr. feuille. Reflex action of the vowel when dropped: innéguim, ingenin, engine. Vowel disappears: fâcie, face, etc.

Note an exception: A low-Latin termination, ìn, which, especially in Languedoc, serves as a derivative, and is applied to a bastard Latin form, itself derived from a neo-Latin word. Such are: compaign, compagnie, company; jâlos, jalouse, jealousy, etc. Strengthened by r, it applies even to words derived from the Teutonic, viz., flâddha, old Eng. to flyte, flatter, to flatter. And from this ív came our true English geographical forms in y, Italy, Arby, etc. Verbs in ívre. When the ív drops they become verbs of the French conjugation in re; so they were, but after the invention of the third in oir they were, owing to a too close juxtaposition of consonants, changed to others.

Thus, empereire, to imprint, is in mod. Fr. empimier.

But as most Norman verbs are changed to English by the summary process of chopping off their tails, little shows of the old forms in our language. But some mistaken transformations of ire can still be discerned: mortc,p, muevrc, to move; placier, pleasir, to please.

II. Toneless Syllables before the Accent.

a. Immediately before, they persist: coróna, couromuc, legális, éal, loyal. Exception: thórca, triacle, treacle. When a consonant drops, and two vowels touch, they are contracted: acutícum, eage, age, or fused: magister, maître, master; but if the syllable begins with a vowel, it is often dropped: aríncusus, oncle; but if not initial, the short vowel immediately before the tone vowel drops: bonífatem, bone, bounty. If the vowel is long it generally persists: labórate, labourer, labor.

b. Unaccented syllables not immediately preceding the tone: domincélla, donnele, donzel.
III.—Latin Vowels.

If toneless, they are treated without method in spelling; but if accented, a continues, á, é, ë, è; even if a toneless vowel has dropped: a(igu)es, ab(igu)is = age, able, etc., grace, grávit. The vowels of the Norman, whether influenced or not by the nasality and burr of the Norsk, show a constant tendency to too great broadness and too great fineness, as compared with a standard approaching the Latin, and this standard is best furnished by modern English pronunciation, when that remarkable system has been left to itself. The Norman changes will be recognized on sight as characteristic of old, notably from Chaucer to Heywood, English, or of provincialisms still current, even in America. Norman a is Danish å, Gothic aa, English ae: grave, sounds prominently graven; but when followed by gutturals or nasals, French turns a to a: pâcien, pals.

The grave accented a in Norman a diphthong, often represented by ae; and the Irish pronunciation of English peace is of course only English of Sponsored times, and rightly descends from it; ai in mountain is rightly placed in French to Montaigne's time, and marks the vowel as short. Norman varies between ai = á, in poitierr or ai = ai, becoming silent, which is modern French, but the a is always very long. Phantasms, fantome, Eng. phantom (f), is a true Norman broad a; but we say tax, while the French is still tâx. Most short vowels are liquified in Norman, just as in Icelandic; thus short a in caput, chart, chief, and even long, gravis, graef, grief. These are, as compared with Norman or French, so few in English that it would seem a late introduction with us. E is something in French raised in pronunciation, but in English persists: festum, feste, feast; e followed by š or é is short, e before a dental fluctuated between e, pronounced as in American a, and e, pronounced in Norman like oy in boy. This struggle continues in modern French, but there is little trace of it in English:

Exceptions: sebum, saccus, which is pronounced sâk in American, sâk in English.

Native v. Norman.

Exceptions: sebum, saccus, which is pronounced sâk in American, sâk in English.

"E" is sometimes a vowel in its Latin form, but otherwise not. "E" is a vowel in any other form, and sounds phonetically like French e.

In French, an e has a reflex action on a; not so in English. This and other indications point to the final e being sounded until about 1100: gloria, gloire, glory, ostrea, oisire, oyster, oyiure, scuol, sill. Changes to ou in French, and in English remains u: curta, crusca, crust; changes to a in French, in English remains: columna, column; columna; changes to ou, both French and English: punctum, point; but truncus, trunk; and ou to ou, but not always in English: fractus, fruit; u long, Latin, is sometimes long, sometimes short in English, but in Norman was always long: cupa, opaque, copia, cupere, copula, and though influenced by the reflex of an i in French, in English varies: angustia, anguis, anguish. Y. The laty y, a Greek letter, was reproducted in Norman and in English, but is i in French: lyn, lyr, Fr. lire; muxa, mesche, match. AE. Treated as an e long, and even as an e short: queste, queste, quest. OE. Same treatment: poena, poine, pine, pain. AU. Already interchanged in late Latin with ë, English, Norman modern French, all vary in treatment: Lat. frauda, thesaurus, naura; Nor. frode, thesere, noise; Fr. fraude, tresor; Eng. fraud, treasure, noise. E. No Latin words in the Norman, but the Celtic: lena, line, liene, league. Ul. Diphthong rare in Latin. The two vowels occur in circuitus, circuit.

IV.—Vowels and Diphthongs Unaccented.

The cases of anomalous change in toned vowels shown in the exceptions just stated are usually the same as those of the toneless sound corresponding. A few cases of persistence or change may be shown more at length: A. Remains in place: carnalis, charnal, charnel. E. mercedem, merci, mercy. I. imaginem, imagine image. O. obscur, obscure. Û. humánus, human, human. Where French takes e, English often keeps A. camális, chenal, canal; Û. féneclum, fenoll, fennall; I. minuitus, menu, mifclés, fleá, feátye, fleátye, fleáty. O. commendo, commande, command; Û. succéfrère, secourre, suerco. Other changes will be found in exceptions, and can be expected from the character of the Norman vowels already described. It is singular that Norsk and Norman, being usually nasal, English, especially old, is not, misspelling by preference any open vowel followed by m or n.

V.—Hiatus and Semi-Consonants.

Hiatus is produced much more frequently in Norman than in French, final e being preserved before a vowel, i in the nominative retained, and probably, under form of i, z, z, pronounced. Vowels not i and e before an open vowel (they are always liquid) are

U. K. X.—43
separated in pronunciation. Both rules are Norse. Ge, gi, de, di, before vowels are certainly not j before 1200, and zh even later. Ci, ki, gui, cv, ke, que, before vowels are not Picardized into ch and sh till the same time. Te and ti may have equaled se and si, but certainly not skh. Hi is of not the slightest consequence—as often absent as present. Ci of early Norman simply equals k. On the whole, English is likely to keep a Latin letter and avoid hiatus, where Norman would drop it.

VI.—Consonants.

Taken as initial, medial, or final, of course after disappearance of the Latin covering syllable. Modern French dislikes double consonants, unless one be liquid or nasal; Norman and English show such feeling in some instances: captivus, chailitif, captive; but judicare, jaguer, judge. Also, true of these consonants when the last drops: blasphemare, blamer, blame. Changes of consonants are: precession, assimilation, transposition, and all are much less common in Norman, and therefore in English, than in modern French. D gutturals c and the ch it replaces.

Initial.
Chorus, quer, quire (= l); but capellam, goubet, goblet; calx, chaunix, chalk, (= ch); cupillum, chable, cable; cedere, ceder, cede (= s); chirurgiamus, surgen, surgeon.

Medial.
Vertica, perche, perch; but laxus, lasche, lax; pacare, payer, pay—disappears; duca-
tas, duch, duchy, various; liecre, loisir, leisure; jecus, jocos, joke.

In combination
Cc, accents, accent; et, fluctuare, floter, float; placidum, plate, plea; factionem, façon, fashion; ox or x, extraneus, estrange, strange; exilium, eisil, exile; r, taxa, taxe, task (= sk); but fixare, ticher, fix; co, Jacomus, James, James, etc. Qe has persisted in English, though less in French; but aquila, aigle, eagle. G. initial and mediál, or final; gobiinem, gongeon, gugeon (= g); but gagites, jayet, jet; angelus, angell (= j); flagellum, flad, flâu, disappears.

In combination.
Geo, gre, languere, languir, languish; gr, gl, peregrinus, pélérin, pilgrim; but integrum, enter, entire; ogr, ugl, plangere, plaire, plain; gn, purgare, pognar, punch; amygdala, amandle, almond. F. Latin, a real g is now in French zh, but English j: projectus, project; ra, rule, ray. H invariable in Norman, only in Teutonic words: hauron, heron; hair, hate. English has from it two words which do not deserve the k; the French is entirely arbitrary: cremina, hermit; umpa, hoopoe. P. almost intact, but capitue, couvoire, covet, pilputitum, poulitre, pulpit; but caput, chief.

In combination.
Ps, psalmus, sainle, psalm (pedantic); pl, duplise, double; pr, aprils, april; ps, capsae, chasse, cause, case; pt, pal, ruptus, raunt, rout, and examples already given: pt, pr, pipionem, pichon, pigeon; pp, mappa, mapp(e)ry. B almost always persis-
t; but taberna, tavern, tavern; subandare, sounder, sound, etc,; be, brevis, brief; felix, flax; fevir; fervor; b, fabula, table; debilis, dencl, dule; bl, subitans, soucie; sudden; bs, absolvere, assolute; assai; bl, bum, buen, overline; Fe, ph, which was always replaced by f, generally persists, yet bifax, vais, bias. V. initial low Latin e represents v, we, gu, even qn of the Teutonic languages, and most of these words in English in which g represents Norman gn have another form in w, the true one: va-
dium, guage, gage = wage; guarder, guard = ward; guigne, gig = gigale, Danish, and the word never has come into English; elsewhere e persists: novellus, novel, estridge; but avistrithro, austriche, ostrich; salvs, saufl, safe. M persists, but comestableus, constable, stramen, estrain, strain; mv, ml, camera, chamber, chamber; marmor, marbre, marble; mu, adhuminare, alluminer, alume; mt, mel, me, mi, my, in all m changes to t: comitem, counte, count; cambiare, changier, change; mb, m, gamba, gambie, gum(m)on. T, th, which is replaced by t, disappears: potere, poir; power; but many old words keep t between two vowels; matieres, matière, matter. And the Languedoc words: metalica, médaille, medal; intybium, endive, change t to d; bombitare, bouder, bound; st, eclectium, colson, onchon; te, silvattens, sauvage; ta, tn, planatus, plane, plane; tr, latrocinium, larçin, larein(y); tl, vulturne, vautrier, vaut. T final, saved though mute in many French words, is even more preserved in Norman, always when originally preceded by a consonant. In past participles it keeps et, and the old t final, which is now et. T before toneless i or e and a vowel is always soft in French, but Norman had preserved the spelling, though hardly the pronunciation: potionem, polson. D initial persists; medial is lost: predicare, preccher, prech; d between two vowels is almost never Norman, yet estude, rude, odeur; d final, drops: grados, grçe, degree; d and another consonant, d drops, but not always in English. D intrudes in tencern, tendre, tender; d as assimilates: adsercer, assurer, assure. S almost unchangeable: but cicer, cêtre, cider; designare, desseiner, design. In combination s usually drops, but not in modern French, sa, vasellum, vaisel, vessel; sp, despectus, despet, despite; st, asinus, asne, ass; sf, vasellactus.
...vaselet, valet (Danish.) Sr or er, insert t, antecessor, ancestrale, ancestore. Dies, ee, in French de and è are preserved in Norman, as well as st; in modern French e, with sp initial, makes é. English makes se, sp, st, initial; late Norman makes ese or esche, esp and est; the inference is evident.

Latin. scala, sparsus, strictus,
English. scale, spare, strict.
Late Norman. eschel, espar, estreet.
French. échelle, espire, étrait.

Not all of these words are technical, and borrowed by Saxon before 1000 A.D., and though it is an exception to Romance rule, it seems likely that Norman was more like English than French in this up to 1150. Other changes are: stannum, estain, taín, tin, stationem, saison, season. Z Latin, in verbal terminations, should always be s: baptizare, baptizar. Before mentioned: zelosus, jaloux, jealous. N, initial, medial, and final remains: samus, san, same; but quaternum, quahier, quire; and diurnum, jour, jour(nal). Latin, utein: consuetudinem, cestume, custum; coughly, couckle, cocickle. Other cases mentioned already. N before short e or t: seniorem, seignior, 2. N inserted: laterna, lantern; reddere, rendre, render; but jocular, jocker, juggle. The groups ndr for nr, and ngl for gl, are decidedly Norsk; so is mbt for mb. L generally rests initial, medial, or final: nilius, flæ, flæz; vocalis, voicle, vowel.

Note, digitalis, deel; détaile, ditany. L in combination: followed by sg consonant, t = n in French, but not in Norman and English: Note, marla (for marg’la), marne, marl; scandalum, scandale, scandal; esclandre, slander. R remains, except changing with s seldom, and t sometimes; remains in English: kaumbern, chambern, chamberlain. Often transposed: nimbria, freange, fringe. The proportion of Norman words in English, and the history of the connection of the two languages, may be found in so many treatises that no attempt has here been made to do more than carefully indicate the true derivation and spelling of Norman words in English. The grammar and the literature of the language belong to the study of French dialects; and as written by even the second generation after the conquest, always excepting Richard Cour de Lion and a few troubadours, the English productions in the tongue are so bald and corrupt as scarcely to repay translation into the pure dialect of their time. They never had a possessive nor any serviceable particles; they forgot the two cases of the noun and the double formation of object and subject; they neglected the subjunctive of their verbs, and forged abstracts by hitching a termination to the first word they happened to remember.

NORMANS (i.e., Northmen), a name generally limited in its application to those sea rovers who established themselves in that part of France called after them, Normandy; but sometimes embracing also the early inhabitants of Norway. During the middle ages, the name Northmen, or Norsemen, was often used in a broader sense, to denote the entire population of Scandinavia, and still more frequently, perhaps, to designate the Danes and Norwegian's, exclusive of the Swedes. The Germans and French called the piratical hordes who ravaged their shores Normans or Northmen; the Saxons, usually Danes or Eastmen. They were also distinguished by the latter as Mark- or March-men (from Den-mark), as Ash-men (i.e. men of the Ashen-ships), and as the Heathen. The primary cause of the plundering expeditions southward and westward across the seas, undertaken by the Norse Vikings (Vikinger, meaning dwellers on the òés, i.e., bays or fiords), as they called themselves, under leaders, who took the name of "Sea-Kings," was doubtless the over-population and consequent scarcity of food in their native homes: besides, the relish for a life of warlike adventure, conjoined with the hope of rich booty, strongly attracted them; while at least as long as the old Scandinavian religion lasted (i.e., till about the end of the 8th c.)—death in battle was not a thing to be dreaded, for the slain hero passed into a region of eternal strife in the Walhalla of Odin. Finally, discontent with the ever-increasing power of the greater chiefs or kings, induced many of the nobles with their followers to seek new homes.

The first Danish Norsemen made their appearance on the eastern and southern coasts of England in 787. After 832, their invasions were repeated almost every year. To one of these belongs the legend of Ragnar Lodbrok (i.e., Ragnar of the "Shaggy Breeches"), who is said to have been taken prisoner by Ella, king of Northumbria, and thrown into a dungeon filled with vipers, where, while expiring amid horrible torments, he sung with heroic exultation the story of his life. The very existence, however, of such a person as Ragnar Lodbrok is questioned by many Scandinavian scholars. In 851, the Norsemen wintered for the first time in the island, and after 866 obtained firm footing there. The Anglo-Saxon Ethelred I. fell in battle against them in 871. His brother Alfred, known as Alfred the Great (q.v.), after a long and doubtful struggle, partially ruined them to subjection; nevertheless, he was compelled to leave them in possession of Northumbria and East Anglia; and had not only to defend himself against a new and fierce invasion led by the famous rover Hastings (q.v.), but like his immediate successors, to contend against the revolts of his Dano-Norman subjects. A period of external peace now ensued; but in 991 the invasions of the Danes and Norwegians began anew. The Saxon king, Ethelred II., at first sought to buy them off by paying a sort of tribute-money, called Danegeld (q.v.); but the massacre of the Danes living in England, by com-
mand of that monarch, Nov. 13, 1002, was avenged by four expeditions under the Danish king, Swen, who frightfully wasted the country, and finally conquered it in 1013, dying the following year. His son Knut, or Canute (q.v.), after carrying out a struggle for the supreme power with Ethelred and his successor Edmund Ironside (q.v.), at length, on the death of the latter, became sole monarch of England, which now remained under Danish or Norse rulers till 1042. The government of the country then reverted into the Saxon hands of Edward the Confessor (q.v.), who was succeeded in 1066 by Harold II. (q.v.), son of the powerful Goodwin, earl of Wessex (q.v.), but in October of the same year, Harold lost his life and crown at the battle of Hastings, and William the Conqueror, a descendant of a Norwegian chief who had settled in Normandy, once more established a Norse dynasty on the throne of England, but one greatly refined and improved by long residence in a comparatively civilized region.

It was also Danish Norsman, in particular, who ravaged the western coasts of European mainland, from the E. be to the Garonne. As early as 810, the Danish king, Gisli, and King Fringolf of Norway, who was a descendant of the great Charlemagne, were sufficiently strong to enter Galicia by land, and to devastate the Tyrrhene coasts, demonstrating the weakness of the continental rulers. But in 881, Leif from Finnmark, and the West Norse ships, under the command of Haarfager, who was banished by the Norwegian king, had landed in the Orkneys and Shetlands, ravaged Ireland, and entered the Tyrrhene sea, on their way to France, the memory of which has been preserved in a song still popular among the country people; but neither that, nor the repulse which they sustained from the brave German monarch Arnulf, near Louvain in 891, could hinder them from making fresh inroads. In 892, they appeared before Bonn, and tradition says that bands of Danish rovers penetrated even into Switzerland, and established themselves in the canton of Schweiz and the vale of Hasli. From their settlements in Aquitania they proceeded at an early period to Spain, plundered the coasts of Galicia in 844, and subsequently landed in Andalusia, but were defeated near Seville by the Moorish prince Abd-ar-Rahman. During 899–90, they forced their way into the Mediterranean, wasted the shores of Spain, Africa, and the Balearic Isles, penetrated up the Rhone as far as Valence; then turning their piratical prows in the direction of Italy, entered the Tyrrhene sea, burned Pisa and Lucca, and actually touched the distant isles of Greece before their passion for destruction was satiated, or before they dreamed of a Mediterranean conquest.

Doubtless Norwegian rovers also took part in these so-called Danish expeditions. We know that as early as the beginning of the 9th c. they made voyages to the n. of Ireland, Scotland, the Hebrides, the Orkney and Shetland isles; and the increasing power of Harald Haarfager in the 9th and 10th centuries, exciting great discontent among the smaller chiefs, great emigrations took place, and these islands became the new homes of these Norwegian Vikings. About the same period, colonies were settled in the Faroe Isles and Iceland, from which some Vikings proceeded westward across the North Atlantic to Greenland in 982, and thence in 1002, south to a region which they called Vinland, now universally believed to be the coast of New England, thus anticipating the discovery of America by Columbus by nearly 500 years. From Norway also issued the last and most important expedition against the coast of France. It was led by Rolf or Rollo, who had been banished by Harald Haarfager on account of his piracies. Rolf forced Charles the simple to grant him possession of all the land in the valley of the Seine, the Ile de France, and the Hautevile, and on the 7th of July, 911, he and his band of invaders had firmly planted themselves in the country, which then went by the name of Normandy (q.v.). They and their descendants are strictly speaking, the Normans of history—warlike, vigorous, and a most brilliant race. They rapidly adopted the more civilized form of life that prevailed in the Frankish kingdom—its religion, language, and manners, but inspired everything they borrowed with their own splendid vitality. At a later period (the 12th c.), they even developed a great school of narrative poetry, whose cultivators, the Trouvères, or Trouvères, rivaled in celebrity the lyrical troubadours of southern France. Their conquest of England, in 1066, gave that country an energetic race of kings and nobles, on the whole well fit to rule a brave, sturdy, but somewhat torpid people like the Anglo-Saxons. But though the Normans had acquired comparatively settled habits in France, the old passion for adventure was still strong in their blood; and in the course of the 11th c., many nobles with their followers betook themselves to southern Italy, where the strifes of the native princes, Greeks and Arabs opened up a fine prospect for ambitious designs. In 1059, Robert Guiscard, one of the ten sons of the Norman count, Tancred de Hauteville, all of whom had gone thither,
was recognized by pope Nicholas II, as duke of Apulia and Calabria, and in 1071 as lord of all lower Italy. His brother and liege-man, Roger, conquered Sicily, 1069–89. Roger II, of Sicily united the two dominions in 1127; but in the person of his grandson, William II., the Norman dynasty became extinct, and the kingdom passed into the hands of the Hohenstaufen family.

The Swedish Norsemen directed their expeditions chiefly against the eastern coasts of the Baltic—Courland, Estonia, and Finland, where they made their appearance in the 9th c.—the very time when their Danish and Norwegian brethren were roving over the North sea, the English channel, the bay of Biscay, and were establishing themselves on the shores of England and France. According to the narrative of the Russian annalist, Nestor, they appear to have penetrated into the interior as far as Novgorod, whence they were quickly banished by the native Slavic and Finnish inhabitants, but were as quickly solicited to return and assume the reins of government. Hitler, consequently, in 987, accompanied by other noted warriors, came three Swedish chiefs, Rurik, Sineus, and Truwor, sons of the same father, and belonging to the tribe of Ies (whence Russ and Russian). Rurik founded one kingdom at Novgorod, which stretched northward as far as the White sea. His successor, Oleg, united with that a second established by other Swedish adventurers at Kie, which town now became the capital of the wide-extended Russo-Swedish kingdom. See Russia.

For a long period these Norsemen, who, it appears, became completely identified with their Slavic-speaking subjects in the 10th c., were dangerous enemies of the Byzantine empire, whose coasts they reached by way of the Black sea, and whose capital, Constantinople, they frequently menaced, as, for instance, in 941, when Igor is said to have appeared before the city with upwards of 1000 ships or boats. Earlier in the same century, these Swedo-Russian warriors had found their way into the Caspian sea, and actually penetrated to the coasts of Tartary and Persia. Partly from them, and partly from native Scandinavians, came those soldiers who, from the 9th to the 12th c., formed the body-guard of the Byzantine emperors.—See Deppings's Histoire des Expeditions Maritimes des Normands et de leur Etablissement en France au 10e Siècle (2 vols. 3d edit. 1843); Wheaton's History of the Northmen from the Earliest Times to the Conquest of England (1831); Worsaae's Mindem om de Danske og Normændene i England, Skotland, og Irlan (1851); Freeman's History of the Norman Conquest (1867–76).

NORGNE, the Parea of the northern mythology. They were three young women, by name Urd, Verdauti, and Skuld—i.e., past, present, and future. They sit by the Urdr- well under the world-tree Yggdrasil, and there determine the fate both of gods and men. Every day they draw water from the spring, and with it and the clay that lies around the wells, sprinkle the ash-tree Yggdrasil, that its branches may not rot and wither away. Besides these three great norms, there are also many inferior ones, both good and bad; for, says the prose Edda, when a man is born there is a norm to determine his fate; and the same authority tells us that the unequal destinies of men in the world are attributable to the different dispositions of the norms. These lesser norms corresponded to the genii of classic mythology. Women who possessed the power of prediction or magic also bore this name.

NORRBOTTEN, the extreme n. province of Sweden, adjoining Russia and the gulf of Bothnia, separated from Lapland by the Torneo and Munio rivers, drained by the Lulea, Pitea, and Kalix rivers; 36,797 sq. m.; pop. 86,635. It contains many lakes and rivers. The summers are hot, but the climate not unhealthy. The principal articles of export are ore and timber. Capital, Pitea.

NORRISTOWN, a borough of Pennsylvania, on the n. bank of the river Schuylkill, 16 m. n.w. of Philadelphia, containing cotton and woolen factories, iron rolling-mills and foundries, machine-shops, court-house, jail, public library, bank, 13 churches, seminary, 5 public schools, 1 German and 7 English newspapers, and in 1870, 10,738 inhabitants.

NORRISTOWN (ante), co. seat of Montgomery co., Penn., on the Philadelphia, Germantown, and Norristown, and Stony Creek railroads; pop.'80, 13,064. It is on high land, and regularly laid out. The principal materials used in its buildings are the marble and stone which are quarried in the neighborhood. It has a fine marble court-house, a jail, a lunatic asylum, a number of churches, a music hall, a public library, 3 banks, 2 large boarding schools, and 7 periodicals, of which, 2 are dailies, and 1 is printed in German. There are machine works, blast furnaces, rolling, cotton, and woolen mills, oil refineries, etc. Two bridges, about 800 ft. long, span the Schuylkill to Bridgeport, the e. terminus of the Chester Valley railroad.

NORR KÖPING, the first manufacturing t. of Sweden after Stockholm, is the chief t. of Linköping-Län, in east Gotland, and is situated at the junction of the Motala with the gulf of Bråvike, in 58° 30' n. lat., and 16° 15' e. longitude. Pop. in '74, 26,365. It is a fine, well-built town, with broad streets, large squares, and numerous churches and charitable institutions. The rapid river Motala, which is spanned by several substantial bridges and lined with commodious wharfs, affords very considerable water-power, by which numerous systems of machinery are worked. The manufactures are cloths, stockings, starch, tobacco, soap, etc., while in the neighborhood are the extensive ironworks
and cannon foundries of Finspång. Norrköping is a good salmon station, and is the principal Swedish port for the importation of wines and foreign spirits.

NORSEMEN, or NORTHMEN. See NORMAN, ante.

NORSE MYTHOLOGY. See ASIR.

NORTH, CHRISTOPHER (pseud.). See WILSON, JOHN, ante.

NORTH, EDWARD, L.L.D., b. Conn., 1829; educated at Hamilton college, and since his graduation in 1841 has been one of the most active members of the faculty. In 1843 he was made professor of ancient languages, and since 1863 has occupied the Greek professorship. For 30 years prof. North has been chairman of the Hamilton alumni association, and has edited the triennial catalogue and also a biographical catalogue. He has contributed articles to the North American Review and several educational journals, and has delivered lectures on literary topics. The degree of L.H.D. (doctor of literature) was conferred upon him in 1862 by the university of the state of New York.

NORTH, FRANCIS, Lord Guilford, 1657-55; second son of sir Dudley North, the fourth baron of the line; educated at St. John's college, Cambridge, and after 2 years study there became a member of the middle temple. He was called to the bar in 1661. He had always been a student of great application, and upon entering into practice he used every means (not always dignified or honorable), to advance himself and obtain the favor of the great. He was made solicitor-general in 1671, attorney-general in 1673, lord chief-justice of the common pleas in 1675, and in 1682 was made lord keeper of the great seal. The memoirs of the lord-keeper by his brother, Roger North, represent him as selfish, cowardly, trimming in politics, and capable of descending to baseness to increase his own power. He was a strong upholder of the prerogative, and only at the last moment warned James II., of the ruin to which that monarch's infatuation was hastening him. As a lawyer, his ability and learning were undoubtedly, and his decisions did much to increase the extent of the jurisdiction of the courts of common pleas. Lord Campbell characterizes his professional qualities by saying, "He had as much law as he could contain, but he was incapable of taking an enlarged and commanding view of any subject."

NORTH, FREDERIC, Lord, English minister, was b. April 13, 1732, and educated at Eton, and Trinity college, Oxford. His father, baron Guilford, a descendant of Roger, baron North (temp. Henry VIII.), was created an earl in 1552. North entered the house of commons at the early age of 21 as a member of the treasurers' department in 1763, and inherited the honour of the earldom of North and the ranks of the law and the state. It was his boast in the house of commons, that "since he had had a seat there he had voted against all popular, and in favor of all unpopular measures." On the death of Charles Townshend, in 1769, he was made chancellor of the exchequer and leader of the house of commons, a post for which he was well qualified by his eloquence, good humor, wit, and readiness of resource. His folly was, however, one of the immediate causes of the American war. Earl Russell, in his Life and Times of C. J. Fox, says that "for $100,000 a year of revenue George Grenville provoked America, and that for $160,000 a year of revenue Lord North lost America." In 1770, he succeeded the duke of Grafton as prime-minister. As a minister he was too ready to surrender his own judgment to that of George III., who, with a narrower understanding, had a stronger will, and was determined to subdue America. North was called by Horace Walpole the obstinest minister; the real minister was the king. North had to encounter an austere and powerful opposition, led by C. J. Fox and supported by Burke. It has since been proved that North "so early as 1776 was of opinion that the system he was pursuing would end in ruin to the king and to the country." In 1778, he renounced the right of taxing the colonies. In 1782, it being impossible to carry on the war with America any longer, North resigned. "A more amiable man never lived," says earl Russell; "a worse minister never since the revolution governed this country." With North's retirement came to an end George III.'s scheme of governing the country by his own will, and ruling the house of commons by court favor and thinly disguised corruption. North was succeeded by the marquis of Rockingham, on whose death lord Shelburne became premier. Fox's dislike of the terms of peace with America led him to enter into a coalition with North, whom he had for so many years inveighed against as a minister without foresight, treacherous, vainglorious, and incapable. North and Fox took office under the duke of Portland in 1783, but the coalition destroyed Fox's popularity, and the Portland administration only lasted a few months. North was afflicted by gout, and the end of his life was spent in a sickbed. He died in the earldom of Guilford, in 1790, on the death of his father, and died in Aug. 1792.

NORTH, SIMEON, D.D. L.L.D., b. Conn., 1802; after graduating at Yale college in 1825, was for 2 years a tutor in that Institution. In 1829 he was appointed professor of ancient languages in Hamilton college, New York, and in 1839 was elected president of the college. He has printed several orations and sermons.

NORTH, WILLIAM, 1755-1836; b. at Fort Frederick, Maine, and in 1775 entered the revolutionary army; rose from the ranks, and in 1778 was a capt. and present at the battle of Monmouth. The next year he was appointed aid to baron Steuben, and remained with him until the surrender of Cornwallis. At the death of Steuben half of
his estate was left to gen. North, as he was then by brevet. He continued to serve in the army as inspector and adjt.gen until 1800; was afterward a prominent federalist, speaker of the N. Y. legislature, and U. S. senator.

NORTH ADAMS, a village in Berkshire co., Mass., on the Hoosac river; about 35 m. e. of Albany, 20 m. n.e. of Pittsfield; on the Troy and Boston, and the Pittsfield and North Adams railroads; pop. '80, 10,192. There are 2 weekly papers, 3 banks, and 7 churches. There are more than 15 cotton and woolen mills in the township of Adams, and very large manufactories making boots and shoes. The various mills have given the village great prosperity. North Adams is near the entrance of the great Hoosac tunnel about 5 m. in length. The scenery around the town is very fine, Greylock, distant but a few m., being the highest mountain in the state, 3,600 ft. The employment of Chinese in some of the village factories attracted much attention some years ago.

NORTHALLERTON, capital of the North Riding of Yorkshire, a market-t., and parliamentary borough, 250 m. n.n.w. of London, and 20 m. n.n.w. of York by railway. It stands near the left bank of the Wiske. It contains a large number of public schools and other institutions. Manufactures of linen and leather, brick-making, and malt ing are carried on on a limited scale. Pop. (1871) of parliamentary borough, 4,961, who send a member to the house of commons. The battle of the “Standard,” so called from a large standard erected on a car by the English, was fought here, Aug. 22, 1188, between the English and the earls of Albemarle and Ferrers, and the Scotch under king David. The latter were defeated, and forced to retreat with great loss.

NORTH AMERICA. See AMERICA, 4th ed.

NORTHAMPTON, a co. in n.e. North Carolina, draining by the Roanoke and Meherrin rivers; on the Seaboard and Roanoke, and the Petersburg railroads; 500 sq.m. pop. '80, 20,032. The surface is generally level and the soil fertile. The principal productions are Indian corn, wheat, oats, tobacco, cotton, potatoes, and sweet potatoes. Co. seat, Jackson.

NORTHAMPTON, a co. in e. Pennsylvania, adjoining New Jersey; bounded on the e. by Delaware river, on the s.w. by the Lehigh river; crossed in the s. by the Lehigh river, on the Lehigh and Susquehanna, Lehigh Valley, and North Pennsylvania railroads; 400 sq.m.; pop. '80, 76,316—64,021 of American birth. The Kittatinny or Blue mountains run along the n.w., and in the south of the county. The surface is level, and the soil fertile. The principal products are Indian corn, wheat, rye, buckwheat, hay, potatoes, and wool. There are slate and limestone quarries, and iron and zinc mines. Sandstone is abundant in South mountain. Among the articles manufactured are bricks, lime, carriages, cigars, castings, leather, flour, lumber, furniture, pig iron, and castings. Co. seat, Easton.

NORTHAMPTON, a co. in s.e. Virginia, between the Atlantic ocean and Chesapeake bay, forming the s. part of a narrow peninsula, the extremity of which is cape Charles; 320 sq.m.; pop. '80, 9,132—9,143 of American birth—5,263 colored. The surface is level, and heavily wooded in parts. The soil is sandy, and the principal productions are Indian corn, oats, potatoes, and sweet potatoes. Co. seat, Eastville.

NORTHAMPTON, a village of Massachusetts, 1 m. w. of Boston, on the Connecticut river railway. It is celebrated for its beautiful scenery, and been Tom and Holyoke rising from a picturesque valley. It contains many elegant residences, the county buildings, 6 banks, several academies, 11 churches, 1 cotton factory, 2 silk factories, 3 paper-mills. A bridge 1080 ft. long connects it with Hadley, Pop. '70, 10,160.

NORTHAMPTON (ante), a t., the co. seat of Hampshire co., Mass., on the Connecticut river, 17 m. n. of Springfield; situated on the New Haven and Northampton, and Connecticut river railroads; pop. '80, 12,172. The town is mostly on rising ground about a m. from the river, is laid out with great taste, well supplied with elms and other old trees, and has long been considered one of the most beautiful places in the country. Water power is furnished by a stream flowing through the town, and there are many mills, the chief manufactures being silk, cotton, and woolen goods, sewing silk, paper, buttons, and cutlery. The public buildings are the county court-house, town hall, Memorial hall, built in memory of Northampton soldiers who died in the war against rebellion, and public library; there are 6 banks, a high school, many district schools, and 8 churches. Here also are the Smith college for women, the Clarke deaf mute institute and the state lunatic asylum; besides privately endowed institutions for charities and aid. There are several hotels, one at Round hill on a hill near the village, was formerly famous as a water cure institution. There are many pleasant drives in the neighborhood, the whole region of the upper Connecticut valley being noted for its picturesque scenery. The main village is connected by horse cars with Florence, which is included in the township and where are extensive sewing machine factories and silk mills.

NORTHAMPTON, capital of the co. of the same name, a market-t., and parliamentary and municipal borough, on a rising ground on the left bank of the Nen, 67 m. n.w. of London by railway. In the center of the town is a spacious market-square. The
principal edifices are the shire hall, the new and handsome town hall, the corn exchange, the numerous churches, several of which are unusually interesting, as St. Peter's, a recently restored and beautiful specimen of enriched Norman, and St. Sepulchre's, much improved in 1885. One of the very few round churches in the empire, and referred to the 12th century. The hospitals of St. John and St. Thomas were religious houses prior to the reformation. Boot and shoe making, which affords employment to about 3,000 persons, is the principal branch of trade carried on here. Leather is made, and hosierly and lace are manufactured. Iron and brass foundries are in operation, and brewing is carried on. Two markets are held here weekly, a general one on Wednesday, and one for cattle on Saturdays. Pop. (1871) of parliamentary borough, 44,571, who return two members to parliament.

Northampton, a very ancient town, was held by the Danes at the beginning of the 10th c., and was burned by them in 1010. After the conquest, it was bestowed on Simon de St. Liz. Its castle was besieged by the barons in 1215, during the civil wars of king John. It was the scene of a great battle fought (July 10, 1460) during the wars of the Roses, between the rival houses, in which the earls of March and Warwick defeated the Lancastrians.

NORTHAMPTONSHIRE, a central co. of England, bounded on the w. by the counties of Warwick, Leicester, and Rutland, and on the s.w. by Oxfordshire. Area, 629,912 acres. Pop. '71, 243,891. Its surface is marked by gently undulating hills, alternating with well-watered vales. The chief rivers are the Nene and the Welland, both of which flow n.e., and fall into the estuary of the Wash. The county is traversed by the London and North-Western, the Great Northern, the Eastern Counties, and other lines of railway, and communication by water is maintained by the Union, Grand Junction, and other canals, as well as by the rivers. The climate of the county is mild and healthy; the soil, a black mould in the fen districts in the n.e., and brown loam on the uplands, is very productive. White and green crops are abundantly produced, and on the rich pastures cattle are extensively reared for the London market. Four members are returned to the house of commons for the county.

NORTHERN BASS ISLAND. See PUT-IN-BAY ISLANDS.

NORTH BERWICK. See Berwick, North.

NORTHBROOK, Lord. See Baring.

NORTH CAPE. See Mageroé.

NORTH CAROLINA (Carolina, North, ante), was first explored by a party of 108 persons sent from England by sir Walter Raleigh in 1584, and the first settlement was made on Roanoke island during that year. Trouble with the Indians, however, caused the colonists eventually to return to England, and no further attempt was made to colonize the region until several years later when people from Virginia succeeded in establishing themselves on the northern border. In 1663 Charles II. made a grant of the province, which included both of the Carolinas, to eight noblemen by whom great efforts were made to induce colonization, and shortly afterwards colonies of French, German, and Swiss Protestants came over. About 1700 the province was divided into North and South Carolina, and separate governments were organized. From this time up to the revolution, North Carolina was ruled by successive governors appointed by the English king. But in Aug., 1776, the colony ratified the Declaration of Independence, and in the following December held a convention at Halifax and framed a constitution for the state, which remained the organic law until 1861. After the revolution the state enjoyed much prosperity, and its history is marked by no particularly eventful period until the breaking out of the rebellion. The popular sentiment in the state at the beginning of 1861 was apparently in favor of the union; but after the surrender of fort Sumter and the declaration of war, an extra session of the legislature was called, and an ordinance of secession passed, April 20. The state thenceforth during the next four years suffered many disasters of war. In Aug., 1861, fort Hatteras and fort Clark were seized by federal forces; Roanoke island and New Berne were next captured by Burnside's expedition; and later the region about Plymouth, Kinston, and Washington was taken and occupied by federal troops. Other important battles fought in the state during the war were at Averysborough, Bentonville, and the taking of fort Fisher. As soon as peace was declared: a provisional governor, W. W. Holden, was appointed, and on Oct. 2, 1865, a convention assembled at Raleigh declared the ordinance of secession null, abolished slavery, and repudiated the state debt created to carry on the war. An election was held soon after, and a governor, legislature, and members of congress chosen. But as the newly re-organized government refused to ratify the fourteenth amendment to the constitution of the United States, the state was declared to be still under military authority, and was placed under the command of gen. D. E. Sickles. Another convention, therefore, was called, and the delegates met in Raleigh in Feb., 1868, and prepared a constitution that was ratified by the people and which congress approved. Accordingly the state was restored to the union in July, 1868. The state has suffered much in many ways during the past 15 years, its peace having been seriously disturbed for a long while by organized
bands of outlaws known as ku-klux klan and its political and financial affairs having been in a troubled condition.

The mineral resources embrace not only coal and iron of superior quality, but the precious metals. Of the coal deposits there are two fields, one in Stokes and Rockingham counties with an area of 30 sq.m., and another in Chatham and Moore counties with an area of 40 sq.m., of which each square mile is believed to contain 6,000,000 tons of coal of the best quality. The beds have been mined to some extent, principally at Egypt, Farmville, and Homsville. Gold has been found in 23 counties and has been mined to a considerable extent for nearly half a century. The most productive mines are the Gold Hill mines in Rowan co., which were discovered in 1842. Other regular veins have been worked in Davidson, Cabarrus, Stanley, Montgomery, and Mecklenburg counties; and irregular veins and surface gold are also found in the same counties to some extent, and in Catawba, Randolph, Union, and Franklin counties. Between 1888 and 1894 more than $1,000,000 in North Carolina, gold was deposited in U. S. mints. Silver is found in Davidson and Clay counties, but the mines have been little worked. Copper ores of various kinds exist in several parts of the state; also lead, zinc, antimony, and other metals are known to exist, with some small amounts of platinum and palladium. Mica is profitably mined in Mitchell and Yancey counties. Alum, graphite, jade, buhrstone, granite, kaolin, limestone, whetstone, grindstone, soapstone, and corundum are found, the latter in great abundance; and, in fact, the mineral wealth of the state is remarkably great. The agricultural products are chiefly rice, cotton, tobacco, sweet potatoes, wheat, and Indian corn; but the soil, as well as the climate, differs much in different parts of the state. The temperature of the lowlands is hot and humid; but in the interior, particularly in the Piedmont and the mountain section, the air is singularly pure, dry, and elastic. The mean annual temperature at Raleigh is 60°; at Asheville, 50°; at Wilmington, 63°; and the average rainfall is about 45 inches. Although the coast region the swamp lands when drained and the river bottoms are fertile, and rice grows well. Further inland the soil improves and is well adapted to wheat, rye, barley, oats, and flax. Cotton is raised principally in the counties along the southern border. The western and mountainous portions are best adapted to grazing, and in these parts stock raising is the leading pursuit. The forest trees of the uplands are oak, hickory, ash, walnut, and lime; in the lowlands, the long-leaf pine: and in the swamps, cedar, cypress, maple, oak, and poplar. A very large extent of territory, extending from a point near the line of Virginia across the entire state, varying in width from 30 to 80 m., is covered with the long-leaved pine, which yields a large share of the world's supply of resin, oil of turpentine, raw turpentine, tar and pitch. In 1870 the state contained 5,298,742 acres of improved land, 12,026,894 acres of woodland, and 2,344,774 acres of other unimproved land. The total number of farms was 93,563, the average size of which was 212 acres. Their cash value was estimated to be $78,211,083, and that of their products, including betterments and additions to stock, about $37,845,910. Among the productions of that year were: spring wheat, 405,299 bushels; winter wheat, 2,451,641; rye, 352,006; Indian corn, 18,454,215; oats, 3,220,105; barley, 3,189; buckwheat, 20,109; peas and beans, 532,749; potatoes, 738,803; sweet potatoes, 3,071,840; hay, 83,540 tons; cotton, 144,935 bales; rice, 2,059,281 lbs.; tobacco, 11,150,087 lbs.; wool, 799,667; butter, 4,207,834; cheese, 75,185; flax, 59,552; honey, 1,404,040; cane sugar, 35 hogsheads; wine, 62,548 gallons; maple molasses, 418.

The leading manufacturing industries are the sawing of lumber and the production of resin, tar, pitch, turpentine oil, cotton-seed oil, tobacco, flour, and the sinewing of ores. In 1870 there were 3,042 manufacturing establishments in the state, employing 13,622 hands, and using $8,140,473 in capital, raw material valued at $18,824,693, and producing goods worth $19,021,327. Of these establishments there were 174 tar and turpentine works; 227 flouring and gist mills; 104 saw-mills; 33 cotton mills; 110 tobacco factories; 12 lime kilns and rolling works; and 130 carriage and wagon factories. The state is divided into 104 counties, and into 9 customs districts—Albemarle, Beaufort, Pamlico, and Wilmington; and it exports, coastwise and to foreign countries, large quantities of tar, turpentine, and resin, lumber, cotton, tobacco, flour, and fish. During 1870 the shipments of resin and turpentine amounted to 426,395 barrels, valued at $1,159,022; and of tar and pitch 17,660 barrels, worth $42,824. The fisheries of North Carolina are more important than any others on the southern coast, the annual catch amounting usually to 100,000 barrels. The kinds caught are chiefly the herring, shad, bluefish, mullet, and rock.

The number of railroads lying wholly or partly in the state in 1875 was 17, and the number of miles of road in operation 1488. The most important of these roads are the North Carolina railroad, 223 m. long; the western North Carolina, 250 m.; the Wilmington and Weldon, with a branch running from Tarboro to Rocky Mount, 181 m.; the Atlantic and North Carolina, 95 m.; the Raleigh and Gaston, 97 m.; and the Wilmington and Columbus, 85 m. in about 45 counties. The Dismal Swamp canal, lying in North Carolina and Virginia, affords communication between Albemarle sound and Chesapeake bay. The number of national banks in the state in 1875 was 11, having an aggregate capital of $2,200,000, and an outstanding circulation, secured by U. S. bonds, of $1,824,545. There were also 8 state banks, with an aggregate capital of $1,697,000; and 3 savings banks, loan, and trust companies, whose capital amounted to $180,000. Two
fire insurance companies, one at Raleigh and the other at Warrenton, possessed assets amounting to $364,827; and there was also one life insurance company at Raleigh with a capital of $200,000, and assets amounting to $321,000.

Financially, the state has never been in a very satisfactory condition since the war. The ante-war debt in 1874 amounted to $8,878,300, but several railroad operations, together with other liabilities incurred by the state, brought up the aggregate indebtedness that year to $38,921,848, of which about $10,000,000 was for due and unpaid interest. In 1875, however, the state treasurer reported to the legislature that the total amount of the debt, principal and interest, was $27,120,727. This legislature passed an act for the sale of bonds. On July 1, 1876, the interest on the bond debt, the state and county capitulation tax, together with the revenue derived from certain fines, forfeitures, and penalties, should be devoted to school purposes. At present about $300,000 is expended annually, and the public schools are kept open four months each year. A state superintendent, assisted by county commissioners and district committees, has control and supervision of the system. In 1870 the number of children in the state between the ages of 5 and 18 was 559,930, of whom 135,845 were colored. The number attending school was 65,301, of whom 11,419 were colored. In 1878, however, the report was considerably more favorable, the number of white pupils attending school during that year having been 145,155, and of colored 15,290. Substantial aid is received also from the Peabody educational fund, which maintains, during ten months of the year, from 20 to 30 graded schools, each having from 100 to 500 pupils. Besides these public school advantages the state has six colleges: the North Carolina University at Chapel Hill, chartered in 1839; North Carolina college (Lutheran), at Mt. Pleasant; Wake Forest college (Baptist), Forestville; Rutherford college (Methodist), at Exselsior; Trinity college (Methodist), at Trinity; Davidson college (Presbyterian), at Davidson; and Shaw university (Baptist, for colored students, male and female), at Raleigh. Several of these colleges have preparatory, theological, scientific, and other special courses; and there are within the state many academies and seminaries of respectable rank, among which may be mentioned the Ellendale teachers' institute at Little River, and the Williston academy and normal school at Wilmington. Of the total number of libraries throughout the state, reported in 1870, there were 1,456, containing about 541,915 volumes, of which 1090 were private. The newspapers and periodicals published amount to about 102, there being 10 daily papers, 80 weeklies, 4 monthlies, etc. The religious organizations, by the census of 1870, numbered 2,683, and possessed 2,487 edifices with 718,310 sittings, and property valued at $8,487,877. The denominations represented were: Baptist, 958; Christian, 60; Congregational, 1; Protestant Episcopal, 77; Presbyterian, 28; Jewish, 1; Lutheran, 73; Methodist, 1193; Moravian, 10; Presbyterian, 204; German reformed, 31; Roman Catholic, 10; Universalist, 2. The constitution of North Carolina, framed and adopted in 1868, declares that the state shall forever remain a member of the American union, and that there is no right on the part of the state to secede; that every citizen owes paramount allegiance to the constitution and government of the United States; that the state shall never assume or pay any debt incurred in aid of insurrection against the United States; and that no property qualification shall be required as a condition of voting or holding office. The executive power is vested in a governor, lieutenant-governor, secretary of state, auditor, treasurer, superintendent of public works, superintendent of instruction, and an attorney-general, all of whom are elected every four years. The legislature consists of a senate of 40 members, and a house of representatives of 120 members, who are elected every two years. The judicial power is vested in a supreme court consisting of a chief-justice and four associate judges; inferior courts have one judge in each county, and the judicial districts into which the state is divided, and courts of justices of the peace. The right to vote is conferred upon every male citizen 21 years of age, who shall have resided in the state 1 year and the county 30 days previous to election. Atheists are disqualified for office, and also all persons who have been convicted of treason, perjury, or other infamous crimes, and not legally restored to the rights of citizenship. Under the apportionment of 1872 the state is entitled to 8 representatives in congress, and 10 electoral votes. The electoral votes have been cast as follows: 1792, Washington and Clinton, 12; 1796, Adams and Pinckney, 12; 1800, Jefferson and Burr, 12; 1804, Jefferson and Clinton, 14; 1808, Madison,
Northcote, north-east.

for president, 11; 1812, Madison and Gerry, 15; 1816, Monroe and Tompkins, 15; 1820, Monroe and Tompkins, 15; 1824, Jackson and Calhoun, 15; 1828, Jackson and Calhoun, 15; 1832, Jackson and Van Buren, 15; 1836, Van Buren and Johnson, 15; 1840, Harrison and Tyler, 15; 1844, Clay and Frelinghuysen, 11; 1848, Taylor and Fillmore, 11; 1852, Pierce and King, 10; 1856, Buchanan and Breckenridge, 10; 1860, Breckenridge and Lane, 10; 1868, Grant and Colfax, 9; 1872, Grant and Wilson, 10; 1876, Tilden and Hendricks, 10; 1880, Hancock and English, 10.

NORTHCOTE, Sir Stafford Henry, b. London, 1818; educated at Eton, and Oxford university, graduating at Balliol college in 1839 with high honors. His first position in political life was that of private secretary to Mr. Gladstone, when the latter was president of the board of trade. In 1847 he was called to the bar and was made legal secretary to the board of trade. In 1851 he succeeded to the family title and estates as eighth baronet of the line. For the next three years he was occupied in examining the state of the English civil service, and the report made by him and his colleague Sir C. E. Trevelyan, led to the establishment of the present system of competitive examinations. He was member of parliament from Dudley and Stamford from 1856-66, and was then returned from North Devon, which place he has since represented in the interest of the conservative party. He was president of the board of trade (1866-67), and in 1867 was made secretary of state for India. He was appointed a member of the joint high commission which signed the treaty of Washington on May 8, 1871. On the formation of Disraeli’s cabinet in 1874, sir Stafford Northcote was made chancellor of the exchequer, and when his leader was elevated to the peerage under the title of lord Beaconsfield, Northcote became himself the leader of the house. He is a magistrate and deputy-lieut. of Devonshire, a fellow of the royal society, and has received from Oxford the honorary title of D.C.L. He has published a number of political and financial pamphlets such as Twenty Years of Financial Policy, Summary of the chief financial measures passed between 1842 and 1861, with a table of Budgets (London, 1892).

NORTH EAST AND NORTH WEST PASSAGES. The numerous and important discoveries made by the Portuguese and Spaniards in the southern latitudes of Asia, and the reports which on their return they spread of the fabulous wealth of those regions, excited the attention of the other maritime nations of Europe, and prompted them to send out expeditions to the East Indies for the purpose of obtaining a share in the lucrative traffic of which Spain had hitherto possessed the monopoly. But the latter power, then at the height of her prosperity, was not disposed to admit other nations as sharers of her good fortune, and dealt so summarily with all intruders, having at that time the complete command of the Atlantic and Indian oceans, that her rivals were reluctantly compelled to abandon all thoughts of trading in those seas. Unwilling, however, to lay aside their designs of opening a trade with the far-famed India and Cathay (as China was then called), they resolved to attempt to reach those regions by some other route. Two plans appeared most feasible—the one to reach Eastern Asia by coasting along the north of Europe and Asia, the north-east passage; the other by sailing westward across the Atlantic. The latter was first attempted by John Cabot in 1497, but he found his progress barred by the American continent, or, at least, those parts of it known as Newfoundland and Labrador. Three years afterward Gaspard Cortal and his brother made three several voyages in the same direction; and on reaching Newfoundland sailed northward, but were stopped on the coast of Labrador, in lat. 60° n. Both brothers afterward perished with all their followers. Several voyages were soon after made to discover if a passage for ships existed to the n. of America (the north-west passage), but without success; and the hardships which navigators were subjected to in these inhospitable climes, caused the abandonment for the time of all further investigations in that direction.

North-East Passage.—The search for a north-east passage was now vigorously prosecuted, and England had the honor of sending out the first expedition for this purpose in 1553. It consisted of three ships, commanded by sir Hugh Willoughby, and was fitted out under the direction of the celebrated Sebastian Cabot; but on rounding the North cape, one of the ships was separated from the others during a violent storm, and subsequently entered the White sea, then unknown to western Europeans. The other two, under Willoughby, drifted hither and thither, in the vast waste of water surrounding the pole, till the navigators sighted Nova Zembla. Being unable to land, they sailed back along the north of Russia, and took up their winter quarters on the coast of Russian Lapland, where they were subsequently found frozen to death. Several other expeditions were, at different times, sent out by the English and Dutch, but none of them ever succeeded in penetrating further than the e. coast of Nova Zembla, though they rendered good service to geography by making accurate surveys of Northern Europe and the archipelago of Zemblia. Nova Zembla, Waygatzen, etc. It was for a long time believed that the promontory which forms the eastern boundary of the gulf of Obi was the tipus of Pliny, and formed the n.e. corner of Asia; and this opinion, which received the assent of the celebrated Gerard Mercator, tended greatly to encourage renewed explorations, as, according to it, the eastern coast of Asia was not more than 400 m. from Nova Zembla. The following is a list of the chief expeditions for the discovery of the north-east passage:
Northern.

684

Williamby and Chancelor .................................... English, 1553
Burroughs .................................................................. 1556
Pet and Jackman .................................................. Dutch, 1594–1596
Barentz, William (three expeditions) ......................... Dutch, 1594–1596

Hudson, Henry

first expedition ..................................................... English, 1608

second expedition .................................................. Dutch, 1609

Wood ........................................................................ 1678

In his third expedition Barentz nearly reached icy cape, about long. 100° e., but was, with his crew, imprisoned by the ice, and died before the return of spring. Various important discoveries were made during this expedition, which proved that in favorable seasons a passage could be found to the eastward, but after the subsequent failures of Hudson and Wood, the attempt was abandoned in despair. The Russian government now took up the search, and both by overland expeditions, and by vessels starting from various points in the northern continent, a series of subterranean, n. w. passage, was made. The chief of these expeditions were those of Behring in 1741, which started from Petropavlovski, and was stopped at the East cape; of Shaloroff; and of Billings. In 1785, and again in 1786, Prof. Nordenskiöld reached the eastern shores of the gulf of Obi; and in July, 1787, a well-equipped Swedish expedition, under that veteran explorer attempted once more the n. e. passage. The party successfully rounded cape Chelyuskin, and in September were able to start from the mouths of the Lena from Behring's strait.

North West Passage. — As was formerly mentioned, Sebastian Cabot and the brothers Cortereal were the first who attempted to double the n. coast of America; Cabot had reached as far n. as lat. 67° 30', in the strait between Greenland and America, but the courage of his crew failing, he was compelled to return. Notwithstanding his urgent representations, he was unable to prevail upon the English monarch to send out another expedition, and it was not till after several unsuccessful attempts had been made to find a n. w. passage that investigations of the coast of America were resumed, and these investigations were carried on till within the last few years solely by the English, their prosecution till a definite result was arrived at came to be looked upon as a point of national honor, and repeated expeditions were sent out long after it had been clearly shown that a n. w. passage, when found, would be useless in a mercantile point of view. In all, more than 200 voyages were made in search of a n. w. passage, so that only the most important of them can be even mentioned. The first expedition, after that of Cabot, was sent out in 1576, under Martin Frobisher, who made a second and third voyage in the next following years, but without any important discovery. In 1585–88 northern enterprise received an impetus from the successful expeditions of Capt. John Davis. This navigator sailed up the strait which bears his name, as far at lat. 72° n., and reported open sea still further n.; he then surveyed the e. and w. sides of the strait, but without further results. Henry Hudson (q.v.), who had previously attempted the n. e. passage, followed in 1610, and discovered the Hudson strait and bay, believing the latter to be none other than an inlet of the Pacific ocean, an opinion which was proved erroneous by the investigations of Button in 1612; the latter, however, disseminated on his return the equally erroneous opinion that the bay was closed in on all sides, with the exception of the two eastern entrances. Button's account was not universally credited, and, accordingly, in 1615, Capt. Bylot, who had been one of Hudson's company, was sent out, accompanied by Baffin, the most skillful navigator and scientific observer of the time; but their first expedition, which was to Hudson's bay, was devoid of results. In their next voyage (1616), they sailed up Davis's strait, reaching lat. 78° n., and, satisifying themselves by a very superficial investigation that their was no northern outlet, the bay (as it was then believed to be) was named in honor of his explorer Baffin's bay. On their return southwards, they coasted along the w. side, and discovered an opening to the w. which they named Lancaster sound, but believing it to be only an inlet, did not explore further. On his return, Baffin gave it as his decided opinion that no outlet to the w. existed from Baffin's bay, and the attention of explorers was again directed to discovering a new outlet from Baffin's bay. In 1619 the solitary attempt by foreign powers to aid in the search was undertaken by Jens Munk, a Dane, but he made no discoveries, and the attempt was not renewed. The expedition of Fox and James, in 1611, led to the partial exploration of the channel since known as the Fox channel, which forms the northern outlet to Hudson's bay, and from this time the spirit of discovery slumbered till 1741. Between this date and 1746, several expeditions were sent out to discover an outlet from the n. w. corner of Hudson's bay, but their united researches satisfactorily proved that no such outlet existed. Owing to these disappointments, the search for a n. w. passage was discontinued for more than half a century, notwithstanding the fact of the British parliament having promised a reward of £20,000 to the fortunate discoverer. In 1818 the admiralty took up the search, and sent out Captain John Ross and Lieut. Parry, who sailed up Davis's strait, and ascended Lancaster sound for 90 m.; here Capt. Ross gave up the search, considering it to be hopeless. But this opinion was by no means confirmed by the subsequent investigations of the coast, which were continued the following year, and succeeded in far outstripping all his predecessors in the career of northern discovery. He entered Lancaster sound on July 30, and a few days afterward discovered a large inlet, 30 m. broad, which he named Prince Regent Inlet. After exploring this inlet for some distance, he returned, and continued his course westward, as the ice allowed him, passing
through a strait which he named after sir John Barrow, the promoter of the expedition. Continuing his westward course, he reached long. 110° w., in Melville sound, where he was stopped by the ice; and after wintering here, and giving names to the numerous islands, seas, and straits he had discovered, returned to Britain, with the glory of having advanced 30° of longitude further w. than any previous explorer. On his arrival he was welcomed with the utmost enthusiasm; and his discoveries imparted renewed energy to the half-dormant maritime enterprise of the British. There was now no doubt in what direction the n.w. passage was to be sought; but Parry's second expedition (1824–29) was for the purpose of determining whether the Fox channel was connected with the Arctic seas by a continuous passage; which, however, unsuccessful. A little before this time the coast-line of North America from Behring's strait to point Turnagain, in long. 109° w., had been fully traced, so that it only remained to find some navigable passage from Regent inlet to this point, and the long-wished-for result would be attained. For this purpose capt. John Ross was sent out with an expedition in 1829, and after a laborious and difficult voyage up Prince Regent inlet, reached a point only 200 m. from point Turnagain. It was during this voyage that he discovered the magnetic pole. Dease and Simpson, in 1838, extended the survey of the American coast from point Turnagain to within 90 m. of the magnetic pole, but the hopes of a channel between these points were dashed by the discovery made by Dr. John Rae, in 1847, that Boothia (the land which bounds Regent inlet on the w.) is a peninsula of the American continent. We now come to the unfortunate expedition of sir John Franklin, which, it was fondly hoped, would settle the question of a n.w. passage. It ended February 1845, and was last seen in Baflin's bay. Franklin is believed to have sailed through Lancaster sound, and ascended Wellington channel to lat. 77° n., and thence returned southwards, crossing Barrow strait, and sailing down the channel (now called Franklin channel) which separates North Somerset and Boothia Felix from Prince of Wales island to the w., where, in lat. 70° n., long 98° 30' w., his ships were beset with ice, Sept. 12, 1846, and Franklin died June 11, 1847. The survivors abandoned the vessels 20 m. s.w. of this point, and perished in the attempt to reach the American mainland. Many expeditions were sent out to search for the missing voyagers, and one of these expeditions, under Collinson and M'Cure, sailed from Plymouth, Jan. 29, 1850, and reached Behring's strait in August the same year. Sailing eastward the following spring, M'Cure's ship became fixed in the ice, about 60 m. w. of Barrow strait, and the crew were picked up by sir Edward Belcher, who had been sent out in April 1852 to the same locality. Belcher, having reconnoitred Melville sound by the eastern passage through Lancaster sound and Barrow strait, returned the same way; and thus M'Cure and his company enjoyed the envied honor of being the only ship's crew who had ever penetrated from Behring's strait to Baflin's bay. To M'Cure, then, belongs the honor of having finally set at rest all doubts as to the existence of a n.w. passage. By the various English and American expeditions (1848–59) sent out to search for sir John Franklin, the whole region to the n. of the American mainland as far as lat. 77° n., and long. 106° w., has been thoroughly explored, and various channels of communication between Davis's and Behring's straits have been discovered, such as the route by Hudson's bay, Fox channel, Fury and Hecla strait and Bellot strait, into Franklin channel, and thence by either the M'Clintock or the Victoria channel, or the routes by Lancaster sound, and the M'Clintock channel, Prince Regent inlet, or Prince of Wales strait, to the open sea n. of Alaska, but all these routes are useless in a mercantile point of view. See Polar Expeditions.

NORTHERN LIGHT-HOUSES. Commissioners of. The body corporate which has under its management the whole of the light-houses of Scotland and Isle of Man. The body was first constituted by act of parliament 26 Geo. III., but has been frequently since the subject of legislation. The light-houses of the Isle of Man were assigned to it in 1815. By the Merchant shipping act, 1854, the commissioners are so far limited in their power, that any proposal for a new light-house must receive the approval of the Trinity house, London, and the outlay must be sanctioned by the board of trade; the cost, however, is borne by the imperial light-house fund. The commissioners act wholly in virtue of office, and give their services gratuitously. The body consists of the lord advocate, solicitor-general, lord provost and senior bailie of Edinburgh; lord provost and senior bailie of Glasgow; lord provost of Aberdeen; provosts of Inverness, Campbellton, Dundee and Greenock; the sheriffs of the following counties: Aberdeen, Argyle, Ayr, Berwick, Bute, Caithness and Sutherland, Edinburgh, Elgin, Fife, Forfar, Haddington, Inverness, Kinross, Lanark, Orkney and Shetland, Renfrew, Ross, Selkirk, and Kirkcudbright. They are assisted by the advice of a secretary and consulting engineers. In 1877 the number of light-houses under the charge of the commission was 60, beside buoys and beacons. The commissioners own a steam vessel, the Pharos, for supplying stores to the several light-houses, and performing annual visits of inspection. The whole system of northern lights is remarkably well organized, the merit of which is in a great measure due to the late Robert Stevenson (q.v.). A royal commission appointed some years ago to inquire into the management of the English, Irish and Scottish light-houses, has acknowledged that the "Scotch light-houses are in the best state of general efficiency, the English next, and the Irish third."
NORTHERN LIGHTS. See Aurora Borealis, ante.

NORTH HOLLAND CANAL. Designed by Herr Blanken, and finished in 1825. It runs from Amsterdam to the Helder, 50 m., and has a water-level width of 123 ft., with a depth of 18 ft., and a bottom width of 31 ft. It enables vessels trading from Amsterdam to avoid the island, and sand-banks of the dangerous Zuyder Zee, the passage through which once took as many weeks as it now does hours. The greatest difficulties in the way of the work were the proverbial lowness of the country, and the necessity of preventing the assaults and encroachments of the sea. The level is such that vessels are locked down from the sea to the canal.

NORTH RIVER. See Hudson River.

NORTHROP, Birdsey Grant, b. Conn, in 1817; took the degrees of B.A. (1841), M.A. from Yale, and studied at the Yale divinity school. He settled as pastor at Springfield, Mass., where he remained about ten years. From 1857 to 1866 he was agent of the Massachusetts board of education, and in 1866 became secretary of the state board of education of Connecticut, a position which he still occupies. He has published a number of papers on the subject of education, and has also done much to encourage the beautifying of country towns by planting shade trees.

NORTH SEA (Germaniam Mare; Ger. Nord See), that arm of the Atlantic ocean which separates the British islands on the w. from the continent on the east. It is 700 m., in extreme length (from n. to s.), about 400 m., in greatest breadth, and has an area of not less than 140,000 sq. miles. The great commercial highways from the North sea to the Atlantic, and the Porth of Dover, which is the strait of Dover where the coasts of Great Britain and the Baltic by the Skagerrack, the Kattegat, Sound, and Great and Little Belt. Along its south-east and southern coasts the shores are low, and are skirted by sand-banks, formed by the sand deposits carried to the sea by the waters of the Elbe, Weser, Rhine and Scheldt, which are the principal rivers that flow into the sea from the east. The shores of England, especially in the s., are also low, and here sand has also accumulated, though not nearly to the same extent as on the continental coasts. The chief British rivers that fall into the North sea are the Thames, Ouse, Humber, Tyne, Tweed, Forth, and Tay. Besides the sand-banks on the coast already referred to, there are others extending to the middle of the sea-bed, and similar in their origin to those on the coasts, and occupying altogether about three-fourths of the entire area. Of these, the principal are the bank running n.e. from the mouth of the Firth of Forth for 110 m.; the one extending n.w. from the mouth of the Elbe for about the same distance; the Dogger Bank, which is surrounded with sand-banks and extends along the North sea, renders its navigation unusually dangerous. Another peculiarity of the bed of this sea is, the number of extraordinary "holes" which have been found in it. Of these the most remarkable are the Little Silver Pitt off Holderness in Yorkshire, and the North-north-east Hole, 8 leagues further east. Little Silver Pitt is 35 m. in length, and from half a mile to 2 m. in width. At its edges there is a depth from 50 to 80 ft. of water, but the "hole" has a depth of 339 ft. In the n., along the Norwegian coasts, the shores are steep and rocky, and there is a depth of about 190 fathoms. The depth (31 fathoms on an average) increases from s. to north. The currents of this ocean are extremely various, and demand the greatest caution on the part of the navigator. Owing to the prevalence of s.w. winds, the currents show a general tendency towards the north-east. On the south-western coast of Ireland, the great tidal wave of the Atlantic is broken into two portions, one of which, coursing up the channel, passes through the strait of Dover; while the other, sweeping n., passes round the n. of Scotland, and then south-west along the e. coast of Britain, and meets the southern wave off the coast of Essex. The northern portion of the tidal wave spreads over the whole of the German ocean, and though on its entrance into the North sea it is only 12 ft. in height, it rises in its progress southward, as the sea becomes narrower, in the same way as the bore (q.v.) is formed in a contracting estuary. In the estuary of the Humber it rises to the height of 20 ft. This sea yields immense quantities of fish, the most important kinds being cod, hake, ling, turbot, sole, mackerel and herring, also lobsters. The fisheries employ many thousand people. On all available points of the coasts, light-houses have been erected, and there are numerous floating-light vessels moored to detached banks. The traffic on the North sea is enormous. It is surrounded by countries whose inhabitants have from the earliest times been famous on the seas, and the enterprise and national bias that formerly covered the Scandinavian waters with conquering fleets, may now be traced in the vast commercial intercourse carried on on the North sea.

NORTH SEA CANAL, or Amsterdam Canal. The rapid increase of the trade of the ports to the southward and eastward of the Helder made it imperative for the merchants of Amsterdam to provide better communication with the North sea than that afforded by the north Holland canal already noticed. In 1865 a company was formed to construct a canal nearly in a direct line to the North sea from Amsterdam, through lake Y and Wyker Meer, 161 miles. Mr. Hawkshaw and Herr Dieks were appointed engineers. The canal terminates in the North sea, in an artificial harbor, inclosed by two piers of concrete on a foundation of rough basalt. Each is 5,069 ft. long, and the area inclosed is about 250 acres. A cutting 3 m. in length through the sand-dunes follows,
involving the excavation of 6,213,000 cubic yards. Between Wyker Moor and lake Y another cutting 227,000 cubic yds. occurs. There is a set of locks at each end, and the average section of the canal is: water-level, 197 ft.; bottom, 89 ft.; depth, 23 feet. The cuttings were first made, and the material was deposited in two banks, 443 ft. apart, through the lakes, the total length of bank being 383 miles. These enable about 12,000 acres, once covered by water, to be reclaimed, and for this purpose there were set up three Appold pumps, the largest ever made, the fans being 9 ft. in diameter, maximum lift 9 ft. 9 in.; at the ordinary working lift, the three discharge 2,700 tons a minute.

Visitors to the American exposition of 1876 will remember the splendid set of drawings and pictures of this canal, the most gigantic work of the kind yet undertaken. The contract sum was originally over $12,000,000.

NORTHUMBERLAND, a co. in e. central Pennsylvania, bounded on the w. by the Susquehanna river and its w. branch; drained by them and the n. branch of Susquehanna, and by Shamokin and Mahonoy creeks; on the Delaware, Lackawanna, and Western, Northern Central, Sunbury, Hazleton, and Wilkesbarre, and Sunbury and Lewistown railroads; 400 sq.m.; pop. 1870, 55,123—48,364 of American birth. The surface is irregular and hilly, with fertile valleys between. The principal productions are Indian corn, oats, wheat, buckwheat, potatoes, and hay. There are many tanneries, currier's shops, saw, flour, and planing mills, manufactories of machinery, metal wares, clothing, carriages, and harness. Co. seat, Sunbury.

NORTHUMBERLAND, a co. in e. Virginia, bounded on the e. by Chesapeake bay, and on the n.e. by the mouth of the Potomac river; 200 sq.m.; pop. '80, 7,927—7,907 of American birth; 3,484 colored. The surface is undulating and heavily wooded in parts, and much of the soil fertile. The principal productions are Indian corn, wheat, oats, potatoes, and sweet potatoes, wool, and sorghum molasses. Co. seat, Heathsville.

NORTHUMBERLAND, the most northern co. of England, is bounded on the e. by the North sea, and on the n.w. by the Scottish counties of Roxburgh and Berwick. Area, 1,290,312 statute acres; pop. '71, 388,646. The surface of the county has a rugged, and especially in the w. and s.w. a naked and barren aspect. The Cheviots run along the western border of the county, and send out spurs toward the e., which, gradually declining, are separated by fertile valleys, that widen as they approach the coast. About one-third of the area of the county is occupied by moorland, and along the Cumberland border the broken and bleak-looking hills are valuable for their lead mines. Allenheads, the center of the lead mining district, is the highest inhabited spot in England, being 1,104 ft. above sea-level. The continuation of the surface toward the e. is indicated by the direction of the rivers Alne, Coquet, and north Tyne, which with the Tyne and Till are the principal rivers of the county. The Tweed forms the boundary of the county on the n. for about 5 miles, and the s. boundary is formed in part by the Derwent and Tyne. The climate is cold, but is milder on the coast than amid the hills, which, however, produce sufficient herbage for the maintenance of large flocks of "Cheviot" sheep. The principal agricultural tracts occur along the coast, and inland along the river valleys for several miles. In these districts, the soil, for the most part, is a strong fertile chaly soil, productive in wheat, barley, beans, and clover. Agriculture is pursued on the most improved methods, and cattle, chiefly short-horned, are extensively reared. The s.e. portion of the county forms a part of the great Northumberland and Durham coal-field, which produces about 25,000,000 tons annually. There are upwards of 160 pits in operation in the county, which are traversed by the Newcastle and Carlisle, North-Eastern, and Border Counties railways. The county returns four members to the house of commons; the county town is Alnwick (q.v.).

NORTHUMBERLAND, a co. in n.e. New Brunswick, on the gulf of St. Lawrence, drained by the Miramichi river and its branches; 4,760 sq.m.; pop. '71, 20,116. Co. seat, Newcastle.

NORTHUMBERLAND, a co. in Ontario, Can., bounded on the s. by lake Ontario, intersected by the Grand Trunk, and Cobourg, Peterborough, and Mannora railroads; 745 sq.m.; pop. '71, 39,086. Co. seat, Cobourg.

NORTHUMBRIA, Dukes of. See Percy, ante.

NORTHUMBRIA, a kingdom in the Saxon heptarchy, made a separate kingdom by Ida in 547, who united the two kingdoms of Bernicia and Deira. It stretched to the firth of Forth, and comprised the territory n. of the Humber. Again divided upon Ida's death, it was once more organized into one kingdom by Ethelfrith in 583. Under Oswald, in the middle of the 7th c., it was the strongest kingdom in the heptarchy. Its separate existence was brought to an end by Egbert in 827. The name survives in the modern county of Northumberland.

NORTH WALSHAM, a small market t. of England, in the co. of Norfolk, on an acclivity on the right bank of the Ant, 14 m. n.n.e. of Norwich. Its market-cross, repaired after the great fire in 1600, by which the town was almost entirely burned down, dates from the reign of Edward III. Pop. '71, 2,842.

NORTH-WEST PROVINCES, a great political division of British India (see India), between Nepal and Oude on the n.e., and Rajpootana and the Indore agency on the s.w., consisting of seven subordinate divisions—Meerut, Kumaon, Rohilcund, Agra, Jhansi,
North-western.
Norton.

Allahabad, and Behares. Each of these divisions comprises from three to six districts. They are treated under separate articles. The area of the North-West Provinces is 81,408 sq.m., and the pop. in '72 amounted to 30,781,204. The capital is Allahabad.

NORTHEASTERN UNIVERSITY, at Evanston, Ill., a Methodist university chartered in 1851, but not fully organized until several years later. The endowment is in real estate of uncertain value, but is estimated at $800,000: annual income, $40,000.

The university grounds are on the shore of lake Michigan, and, together with the buildings, are valued at 200,000. The principal buildings are university hall, containing the chapel, library, museum and recitation rooms; lecture hall, used by the theological department; and the woman's college of literature and art. The university, besides a preparatory school, embraces seven departments, each with a separate faculty, as follows: 1. department of literature and science; 2. department of technology; 3. department of literature and art, formerly known as the college of letters; 4. conservatory of music; 5. department of theology, or Garrett Biblical institute; 6. department of law; 7. department of medicine. The library contains 30,000 volumes, and has a fund of $60,000 at interest, to be ultimately used in erecting a fire-proof library building. The Garrett Biblical institute, on the university grounds, has a distinct charter and board of trustees, but sustains a cooperative relation to the university. The museum contains 15,000 specimens. Professors in all departments (1880), 37; students in all departments, 703; alumni of all departments, 1174. A thorough preparatory school is maintained with a distinct building and faculty. President (acting), Oliver Merey, L.L.D.

NORTHWEST TERRITORIES, the designation of all that portion of British North America under the dominion of Canada, except the provinces of Manitoba and British Columbia, lying w. and n. of the provinces of Quebec and Ontario. On the n. it is bounded by the Arctic ocean, on the e. by the Atlantic, on the w. by the Pacific, and on the s. by parts of Canada and the United States. Its length e. and w. is about 2,500 m.; breadth of the mainland n. and s. 1,500 m.; and its estimated area, including the islands in the Arctic ocean, about 2,750,000 sq. miles. A great portion of the region consists of inland seas, bays, lakes, rivers, swamps, treeless prairies, and barren hills and hollows. By one explorer it has been not inaptly called "the fag end of the world." In the s.w. the face of the country is level or rolling; farther e. the surface is broken and there are mountains 1000 ft. high; and on the Atlantic coast there are rocks, lakes, swamps, and mountains. The extreme n. is intersected with lakes, marshes, and rivers to a greater extent than any other portions of the globe that have been explored. The country immediately s. and w. of Hudson's bay is generally well wooded and has a fair soil. The principal rivers of the territories are the Churchill, Nelson, Severn, Albany, Abibibbi, East Main, and Great Whale rivers, flowing into Hudson's bay; the Mac-Keuzle, Coppermine, and Red Fish rivers, flowing into the Arctic ocean; the Saskatchewan, Assiniboin, and Red rivers, falling into lake Winnipeg; and the Caniapiscau and Natwakame rivers, falling into Hudson's strait. The chief lakes are the Great Bear, Great Slave, Athabasca, Winnipeg, Manitoba, Lake of the Woods, Winnipegoos, Clearwater, Nelson, Deer, Wollaston, North-Lined, Mistassini, and Abibibbi. The geology of the region is not accurately known; but the western limits of the Hudson's bay basin are believed to be in part marks off by hills of metamorphic rock, and the iron and lignite-bearing beds of Colorado and Wyoming appear to continue northward to the region. The s. from this is almost entirely more than ten inches even in midsummer, and from the middle of October to the middle of May the country is buried under snow, while the smaller rivers and lakes are frozen to the bottom. In the w., however, the temperature is somewhat higher, and in the s. very variable, the range being 14°. A region commencing at the 100th meridian and 49th parallel and extending n.w. to the 52d parallel and 113th meridian embraces about 50,000 sq.m. that has a prairie hay which preserves its flavor and nutritive properties throughout the winter and provides the herds of buffalo with food. Here and there along the principal rivers and around the larger lakes are tracts capable of cultivation. The best of these localities are the valley of the Peace river, the district along the upper waters of the Athabasca and the upper valley of the Saskatchewan. Of the wild animals that are found the buffalo, beavers, sables, martens, wolves, foxes, bears, and others are very numerons, making the territories the most important fur-producing portion of the world. The musk-ox and some species of deer are also abundant, and the seal and walrus are found on the shore of the Arctic ocean. The principal rivers and lakes are well-stocked with fish, including perch, carp, pike, whitefish, and sturgeon.

The history of this immense region dates back to 1610 when Hudson's bay was discovered by John Hudson, an English navigator. Sixty years later Charles II. granted a great tract within its limits to prince Rupert, the duke of Albemarle, and others, who organized the Hudson's bay company to carry on the fur trade. This tract by the original charter was called "Rupert's land," and it constituted one of the king's colonies or plantations in America and was defined as all the lands and territories upon the countries, consis, and confines of the seas, bays, lakes, rivers, and sounds, in whatsoever latitude they might be, that lay within the Hudson's straits, and that were not already
possessed by the subjects of any other kingdom. Up to 1870 the whole region was known as the Hudson's Bay territory and was governed by the Hudson's Bay company, by whom it was divided into four large departments or regions which were subdivided into 33 districts, including 155 trading posts. The government was administered by a chief governor and council, and the various departments by chief factors and traders. But in 1869 the company relinquished governmental functions, and during the following year the Northwest Territories came into the possession of Canada and were made a province. The scanty population is mostly Indian or half-breeds, and the various tribes together are believed to number about 60,000 persons. They subsist by hunting, trapping, and fishing. The white inhabitants, scattered at the various posts of the Hudson's Bay company, and employed by the company are mostly Scotch and French Canadians, and number about 3,000. There are numerous Roman Catholic, a number of Anglican, and a few Methodist and Presbyterian missions among the Indians, many of whom have become civilized and embraced the Christian religion. The most important settlement is York Factory, on Hudson's bay near the mouth of the Nelson river, communication is had in the winter season between this place and Fort Garry in Manitoba, the headquarters of the Hudson's Bay company in America, by means of dog sledges, and in summer by means of canoes and boats on the streams. The government of the territories is vested in a lieutenant-governor and a council of not more than five members, appointed by the government of Canada in council. As soon, however, as any district of not more than 1000 sq. m. contains 1000 adult inhabitants, it is entitled to elect a member of the council for two years, and a second member when the inhabitants number 2,000. The seat of government is Battleford, a town situated at the junction of Battle river with the north fork of the Saskatchewan, and on the Canadian Pacific railroad, about 500 m. n.w.n.w. of Winnipeg.

Norton, a co. in n.n.w. Kansas, adjoining Nebraska, drained by the n. fork of Solomon river by Prairie Dog creek, and the tributaries of Republican river; 900 sq. m.; pop. 1870, 7,662; 252 of American Indian stock. The surface is generally level, the soil fertile. The principal productions are wheat and Indian corn. Council seat, Norton.

Norton, Andrew, Rev., American scholar and theologian, was b. at Hingham, Mass., Dec. 31, 1786. Having graduated at Harvard College in 1804, he was appointed, in 1809, a tutor of Bowdoin college, and in 1811 mathematical tutor at Harvard, and in 1813 librarian of the university, and succeeded Dr. Channing as lecturer on biblical criticism and interpretation. In 1819 he was appointed Dexter professor of sacred literature, which office he retained until failing health compelled his retirement in 1830. Dr. Norton was, after Dr. Channing, the most distinguished exponent of Unitarian theology, a clear and perspicacious lecturer, an able and conservative critic, and a voluminous writer. Rejecting the doctrine of the Trinity, and protesting against Calvinism, he also opposed the school of Theodore Parker and the naturalistic theology. Besides his contributions to the General Repository and Review, the North American Review, Christian Examiner, he published (1833) A Statement of Reasons for not believing in the Doctrine of the Trinity; (1737) The Genuineness of the Gospels; (1830) On the Latest Forms of Infidelity; and left some poems and a translation of the gospels. He died at Newport, R. I., Sept. 18, 1853.

Norton, the Hon. Caroline Elizabeth Sarah, a poetess and novelist of some reputation, the daughter of Thomas, and the granddaughter of Richard Brinsley Sheridan, was b. in 1808. Her father, of whom she was ill all of her education, which embraced an unusually varied course of studies, was superintended by her mother. In 1827, she married the hon. George Chappel Norton. In 1831 she first met lord Melbourne, then prime-minister, and the intimacy which succeeded having given rise to some scandalous rumors, Mr. Norton brought an action against lord Melbourne, which resulted in a verdict for the defendant. She died June 15, 1879, after having been for some months the wife of sir W. Stirling Maxwell. Her chief works are The Sorrows of Rosalie (1827); The Undying One (1830); The Child of the Islands (1845); Stuart of Dunleath, a novel (1847); English Loves for Women in the Nineteenth Century (1854); The Lady of Garway (1862); Lost and Saved, a novel (1863); and Old Sir Douglas (1868). Her prose works, several of which depict the wrongs incident to the position of women, are written with considerable cleverness and vigor; and her verse, though overstrained and stagy in sentiment, has numerous admirers, and manifests some degree of that brilliance for which the Sheridans have been so famous.

Norton, Charles Eliot, b. Mass. 1827; son of the Rev. Dr. Andrews Norton. After graduating at Harvard college, in 1846, he entered a commercial house in Boston to learn the details of the East India trade. In 1849 he went out as supercargo of a ship consigned to India, through which he traveled, returning to Boston by way of Europe. In 1855 he again went to Europe where he spent two years, and he was once more abroad 1868-73. In 1875 he was appointed professor of fine arts at Harvard college. In 1855 he edited, in conjunction with Dr. Ezra Abbot, his father's Internal Evidence of the Genuineness of the Gospels, and translation of the gospels. He edited the North American Review, in association with James Russell Lowell, 1864-68, and during the rebellion he edited the publications of the loyal publication society at Boston. His Considerations on some recent Social Theories appeared in 1853; Notes of Travel and Study in Italy, 1860; and his translation of Dante's Vita Nuova in 1867. He is an accomplished Dante scholar.
and Kari Witte's edition of the Vita Nuova is dedicated to him. He published in 1880 Historical Studies on Church Building in the Middle Ages. He is president of the archaeological institute of America.

NORTON, John, 1603-63; b. Stortford, Hertfordshire, Eng.; educated at Cambridge; became curate of Stortford. Having embraced Puritanism he came in 1636 to Plymouth, Mass., where he preached the first winter; was pastor of the church in Ipswich in 1636; was a member of the convention which framed the "Cambridge platform" in 1648; became colleague of the Rev. John Wilson, minister of the first church in Boston in 1652, and in 1663 went with gov. Bradstreet as agent of the colony to present an address to Charles II. after the restoration. He wrote many works, one of which was a treatise against the Quakers, entitled The Heart of New England rent by the Blasphemies of the Present Generation, by which they were so enraged that after his death they informed the king that "John Norton, chief priest in Boston, was smitten and died by the immediate power of God."

NORTON, William E., b. Mass., 1843; was apprenticed when young, to a house, sign, and fresco painter; went to sea at the age of 18; at 22 he commenced marine painting in which he became successful.

NORWALK, a township of Connecticut, on both sides of the mouth of the Norwalk river and Long island sound, on the New York and New Haven railway, 43 m. n.e. of New York, and 31 s.w. of New Haven. It has manufactories of iron, machinery, hats, felt (either of which two companies make 300,000 yds. per annum,) 16 churches, etc. Pop. '70, 12,119.

NORWALK (ante) a t. in Fairfield co., Conn., has a fair harbor and is the terminus of the Danbury and Norwalk, and the Shepaug Valley railroads; pop. '50, 18,956. There are several public halls, a public library, schools and academies. 5 banks, 15 churches, 2 daily papers, several hotels and a large number of mills, foundries and factories. The lock-works and iron-works are among the most extensive in the country. The people are largely engaged in the oyster trade, sending great quantities to New York annually. There are two or three hot-house nurseries, and a large trade in flowers is carried on with New York city. Woolen goods, hats, shoes, and straw articles are among the manufactures. That portion of the township lying upon the Sound and through which the New York railroad passes is known as South Norwalk. In the upper or north portion of the town, which is built upon rising ground, are many pleasant residences and country seats. The union school building is one of the handsomest in the state, and there are several private academies.

NORWALK, a t., the co. seat of Huron co., Ohio, 56 m. w. of Cleveland, on the Lake Shore and Michigan Southern railroad, pop. '70, 4,498. It is situated on a long sandy ridge, with streets and pike laid with double rows of maples. It has gas and water works, flour and saw mills, machine-shops and foundries. There are churches, schools, banks, and 4 weekly newspapers.

NORWAY (Norw. Norge), the western portion of the Scandinavian peninsula, which, together with Sweden, forms one joint kingdom, is situated between 57° 58' and 71° 10' n. lat., and 5° and 28° e. long. It is bounded to the e. by Sweden and Russia, and on every other side is surrounded by water, having the Skagerak to the s., the German ocean to the w., and the Arctic sea to the n. Its length is about 1,100 m., and its greatest width is about 200 m.; but between the hts. of 67° and 69° its breadth measures little more than 25 m., in breadth. The following table shows the areas and populations of the 20 aemter into which Norway is divided, as given in the last census of Jan., 1876:

</table>
Of this total, only 332,938 live in towns. At the preceding census on Dec. 31, 1865, the population was 1,791,756.

The Scandinavian peninsula consists of more or less connected mountain masses, which, in the s. and w. parts of Norway, constitute one continuous tract of rocky highlands, with steep declivities dipping into the sea, and only here and there broken by narrow strips of arable land. South of Trondhjem (63° n. lat.) the ridge expands over more than the entire area of Norway. The n. portions of the range, known as the Kjollen Fjelle,* occupy a space of about 25 m. in width and form, as far n. as 69°; the boundary-line between Sweden and Norway. South of 63° n. lat. the range of the Scandinavian mountains is known as the Norska, or Dovre Fjelle, although the latter name belongs properly only to the part immediately in contact with the Kjollen. The general elevation of the Norska Fjelle does not rise above the line of perpetual snow, whose average height in these latitudes is 5,000 ft.; but it ranges above that of the growth of trees, which may be stated to lie 1000 ft. lower. Only two carriage-roads traverse the Norska Fjelle, the one connecting Christiania with Bergen, and the other with Trondhjem. The Justedal glacier, in Bergen amt, is the largest on the continent of Europe, and covers an area of 588 sq. miles. The whole of the w. coast of Norway is densely fringed with islands and isolated rocky masses, which, n. of 66°, in the Lofoden (q.v.) group, assume larger dimensions, and form extensive insular districts. The more important are Hindö (357 sq.m., 8,190 inhabitants), on the borders of Nordland and Trondhjem; Langö (147 sq.m., 5,812 inhabitants); Karmö (only 21 sq.m., although the pop. is 11,827); and Senjen (273 sq.m., with 3,339 inhabitants). To the s. of the Anden group, near the little islands, Mosken and Værö, occurs that eddying whirl of counter-currents known to us as the Maelström; but with this and a few other similar exceptions, no serious obstacles impede navigation along the numerous channels of the coasts. The most important of the rivers are the Glommen (350 m. long, with a basin of 6,657 sq.m.), the Drums-elv, of timber, of less than half the length and basin, Tanæ, Passvikel, Skiers, Langen, and Vormen. These and numerous other streams are of more importance for floating down timber to the fjords than for navigation. The fjords or inlets form a characteristic feature of Norwegian scenery, and give a coast-line of upwards of 500 miles.

The most considerable of the lakes of Norway is the Mjøsen, near Christiania; but even this last, which in some places is more than 1400 ft. deep, is scarcely 60 m. long, and has an area of less than 200 sq. miles. Swamps and morasses, which occupy a large area, have of late years engaged the attention of the government, which is endeavoring to drain and utilize them for agricultural purposes, and with a view of converting them into fields of turf and peat for fuel.

Climate, Soil, etc.—The peculiar physical character of Norway necessarily gives rise to great varieties of climate in different parts of the country. The influence of the sea and of the gulf stream, and the penetration into the interior of deep inlets, greatly modify the severity of the climate, more especially on the w. coast. Thus, while the mean annual temperature is for Christiania, on the e. coast, 41°, it is 46.8 Fahr. for Bergen on the w. coast, which is only 30 further north. On the coast generally, wind, rain and fogs prevail: while in the regions near the North cape, storms are almost incessant. In the interior, the air is clear and dry, and the winters are cold and the summers hot, with only moderate fluctuations of temperature. The longest day, while in the s. is 18 hours, may be said to be nearly three months in the high latitudes of the n. districts, where the longest night lasts almost an equal length of time. The protracted winter of the n. regions follows almost suddenly on the disappearance of the sun, when the absence of solar lights is compensated for by the frequent appearance of the aurora borealis, which shines with sufficient intensity to allow the prosecution of ordinary occupations.

It is estimated that 1/3 of the area of Norway lies within the region of perpetual snow, while elevations exceeding 2,000 feet above the level of the sea are unfitted for human habitations, although for a portion of the brief summers, the herdsmen can occupy sotre or huts at elevations of 3,000 feet and upwards. A large extent of the mountain districts yields no produce beyond scanty grasses, mosses, lichens, and a few hardy berry-yielding plants. Only birch and juniper grow n. of 67, which is the boundary of the pine. The Scotch Fir, Pinus sylvestris (Norwegian, Fyr), and Spruce, P. abies (Norwegian, Grein), cover extensive tracts, and with birch, constitute the principal wealth of Norway. The harder fruits, as strawberries, gooseberries, cherries, and raspberries, are abundant and excellent of their kind. Hemp, flax, rye, oats, and barley are grown as far north as 66; but although agriculture has been more systematically pursued of late years, the crops are not always sufficient for home consumption, and hence it is found absolutely necessary annually to import considerable quantities of corn and potatoes. The frugal peasantry do not, however, rely wholly upon importation, but prepare a species of cake or bread from the bark of the pine when corn is scarce, and in plentiful years store away some of the produce of the harvest in the national corn-magazines, which are established in every part of Norway by way of a provision for an unfavorable season. Agriculture is most successfully prosecuted in the ards of Jarlsberg and Laut-

* Fjelle is the plural of fjeld, a mountain-side.
vik, and in the south generally; while in the northern parts, in the upper valleys, the rearing of cattle constitutes an important branch of industry. The herds and flocks are driven from the distant farms to the pasture-lands in these high mountain valleys, known as Sæterdale, where they remain till the approach of cold weather obliges the herdsmen to return with their charges to the shelter of the farms. Although the cattle and horses are small, they are generally strong and capable of bearing much labor.

Products, etc.—Fish are caught in almost every stream and lake of the interior, as well as in the fjords of the coast, and in the bays and channels which encircle the numerous islands skirting the long sea-line of Norway. Salmon, herring, and cod are of the greatest importance, and together give occupation to upwards of 30,000 men, who pursue the herring and cod fishing in the spring, and again in the summer, while cod is also fished in the winter-time. The value of the fish, fresh and dried, exported from Norway in 1870, was 7,951,000 sp. d.,* although that year was unfavorable in regard to the catching of deep-water fish. The average annual value of the fish and oil produce is between 9 and 10 millions of sp. d. In 1869 there were 38,000 men employed in the herring fisheries, and the value of the fish for that year was 250,000 sp. d. In the same year 15 Norwegian ships were engaged in the Jan Mayen (70° n. lat.) seal fisheries, when 33,000 young and 29,000 old seals were taken, and the profits of the captures were 45,000 sp. d. Next to the fisheries, Norway derives its greatest sources of wealth from the produce of its woods. In 1870 there were 850,000 tons weight of timber (both deals and unhewn trunks) exported, of the net value of 7,600,000 sp. d. Within the last few years the Norwegian forests have yielded a new product of industry, known as wood-paste, extensively employed in the manufacture of paper, for which it promises to serve as a cheap and efficient substitute for rags.

The fauna of Norway includes the bear, wolf, lynx, elk, otter, reindeer, red-deer, seal, the eider-duck and many other kinds of sea-fowl, blackcock, capercaille, and a great variety of small game. According to the census of 1865, there were in Norway 149,107 horses, 903,956 horned cattle, 1,705,934 sheep, 90,985 goats, 98,186 swine, 101,768 reindeer.

The mineral products, which comprise silver, copper, nickel, cobalt, iron,chrome ironstone, etc., yield a large annual return. The value of the metal exports was, in 1870, 835,000 sp. d. for raw and partially worked ores, and 16,000 sp. d. for wrought metals. The richest mines are situated in the south, and chiefly in the district of the Glommen, as the celebrated and ancient silver-works of Kongsberg, the copper mines of Røraas, Alten, and Vigsnes, the nickel mines of Modum and Bamhle, and the cobalt-works of Buskerud, and the numerous iron shafts on the southern declivities of the mountains between Kongsberg and the Glommen. Latterly, however, some productive copper-works have been opened in the northern districts of Kaafjord in Finmark.

Ship-building in all its branches is almost the only industrial art that is extensively and actively prosecuted. In many parts of the country there are absolutely no special trades, the inhabitants of the small fishing-ports, no less than the inmates of the widely separated, but all employing their compulsory leisure during the long winter in weaving, spinning, and making the articles of clothing and the domestic implements required in their households.

Trade, etc.—The principal seats of trade are Christiania, Drammen, Arendal, Bergen, Stavanger, and Trondhjem. The merchant fleet numbered, in 1874, 7,447 vessels of 1,220,000 tons, manned by 56,147 seamen. In 1873, 13,404 vessels cleared the ports of Norway. The exports, which consist mainly of timber, fish, minerals, furs, feathers, and down, amounted in 1873 to 33,957,000 sp. d., or about £7,000,000; while the imports for the same year were 45,839,000 sp. d., or £10,300,000 sterling. The value of the exports to Great Britain in 1877 was £5,295,000, the imports thence being valued at £1,728,000. The imports consist not only of the ordinary colonial goods, and objects of luxury, but in a large proportion of the most necessary articles of consumption, as cereals to the annual amount of 2,000,000 tons, salt in nearly half that quantity, fresh and salted meats, wines and spirits, and many other articles, which in the colonies are regarded goods of all descriptions. The most important commercial relations of Norway are with Great Britain and Germany. Russia and Denmark stand next in order as importers to Norway, while the Catholic countries of the Mediterranean are the principal purchasers of the smoked and dried Norwegian fish.

Revenue, etc.—By the budget for 1876-77, the revenue was estimated at 39,200,00 kroner (the krone, worth 1s. 1d., having in 1875 superseded the old specie daler), or about 27,190,420, the expenditure being presumed to equal the receipts. The national debt of Norway amounted in 1875 to 48,307,600 kroner.

Administration, etc.—Norway is divided into 20 amts, or administrative circles, as given in the table. The circles are subdivided into 56 fogderier (bailiwicks), each presided over by a rural magistrate, and containing in all 446 herred, or administrative districts, which have similarly their own judicial or official heads. Norway has a great representative government, based on the constitution which was established in 1814, and ratified at Eidsvold. The Storting, or legislative chamber, meets annually, and is composed of representatives who are elected by deputies who have been selected for the

* The specie daler is worth about 4s. 6d.
Religion, etc.—The Lutheran is the predominant church, to which all persons holding public offices of trust must belong, although freedom is allowed to all other Christian denominations and to Jews. The church is under the administration of six bishops, whose sees are Christiania, Christiansand, Trondhjem, Bergen, Hamar, and Tromsö. There are 80 deaneries, 457 higher rectories, 900 parish and district, town and country churches in all. There were, in 1870, 532 beneficed clergymen, and 337 theological candidates without fixed preferment. The whole number of dissenters in that year did not exceed 5,200. The clergy who receive titles, exercise considerable influence in remote country districts, where they frequently are called upon to settle disputes, and exercise various judicial functions. Much has been done of late years in Norway for the diffusion of knowledge, and provision is now made to extend education to the inhabitants of the most inaccessible districts by means of itinerant teachers, a certain number of whom, corresponding to the number of farms in each parish, are nominated to the office of schoolmaster. These men proceed from house to house, being supplied with a schoolroom, and fed and entertained by each householder in succession for the number of days at which the farm is mulcted; and by the aid of these means, education is so universally diffused that it is rare to meet with Norwegians who cannot read and write. In 1869 there were 150 higher poor schools, 15 normal schools for the parish-school teachers, 96 higher private schools, 15 military, naval, and navigation schools, and 12 polytechnic institutions. The expenses incurred for education were, for the country districts, 35,500 sp. d., and for the towns, 111,367 sp. d. The university of Christiania (q.v.), which was founded in 1811, has 47 professors, and is attended by about 1000 students, amongst whom are the sons of many of the peaceable land-owners, who receive a university education without intending to follow the learned professions.

Army, etc.—By the terms of the laws of 1866 and 1876, the army of Norway is composed of troops of the line, the military train, the militia or Landwehr, the civic guards, and the Landstorm, or final war-levy. In 1878 the troops of the line numbered 12,000 men and 750 officers. All young men above twenty-one years of age, are liable to serve, with the exception of the inhabitants of the three northern aunts of the kingdom. The fleet numbered, in 1878, 121 vessels, of which 29 were steamers, carrying 142 guns. The navy was manned by 2,400 sailors, but the number of men liable by law to be called upon for naval service in the districts of Norway exceeds 60,000. Horten, in Christiania-Flint, is the principal naval port. The only fortified ports are Fredriksten at Fredrikshald, Frederikshald, Akershus, Bergenhus, Munkholm, and Vadsohus.

The population of Norway is chiefly rural, only about 11 per cent living in towns. Christiania, the principal city, has 77,000 inhabitants, while Bergen and Trondhjem
have respectively only 34,000 and 22,500. The physical character and consequent climatic relations of Norway leave a very small proportion (according to some writers, only about 2 per cent) of the area capable of being cultivated. There are few villages, and the isolated farmsteads are often separated from one another by many miles. The cultivators of the land are in most instances also the proprietors, less than one-third of the whole number being tenants only. Allodial land, known as Udal or Odel, does not descend to the eldest son unconditionally, since all his relatives have a claim upon it, and if it should be sold, have the right of buying it back within the term of five years at the sale-price.

Roads, Railways, etc.—The public roads in Norway are excellent; and traveling is rendered cheap and expeditions by the system established and regulated by law, in accordance with which carriages and horses are provided at fixed rates of payment for travelers passing through the rural districts of the country. This system, which is known as “Skyds,” is completely under the control and direction of the authorities, by whom the number of the guest-houses and stations are regulated. The length of the railways in Norway in 1876 was about 340 m.; and the number of letters that passed through the post in 1875 was 8,764,000.

Race, Language, etc.—With the exception of some 20,000 Lapps and Finns, living in the most remote northern regions, the inhabitants of Norway are generally a pure Scandinavian race, akin to the North German nations of Aryan descent. The genuine Norwegians are of middle height, with strong, well-knit, muscular frames, of fair skin, with light flaxen or yellow hair, and blue eyes. In character, they may be said to be frank, yet cautious and reserved, honest, religious, and superstitious, more from an inerterate love of clinging to the forms, thoughts, and creed of their ancestors, than from fanaticism. Their love of country, and the irrepressible fondness for the sea, by the very anomaly which these apparently contradictory propensities exhibit, show them to be the true descendants of the sea-roving Northmen of old. Of late years emigration has continued steadily to increase at a rate which threatens to be a serious evil to so badly populated a country as Norway, but which is easily explained by the small portion of land capable of cultivation. The general diffusion of education, and the perfect equality and practical independence which they have known how to secure and to retain themselves, notwithstanding this nominal incorporation with the other Scandinavian kingdoms, give to the poorest Norwegians a sense of self-respect and self-reliance which distinguishes them favorably from those of the same class in other countries. The peasants, more especially in the ants remote from towns, retain their ancient provincial costumes, which are, for the most part, highly picturesque, consisting among the women, of ample woolen skirts and brightly-colored knit bodices, fastened and adorned with silver or brass clasps and buckles. Music is much cultivated by all classes of the people, and the national songs and melodies which are the favorites, are for the most part of a melancholy character.

Danish is the language in ordinary use both in writing and speaking, although dialects near akin to the old Norse are spoken by the dalesmen and mountaineers of special districts. Since the separation of the country from Denmark, a strongly national tendency has been manifested by some of the best Norwegian writers, and attempts have been made to reorganize these dialects into one general Norwegian language, and thus, in fact, to revive the ancient Norse, or Icelandic, which has been preserved in Iceland in almost perfect purity since its introduction to the island in the 9th c. by colonists from the northern districts of the continent. Among the most prominent of the ancient and modern literature and history of Norway, we may instance Prof. P. A. Munch, whose able expositions of the laws and social conditions of his country have thrown new light on its history; Keyser, Unger, and Hohnboe, who have done much to elucidate the Norse tongue and literature; A. Munch, Bjørregaard, Hansen, and Wellhaven the critic, successful cultivators of the national lyric; J. Moe and Ashjørnsen collectors and annotators of native sages; Ibsen the dramatist, and Bjørnsen the delineator of national peasant life. In the more abstruse departments of mathematical and physical science, Norwegians have gained for themselves a foremost place, as is sufficiently testified by the mention of names such as N. H. Abel, renowned for his discoveries in indefinite integrals; C. Hansteen, the astronomer; and Kellihan, the geologist.

History.—The early history of Norway is comprised in that of the other Scandinavian countries, and is, like theirs, for the most part fabulous. It is only towards the close of the 10th c., when Christianity was introduced under the rule of Olaf I., that the mythical color in which the annals of the kingdom had been previously plunged begins to give place to the light of historical truth.

The introduction of Christianity, which was the result of the intercourse which the Norwegians had with the more civilized parts of Europe through their maritime expeditions, destroyed much of the old nationality of the people with the heathenism which they had hitherto cherished, although the sanguinary feuds which had raged among the rival chiefs of the land can scarcely be said to have lost their ferocity under the sway of a milder religion. Olaf II., or the Saint (1015–30), who zealously prosecuted the conversion of his countrymen, raised himself to supreme power in the land by the subjection of the small kings or chieftains, who in the times of heathenism had subdivided the kingdom among them. The war between Olaf and King Knud the Great of Denmark,
which terminated in 1030 with the battle of Stricklesfjord, in which the former was slain, brought Norway under the sway of the Danish conqueror; but at his death in 1036, Olaf's son, Magnus I., recovered possession of the throne, and thenceforth, till 1319, Norway continued to be governed by native kings. The death in that year of Hakon V. without male-heirs, threw the election of a new king into the bands of the national assembly, who, after many discussions, made choice of Magnus VIII. of Sweden, the son of Hakon's daughter. He was in turn succeeded by his son Hakon, and his grandson Olaf IV., who having been elected king of Denmark in 1376, became ruler of the sister Scandinavian kingdoms on the death of his father in 1380. This young king, who exercised only a nominal sway under the guidance of his mother queen Margaret, the only child of Valdemar III. of Denmark, died without heirs in 1387. Margaret's love of power and capacity for government brought about her election to the triple throne of the Scandinavian lands, and from this period till 1814, Norway continued united with Denmark; but while it shared in the general fortunes of the latter state, it retained its own constitutional mode of government, and exercised its right of electing to the throne, until, like the sister-kingdom, it agreed of its own free will to relinquish this privilege in favor of hereditary succession to the throne. See Denmark, History of. The Napoleonic crisis may be said to have severed this union, which had existed for more than 400 years, for Denmark, after having given unequivocal proofs of adhesion to the cause of Bonaparte, was compelled, after the disastrous war of 1813, to purchase peace at the cost of this long united partner of her state. Crippled in her resources, and almost bankrupt, she saw herself constrained to sign the treaty of Kiel in 1814, by which it was stipulated by the allied powers that she should resign Norway to Sweden, receiving in exchange the duchy of Holstein and the Prince of Slesvig-Holstein; a price which the Norwegians, and the island of Rügen, which were subsequently exchanged with Prussia for Lauenburg on the pay ment by that state of two million rix-dollars. The Norwegians, having refused to admit the validity of the treaty of Kiel, nominated Prince Christian, the heir-presumptive to the throne of Denmark, regent and subsequently king of Norway. The nomination was made by the national diet, or storthing, which met at Eidsvold, where they drew up a constitution based on the French constitution of 1791. These measures found, however, neither supporters nor sympathizers among the other nations; and with the sanction of the greater allied powers, Charles John Barnadotte, crown-prince of Sweden, led an army into Norway, and after taking Fredericstadt and Frederickshald, threatened Christianity. Denmark being unable to support the cause of prince Christian, and Norway being utterly destitute of the means necessary for prosecuting a war, resistance was of no avail, and the Norwegians in this untoward conjuncture of affairs, were glad to accept the proposal made to them by the Swedish-Scandian monarchs, for a union with Sweden, the result of which was the establishment of the kingdom of Norway, December 28, 1814, by which they were to retain their own form of government, and enjoy full liberty and independence within their own boundaries. These conditions were agreed to, and strictly maintained; a few unimportant alterations in the constitution, necessitated by the altered conditions of the new union, being the only changes introduced in the machinery of government. Charles XIII. was declared joint king of Sweden and Norway in 1818, and while the latter has become an almost independent state, it is questionable whether the former has found in its nominal acquisition an equivalent for the loss of Finland, which was the price exacted for it by the allied powers, and made over to Russia. Since the union, Norway has firmly resisted every attempt on the part of the Swedish monarchs to infringe upon the constitutional prerogatives of the nation; and during the reign of the first Barnadotte dynasty, the relations between him and his Norwegian subjects were marked by jealousy and distrust on both sides; but, since his death, the people generally have been more contented, and Norway has continued to make rapid progress towards a state of political security and material prosperity far greater than it ever enjoyed under the Danish dominion.—See T. Thorlak, Historia regum Norvegicarum (Copenhagen, 1711); Schöning, Norges Rige Historie (Soroe, 1771); Munch, Det Norske Folk's Historie, vols. 1 to 8 (Christ, 1852-63); Brädov, til Norges Officielle Statistik, 1871.

NORWAY HADDOCK. See BERGILYT.

NORWEGIAN LANGUAGE AND LITERATURE (Norway, ante). The great Tenta-tonic stem divides at about the time of the invasion into four dialects; but whether these dialects antedate the year 500 A.D. is very doubtful. The Gothic of Ulfils is, undoubtedly, the oldest; but the Saxon follows not long after. The high German, by the testimony of charters, only begins after the battle of Tolbiac (Zwichich). The Norwegians, if by this we understand the Icelandska tunga (Icelandic), though at most of the 12th c. represents a dialect at least 100 years earlier, and allows us to supply missing Gothic forms better than any other. Perhaps its great changes may be referred to the 8th c.; and they are greater than those of either Saxon, or high German. They are: (a) great contraction and assimilation; (b) dropping of case-endings; (c) dropping of prefixes; (d) an harmonious system of vowels, but accomplished by umlaut and reflex, more like Saxon than German; (e) assimilation of vowels; (f) the suffixed article; (g) w before r, l, and u is dropped; (b) j initial dropped; (i) w is vocalized. The real test is the introduction of new terms, as georwa, Scotch gar, and taka, take, replace, thuwa, do, and nimma, niman, Ang.- Sax. Also, at, ok, replace, ettu, ekende, to, and. About 1120 A.D. lived Thorodd, the
grammarian; and in his time certain changes had already taken place in a father which involved the loss of a final in verbs and in weak nouns. He specifies vowels, a short, as in father; /a long (an) as in hall; /e short, as in man; /e long, as in were; /i short, as in red; /i long, as in they; /i short, as in it; /o long, as in sweet; /o short, as in not; /o long, as in row; /u short, as in foot; /u long, as in food; /y short, as in une (French), kueen (German), /y long, as in duke, neue (Dutch); /e short, as in hurt; /e long, as in earth; /æ short, in Danish and French (!æ), /æ long, as in boy. Three diphthongs: /aʊ/—all with a distinct vowel for each letter; /eɪ/—all nasalized. B, p, m, n, k, l, t, and d as in English; c and g always hard; s always sharp; z always trilled; f initial; f pronunciation and final, v; v initial, v; v medial, w; i = English y; /h initial, elsewhere, /dh. There was a sign for ng, /hr, /hn, /h/, like our /ch/. Double consonants kept separate, and, after the discontinuance of nasal vowels, /θ/ = /θ/ = h/; /θ/ = /θr/; /θ/ = /θr/. Short vowel and d = /n/; short vowel and k or g = /ŋ/. In short the rule seems to be pronunciation clear, and rather slow; words and phrases cut as short as possible. Accent on first, if not, on root syllable. Quantity entirely by accent. At the end of the 13th c. ensued a change of pronunciation and spelling; and in the 16th c. a whole new series of changes in pronunciation, making the language like modern English—spelled, not pronounced. The MS. was the Lombard; that is, Anglo-Saxon or Irish, gradually changing, as with us, to Gothic. Modification of words had been accomplished in vowels by (/a) w(ab)ut, as in Gothic, and more in Saxon; (/b) reflection by /I=I/, and = = from the next syllable. As in English these changes had been taken advantage of to show difference of meaning, as faila, to fail, and fell, to fell. This also liquidizes—the common sign of the language—all broad vowels, when a corresponding termination has dropped. Fjarr, Eng. far, fjohler, feather, etc. Changes in consonants are (/a) assimilation: /np=pp/, hopp (hop); /nk=kk-dríkka (drink) /nt or /nt=t/, vettr (winter); /nth=nn=sanur (south); /th=t—gull (gold); /rd zd=dd—odd (point); /rn zn=nn=rann (house) ran (sack); /mn dnr=dr/dhe (finds). (/b) Inflation: /tr (z)=ll—gamall (old); /nr (wz)=nn—stein (stone); /rzs—iss (ice); /dhd =dd—tædda (fed); /dht=l gött (good). Alone of all Indo-European languages (since the formation of case), it suffices the article, and that to both noun and article, and the independent adjective has best preserved the old forms. There is a strong declension of nouns, v taking the place of s and a weak declension, but German n dropped already. Comparison much as in English: illr (ill); verri (worse); verstr (worst). Numerals between Saxon and Danish in English have the: the (thou); the (he), hon (she); vit (we two); ver (we); théir (ye); their (they, men); théer (they, women); than (they, things). Verbs have two tenses, present and past, other by help verbs, as in English: and four moods—indicative, subjunctive, imperative, and infinitive. Strong and weak verbs as in German and Saxon, and, as in English, the strong are becoming weak. It has a peculiar form. The reflexive is formed by adding z to verb, or /sek as a pronoun. Adverbs vary between English and German. Adjectives are formed for the most part with terminals not found in English. The grammar is particularly noticeable for what may be called close contact in the parts of a sentence, for impersonal and reciprocal verbs, for prepositional verbs, with a different meaning as in English and Russian, and the use of the dative of near definition. Of the earliest works Heims-Krugne still shows traces of poetic arrangement; but the language can only be judged by Kornak's saga, rather antiquated, and by Laxdaela, and Niala, the latter heroic in brevity and pithiness. The poetry, though formed on some extinct model, which must have served for all the early memory, rhythmic of the Indo-European, addition of alternation, and later of rhyme, seldom it rises to the height of Eirik Blood-Axe's death-song; and for the most part it is a mere convolution of stereotyped allusions and forced alliterations.

NORWEGIUM, a metallic element discovered by Teleff Dahl, in copper-nickel from Kraguro in Skjaergaard, Norway. The color of the pure metal is white, with a slight brownish cast. When freshly polished it has a perfect metallic luster, but after a time becomes covered with a thin film of oxide. In order to prevent this, it is always oxygened. A brown sulphide is formed by treatment with sulphurized hydrogen, which redissolves in ammonium sulphide. Solution in hydrochloric acid, green; in nitric acid, blue; and in sulphuric, colorless.

NORWICH, a city of Connecticut, at the head of navigation of the Thames river, 18 m. n. of New London, and 38 s.e. of Hartford. The chief portion of the city lies on an eminence that rises between the Yantic and Shetucket rivers, which here unite to form the Thames. There are numerous manufactories of cotton, wool, paper, etc., which are supplied with water-power by falls of 50 ft. on the Yantic river. Norwich contains county buildings, 7 banks, 1 daily and 3 weekly papers, 16 churches, 40 public and 5 private schools, and a free academy. Norwich was settled in 1569, when 9 sq. m. were bought for £70 of Uncas, an Indian chief, whose grave is in the city. Pop. '70, 16,653.

NORWICH (ante), semi-capital of New London co., Conn.; situated on the Norwich and Worcester, and the New London Northern railroads, connected with New York by a line of large steamboats; pop., '80, 21,141. The town is built upon a series of terraced hills, and in the valleys of the Shetucket and Yantic, which here uniting form the Thames. There are a court house, 10 banks, 2 daily and 2 weekly papers, a public
library, high school, and the Norwich Free academy, which has a very high reputation as a training school for college. Water power is obtained from the tributaries of the Thames and the variety of manufactures is very great, including cotton and woolen goods, paper, machinery, rubber articles, pistols, envelopes, iron, and machinery.

The increase in population since 1870 has been about 6,000; indicating that the business prospects of the town are excellent. Main street is the principal business thoroughfare, and Broadway and Washington streets are among the most beautiful of those occupied by private residences. There are many fine public buildings, handsome dwellings, and ornamental grounds; and the city is noted for picturesque beauty.

NORWICH, a t. the co. seat of Chenango co., New York, pleasantly situated on the Chenango river and canal, and the Delaware, Lackawanna, and Western, and New York and Oswego Midland railroads; 90 m. w. of Albany; pop. 70, 4,279. It has a stone court-house, an academy, 8 churches, 2 banks, and 2 weekly newspapers. Among the articles manufactured are carriages, pianos, hammers, leather, and machinery.

NORWICH, a city of England, capital of the co. of Norfolk, and a co. in itself, on the Wensum, immediately above its confluence with the Yare, 20 m. w. of Yarmouth, and 98 m. n.n.e. of London. It covers an area about 5 m. in circumference, is skirted on its n, and e. sides by the river, and on the w. and s. it was formerly surrounded by walls, the last vestiges of which have been recently removed in order to make room for the extension of the city. The market-place (600 ft. long by 340 ft. wide) and its vicinity contain many large shops and good houses. The castle, finely situated on an elevation near the center of the town, originally covered, with its works, an area of about 25 acres. The bridge (150 ft. long) over the ditch has one of the largest and most perfect arches remaining in the county. The massive quadrangular Norman keep is now used as a prison. The cathedral, almost wholly Norman in plan, was founded in 1094 by bishop Herbert Losinga. It is 411 ft. long, 191 ft. broad at the transepts, and is surmounted by a spire 315 ft. high. Near the cathedral are a number of ancient and interesting structures now more or less in ruins, among which may be mentioned St. Ethelbert's and the Erpingham gate, the former in decorated English, the latter in late perpendicular, and both valuable and rich specimens of their styles. Besides a large number of dissenting chapels and other places of worship, there are about 40 churches, of which St. Peter's, Manerock, a handsome cruciform edifice of the 15th c., with a remarkably fine peal of 12 bells; St. Andrew's, St. Clement's, St. George's, St. Giles, St. Michael's, and others, are worthy of mention. The Free Grammar school, with an endowment of about £200 a year, was founded by Edward the VI., and the other educational establishments are numerous and various in character. The public library contains 20,000 volumes, and the library of the Norwich literary institution, 15,000 volumes. Norwich is the seat of extensive and flourishing manufactures, the chief of which are bandanas, bombazines, shawls, crapes, gauzes, damasks, camlets, and muslins; shoemaking is extensively carried on, yarn and silk mills are in operation, and employ many hands. Iron-founding, dyeing, printing, etc., and agricultural implement-making, are also carried on. The trade, which is facilitated by a canal and river system of communication with the sea, is chiefly in agricultural produce and coal. Norwich is the see of a bishop, and returns two members to parliament. Pop. of municipal and parliamentary borough in '71, 80,386.

About 3 m. s. of Norwich is Castor St. Edmunds, which, prior to the Roman era, was called Caister, and under the Romans received the name of Venta Icenorum. Norwich occupies a place in history from the time of the earlier Danish invasions, had its origin in the castle erected as a stronghold by the East Anglian kings, and resorted to as a place of safety by the inhabitants of Venta Icenorum, who gave it the name of North-wic, or northern station or town, on account of its relative position with respect to their own town. The bishopric of the East Angles was removed hither in 1094. About 4,000 Flemings settled at Norwich in the reign of Elizabeth, and greatly increased the prosperity of the town by the branches of manufacture which they introduced.

NORWICH CRAG, or MAMMALIFEROUS CRAG, a series of highly fossiliferous beds of sand, loam, and gravel, of Pleistocene age, occurring at several places within a few miles of Norwich, where there are peculiarities named "crag." They contain a mixture of marine and fresh-water mollusca, with ichthyolites and bones of mammalia. They are evidently estuary beds, the most common shells being the very species now abundant in such situations around the coasts of Britain; but with them are associated a few extinct species. The beds rest on the white chalk, the surface of which is frequently perforated by photos crisipeta, the shell still remaining at the bottom of the cavity. The mammalian bones belong to species of elephant, horse, pig, deer, and field-mouse. With them are occasionally found the bones of mastodon angustidens and some mollusca, which belong to the red craug. Their occurrence here is believed to have arisen from their having been washed out of the Red Into this, the Norwich crag.

NORWOOD, Upper and Lower, are two villages in Surrey, England, with a station on the London and Croydon railway, 6 m. s. of London. The public pleasure-ground, called the Beulah Spa, is prettily laid out around a mineral spring. The villages are worthy of mention, however, chiefly on account of their schools, among which are a district school for the poorer children of Lambeth parish, and a very large and important educational...
establishment for the pauper children of London. The district parish of Norwood had, in 1871, a population of 12,536.

NOSE, AND THE SENSE OF SMELL. The nose is not only the organ of smell, but is likewise a part of the apparatus of respiration and voice. Considered anatomically, it may be divided into an external part—the projecting portion, to which the term nose is popularly restricted; and an internal part, consisting of two chief cavities, or nasal fossae, separated from one another by a vertical septum, and subdivided by paired nasal bones projecting from the outer wall into three passages or meatuses, with which various cells or sinuses in the ethmoid, sphenoid, frontal, and superior maxillary bones communicate by narrow apertures.

The external portion of this organ may be described as a triangular pyramid which projects from the center of the face, immediately above the upper lip. Its summit or root is connected with the forehead by means of a narrow bridge, formed on either side by the nasal bone and the nasal process of the superior maxillary bone. Its lower part presents two horizontal elliptical openings, the nostrils, which overhang the mouth, and are separated from one another by a vertical septum. The margins of the nostrils are usually provided with a number of stiff hairs (cérisses), which project across the openings, and serve to arrest the passage of foreign substances, such as dust, small insects, etc., which might otherwise be drawn up with current of air intended for respiration. The skeleton, or framework of the nose, is partly composed of the bones forming the top and sides of the bridge and partly of cartilages, there being on either side an upper lateral and a lower lateral cartilage, to the latter of which are attached three or four small cartilaginous plates, termed sphenoid cartilages; there is also the cartilage of the septum which separates the nostrils, and in association posteriorly with the perpendicular plate of the ethmoid, and with the vomer, forms a complete partition between the right and left nasal fossae. It is the lower lateral, termed by some writers the alar cartilage, which by its flexibility and curved shape forms the dilatable chamber just within the nostril. The nasal cartilages are capable of being slightly moved, and the nostrils of being dilated or contracted by various small muscles, which it is unnecessary to describe.

The integument of the nose is studded with the openings of sebaceous follicles, which are extremely large and abundant in this region. The oleaginous secretion of these follicles often becomes of a dark color near the surface; and hence the spotted appearance which the tip and lower parts of the sides, or alae, of the nose frequently present.

On firmly compressing or pinching the skin of these parts, the inspissated secretion is forced out of the follicles in the form of minute white worms with black heads.

The nasal fossa, which constitute the internal part of the nose, are lofty, and of considerable depth. They open in front by the nostrils, and behind they terminate by a vertical slit on either side in the upper part of the pharynx, above the soft palate, and near the orifices of the eustachian tubes, which proceed to the tympanic cavity of the ear.

The mucous membrane lining the nose and its cavities is called pituitary (Lat. priva), slime, rheum, from the nature of its secretion; or Schneiderian, from Schneider, the first anatomist who showed that the secretion proceeded from the mucous membrane, and not, as was previously imagined, from the brain; it is continuous with the skin of the face at the nostrils, with the mucous covering of the eye through the lachrymal duct (see Eye), and with that of the pharynx and middle ear posteriorly. This membrane covers the inner surface of the orifices of the nostrils, the septum and spongy bones bounding the direct passage from the nostrils to the throat, the lining membrane is comparatively thick, partly in consequence of a multitude of glands being disseminated beneath it, and opening upon it, but chiefly, perhaps, from the presence of ample and capacious submucous plexuses of both arteries and veins, of which the latter are by far the more large and tortuous. These plexuses, lying as they do in a region exposed more than any other to external cooling influences, appear to be designed to promote the warmth of the part, and to elevate the temperature of the air on its passage to the lungs.

They also serve to explain the tendency to hemorrhage from the nose in cases of general or local plethora. In the vicinity of the nostrils, the mucous membrane exhibits papillae and a seedy epithelium, like the corresponding parts of the skin. In the sinuses, and in all the lower region of the nose, the epithelium is of extraneous delicacy, being of the columnar variety, and clothed with cilia. In the upper third of the nose—which, as the proper seat of the sense of smell, may be termed the olfactory region—the epithelium ceases to be ciliated, and the right parts of the orifices of the vomer, septal and inferior cartilages, become remarkably in thickness, so that it forms an opaque soft pulp upon the surface. It is composed of an aggregation of nucleated particles, of nearly uniform appearance throughout, except that the lowest ones are of a darker color than the rest, from their containing a brown pigment in their interior. Dr. Todd and Mr. Bowman remark, in their Physiological Anatomy, from which we have condensed the above account of the nasal mucous membrane, that the olfactory region abounds in glands, apparently identical with sweat glands, which dip down in the recesses of the submucous tissue among the ramifications of the olfactory nerve.

The nerves of the nose are the first pair or olfactory which are specially connected with the sense of smell, branches of the fifth pair which convey ordinary sensibility on
its skin and mucous membrane, and motor filaments, from the facial nerves to the nasal muscles. The olfactory nerve on each side is connected with the inferior surface of the brain (q.v.) by an external, a middle, and an internal root, which unite and form a flat band (or, more correctly, a prism), which, on reaching the cribiform plate of the ethmoid bone, expands into an oblong mass of grayish-white substance, the olfactory bulb. From the lower surface of this bulb are given off the olfactory filaments, fifteen or twenty in number, which pass through the cribiform foramina, and are distributed to the mucous membrane of the olfactory region. These filaments differ essentially from the ordinary cerebral nerves. They contain no white substance of Schwann, are not divisible into elementary filaments, and resemble the gelatinous fibers in being nucleated, and of a finely granular texture. The branches of the fifth pair (or trifacial) given to the nose are the nasal nerve (derived from the ophthalmic division), which supplies the skin and mucous membrane in the vicinity of the nostrils, and the naso-palatine nerve (derived from Meckel's ganglion, which is connected with the superior maxillary division), which supplies the mucous membrane on the spongy bones and on the septum. The peculiar sensation that precedes sneezing is an affection of the nasal nerve, and the flow of tears that accompanies a severe fit of sneezing is explained by the common source of this and the lacrimal nerve; while the common sensibility of the nose, generally, is due to the branches of this and of the naso-palatine nerve.

The nature of odorous emanations is so little known, that it is impossible to give a definite account of the mode in which they produce sensory impressions. From the fact that most odorous substances are volatile, and réc réc, it may be presumed that they consist of particles of extreme minuteness dissolved in the air; yet the most delicate experiments have failed to discover any loss of weight in musk, and other strongly odorous substances, after they have been freely evolving their effluvia for several years. But whatever may be the nature of the odorous matter, it is necessary that it should be transmitted by a respiratory current through the nostrils to the true olfactory region, whose membrane must be in a healthy condition. If it is too dry, or if there is an irregular excretion of fluid from its surface (both of which conditions occur in catarrh or cold), then, the sense of smell is impaired or lost, in consequence of the necessary penetration of the stimulating odorous matter to the nervous filaments being prevented.

The acuteness of the sense of smell is far greater in many of the lower animals (dogs, for example) than in man, and they employ it in guiding them to their food, in warning them of approaching danger, and for other purposes. To civilized men its utility is comparatively small; but it is occasionally much increased when other senses are deficient. In the well-known case of James Mitchell, who was deaf and blind from his birth, it was the principal means of distinguishing persons, and enabled him at once to perceive the approach of a stranger. Amongst many savage tribes the sense is almost as acute as in many of the lower mammals. For example, the Peruvian Indians are able, according to Humboldt, to distinguish, in the middle of the night, whether an approaching stranger is a European, American Indian, or Negro.

Although all poisonous gases are not odorous, and all bad odors may not be positively deleterious to health, there can be no doubt that one of the principal objects for which the sense of smell is given to us is to enable us to detect atmospheric impurities, many of which are of a most noxious character, and give rise to the most serious forms of fever.

NOSE-RING. See Ring.

NOSING, the projecting edge of a molding, such as the bead or bottle used on the edge of steps, to which the term is most frequently applied.

NOSOLOGY (Gr. nosos, disease) is that branch of the science of medicine which treats of the distribution and arrangement of diseases into classes, orders, etc. Many systems of nosology have at different times been adopted; some of which have been based upon the nature of the ascertained causes of diseases; others on the pathological states or conditions which attend diseases; others on the differences between structural and functional diseases, etc. It is hard to say which is the most perfect method; but that of Dr. Farr, one of the most distinguished living medical statisticians, is adopted by the registrar-general of the United Kingdom in his reports on the mortality of London and England, and is becoming more generally adopted than any other. It has the advantage over the antiquated but once popular system of Cullen (1792) of meeting the requirements of modern science, and (by illustrating great questions connected with public health) of showing those causes that are injurious or fatal to life, and of thus contributing to the removals of those evils (bad drainage, imperfect ventilation, etc.) which tend to shorten human existence.

We append Dr. Farr's system of nosology, which is arranged in four primary classes, each of which includes various orders:

Class I. Zymotic Diseases (Gr. zymé, a ferment).—Diseases that are either epidemic, endemic, or contagious, and that are induced by some specific body, or by want of food or by its bad quality. In this class there are four orders—viz., Order I. Miasmatic Diseases (Gr. miasma, a stain), such as small-pox, measles, scarlet-fever, diptheria, typhus and typhoid fevers, cholera, gague, etc. Order II. Enthetic Diseases (Gr. enthélos, put in or implanted), such as syphilis, gonorrhœa, ganders, hydrophobia, malignant pusule, etc. Order III. Dietic Diseases (Gr. dietés, way of life or diet), such as famine, fever,
scurry, purpura, rickets, bronchocele, delirium tremens, etc. Order IV. *Parasitic Diseases*, such as scabies (or itch), and worm disorders from animal parasites and ringworm, scald-head, etc., from vegetable parasites or fungi.

Class II. *Constitutional Diseases*.—Diseases affecting several organs, in which new morbid products are often deposited; sometimes hereditary. This class consists of two orders. Order I. *Diathetic Diseases* (Gr. diathesis, condition or constitutional), including gout, cancer, megalosis, lupus, etc. Order II. *Tubercular Diseases*, such as scrofula, phthisis, mesenteric, tubercular meningitis, etc.

Class III. *Local Diseases*.—Diseases in which the functions of particular organs or systems are disturbed or obliterated with or without inflammation; sometimes hereditary. This class includes eight orders. Order I. *Brain Diseases* (or more correctly, *Diseases of the Nervous System*), such as apoplexy, paralysis, epilepsy, chorea, hysteria, mania, etc. Order II. *Heart Diseases* (or more correctly, *Diseases of the Circulatory System*), such as pericarditis, endocarditis, aneurism, angina pectoris, atheroma, phlebitis, varicose, etc. Order III. *Liver Diseases* (or more correctly, *Diseases of the Respiratory System*), such as bronchitis, pneumonitis, pleurisy, asthma, emphysema, laryngitis, etc. Order IV. *Bowels Diseases* (or more correctly, *Diseases of the Digestive System*), such as stomatitis, gastritis, enteritis, peritonitis, jaundice, etc. Order V. *Kidney Diseases*, such as Bright’s disease, nephritis, ischuria, diabetes, stone, gravel, etc. Order VI. *Genetic Diseases* (or *Diseases of the Generative System*), such as hydrocele, ovarian dropsey, etc. Order VII. *Bone and Muscle Diseases*, such as caries, necrosis, exostosis, synovitis, muscular atrophy, etc. Order VIII. *Skin Diseases*, such as urticaria, eczema, herpes, impetigo, acne, itching, prurigo, etc.

Class IV. *Developmental Diseases*.—Special diseases, the incidental result of the formative, reproductive, and nutritive processes. It contains four orders. Order I. *Developmental Diseases of Children*, such as malformations, idiocy, teething, etc. Order II. *Developmental Diseases of Women*, such as amenorrhea, childbirth, change of life, etc. Order III. *Developmental Diseases of Old People*, such as old age, and its concomitant affections. Order IV. *Diseases of Nutrition*, such as atrophy, debility, etc.

**Nossi-be, Nossi-Barim, Varies or Helleville**, an island on the n.w. coast of Madagascar, at the mouth of the bay of Posaondera, and separated from the main land by a narrow channel. It is about 74 sq.m. in extent; its coast-line is very much indented; and its surface much diversified. The highest hill is 1700 ft. in height, and is clothed to the summit with magnificent trees; but much of the island has a bare aspect, the forest having been cut down in order to the cultivation of rice. The soil is very fertile, and rice, maize, manioc, bananas, etc., are produced far beyond the wants of the inhabitants. The soil is volcanic, and there are several old craters filled with water. Nossi-Bé has been in the hands of the French since 1840, and is regarded by them as an important possession, on account of an old claim which they suppose themselves to have to Madagascar. There is on this island a small town called Helleville, with a harbor well sheltered from the north and east winds. There is good anchorage also at several other parts of the coast. The population of the island is about 6,000.

**Nossibrahim, or Sainte Marie**, an island on the e. coast of Madagascar, and separated from it by a strait of about 5 m. in width. It is about 40 m. in length from n.e. to s.s.w., but only a few miles in breadth. It is one of the much-prized possessions of the French on the coast of Madagascar, has been in their lands since 1750, and is their chief place of commerce on that coast. The soil is generally arid, and the climate moist and unhealthy. Rain is of extreme frequency. The population of the island is about 5,000. It contains a small town called Saint Louis—a seaport, and fortified. All the French possessions on the coast of Madagascar were placed by an imperial decree of 1851 under one government, that of the Comoro Isle (q.v.).

**Nosc Toce**, a genus of plants of the natural order *Algae*, suborder *Confertae*, found upon moist ground, rocks near streams, etc., and consisting of a somewhat gelatinous hollow tufted frond, filled with simple filaments resembling strings of beads. *N. commune* is frequent in Britain, springing up suddenly on gravel-walks and pasture-grounds after rain. It is a trembling gelatinous mass, often called *Star Jelly*, and vulgarity regarded, owing to the suddenness with which it makes its appearance, as having fallen from the skies, and as possessed of important medicinal virtues. *N. edule* is employed in China as an article of food.

**Nostadamus**, a celebrated astrologer of the 16th c., b. Dec. 14, 1503, at St. Remi, in Provence. His proper name was Michel Notre-Dame, and he was of Jewish descent. He studied first at the college d’Avignon, where he exhibited remarkable scientific powers, and subsequently attended the celebrated school of medicine at Montpellier. Here he first acquired distinction during an epidemic that desolated the s. of France, by his heroic attempts to those stricken by the pestilence. After taking his degree, he acted for some time as professor, but was induced by his friend J. C. Scaliger to settle in Agen as a medical practitioner. After traveling for some time, he finally settled at Salon, a little town situated in the environs of Aix, about 1544. Already he must have been reckoned a man of note, for in the following year, when an epidemic was raging at Lyon, he was solemnly invited thither by the civic authorities, and is said to have rendered immense services. He first fell upon his prophetic vein about the year 1547, but
in what light he himself regarded his pretensions, it is now impossible to say. At any rate, he commenced to write his famous predictions (Prophéties) which first appeared at Lyon in 1555. The predictions were in rhymed quatrains, divided into centuries, of which there were seven; the 2d ed., published in 1558, contained ten. Astrology was then the fashion, and these quatrains, expressed generally in obscure and enigmatical terms, had a great success. Some, indeed, regarded the author as a quack, but the great majority as a genuine seer or predictor of the future. He was, consequently, much sought after by all sorts of people, high and low. Catherine de Médicis invited him to visit her at Blois, to draw the horoscope of her sons, and on his departure loaded him with presents. The duke and duchess of Savoy went to Salon expressly to see him; and when Charles IV. became king, he appointed Nostradamus his physician-in-ordinary (1564). He died at Salon, July 2, 1566. Nostradamus's predictions have been the subject of an immense amount of illustrative and controversial literature. He also wrote an Almanac, which served as the model of all subsequent ones, containing predictions about the weather.—See Jaubert's Vie de M. Nostradamus, Apologie et Historie (Amst. 1656); Astruc's Mémoires pour servir à l'Histoire de la Faculté de Montpellier (Paris, 1707); Apologie pour les Grands Hommes Souffreurs de Magie (Paris, 1825); and E. Barest's Nostradamus (Paris, 1842).

NOSTRILS. DISEASES OF THE. Acute inflammation of the nasal mucus membrane is a very common and well-known affection, which has been already described under the title of catarrh (q.v.), or cold in the head; while the chronic form of inflammation is described in the article OZÖXEA. Hemorrhage from the nostrils, or Epistaxis (Gr. a drop ping), is by far the commonest form of bleeding from a mucous membrane. It may be produced (1) by direct injury, as by a blow on the nose, or a scratch in the interior of the nostrils; or (2) it may be an active hemorrhage, in which case it is often preceded by a feeling of tension and heat in the nostrils, pain in the forehead, giddiness, buzzing in the ears, and flushing of the face; these symptoms are, however, seldom all present in the same case, and not unfrequently the flow of blood is preceded by no apparent disorder; or (3) it may be of a passive character, and may be the either to a morbid condition of the blood, as in malignant scarlatina, typhoid and typhus fevers, scurvy, purpura, etc., or to obstruction of the circulation by disease of the liver and heart.

If the hemorrhage occur in a flushed or plethoric subject, and is obviously of an active character, it may be regarded as a salutary effort of nature, and may be left alone till it ceases spontaneously; but if it continues so long as materially to weaken the patient, or if it be of the passive character, or if it arise from injury, then means should be taken to stop it with as little delay as possible. The patient should be placed in the sitting posture at an open window, with the head erect or slightly inclined backwards, and amongst the simpler means to be first tried, are compression of the nostrils by the fingers, the application of a key or other piece of cold metal to the back of the neck, and the occasional immersion of the face or whole head in cold water, especially if accompanied by a drawing-up of the water into the nostrils; or Dr. Negrier's plan of causing the patient, in a standing position, suddenly to raise his arms straight upwards and to retain them in this position—a remedy which he states to have always succeeded, even in very bad cases, when other means had failed. Should these means fail, recourse must be had to astringent injections (for example, twenty grains of alum dissolved in an ounce of water) thrown up the nostrils by a syringe, or to astringent powders (as finely powdered galls, kino, matico, alum, etc.) blown up the nostrils by means of a quill or other tube, or sniffed up by the patient. As a final resource, direct compression must be applied. Abernethy never failed in stopping the bleeding by winding a piece of moistened lint around a probe, so as to form a cylindrical plug, passing this along the floor of the nose for its entire length, then carefully withdrawing the probe, and allowing the lint to remain for three or four days. Cases occasionally occur in which it is necessary also to plug the posterior orifices of the nostrils by an operation, into the details of which it is not necessary to enter.

Purulent discharges, which is an old term employed to signify any sort of penetrated tumor firmly adhering (literally, "by many feet") to a mucous surface, is of common occurrence in the nostrils; its most usual seat of attachment being one of the turbinate bones. The ordinary kind is of the consistence of jelly, yellowish, streaked with blood-vessels, and of a pear-shaped form. The patient has a constant feeling of fullness in the nostril (as if he had a cold in the head); he cannot effectually blow his nose; and his voice is sometimes rendered more or less thick and indistinct. If he force his breath strongly through the affected nostril, and at the same time compress the other, and close the mouth, the polypos may generally be brought in view. The best treatment is to seize the neck or pedicle with the forceps, and twist it off. The consequent hemorrhage may be readily checked by the means already described.

Foreign bodies are often inserted into the nostrils by children, and become impacted. They may usually be extracted by a small scoop or a bent probe. If they cannot be removed by these means, they must be pushed back into the throat through the posterior nares.

Children are occasionally born with imperforated nostrils. This congenital malformation may, however, usually be remedied by surgical assistance.
NOTABLES, the name formerly given in France to persons of distinction and political importance. As the states general were inconvenient to the despotism of the monarchy, the kings of the House of Valois adopted the expedient of calling in their stead Assemblies of the Notables, the time of calling them and the composition of them being entirely dependent on the pleasure of the crown, by which also their whole proceedings were guided, so that they generally consented at once to whatever was proposed to them. They showed a particular readiness in granting subsidies, to which they themselves, as belonging to the privileged classes, were not to contribute. An Assembly of Notables, convened in Paris by Richelieu in 1628, and presided over by Gaston, brother of Louis VIII., consisted of only 25 members. For more than a century and a half even this poor acknowledgment of any other mind or will in the nation than that of the sovereign ceased to be made; but when the state of the finances brought the monarchy into difficulties and perils, Louis XVI., at the instigation of the minister Calonne, had recourse again to an Assembly of Notables, which met Feb. 22, 1787, and was dissolved May 25. It was composed of 132 members, of whom there were 5 priors of the blood, 9 dukes and peers, 8 marshals, 11 archbishops, 22 nobles, 8 councilors of state, 4 masters of requests, 37 judges, 12 deputies of the Pays d'Etats, the civil lieutenant, and 25 persons belonging to the magistracy of different cities of the kingdom. Calonne's representations of the state of the finances induced the Notables to adopt many reforms in the matter of taxation; but no sooner was the assembly dissolved, than many of them joined the parliaments in opposition to resolutions adverse to their private interests, so that the king was compelled to determine upon assembling the states general. Necker, who had meanwhile been placed at the head of affairs, assembled the Notables again, Nov. 6, 1788, to consult them concerning the form in which the states general should be convened. The Notables declared against every innovation, and so compelled the court to half measures which helped to prepare the way for the Revolution. The parliament of the new principality of Bulgaria is spoken of as the Assembly of the Notables.

NOTACANTHIDÆ, a family of acanthopterous, fishes allied to the mackerels: indeed, they were formerly placed in the same family, (semoneridae). They have also been placed by recent writers in a separate order (opsiformes). They have an elongated cecal-like form, and the caudal extremity is surrounded, as in eels, by a continuous fin. The body is covered with very small cycloid scales, and the lateral line is well marked. They are five species, 1. notacanthusanus, Greenland, 2. n. Bonaparti, 3. n. Mediterraneus, 4. n. Scopasus, Australia, 5. n. rissoni, Mediterranean.

NOTARY PUBLIC is an officer of the law, whose chief function is to act as a witness of any solemn or formal act, and to give a certificate of the same: which certificate, if duly authenticated, is accepted all the world over as good evidence of the act done in his presence, and attested by him. The services of a Notary are chiefly available where his evidence is to be used in a foreign country. Solicitors are sometimes notaries-public, but in England there are fewer notaries, comparatively, than in Scotland, where notarial acts and certificates are more largely used.

NOTARY PUBLIC (ante), an officer introduced from the civil law, and known in ancient Rome as tabellio forensis; in England, appointed by the archbishop of Canterbury. In this country, the duties of a notary vary in the different states, being a matter of statutory regulation. But in general his duties are to protect bills of exchange, to take oaths and affirmations, to attest legal instruments, and to certify to documents. Notaries in England have always exercised the right of administering oaths, and that right has been confirmed by the statute, 5 and 6 Will. IV. In this country, the right can be exercised only where express statutory authorization is given, unless the oath administered is to be used in proceedings in the U. S. courts, or courts outside of the state. The act of Congress, Sept. 10, 1896, gave notaries equal authority with justices of the peace to administer oaths and take acknowledgments. A notary is liable for damages resulting from negligence in the discharge of his duties. He cannot as a rule delegate his notarial authority to another person. But a protest of a foreign bill of exchange by a notary's clerk, if such delegation be shown to be a commercial custom in the place fixed for the payment of the bill is valid. Where a notary is employed by an agent, and is guilty of negligence, the question arises whether the principal has a remedy against the agent, or against the notary: thus where an agent entrusted with the collection of a bill of exchange has it protested by a notary, whose negligence discharges the drawer and indorsers. Some courts hold that the principal may recover against the notary only when the latter's act is purely notarial, i.e. one that can be performed only by a notary; other courts hold that the remedy of the principal is against the notary only, whether the act be notarial or not.

NOTATION, the method of representing numbers and quantities by marks or signs. The representation of numbers is known as "arithmetical," and that of quantities as "symbolical" notation.

1. ARITHMETICAL NOTATION.—The invention of arithmetical notation must have been coeval with the earliest use of writing, whether hieroglyphic or otherwise, and must have come into use about the time when it was felt that a mound, pile of stones, or huge muspahan pillar, was insufficient as a record of great events, and required to be supplemented by some means which would suffice to hand down to posterity the requisite
information. The most natural method undoubtedly was to signify "unity" by one stroke, "two" by two strokes, "three" by three strokes, etc.; and, as far as we know, this was the method adopted by most of those nations who invented systems of notation for themselves. It is shown on the earliest Latin and Greek records, and is the basis of the Roman Chinese, and other systems. We have thus a convenient division of the different notational systems into the natural and artificial groups, the latter inclosing the systems of those nations who adopted distinct and separate symbols for at least each of the nine digits. The Roman and Chinese systems are the most important of the former, and the Hebrew, later Greek, and "decimal" systems of the latter group.

Roman System.—The system adopted by the Romans was most probably borrowed at first from the Greeks, and was distinguished equally by its simplicity and its cumbrous-ness. The following seems to be the most probable theory of its development. A simple series of strokes was the basis of the system; but the labor of writing and reading large numbers in this way, would soon suggest methods of abbreviation. The first and most natural step was the division of the strokes into parcels of ten, thus producing a plan which produced great facility in the reading of numbers. The next step was to discard these parcels of ten strokes each, retaining only the two cross strokes, thus, \( \times \), as the symbol for 10. Continuing the same method as larger numbers came to be used, they invented a second new symbol for 100, thus, \( \ell \) (which was at first probably the canceling stroke for ten \( \times \)’s in the same way as \( \times \) was originally the canceling stroke for ten units); and for the sake of facility in writing, subsequently employed the letter \( C \), which resembled it, in its place. The circumstance that \( C \) was the initial letter of the word centum, "a hundred," was doubtless an additional reason for its substitution in place of the original symbol for 100. An extension of the same process produced the symbol for 1000, which was also written \( \text{L} \), \( \gamma \), and very frequently \( 
abla \). This symbol was probably suggested by the circumstance that \( M \) was the initial letter of the Latin word mille signifying a thousand. The early Roman system went no higher. But though the Romans had great reason to be dissatisfied, with a method of reading off numbers, further improvements were urgently required. The plan of "bisection of symbols" was now adopted; \( \times \) was divided into two parts, and either half, \( V \) or \( \Lambda \), used as the symbol for 5; \( \ell \) was similarly divided, \( \Gamma \) or \( \ell \), standing for 50; and \( \Lambda \), \( \Sigma \), or \( 
abla \), was obtained in the same manner, and made the representative of 500. The resemblance of these three new symbols to the letters \( V \), \( \ell \), and \( D \), caused the substitution of the latter as the numerical symbols for 5, 50, and 500. A final improve-ment was the substitution of \( IV \) for 4 (in place of \( IIII \)), \( IX \) for 9 (in place of \( VIIIY \)), \( XC \) for 90 (instead of \( LXXX \)), and similarly \( XL \) for 40, \( CD \) for 400, \( CM \) for 900, etc.; the smaller number, when in front, being always understood as subtractive from the larger one after it. This last improvement is the sole departure from the purely additional mode of expressing numbers; and if the symbols for 4, 9, 90, etc., be considered as single symbols, which they practically are, the deviation may be looked upon as merely one of form. In later times, the Roman notation was extended by a multiplication of the symbol for 1000, thus \( CCC \), represented 10,000; \( CCC \), represented 100,000, etc.; and the bisection of these symbols gave them \( I \), \( L \), and \( D \), as representative of 5000 and 50,000 respectively. This, in all probability, is the mode according to which the Roman system of notation was constructed. To found a system of arithmetic upon this notation, would have been well-nigh impossible; and so little inventive were the Romans, that the attempt seems never to have been made. They performed what few calculations they required by the aid of the abacus (q.v.).

Chinese System.—This system presents a strong resemblance to the former, but is, in facility of expression, much superior to it. Like the Roman, it retains the primitive symbols for the first three digits, and like it also expresses the last four by prefixing a new symbol to the symbols for the first four, and the analogy is continued up to "twenty." From this point onwards, the Chinese system departs from the "additive" principle, as 20, 30, etc., are represented not as in the Roman system by a repetition of the symbol for 10, but by prefixing the symbol for 10, on its left side, the symbols for 2, 3, etc., as multiples. The same method is adopted with the numbers 200, 300, etc.; and should the number contain units, they are annexed on the right-hand side. For small numbers up to 20, the Roman notation is more expeditious, on account of the greater simplicity of its characters; but for very large numbers, the Chinese is scarcely more cumbrous than our own. Some numbers which are expressed by the Chinese with 14 characters, require more than 100 symbols when expressed in the Roman notation.

Previous to the intercourse of the western European nations with China, their nota-tion was much more cumbrous than it is at present; but the changes since made have affected merely the form of the characters, without altering the principle of the system.

Artificial Systems.—The first of these, in point of date, is the Hebrew; but as the knowledge we possess of it is very meager, and as its principle was adopted by the Greeks in the construction of their improved system, it will be sufficient to describe the latter.

Greek System.—The Greeks at first used a method similar to the Romans, though at the same time they appear to have employed the letters of the alphabet to denote the first 24 numbers. Such a cumbrous system was naturally distasteful to so fastidious a race, and they hit upon the happy expedient of dividing their alphabet into three portions—
using the first to symbolize the 9 digits, the second the 9 tens, and the third the 9 hundreds. But as they possessed only 24 letters, they had to use three additional symbols; their list of symbols of notation then stood as follows:

<table>
<thead>
<tr>
<th>Units</th>
<th>Tens</th>
<th>Hundreds</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\alpha) represents 1</td>
<td>(\beta) represents 2</td>
<td>(\rho) represents 10</td>
</tr>
<tr>
<td>(\kappa) represents 3</td>
<td>(\chi) represents 4</td>
<td>(\sigma) represents 20</td>
</tr>
<tr>
<td>(\lambda) represents 5</td>
<td>(\mu) represents 6</td>
<td>(\tau) represents 30</td>
</tr>
<tr>
<td>(\nu) represents 7</td>
<td>(\xi) represents 8</td>
<td>(\upsilon) represents 40</td>
</tr>
<tr>
<td>(\chi) or (\varphi) (introduced) represents 9</td>
<td>(\psi) or (\varpi) (introduced) represents (\delta)</td>
<td>(\omega) or (\omega) (introduced) represents (\lambda), (\Lambda), (\Lambda)</td>
</tr>
</tbody>
</table>

By these symbols, only numbers under 1000 could be expressed, but by putting a mark, called \(\sigma\) or \(\tau\), under any symbol, its value was increased a thousand-fold, thus \(\alpha = 1000\), \(\varepsilon = 20,000\); or by subscribing the letter \(M\), the value of a symbol was raised ten thousand-fold, thus, \(\pi = 80,000\). For these two marks, single and double dots placed over the symbols were afterwards substituted. This improvement enabled them to express with facility all numbers as high as 9,990,000, a range amply sufficient for all ordinary purposes. Further improvements were made upon this system by Apollonius, who also by making 10,000 the root of the system, and thus dividing the symbols into tetrads, greatly simplified the expression of very large numbers. Both Apollonius and Archimedes had to a certain extent discovered and employed the principle of giving to symbols values depending on their position and multiplicative of their real value, but this principle was applied to tetrads or periods of four figures only, and the multitude of symbols seems to have stood in the way of further improvement. Had Apollonius, who was the chief improver of the system, discarded all but the first nine symbols, and applied the same principle to the single symbols which he applied to the "tetrads" groups, he would have anticipated the decimal notation.

The Greek arithmetic, founded upon such a system of notation, was necessarily lengthy and complicated in its operations, each number in the multiplicand forming with each number in the multiplier a separate product (not as in our system, where one product blends with another by the process of "carrying"), though by arranging these products in separate columns, according as they amounted to units, tens, hundreds, etc., the process was somewhat simplified. But when fractions formed part of the multiplier and multiplicand, the Greek arithmetic became almost unmanageable, till the invention of sexagesimals (q.v.) by Ptolemy superseded it. After Ptolemy's death, all improvement was arrested.

Decimal System.—The decimal system, which was introduced into Europe from the east (see Numerals), was first employed by the Spaniards, and was from them transmitted to the French and Germans, through whom its use was extended over Europe. The modern arithmetic was not practiced in England until about the middle of the 16th c., and for a long time after its introduction was taught only in the universities. The decimal system, possessing only 9 symbols—viz., 1, 2, 3, 4, 5, 6, 7, 8, 9 (called the nine digits)—adopts the principle of giving to each symbol or "figure" two values, one the absolute value, and the other a value depending upon its position. The numbers from "one" to "nine" inclusive, are expressed by the nine digits; ten is expressed by writing a cipher or zero after 1 (10), thus throwing it into the second place, and giving it a positional value ten times its absolute value. From the principle that a figure thus moved one place to the left is held to be increased in value ten times, this method of notation is called decimal notation (Lat. decem, ten), and ten is said to be the "radix" of the system. The numbers from "eleven" to "nineteen" inclusive are expressed by taking the symbol 10 and putting the digits from "one" to "nine" inclusive in place of the zero—e.g., twelve is written 12, 1 in position signifying ten units, and 2 two additional units. On the same principle, twenty is expressed by putting 2 in the second position (20), and so on to 90. To express a hundred, 1 is put in the third place (100), thus making its value ten times what it is in the second place, or ten times ten units; two hundred is similarly expressed by 200, etc.; and should a number of tens and units amounting to less than a hundred exist in the number, the symbols expressing them are substituted for the two zeros. This process can be similarly continued without limit.

There is another way of looking at this notation, which is perhaps simpler and clearer. In such a number, e.g., as 393, instead of attributing different values to the figure 3 in the different positions, we may consider it as symbolizing the same number throughout, namely, three; but three what? In the first place, it signifies three ones or units (e.g., three single pounds or sovereigns); in the second place, it still signifies three, but now it is three "tens" or decades (three parcels of ten sovereigns each); and in the third place, it still signifies three, but now three hundreds (three parcels of a hundred each). It is from this point of view that the first place to the right is called the place of units, or the units' place; the second, the place of tens, and so on. When such a number as 6473 is analyzed on this principle, it is seen to mean \(6 \times 1000 + 4 \times 100 + 7 \times 10 + 3 \times 1\):
and 600\,4 becomes \(6 \times 1000 + 4 \times 1\). In this latter instance the peculiar importance of the figure 0 is seen (see \textit{Nothing}). Following out the method, the general formula for all numbers is \(a \times 10^n + b \times 10^{n-1} + c \times 10^{n-2} + \ldots + m \times 10^2 + n \times 10 + q\), where \(a, b, c, \ldots, m, n, p, q\), stand for any of the nine digits or zero.

The special advantages of such a system are manifold. It enables us to express small numbers with the greatest ease, and as the smaller numbers are those most commonly used, this is a great point in favor of the system. It also gives to computation a unity which could never under any circumstances have existed in the systems of notation above described, and the most ordinary, and at the same time effective illustration of this is the process of "carrying" in multiplication, whereby one product is blended with another, and much time and trouble in the subsequent addition is saved. This simplification, however, is chiefly due to the introduction of the symbol 0, which, supplying the place of an absent digit, preserves to those figures on the left of it their true positional value. Another advantage of this system is the ease with which computations involving fractions are performed (see \textit{Fractions}, \textit{Decimal}). The use of the number 10 as \textit{radix}, is universal in all systems of notation; but it has been often doubted, and in some respects with good reason, whether it is the number best fitted for this position, and many have proposed to substitute 12 for it. This question will be referred to under \textit{Scales of Notation}.

\section{2. Symbolical Notation, the general designation of those symbols which are used by mathematicians to express indefinite quantities. The symbols are generally taken from the English, Roman, and Greek alphabets, and are apportioned as follows: Algebraic quantities are expressed by the English alphabet; those which are known, by the earlier letters \(a, b, c, \ldots\), and those which are unknown, by the later ones, \(u, v, w, x, y, \ldots\). In trigonometry, the letters \(a, b, c, \ldots\), denote measures of length, and \(\Lambda, \beta, \gamma, \ldots\), are used to express angles. In mechanics and astronomy the Greek letters are generally used to express angles. When different sets of quantities are similarly related among themselves, the sets are, for convenience, expressed by the same letters; and to prevent confusion, each set has a peculiar mark attached to each symbol, thus, \(a, b, c\ldots\) denote one class; and \(a', b', c'\ldots\) another class; \(a^*, b^*, c^*\ldots\) a third class; and so on, or \(a_1, b_1, c_1, \ldots, a_2, b_2, c_2, \ldots\), etc.

\textbf{NOTE.} in music, a character which by the degree it occupies on the staff represents a sound, and by its form the period of time or duration of that sound. The notes commonly in use in modern music are the semibreve, \(\|\); minim, \(\|\); crotchet, \(\frac{1}{2}\); quaver, \(\frac{1}{4}\); semiquaver, \(\frac{1}{8}\); demisemiquaver, \(\frac{1}{16}\); and semi-semi-demi-quaver. \(\frac{1}{32}\). Taking the semibreve as unity, the minim is \(\frac{1}{2}\) of its duration, the crotchet \(\frac{1}{4}\), the quaver \(\frac{1}{8}\), the semiquaver \(\frac{1}{16}\), the demisemiquaver \(\frac{1}{32}\), and the semi-semi-demi-quaver \(\frac{1}{64}\). Notes of greater length than the semibreve were formerly in use—viz., the breve, twice the duration of the semibreve; the long, four times; and the large, eight times the semibreve. Of these, the breve, \(\|\) or \(\|\), is still sometimes met with in ecclesiastical music. The term \textit{note} is often used as synonymous with musical sound.

\section{NOTES OF THE CHURCH} are marks by which a true church is distinguished. Practically, as to human judgment, they vary according to the different theories held concerning the constitution of a church. Irrelevant refers to the unity of the church’s doctrines, and her succession of bishops from the apostles; Tertullian appeals to the antiquity of the church derived from the apostles, and its priority to all heretical communities. The creed of Constantinople defines the church as "One, holy, Catholic, and apostolic." Augustine discerned the church chiefly in the consent of nations, authority founded on miracles, sanctity of morals, succession of bishops from Peter, and even in the name "Catholic church." Jerome specifies the duration of the church from the apostles and the Christian name. Luther insists on the uncorrupted preaching of the gospel, administration of baptism, and of the eucharist, and the keys. Calvin regards chiefly truth of doctrine and right administration of the sacraments. Bellarmin multiplies the marks into catholicity, antiquity, duration, amplitude, episcopal succession, apostolic agreement, unity, sanctity, and efficacy of doctrine, holiness of life, miracles, prophecy, admission of adversaries, unhappy end of enemies, and temporal felicity. Bishop Taylor mentions antiquity, duration, succession of bishops, union of members among themselves and with Christ, and sanctity of doctrine.

\section{NOT GUILTY} is the form of verdict in a criminal prosecution, and also in some civil actions, when the jury find in favor of the defendant or accused party. The verdict is conclusive, and the accused cannot, in criminal cases, be tried a second time.

\section{NOTHING}, in mathematical language, denotes the total absence of quantity or number, as when equal quantities are subtracted from equals, but it is often employed (see \textit{Limit}) to indicate the limit to which a constantly decreasing position quantity approaches. The absence of number or quantity could be equally well signified by the absence of any symbol whatever, but the presence of "0" shows that in its place some number or quantity might, and under other circumstances would, exist.

In physics, the symbol "0" is generally denominated \textit{zero}, and has a different mean-
NOTHOPIDÆ, a family of non-venomous snakes, established by prof. Cope, for a peculiar genuine type made known by himself. It is related to the boas and pythons, but is of small size. The only known species is found in central America.

NOTICE, in law, denotes existing knowledge of some fact or the act of giving information. In the former sense it may be actual or constructive, actual when the party is directly informed of the fact by word of mouth or by letter; constructive, when the party is legally presumed to have information on grounds of public policy or has been "put upon inquiry" by his knowledge of facts intimately connected with the particular fact in dispute. Thus a party to a suit has constructive notice of a newspaper advertisement published by order of the court, and a person accepting a conveyance which refers to some other deed is bound to consult the latter or take the consequence of his negligence. But when the liability of a party to do or not to do a certain act is conditioned on the occurrence of a fact which is best known to the other party, the plaintiff must prove that actual notice was given to the defendant. Averment of notice is the allegation in a pleading that notice has been properly given, and there must be such averment when the matter lies more properly in the knowledge of the plaintiff than the defendant. A claim in a contract for payment of an amount of money specifies no such claim of judgment by default. Notice to plead before a fixed time must be given in writing before judgment can be signed for non-pleading, and, in general, notice must always be given to the opposing party of any new step in procedure. Secondary evidence cannot be offered of the contents of a written instrument until notice has been given to the opposing party to produce it on trial, except where the party in possession holds the paper by fraud or when he is supposed from the nature of the case to have constructive notice. The notice to produce should be in writing, should clearly describe what is required, and must be served on the party or his attorney a reasonable time before trial. Notice of dishonor must be given to an indorser of a promissory note and to the drawer or indorser of a bill of exchange, when demand for payment or acceptance has been made and refused by the maker of the note or by the drawer or acceptor of the bill of exchange, in order to change such indorser or drawer. Only persons who after dishonor are at once liable to an action on the negotiable paper need be immediately notified. Notice of dishonor must be immediate, must clearly describe the bill or note and the nature of the non-acceptance, may be oral though usually in writing, and may be served personally or by mail. Notice to quit from a landlord to a tenant is necessary only when the tenant holds at will or for an uncertain time. Notice in this case should be served by the owner or agent upon the tenant in person or some member of his family and at his usual place of abode. A time must be fixed at the end of which the premises must be vacated. This at common law was 6 months, but in this country is governed by statutory enactment, being, in many cases, 3 months. When there are joint tenants or tenants in common the notice must be addressed to all but may be served on one. After the specified time has passed any act of the landlord which recognizes the continuance of the tenant in possession of the premises is a waiver of the notice. The acceptance of rent, if not explained, would constitute such an act. Where A. assigns to C. a debt due from B. B. is not affected by the assignment without due notice. Thus where a mortgage has been assigned and subsequently the mortgagee or having notice, has made payments to the original mortgagee, such payments are good, and the assignee cannot recover from him. In a contract notice may be expressly required or may be implied from the nature of the agreement. If the act to be done is indefinite—as to pay for certain kinds of lumber as much as could be gotten by the vendor from any one else—it is obvious that notice is necessarily implied; not so, however, when the act is definite or specific, as to pay a fixed sum on the occurrence of a certain event. When a bona fide purchaser for consideration has had notice of the existence of fraud or unfairness in the contract by which his vendor obtained the possession of the article bought, that contract cannot be sustained on the ground that he is an innocent third party.

NOTICE TO QUIT, is the formal notice given by a landlord to a tenant, or by a tenant to a landlord, that the tenant ought or intends to quit at a future day named. See LANDLORD AND TENANT.

NOTIDANIDÆ, a family of sharks distinguished by the number of branchial apertures, which are six or seven. There are three genera, Hexanchus, Heteranceus, and Notorynchus, the latter inhabiting south African, and western North American shores, and the first two the Atlantic ocean and Mediterranean. The members of the family are small, none of them much exceeding 3 ft. in length.

NOTO, a t. of Sicily, in the province of Syracuse, and 16 m., s.w. of the city of that name, 3 m. from the sea. It is of the highest antiquity, was a place of great strength.
under the Saracens, and hold out against the invading northmen longer than any other town of Sicily. It is a very handsome town, contains rich churches, beautiful palaces, and broad and straight streets. Its academy has a library attached, and a collection of antiquities. A good trade is carried on in corn, wine, oil, and the other produce of the vicinity. Pop. 14,619. Noto was destroyed by an earthquake in 1693, and rebuilt about 4½ m. from its former site.

NOTHOPIDAe. Notre.

NOTCHORD, the chorda dorsalis (q.v. in Development of the Emiryo, ante),

NOTOPTERUS, a genus of fish belonging to the herring family (clupeidae).

NOTOTHENIID.E, a family of acaenipterous fishes, inhabiting southern seas, and representing the cod-fishes of the northern. The greatest number of species belong to the typical genus notothenia, and they are abundant on the southern shores of South America.

NOTORIS, a genus of birds of the family Bittidae, nearly allied to the cots, although in some of its characters it resembles the ostrich family. One living species only is known. Notornis Mantelli, a native of New Zealand. It is particularly interesting, because it was originally established and the species characterized by Owen, from remains found along with those of dinornis and other large birds of the ostrich family, called moos by the New Zealanders. The bird was, however, ascertained in 1850 still to exist. It inhabits some of the most unfrequented parts of the middle island. It is larger than the other coots, but small in comparison with the true moos. The flesh is said to be delicious. It seems to be a bird likely soon to become extinct unless preserved by human care, and of which the domestication would be easy and desirable.

NOT PROVEN is a form of verdict used in Scotland in criminal prosecutions when the jury think there is some foundation for the charge, but the evidence is not strong enough against the prisoner to warrant a verdict of guilty. In such a case, a verdict of "Not Proven" is substantially a verdict of acquittal. The prisoner cannot be tried afterward, even though new and conclusive evidence come to light after the verdict.

NOTRE DAME, i.e., Our Lady; the old French appellation of the virgin Mary, and therefore the name of a number of churches dedicated to the virgin Mary in different parts of France, and particularly of the great cathedral of Paris.

NOTRE DAME, CATHEDRAL OF (ante), the most celebrated church among the many of that name in France. It is the cathedral of Paris; and by its great age, the majesty of its proportions, and the stinging scenes of seven centuries of history, of which it has been either theater or witness, it is one of the remarkable historical monuments of the world. History does not reach to the time when it was originally built. It stands on the site on which for many centuries the church of St. Geneviève, the Roman emperors Tibereus altars for pagan worship existed on the east end of the island in the Seine, where Notre Dame now stands. The remnants of a temple of Jupiter and Cernunos, and the image of a horned god, were found on the spot about 375, when a church was erected on the same site; supposed to have been the first Christian church erected in north France. In the 6th c. there were two churches there, St. Etienne and Ste. Marie. Childebert rebuilt the latter about the year 520 in a Roman style, considered very grand. The first glass window now known of in France was placed in it. Fragments of mosaic and precious marbles supposed to be from the floor and columns of this church were discovered in excavations in 1817, and are now in the Museum de Chart. This church was pillaged and partly destroyed by the Normans in 857, but it was repaired by "Ansheric, 50th bishop of Paris." In 1140 the abbé of St. Denis put in a glass window of great beauty. It was then called the "Flèche neuve," to distinguish it from the St. Etienne, called le vieil. In the 12th c. both were falling into ruin, through they had for centuries been used for the great religious ceremonies and royal pageants of France.

About 1160 bishop Maurice de Sully resolved to replace both old churches with a single edifice worthy the capital of the kingdom, and in 1163 the foundation of the present majestic pile was begun, and its corner stone placed by the hands of pope Alexander III., then a refugee in France. The work was pushed rapidly, so that, in 1182, on Wednesday of pentecost, the great altar was consecrated by a legate of the pope. In 1183 Heracle, patriarch of Jerusalem, came to Paris to officiate with the bishop in the dedication of the altar. Henry II., king of England, was interred before its high altar in Aug., 1189. Notwithstanding the completion for service of the body of the church in the 12th c., the grandest part of the cathedral—its western front with the two towers—was only begun by bishop Pierre de Nemours, a.d. 1298. It rose at the rate of about one story in the life of one generation of men. The portal of the south transept façade was built still later, as shown by an inscription of the mason who began work upon it in 1257, in the reign of St. Louis, and some of the most important work which was completed during the succeeding centuries. The environs chapels in the rear of the transept were not a part of the original design, and were added in the last part of the 13th c., about which time, also, the towers of the west front were complete. In 1699 Louis XIII. was seized with the ambition to place in the cathedral an altar piece in the renaissance style, then just coming into vogue; and removed the original altar to give place to it. Other alterations were made by Soufflot, an eminent architect, in 1771-78. During the revolution, the masses of saintly curvings upon the church were threatened with destruction by the infidel mobs, and were saved at one time by a ruse of Chaumette, who assured...
the people that information concerning the planetary system was embodied in some of the image sculpture. But the statues of the old kings of France, which were upon the gallery of the grand façade, did not escape the vandalism. In 1783 the cathedral became, by law of the revolutionists, the Temple of Reason. In 1845 the first thoroughly intelligent and comprehensive work for the restoration of Notre Dame was entered upon, under the control of architects Lassus and Viollet-Le Duc. Their work was prosecuted uninterruptedly for ten years, so that by 1855 the marvelous blending of majesty of proportion with grace of detail and spirit in design in its west façade were exhibited in bolder relief than ever before in all its history. During the reign of Louis Napoleon the vast structure, on every side, from foundation to pinnacles, was cleaned and repaired; and for the first time in the seven hundred years of its growth could be seen with all its varied constructions as one completed whole. The year 1882 will be the 700th anniversary of its consecration. From 1162 to the present its lofty nave, its altars, and all its chapels, have been the scenes of all the most important ceremonies of church and state in France. The baptism of princes, their marriages, coronations, royal funerals, the reception of the great dignitaries of the church, Te Deums for victories, and the surging masses of Parisian revolutions for seven hundred years have made historic procession under its lofty vaults. The architecture embraces nearly every noble feature peculiar to the era that witnessed the growth and culmination of Gothic architecture, and for simple majesty of expression its façade has no superior. The extreme length of the cathedral is 450 ft.; width at transept, 170 ft.; and area covered by it, 64,108 sq. ft.; height of towers, 223 ft.

NOTRE DAME, SCHOOL SISTERS OF. See SCHOOL SISTERS.

NOTRE DAME, University of, at Notre Dame, St. Joseph co., Ind., a Roman Catholic institution, founded in 1842. It has no endowment. It has 14 buildings, good laboratories and apparatus, with cabinets and collections of art, and a library of 30,000 volumes. It embraces a preparatory school, a commercial and classical department, and schools of art, science, medicine, and law. The students are trained in gymnastic and military exercises. Jan. 1, 1880, it had 20 professors, 19 other instructors, 530 students, and 400 alumni. President, the very rev. William Corby, C.S.C.

NOTT, Eliphlet, D.D., L.L.D., 1773-1866; b. Ashford, Conn. He enjoyed the careful training of an excellent mother, and at the age of four had read the Bible through. At the age of 16 he taught school, and at 18 took charge of the Plainfield academy, pursuing at the same time his classical and mathematical studies with the rev. Dr. Benedict. From Plainfield he went to Boston university, remaining there 5 years, during which time he discovered a vein of coal. He then studied theology with his brother in Franklin; was licensed by the New London Congregational association in 1796; was missionary and school teacher at Cherry Valley, N. Y., in 1795-97; pastor of the Presbyterian church in Albany in 1798-1804. In 1804 he was elected president of Union college, Schenectady. He found the college in a low condition, "without funds, buildings, or library, and in debt," and its friends greatly disheartened; but he was successful in raising funds, and providing for its pressing needs. His remarkable executive abilities, and his power as a disciplinarian, were soon apparent, and young men came to the college from every state in the union. During his presidency of over 62 years, upwards of 4,000 students graduated. Dr. Nott was one of the most distinguished of American educators, and is spoken of as "one of the historical monuments of this country." In 1811 he was the moderator of the general assembly of the Presbyterian church. He published "Counsels to Young Men on the Formation of Character and the Principle, which lead to Success and Happiness in Life; Lectures on Temperance," presenting a convincing argument for the disuse of intoxicating liquors. He published also several baccalaureate and other sermons and addresses. His most remarkable discourse was on the occasion of the fatal duel between Hamilton and Burr. The sermon made a profound impression upon the public mind, and gave him wide fame as a pulpit orator. Dr. Nott had great mechanical talent, and in the "Digest of Patents" are found 36 in his name granted for the application of heat to steam-engines, the economical use of fuel, etc. Dr. Crook, of the Methodist, says of him: "Perhaps no American educator, no American preacher, who has seen the dawning of 1865, has had so unique a history—few, probably, so effective a career. Intellectually, he was a remarkable man—many-sided, and superior on most sides. His mechanical genius is well-known, and one of the most famous iron manufactories (the 'Novelty Works') originated in one of his inventions, which, by its economical peculiarities, was first known as a 'novelty. He was a great financier, and enriched himself and Union college by his masterly skill and enterprise." Dr. Nott was not only an able theologian, but probably the most skilled pulpit orator in the country. "Strong, serene, dignified, beautiful in language, clear in thought." "His most striking characteristic as a preacher was his perfect grace of manner, toned by a perfect graciousness of religious feeling." His memory was extraordinary, contributing greatly to his eloquence, as he was able to go at once from the writing of his discourse to the pulpit without his manuscript, and deliver it without any effort at recollection. He had indomitable force of character, and his mental power was controlled by Christian principles.

NOTT, Josiah Clark, 1804-73; b. S. C.; educated at the college of South Carolina, and in medicine at the medical school in Philadelphia, where he was for a time demonstrator in anatomy. In 1829 he returned to South Carolina, and entered upon the prac-
tice of his profession. In 1855 he went to Europe, where he spent a year in the study of medicine and the natural sciences. On his return he settled in Mobile, where he continued to practice medicine, founding, in 1858, a medical college, which became a department of the university of Alabama. He gave much attention to ethnology; and published, besides many contributions to medical periodicals, Two Lectures on the Connection between the Biblical and Physical History of Man, 1849; The Physical History of the Jewish Race, 1850; Types of Mankind, 1854; and Indigenous Races of the Earth, 1857. He wrote the last two works in conjunction with George R. Gliddon. He attempted, in his books on ethnology, to dispove the unity of the human race. His theories were regarded, in general, as more original than profound.

NOTT, SAMUEL, D.D., 1754—1852; b. Conn.; brother of Dr. Eliphalet, the president of Union college; graduated at Yale college in 1780; ordained pastor of the Congregational church in Franklin, Conn., Mar. 13, 1782, where he remained until his death, performing his pastoral duties up to his 94th year, and dying from the effects of a fall. He published several occasional Sermons.

NOTT, SAMUEL, 1788-1869; b. Conn.; son of the rev. Samuel of Franklin, Conn., and nephew of the rev. Dr. Eliphalet, president of Union college. He graduated at Union college, 1808; Andover seminary, 1810; ordained (Congregationalist), 1812, with Newell, Judson, Hall, and Rice; and embarked with Hall, Feb. 24, as a missionary of the American Board to India. After some delays from the East India company, they reached Bombay, where they began a mission. His health failing, he returned to his native land in 1815. His return caused great dissatisfaction among the friends of missions in America, as in that day it was thought inconsistent for one who had undertaken to labor for Christ among the heathen to return home on any account. He was engaged in preaching, teaching, and writing for the press until 1850. Among his published works was Slavery and the Revived. He died in Hartford, Conn.

NOTTINGHAM, an inland co. of England, between Lincolnshire on the e., and Yorkshire and Derbyshire on the w. Area, 526,176 acres; pop. '71, 319,758. It is 50 m. in length from n. to s., and 20 m. in average breadth. The meridian of 1° w. falls along the middle of the county, and may be said to divide it into two nearly equal portions, of which the eastern, comprising the vale of the Trent, is level, and the western is occupied by hills of no great elevation. In the s. of the co. are the woods, consisting of upland moors and pasture-lands, broken up by many fertile hollows. In the w. are the remains of the royal forest of Sherwood, famous as the chief haunt of Robin Hood. The principal rivers are the Trent, and its tributaries, the Erewash, Maun, and Idle. The Nottingham and Grantham canal, in the s., connects the Trent with the Witham, and these two rivers are also connected by the Fosse Dyke canal, which, running n.w. from the city of Lincoln, joins the Trent on the n.e. boundary of the county. By the rivers, canals, and North Midland, Sheffield, and Lincoln, and Great Northern railways, there is direct communication in every direction. The climate, especially in the e., is remarkably dry. The soil is various; and, with regard to productivity, the land is not above mediocrity. The usual crops are raised; there are many hop-plantations, and much land is laid out in market-gardens. Extensive tracts have been planted recently. Four members of parliament are returned for the county.

NOTTINGHAM, a municipal and parliamentary borough of England, capital of the county of the same name, and a county in itself, on the Leen at its junction with the Trent, 130 m. n.n.w. of London. It is built principally on the slope and at the foot of a rocky eminence, and, in an architectural sense, it has, within recent years, been much improved. The market-place is 51 acres in extent, and is surrounded by lofty buildings. The Trent, which passes about a mile s. of the town, and is here about 200 ft. wide, is crossed by railway bridges, and by an ancient bridge of 19 arches. The exchange, the town and county halls, the house of correction, St. Mary's church, the Roman Catholic chapel, and the new free grammar-school, erected in 1868, are edifices worthy of special mention. The free grammar school, with an income from endowment of about £1000 a year, was founded in 1513. A free library was opened in April, 1868. There are numerous hospitals for the poor and infirm. Of the manufactures, which are various and important, the principal are bobbinet and lace, and cotton and silk hosiery. Cotton, silk, and flax mills, bleaching works, and wire, iron, and brass works are in operation. Nottingham sends two members to parliament. Pop. '71, 86,621.

The original castle of Nottingham was built by William the conqueror. Ruined during the civil war, it was restored after the Restoration, and burnt during the reform bill riots. In 1787 it was restored and transformed into a museum and picture gallery.

NOTTINGHAM, HERENAGE FINCH, D.C.L., first Earl of, 1621-82; b. England; son of the Recorder of London, and connected with the family of the earls of Winchelsea. He was educated at Westminster school, and at Oxford, and on quitting the university, began to read law in the inner temple, London. In 1660, upon the restoration of Charles II., he became solicitor-general, and represented the crown in the prosecution of the regicides, of the proceedings against whom he published an account, in 1660. In 1661 he was returned to parliament for the university of Oxford, and made a baronet. He was conspicuous in the impeachment of the earl of Clarendon in 1667, and three years
later was made attorney-general. In 1678 he was made keeper of the great seal, in succession to Lord Shaftesbury, and in 1673 he became lord chancellor. In 1650 he sat as lord steward, on the trial of viscount Stafford, against whom he delivered judgment with great eloquence. He was made earl of Nottingham in 1681. He published a number of legal arguments and a volume of Reports of Cases decreed in the High Court of Chancery.

NOTTOWAY, a co. in s.e. Virginia, bounded on the s. by the Nottoway river; on the Atlantic, Mississippi, and Richmond and Danville railroads; 300 sq. m.; pop. '80, 11,156—11,110 of American birth, 8,143 colored. The surface is uneven, and portions are heavily wooded. The principal productions are tobacco, of which great quantities are raised, Indian corn, wheat, and oats. Co. seat, Nottoway Court House.

NOTTOWAYS, a tribe of Indians, who lived about the Nottoway river, in Virginia. They belonged to the Huron Iroquois family and spoke a language of that family, of which they formed one of the most southern divisions. They gave themselves the name of Cherohakah. They were at one time a powerful tribe, and survived the famous Powhatans. In 1700 they still numbered 130 warriors, and in 1729 they had increased to 200. They were then living in cabins surrounded by a palisade, on the w. bank of the Nottoway. Attempts were made by governor Spotswood and others to civilize and teach them, but unsuccessfully. In 1781 they had a reservation of 27,000 acres, of which only a very small part was under cultivation; and, according to Jefferson, not a single male of the tribe was then left alive.

NOUKHA, a town of Asiatic Russia, in Trans-Caucasia, is built on the southern slope of the Caucasus mountains, 80 m. s.w. of Derbeud, in lat 41° 12' n., long. 47° 13' e. Pop. (1897) 23,571, consisting of native Tartars belonging to the Mohammedan creed, of Armenians, and a few Russians, chiefly officials. Breeding the silk-worm is the staple branch of industry. The native breed of silk-worms is somewhat coarse, and is now being supplanted by the Italian breed.

NOUN (Lat. nomen, a name), in grammar, is the term applied to that class of words that "name" or designate the persons and things spoken about. In a wide sense, such words as rich, tall, are nouns, as well as John, man, tree; for they are names applicable to all objects possessing these attributes. But as words like John, man, tree, suffice of themselves to mark out or designate an object or a definite class of objects, while words expressive of a single attribute, like rich, tall, can be used only in conjunction with such a word as man or tree, the one class are called substantive nouns, or simply adjectives (q.v.), while the others are called substantive nouns, or simply substantivs or nouns. Nouns or names, in this narrower sense, may be divided into classes in a variety of ways, according to the ground we take for our division. One of the distinctions commonly made by grammarians is into proper nouns and common nouns. A proper noun is usually defined to be the name of any individual person, or place, as John, London; while a common noun is applicable to every individual of a class of objects, as prince, elder. But this definition fails to point out the real difference; for there are several Londons, and there are more Johns than princes; other things also have proper names, besides persons and places, as ships (the Minotaur), and bells (Big Ben). Providence again, although applicable to only one being in the universe, is not a proper noun. Wherein, then, lies the difference? In order to answer this question, we must advert to an important distinction made by logicians with regard to the import of names. A word is said to denote all the objects to which it is applicable as a name; thus, the word man is a name for all the objects known individually, as James, John, Adam, Caesar, etc., and therefore denotes the whole human race; but while thus denoting or naming them, it also implies something concerning them; in the language of logic, it connotes that they possess certain attributes; namely (1) a certain corporeal form, known as the human form; (2) animal life; (3) rationality. All this, at least, is included in the meaning or connotation of the word "man." Now, if we consider any noun of the class called common, we find that there it denotes or names, or points out a certain object, or class of objects, it also conveys or implies some qualities or facts concerning them; in other words, all such names are connotative, or have a meaning. Not so with proper nouns. To say that a man is called John Butler, informs us of no quality he possesses, or of any fact except that such is his name. The name itself conveys no meaning; it is nonconnotative. And this is what really constitutes a proper name; it is allixed to an object, not to convey any fact concerning it, but merely to enable you to speak about it. Proper names, indeed, are often given at first on account of the object possessing certain attributes; but once given, they do not continue to connote those attributes. The first John Baker was probably so called because he exercised the trade of baking; but his ceasing to bake would not have made him lose the name; and his descendants were called Baker, regardless of their occupation.

Proper names are thus meaninglessness marks, to distinguish one individual from another; and the A, B, C, etc., which a mathematician affixes to the several angles of a figure, are as proper names as Tom, Lawrie, etc., applied to the individual bells of a chime. The proper contrast then, to a proper noun is not a common noun—meaning by that a name common to a class of objects—but a significant noun.

Of significant nouns, by far the greater number are general or class names; that is, they can be applied to any individual of a class of objects, implying that all these indivi-
duals have certain attributes in common—as quadruped, book. The quadruped spoken of may perhaps be a horse, and here we have another class-name, applicable to the same object, but of less generality than “quadruped.” Animal, again, is more general than quadruped; being applicable to a far wider class. But it is important to observe, that as the number of objects that the terms are applied to, or denote, increases, the number of attributes they imply—in other words, the amount of their meaning—diminishes. To call an object an “animal,” merely implies that it is organized and is alive (with that kind of life called animal life); to call it a “quadruped,” implies all this and a number of attributes in addition; and to call it a “horse” implies a still further addition.

It is to this class of words that the term common nouns is properly applicable; and the contrast to them is not proper nouns, but what might be called singular nouns, such as “God,” “Providence,” “universe.”

Collective names are such as regiment, fleet, senate, show. They form a subdivision of class names or common names; for regiment is applicable to all collections of men organized in a particular way.

Names of materials are such as iron, water, sugar, wheat. These two classes appear in many cases to merge into each other. In both the objects named consist of an aggregate; but in collective names the parts forming the collection are thought of as individual objects; as the soldiers of a regiment, the fishes composing a shoal. Substances, again, like iron, gold, water, are not made up of definite individual parts (at least to our senses); and in such as wheat, sand, the name of the individual visible part (grain of wheat, grain of sand) is derived from the name of the mass, showing that the idea of the individual is swallowed up in that of the mass.

A convenient term for names of materials or substances is that used by German grammarians—stuff-nouns. Sometimes the same word is used as a stuff-noun, and also as a class-noun. Thus: “The cow eats grass” (stuff-noun); “the botanist studies the grasses and has found a new grass” (class-noun); “they had fish (stuff-noun) for dinner, and consequently caught fish” (class-noun).

Names of materials are not, like collective nouns, a subdivision of common nouns; they belong to the contrasted class of singular nouns; and, when the substance is simple or invariable in composition, cannot be used in the plural; as gold, water, beef.

Abstract Nouns.—In the expression “hard steel,” or “the steel is hard,” the word hard implies a certain quality or attribute as belonging to the steel. This quality has no existence apart from steel or some other substance; but I can withdraw (abstract) my thoughts from the steel in other respects, and think of this quality as if it had an independent existence. The name of this imaginary existence or abstraction is hardness. All words expressive of the qualities, actions, or states of objects, have abstract nouns corresponding to them; as brave—bravery; strike—stroke; well—health. In opposition to abstract nouns, all others are concrete nouns—that is, the attributes implied in them are considered as embodied in (concrete, Lat. growing together) the actual existences named.

NOUreddin-MAhMoud, MaLeX-Al-Adel, one of the most illustrious men of his time, and the scourge of the Christians who had settled in Syria and Palestine, was born at Damascus, Feb. 21, 1116. His father, Omad-ed-din Zenguil, originally governor of Mosul and Diarbekir on behalf of the Seljuk sultans, had established his independence, and extended his authority over Northern Syria, including Hems, Edessa, Hamah, and Aleppo. Noureddin-Mahmoud succeeded him in 1145, and the better to carry out his ambitious designs, changed the seat of government from Mosul to Aleppo. Count Joscelin of Edessa, thinking the accession of a young and inexperienced sovereign afforded him a favorable opportunity of regaining his territories, made an inroad at the head of a large force, but was signally discomfited under the walls of Edessa, his army, with the exception of 10,000 men, being completely annihilated. The report of Noureddin-Mahmoud’s success being conveyed to western Europe, gave rise to the second crusade. The crusaders were, however, foiled by Noureddin-Mahmoud before Damascus, and being defeated in a number of partial conflicts, abandoned their enterprise in despair. Noureddin-Mahmoud next conquered Tripolis and Antioch, the prince of the latter territory being defeated and slain in a bloody conflict near Rugia (June 29, 1149), and before 1151 all the Christian strongholds in Syria were in his possession. He then cast his eyes on Egypt, which was in a state of almost complete anarchy under the feeble sway of the now effeminate Fatimites, and, as a preliminary step, he took possession of Damascus (which till this time had been ruled by an independent Seljuk prince) in 1156; but a terrible earthquake which at this time devastated Syria, leveling large portions of Antioch, Tripolis, Hamah, Hems, and other towns, put a stop to his scheme for the present, and compelled him to devote all his energies to the removal of the traces of this destructive visitation. An illness which prostrated him in 1159, enabled the Christians to recover some of their lost territories, and Noureddin-Mahmoud, in attempting their re-subjugation was totally defeated near the lake of Quneesaret by Baldwin III., king of Jerusalem; but undismayed by this reverse, he resumed the offensive, defeated the Christian princes of Tripolis and Antioch, making prisoners of both, and again invaded Palestine. Meanwhile, he had obtained the sanction of the caliph of Bagdad to his projects concerning Egypt, and the true believers flocking to his standard from all quarters, a large army was soon raised, which, under his lieut. Shirkoh, speedily overran Egypt. Shirkoh
dying soon after, was succeeded by his nephew, the celebrated Salâh-Ed-Dîn (q.v.), who completed the conquest of the country. Nowrûz-Mahmûd, becoming jealous of his able young lieut., was preparing to march into Egypt in person, when he died at Damascus, May 15, 1174. Nowrûz-Mahmûd is one of the great heroes of Moslem history. Brought up among warriors who were sworn to shed their blood for the cause of the prophet, he retained in his exalted station all the austere simplicity of the first caliphs. He was not, like the majority of his co-religionists, a mere conqueror, but zealously promoted the cultivation of the sciences, arts, and literature, and established a strict administration of justice throughout his extensive dominions. He was revered by his subjects, both Moslem and Christian, for his moderation and clemency, and even his most bitter enemies among the Christian princes extolled his chivalrous heroism and good faith. He possessed in an eminent degree the faculty of impressing his own fiery zeal for the supremacy of Islam upon his subjects, and their descendants at the present day have faithfully preserved both his name and principles.

NOVACULITE, a siliceous slate derived from the argillaceous schists of the paleozoic period. Novaculite is the compact and homogeneous portions of the rock. See Horne, ante.

NOVALIS. See Hardenberg.

NOVARA, a province in n.w. Italy, adjoining Switzerland; bounded on the e. by the lake Maggiori and the Ticino, on the s. by the Po, and on the w. by Turin; drained by the Po and its affluents; 2,526 sq. m.; pop. 72,624,985. The surface is mountainous, intersected by the Alps, among whose ridges are fertile valleys. The principal productions are silk, hemp, grain, and rice. Capital, Novara.

NOVARA, a t. of Northern Italy, and capital of the province of the same name, is situated in a fertile district about 60 m. n.e. of Turin. Pop. 71, 24,885. It commands fine Alpine views from its ancient dismantled fortifications, and contains several notable churches, especially the cathedral, with its fine frescoes and sculptures, and grand high altar. On March 23, 1849, Novara was the scene of a grand battle between the Sardinian forces and an Austrian army commanded by Radezky, which resulted in the complete defeat of the Italians, and ultimately led to the abdication of Charles Albert in favor of his son, Victor Emmanuel.

NOVA SCOTIA, a province of the Dominion of Canada, is bounded on the n.w. by New Brunswick and the bay of Fundy, on the n. by the straits of Northumberland and the gulf of St. Lawrence, and on the other sides by the Atlantic ocean. It consists of two portions, Nova Scotia proper, a large peninsula connected with New Brunswick by an isthmus about 15 m. in width, and the island of Cape Breton (q.v.). The peninsula, about 280 m. in length, and from 50 to 100 m. broad, extends in an e. and w.s.w. direction. Cape Breton lies n.e. of Nova Scotia proper, separated from it by a narrow strait called the gut of Canso, 16 m. long, and from half a m. to 2 m. wide. Sable island, which is 25 m. in length by 14 in breadth, and is surrounded by a dangerous, widely-extended sand-bank, is situated about 90 m. from the nearest coast of Nova Scotia, in lat. 44° n. and long. 60° west. It is formed of sand-hills thrown up by the sea, some of them being about 80 ft. in height. The island is covered with wild grasses, which support herds of wild horses, known as Sable island ponies. It is in the track of vessels trading between America and Britain, and owing to the number of wrecks that take place on its shores, a superintendent and several men are stationed here for the purpose of rescuing and aiding shipwrecked mariners. The area of the province is 18,600 sq. m.; pop. 71, 387,800. The coast-line is about 1000 m. in length, and the shores, which are much indented, abound in excellent bays and harbors, of which the chief are Chedabucto bay, Halifax harbor, St. Margaret's, Mahone, and St. Mary's bays, Annapolis, Minas, and Cobequid bays, and Pictou harbor. There are numerous rivers, but few of them are over 50 m. in length; the most important are the Avon, the Annapolis, the Mahone, the Cobequid, and Canso, each about 400 lakes, of which the Bras d'Or, in Cape Breton, covers an area of 500 sq. m., or about one-sixth of the entire area of the island. The surface is irregular and undulating, but not elevated. Ranges of hills traverse the center of Nova Scotia in the direction of its length. The Cobequid mountains, 60 m. from the Atlantic and 1100 ft. high, traverse the peninsula from the bay of Fundy to the straits of Canso. The soil in the valleys is rich and fertile, producing all the fruits of temperate climates; and, especially in the n., the uplands also are fertile. The climate is remarkably healthy, its rigor being modified by the insular character of the province, and by the influence of the gulf stream. The mean temperature for the year is 42.09° at Pictou, and 45.6° at Windsor. The extreme limits of the thermometer may be stated at 15° Fah. in winter, and 95° in the shade in summer. The province abounds in mineral riches, including gold, coal, and iron. Gold was first discovered in the colony in March, 1861, on Tanger river, about 40 m. e. of Halifax. The chief diggings are along the Atlantic coast, and gold has been found in nearly 100 different localities. An act of the legislature regulating the disposal of claims and the collection of revenue from the gold-fields was passed in March, 1862. The gold mines have been worked steadily, and in many cases profitably. In 1871 the yield of gold was 19,227 oz., in value about $355,700; in 1875 the yield was 11,508 oz., valued at $201,756.
In 1873, 781,165 tons of coal and 4,467 tons of iron ore were raised in the province. Of the entire area of the colony, 10,000,000 acres are considered good land, and of these 1,928,032 acres were under cultivation. Three-fourths of the whole area are comprised in the peninsula of Nova Scotia, and the remainder in the island of Cape Breton. The principal agricultural products are: hay, wheat, barley, buckwheat, oats, rye, Indian corn, potatoes, and turnips. The waters around the colony abound in fish, as mackerel, shad, herring, salmon, etc., and the fisheries are pursued with ardor and ever-increasing success.

In 1873-74 the number of men employed in the fisheries was 21,651, and the total value of the fish caught, $8,652,301. In 1873-74 the imports amounted to £2,181,476, the exports to £1,501,309; the revenue for 1873 to £104,500, the expenditure to £136,200. The number of vessels that arrived in Nova Scotia during the year ending June 30, 1874, was 4,454, of 693,114 tons, and the number that departed 3,752, of 581,293 tons. These are in the colony 1,590 m. of telegraph, and 200 m. of railway. It is provided with 5 colleges, 10 academies, and 1700 grammar, normal, and other schools.

Nova Scotia is supposed to have been visited and “discovered” by the Cabots in 1497. Its first colonists were a number of Frenchmen, who established themselves here in 1604, but were afterwards expelled by settlers from Virginia, who claimed the country by right of discovery. Under the French settlers it bore the name of Acadia (Acadia); but its name was changed for its present one in 1621, when a grant of the peninsula was obtained from James I. by sir William Alexander, whose intention was to colonize the whole country. Having found, however, that the localities they had fixed upon as suitable for settlement were already occupied, the colonists returned to the mother-country. In 1654 the French, who had regained a footing in the colony, were subdued by a force sent out by Cromwell. By the treaty of Breda, the country was ceded to the French in 1667, but it was restored to the English in 1713.

After the middle of the 18th c. strenuous efforts were made to advance the interests of the colony. Settlers were sent out at the expense of the British government. The French, who had joined the Indians in hostilities against the English, were either expelled or completely mastered, and Cape Breton, which was French till 1763, and was subsequently a separate province, was united to Nova Scotia in 1819. Nova Scotia was incorporated with the Dominion of Canada in 1867, and is represented in the Canadian parliament by 12 senators, and 20 members of the lower house. It has also its own local legislature and lieutenant governor; the legislature consisting of a council and a house of assembly elected by the counties—which are 18 in number—and the cities, the chief of which are Halifax, Yarmouth, Truro, and Pictou.

NOVATIAN, a priest of the Roman church in the 3d c., and the leader of a sect called after his name. The place and time of his birth are not known with certainty. Novatian had been a stolic philosopher, but after his arrival in Rome was converted to Christianity, and being seized with sudden illness while still a catechumen, received what was called clericul baptism, that is, baptism administered on a sick-bed, and without the solemn ceremonial. Such baptism was, in ordinary circumstances, an impediment to holy orders. Notwithstanding this irregular baptism, Novatian was promoted to orders by Fabian the Roman bishop; and soon afterwards showed his weakness by flying during a persecution. At this time a controversy arose about the manner of dealing with the lapsed; that is, those who fell away in persecution. Novatian at first inclined to the milder side, but on the election of Cornelius to the Roman bishopric to which Novatian had aspired, and on Cornelius taking the indulgent course toward the lapsed, Novatian, together with Novatus and some other discontented priests of Carthage, opposed his authority, and eventually Novatian was chosen by a small party, and actually ordained bishop, in opposition to Cornelius. The party who espoused his cause was called by his name. They were confined mainly, in the first instance to Rome and to Carthage, where a kindred conflict had arisen. They held that in the grievous crime of idolatry through fear of persecution, the church had no power to absolve the penitent: and therefore, although it does not appear that they excluded such sinners from all hope of heaven, yet they denied the lawfulness of readmitting them to the communion of the church. This doctrine they extended at a later period to all grievous sins, of whatever character. Novatian may thus be regarded as the first anticipator of that system of doctrine which came into general adoption in the churches throughout Italy, Africa, and the East adhered to Cornelius; but the Novatian party set up bishops and established churches not only at Carthage, but at Constantinople, Alexandria, Nicaea, Phrygia, Gaul, Spain, and elsewhere. They claimed for themselves a character of especial purity, and assumed the appellation of Cathari (Puritans). The time and manner of the death of Novatian is uncertain. According to Socrates (Hist. Ecc. iv. 28; v. 21; vii. 5, 12, 25), he died a martyr in the persecution of Valerian, but this is improbable. He was a man of considerable learning, and the work recently discovered in one of the monasteries of Mount Athos, and published by Mr. Miller at Oxford in 1851, under the title of Origenis Philosophitnearum, is by some ascribed to him. His sect survived long after his death. An unsuccessful effort was made in the council of Nice to re-unite them to the church; and traces of them are still discoverable in the end of the 6th century.

Novation, in law, the extinguishment of an old obligation by the substitution of a new. The civil law distinguished 3 kinds of novation: 1. Where a new debt is substituted,
due by the same debtor to the same creditor, but with changed terms of payment. 2. Where a substituted new debtor assumes the old debt. This kind of novation is called delegatio, and differs from the other kinds in that it may be completed without the knowledge of the original debtor. It can be created by an assignment, by the debtor, of the debt to another person who agrees to become responsible for the debt, and whom the creditor agrees to accept in place of the original debtor. When the novation takes place without the action of the original debtor, the transaction is called ex promissio, and the accepted new debtor ex-promissor. 3. Where the old debt is made payable to a new creditor. This is also called delegatio, and requires the consent of all parties. A novation was not a matter of legal presumption, but an intent to innovate, avidi novanin, must be distinctly shown. In the absence of proof of such intent to extinguish the old debt, the debtor is liable for that, and also liable under the new obligation. There must have been a payment which the obligation of which can be taken by the new obligation is subject to the same conditions, if any, as the old one, and if the old be void, as against good morals, the new one will be void also; but otherwise, at least in some cases, where the old debt was merely voidable—the new promise being considered as a waiver of any disability which might have been a good defense. A consent by parties capable of consenting, is requisite to the validity of a novation, though the older civil law recognized a sort of involuntary novation. All obligations are subject to novation, so that debts by specialty, warrants, legacies, etc., are as capable of novation as debts by simple contract. But it has been held in New York, that an agreement by the obligee in a bond, not to sue the obligor within a certain time, is not a novation, but a covenant, for breach of which the usual action lies. A new debtor has no rights under the old obligation, nor have the creditors any remedy against the old debtor, though the latter be solvent, and the new debtor insolvent. A novation may be conditional, in which case the old obligation subsists, the new obligation detaches from the original debt are extinguished by its extinction, unless expressly retained by the new contract; and in an action upon the new contract, no claims or set-offs between the parties to the old contracts can be set up in defense by the new parties. A single creditor may make a contract of novation with two or more debtors, all individually liable. The term novation, in the common law, is much less used than assignment and merger. With some differences, common law and civil law novation are in the main alike. There must have been an original and now extinguished debt, whose cancellation forms the consideration for the new contract, which alone can be the subject of the action. A simple agreement to change the contract is not sufficient; the change must be ratified by the parties, and actually carried into effect. As in the modern civil law, the consent of the debtor is necessary to the novation, and the substitution of a new creditor, nor can the latter, in the absence of such consent and privity, recover against the debtor. There is no privity of contract between them, and to recover, the creditor must show such privity by setting forth a new promise upon sufficient consideration. In equity, however, a debt may be assigned without the debtor's consent, and the assignee can maintain a suit in his own name. But at law, in the absence of consent or consideration, the assignee cannot sue for the debt in his own name, and in a suit upon it, all set-offs, accounts, or equitable defenses, which could be pleaded by the debtor against the original creditor, may be used. The extinction of the original debt is itself a sufficient consideration, and no consideration need be stated in the new contract, though one must be proved to constitute a valid defense to a suit by creditors of the assignor. The most usual case of novation in modern law, is the substitution of a new bill of exchange, or promissory note for an old one surrendered and extinguished. Wherever an intention is shown to make the new note or bill an absolute payment, it will be so held. In Maine, Vermont, Massachusetts, and some other states, the receipt of a negotiable promissory note or bill is prima facie evidence of payment of the debt, and it is held in Louisiana, that the receipt by the creditor for a draft payment of a note constitutes a novation. The general rule, however, in England and in this country is that the receipt of a promissory note does not make a novation, but is merely prima facie evidence of a conditional payment, made absolute payment by the occurrence of the condition, i.e., the payment of the note.

NOVA ZEMBLA (Russ. Novaja Zemlja, "new land"), the name given to a chain of islands lying in the Arctic ocean (lat. between 70° 30' and 76° 30' n., and long. between 52° and 66° e.), and included within the government of Archangel. Length 450 miles; width, 50 miles; area, 17,250 square miles. The most southern is called Nova Zembla; of the others the principal are Matthew's land and Lütke's land. They were discovered in 1553, and are wild, rocky, and desolate—the vegetation being chiefly moss, lichens, and a few shrubs. The highest point in the chain is 3,475 ft. above the level of the sea. Mean temperature in summer at the southern extremity, 35.5°; in winter, 32.2°. Nova Zembla has no permanent inhabitants, but as the coasts swarm with whales and walruses, and the interior with bears, reindeers, and foxes, they are periodically frequented by fishermen and hunters.

NOVELDA, a t. of Spain, in the province of Alicante, and 18 m. w. from Alicante, on the railway between Madrid and Alicante. There are corn and oil mills, Brandon distilleries, and manufactures of lace. Pop. 8,095.
NOVELLE. See Justinian.

NOVELLO, Clara, a distinguished vocalist, daughter of the following, was b. in 1818. Her talent showed itself very early. At the age of 10 she became a pupil of the French academy of singing for church music, and studied in Paris for several years, following up her studies in after years in Italy and Germany. Both in England and in Italy she created quite a furor from the year 1840 to 1848: her singing has indeed hardly ever been equalled in equality, flexibility, and executive skill. In 1848 she married count Gigliucci, and quitted the stage, returning to it, however, for a time from 1850 to 1860.

NOVELLO, Vincent, an eminent musical performer and composer, was b. in London, of an Italian father and English mother, in 1781. At the age of 16 he was organist in the chapel of the Portuguese embassy; and even then had attained a large measure of that proficiency on the organ for which he was celebrated in later life. He was one of the founders of the Philharmonic society. His musical compositions, which are very numerous, and chiefly sacred, are considered to have contributed much to the improvement of cathedral music. As a pains-taking editor of unpublished works of eminent musicians, he has also done great service to musical literature. He died at Nice in 1861.

NOVELS. The novel and the so-called romance, inasmuch as they constantly merge in one another, and are only superficially distinguished by the preponderance in the one of ordinary and familiar incidents, in the other of incident more or less remote and marvelous, may conveniently be included here under the common definition of prose narrative fiction. Between the legendary epic, the drama into which portions of its available material from fluent become crystallized, and the wider prose fiction or novel, into which this again expands itself, there are obvious affinities, the distinctions being rather of form than of essence. It is of the later development, the novel, that we purpose to give here a historical sketch, omitting, however, any consideration of the remoter and but slightly known specimens produced in Hindustan and China.

1. Ancient Classical Prose Fiction. The earliest Greek compositions of a fictitious character, of which we possess any knowledge, are the Milesian, or Milesian Tales, said to have been written chiefly by Aesop. The Milesians were a colony of Ionian Greeks who settled in Asia Minor, and fell under the dominion of the Persians, 494 B.C. They were a voluptuous, brilliant, and inventive race, and are supposed to have caught from their eastern masters, whom they somewhat resembled, a liking for that particularly oriental species of literature—the imaginary story or narrative. None of the Milesian tales are extant, either in the original Greek or in the Latin version made by Sisenna, the Roman historian, about the time of Marius and Sulla; but we have some forty stories by Parthenius Niceas, which are considered to be to a certain extent adaptations from them. The collection of Parthenius is entitled Peri Erotikon Pathematon, and is dedicated to Cornelius Gallus, the Latin poet, and the contemporary and friend of Virgil. If we may judge from this later set of fictions, which are mainly concerned with the description of all sorts of seduction, of criminal and incestuous passions, and of deploable terms, written in wretched verse, we have little cause, either morally or aesthetically, to regret the loss of their more famous prototypes. In Greece proper nothing was done, so far as we know, in the way of novel or romance until after the age of Alexander the great. It has been conjectured, not improbably, that his eastern conquests had a potent effect in giving this new bent to the fancy of his countrymen. Clearchus, a disciple of Aristotle, wrote a history of fictitious love-adventures, and is thus, perhaps, to be considered the first European Greek novelist, and the first of the long series of erotikoi, who reach down to the 13th c. after Christ. Not long after came Antonius Diogenes, whose romance, in 24 books, entitled Tz hyper Thouton Apista (of the incredible things beyond Thule), was founded on the wanderings, adventures, and loves of Dinias and Dereyllis. It appears to have been held in high esteem, and was at least useful as a storehouse, whence later writers, such as Achilles Tatius, derived materials for their more artistic fictions. The work has not been preserved, but Photius gives an outline of its contents in his Bibliotheca Cod.

A long interval, embracing, indeed, several centuries, now elapses before we come upon another Greek novelist or romancer. Be the cause of this what it may, the ever-increasing luxury and depravity of the pagan imperial world, combined to develop and intensify that morbid craving for horrible, magical, and supernatural incidents which in general fill the pages of the romancers of the empire. The first names that occur in the new series are Lucius of Patra (Patrensis) and Lucian (q.v.), who flourished in the 2d c. A.D., during the reign of Marcus Antoninus: but as the former simply collected accounts of magical transformations (metamorphoses), he is perhaps not to be regarded as a novelist proper at all; while the latter was really a humorist, satirist, and moralist in the guise of a story-teller—in a word, a classic Hellenist and Heine, and as far as possible from being a member of the wonder-loving school of erotics, with whom he has only an accidental connection by the external form of some of his writings. The first of the new series of romancers belongs to the later and so-called is properly landish (fifth and Sixth Neoplatonic philosophers), whose Babylonios is, indeed, no longer extant; but we are able to form a pretty just estimate of it from the epitome of Photius. The next notable name is that of Heliodorens (q.v.), bishop of Trikka, who flourished in the 4th c. A.D. This Christian writer, whose Loves of Theagenes and Charicleia is really the oldest extant erotic romance, has
far excelled all his predecessors in everything that can render a story interesting or excellent, and his charming fiction obtained a great popularity among such as could read. Some imagine that they see in Heliodorus a resemblance to the minutely descriptive style of novel introduced into England by Richardson, but without adopting this rather extreme notion, it can at least be safely asserted that Achilles Tatius and all the subsequent eroticœi deliberately imitated his style and manner, while he was not less certainly used as a model by that once celebrated but dreadfully tedious school of heroic romance which flourished in France during the 17th c., and whose best-remembered representative is mademoiselle de Scudéry. Tasso, Guarini, D'Urfe, and several other modern writers have drawn many particulars—sometimes almost verbatim—from the stories in the Theagenes and Chariclea. Achilles Tatius (q.v.), probably belonging to the 5th c., ranks next but to at some distance from Heliodorus in point of merit. His romance, entitled Ta kate Logikypen hat Kleophoû, and consisting of eight books, has supplied inspiration to at least one whole work of Fielding.

The next work that invokes our attention in point of time, the Daphnis and Chloe of Longus, is of a totally different character. It is a simple and picturesque prose-pastoral, with no poisonings, murders, magic, supernaturalism, and impossible exploits. Over the whole story rest a rural peace and a smile of cheerful sunshine; and, in spite of some singularly polluted passages, it was, for its time, a pure and wholesome fiction. Daphnis and Chloe is the only pastoral romance produced by any Byzantine author. Whether or not it exercised any influence on the development of the modern pastoral of Italy and France cannot be proved, but it has been noticed that there is no slight resemblance between it and the story of the Gentle Shepherd, which we know was suggested to Allan Ramsay by a classical friend, who may have borrowed from the Greek the sketch which he gave to the poet. It has also been very closely imitated by Gessner in his translation of Daphnis.

After Longus comes Chariton (flor. some time between the 6th and 9th centuries), whose romance, in eight books, on the Loves of Chères and Callirhoe, is not quite complete, but nearly so. It contains, like the other erotic fictions, plenty of stirring and starting adventures, but on the whole these are less improbable than what we encounter in the writings of his predecessors. Of three Xenophons, also noted among the eroticœi, and of uncertain date, the best is Xenophon of Ephesus, whose romance, entitled Ephe-

ricus, or the Loves of Anthia and Aromnus, is in ten books, and has all the sensational characteristics of the school to which it belongs. It is, however, perhaps worth mentioning that in the romance of Xenophon we meet for the first time with the story of the love-potion, the pretended death, and the mock-entombment of the heroine, which forms the leading incident in Shakespeare's Romeo and Juliet, and which, it is thought, reached the great English dramatist at second or third hand, through the Italian novelist Luigi da Porta.

Again a long interval elapses before we meet with another love-fiction of the old pagan sort. During this period, however, a work made its appearance which was essentially a romance, and was composed expressly for the purpose of recommending that form of Christian life which was the favorite in early times—the ascetic and reclusive form. This was the Barbaram and Josephat (q.v.), the author of which is unknown, but whose popularity, during the middle ages, may be estimated from the fact that it was translated into every language of Christendom from Norway to Spain. In the 12th c., another erotic, Eustathius or Euanthis, who was properly the last of the series, published his Iasene and Ilamene, in eleven books. This romance is, in truth, a feeble performance; the expiring flicker of a lamp whose oil is about done. It is puerile in its delineation of character, and full of plagiarisms; yet many of its details have been copied by later accidental writers, such as D'Urfe and Montemayor.

In all the erotic romances the adventures, which in fact constitute the story, have certain common characteristics. The hero and heroine are generally carried off by robbers or pirates; or they flee from home and are accidentally separated. They resolve to seek each other throughout the world, and in the course of their loving quest they visit the remotest regions, encounter the most frightful perils, make hairbreadth escapes from tragic ends, meet again in most unexpected and miraculous ways, and generally close their career in happiness and splendid prosperity—often turning out to be the offspring of far greater people than they fancied. Copious use is made of poisons, love-potions, improbable tricks, magic instruments, etc.; and one can easily see that the stories were meant to tickle and stimulate a languid, corrupt, sensual, and credulous people, such as the Greeks of the lower empire undoubtedly were.

Before touching on the mediaeval romance of western Europe we may in a few words notice such specimens of classical fiction as exist, or are known to have existed in Latin. We have already stated that the Milesian tales were translated into that tongue by Sisenna, who derived his knowledge of them from the Sybarites, a Greek colony of lower Italy. The taste for similar stories increased during the empire, but the writers in general cannot have displayed much genius in their compositions. If we may judge from the contemptuous language used by the emperor Severus against Clodius Albinus, whose fictions he designates libera literaria, and amila (old wives' tales). But higher praise must be assigned to the work commonly attributed to Petronius Arbiter (q.v.), who flourished in the time of Nero, and whose Satyricon—incomplete—is a comic novel or romance, and
(although the dirtiest work even in pagan literature) is executed with skill, vigor, and at times, with beauty. In the 2d c. A.D., Appuleius (q.v.), wrote his *As* (called from its excellence the *Golden Ass*), which relates the adventures of a young man who had the misfortune to be accidentally metamorphosed into that animal while sojourning in Thessaly: retainting, however, his human consciousness. The miseries which he suffers at the hands of robbers, cunmucha, magistrates, and other persons into whose hands he falls, until the period when he is enabled to resume his former figure, are portrayed with a wit, humor, sympathy, and feeling for the human heart, which are found in no other book. The work is also believed to have inspired the writings of his Greek contemporary, a moral and satirical aim. It was immensely popular in the middle ages; has supplied Boccaccio with some of his stories, and the author of *Gil Blas* with the picturesque incidents of the robbers' cave in the early part of his romance, and contains in the episode of *Capid and Psyche* one of the loveliest allegories of classical antiquity.

2. *Romantic fiction in western Europe.*—The first thing to be clearly understood in connection with this branch of literature is, that it is not a continuation of the Graeco-Byzantine or classical fiction, though, curiously enough, it began to spring up in the west just as the other was dying out in the east. It is a completely new growth, the product of new historical circumstances, which were but very slightly affected by Byzantine influences of any kind; and it transports us into a world of ideas, sentiments, beliefs, and actions, as different from what we find in the *Erotikoi* as could well be imagined. In the latter, the principal characters are mere lovers *forced* into adventures by the ministers of fate; in the former, they are real heroes, of the old Homeric type, and *seek* dangers greedily and joyously. When we read the *Erotikoi* we are reminded in many ways that we are in the midst of a corrupt and decaying civilization; when we turn to the romances of chivalry in spite of certain superficial and barbarous vices—such as the prevalence of bastardy, and the indifference displayed to bloodshed—we feel that we are in the presence of a youthful, healthy, vigorous, and growing social life. That these romances, generally from beginning to end, consist of a series of extraordinary and utterly impossible exploits, in which the magic, the mystery, and the enchantments of the *Arabian Nights* are rivalled or outshone, is unquestionable; but this proves no more than that the races of western Europe, who slowly, during the dark ages, rose, by the help of the church, out of barbarism into feudalism—the first step toward the civilization of the modern world—were boundlessly ignorant, credulous, and wonder-loving. Their prodigious vigor and vehemence of character, having no proper intellectual *pabulum*, was forced to supply its craving for a knowledge which was beyond its immediate attainment, by the exaggerations of a fancy that was without law or limit. We need not go so far as to assert that, in the medieval romance, everything is of native or "Gothic" origin; the fact is very much the reverse. This extreme theory, propounded by Mallet, and supported by bishop Percy, and other writers, is totally inadequate to account for all that is contained in these romances. Not less inadequate is another theory, first suggested by Salmasius, and afterward elaborated by Warton, that the mediaval romance is mainly of Saracenic origin, and was probably introduced by the Moorish conquerors into Spain, and thence propagated into France and Britain; while a third theory, which has also found supporters, viz., that it was derived from the classical mythology of ancient Greece, is the most inadequate of all. The true explanation of the matter appears to be that mediaval romance is a product of its source, and foundation in its revelry (q.v.)—a genuine product of western Europe—and although the material on which to speckle this widely-spreading plant have often been derived from the foreign sources we have mentioned, yet the spirit, scenery, sentiment, and life of the legends thoroughly reflect the characteristics of the earlier ages of feudalism. The notions of dragons, giants, magic rings, enchanted castles, are probably of Saracenic origin, and may have been introduced into Europe by the horde of pilgrims who visited the east in the time of the crusades; such incidents as the detaining of a knight from his quest by the enchantments of a sorceress may have been a tradition of the *Odyssey* of Homer; but the gaiety, the courtesy, the romantic valor, the tournaments, the noble friendships of brother-knights—all that distinguishes the romances of chivalry from Ironic legends, or the *Arabian Nights*, cannot be traced to any other source than the new-born chivalry of Europe.

The mediaval romances are divisible into three great series—1. Those relating to Arthur and the knights of the round-table. 2. Those relating to Charlemagne and his paladins. 3. Those relating to Amadis de Gaul, and his descendants.

The Arthurian series is, in its essence, of Welsh and Armorican origin. Its genesis is as follows: First came the legendary chronicles composed in Wales or Brittany, such as the *De Excidio Britanniae* of Gildas (q.v.); the chronicle of Nennius, belonging to the 9th c.; the Armorican collections of Walter Calenius or Gualter, archdeacon of Oxford; and the famous *Chronicon sive Historia Britonum* of Geoffrey of Monmouth (q.v.)—from these, and from the multitude of floating unrecorded traditions, sprung the *metrical*, which in turn gave birth to, and were ultimately superseded by, the *prose* romances. It is with the latter alone that we have here to do. They, like the metrical romances, were composed by Anglo-Norman authors (whose names are unknown) during the 13th, 14th, and 15th centuries, who took all the more willingly to the old British legend that in these the "Saxons" were the objects of the authors' hatred and detestation. The principal romances of the Arthurian cycle are those of *Merlin* (q.v.), the enchanter; of *Arthur*
Novels.

(q.v.); of the Sangreal (see Grail); of Persicul; of Lancelot du Lac; of the princes of Lyonne, Meliadus and his son Tristan; and of Isité le Triste, the son of Tristan. They relate the marvelous adventures, exploits, loves, and gallantries of the knights of the round-table, and are probably in substance the oldest of the mediaeval prose romances. The scenes are generally laid in Wales, Cornwall, Brittany, Ireland, or Scotland; only in one or two of the series are we taken as far as Egypt or India; and though Arthur is slain by "Saracens" who supported his nephew, Mordred, and a general eastern coloring is present in the cycle, yet it is "Saxons" who are the principal foes. The scenes of Our romances and his paladins is of purely French origin, and originated in a somewhat similar fashion to the Arthurian cycle; that is to say, there was first a legendary chronicle (in verse, however), entitled Historia de Vita Caroli Magni et Rolandi, erroneously attributed to Turpin or Tilpin, archbishop of Rheims, and of contemporary of Charlemagne, but probably executed in the 11th or 12th centuries; then came a series of metrical romances, strictly so called, which were gradually supplanted by their prose counterparts, the authors of which last, however, appear to have diverged more from the metrical original, and to have been more free and fanciful than their predecessors of the Arthurian cycle. The principal are Huon de Bohoruc (the incidents of which are followed by Wieland in his Oberon), Guzman de Mongeles, Gujleru Rhotetor (in which Charle- magne and his paladins proceed ineguludo to the Holy Land), Miles and Ames, Journad de Flores, Doñnn de Méguey, Ogier le Danois, and Manis the Enchanter. In these romances we are, in some respects, on totally different ground from that on which we find ourselves in the Arthurian series as all the Eastern lands of Asia and Africa, Palestine, Arabia, Bagdad, Constantinople, India, Persia, the Caspian sea, etc. We are introduced to the courts of Saracen "princes," "sultans," and "emirs;" and see Mohammed- dian maidens of peerless beauty falling in love with Christian knights, and for their sakes abandoning, or even betraying father, mother, brethren, and kinsmen. Fairies, who figure but slightly in the Arthurian romances, play a frequent and an important part in these; demons, dervishes, apes, talismans, palaces with cupolas and gilded roofs, splendid jewels, diamonds, etc.—everything, in fact, shows the influence exercised on the imagination of Western Europe by the glowing scenery, the brilliant life, and the gorgeously fanciful superstitions of oriental lands.

The series relating to Amadis de Gaul and his descendants is sufficiently characterized under the head of Amadis (q.v.). We may only observe, as a proof of the comparative lateness of their composition, that the "Saracens" of the French romances here give place to the "Turks," which as they were known in the East and the tottering Greek empire, many of the scenes of warfare are laid at Constantinople.

Besides the three distinct series of romance above-mentioned, a fourth, perhaps, deserves mention, in which the heroes of antiquity are grotesquely tricked out in the costume of mediæval knights. The exact date of their composition cannot be ascertained; but they were probably later in general than any of the other three series; and, at any rate, were for the most part not published till the end of the 15th and the beginning of the 16th centuries. The principal are the romance of Jason and Medea, of Hercules, of Eöllipus, and of Alexander. They are all written in French, and the first two profess to be the work of a Raoul le Fevre. An attempt is made to adhere, in the general outline of the stories, to the ancient myths, but most marvelous embellishments are added, such as only the middle ages could have conceived; while the transformations that the classical personages undergo are exceedingly ludicrous. Jove becomes a "king;" Mercury his "squire;" the fates "duennas." Cerberus and the sphinx, "giants;" etc. Before leaving this division of our subject we would observe that, though the romances of chivalry may appear infinitely tedious and absurd to a modern reader, they were immensely relished and admired during the ages in which they were produced; were widely disseminated, in different forms, throughout all Christendom, and were highly popular with later poets. The influence which they exercised on Pulci, Boiardo, Tasso, Spenser, etc., shows the strong hold that they must have had on the imagination of Europe; and, with the decline of chivalry, the spread of the more rational and artistic fictions of the Italian novelists, the revival of letters, and the general advancement in civilization of Christendom, the taste for the romances of chivalry also declined, until finally Cervantes laughed them out of literature, and well-nigh out of memory, in the beginning of the 17th century.

3. Development and Influence of Fiction in Italy.—The Italians originated no romances of the kind described above. This resulted from various causes, the principal of which perhaps are: 1st, that they were really not a Gothic but at least a semi-classic people; 2d, that they were more closely related to the northern nations; and 3d, that instead of feudal chivalric institutions, the most characteristic political features of Italy, during the middle ages, were mercantile and lettered republics. There was what may be roughly called a middle class—of merchants—in Italy, when England and France and Spain contained little more than nobles and serfs; and these were really the best instructed and the most enlightened portion of the community. Hence it is but natural that we should find a style of fiction mirroring to some extent this more civilized and sober form of social life. That the classical romances had some influence on the development of Italian fiction is probable; several of the tales recorded in the love-letters of Ariosto, and in the Golden Age of Appolline, are quite like what we read in Boccaccio and others. The
Noves.

fables of Pilpai or Bidpai (q.v.), translated into Latin as early as the 13th c., were also not without a certain effect; but it is to the Arabico-Italian book of the seven counselors (better known as The Tales of the Seven Wise Masters), still more to the stories of Petrus Alphonsus (whose work is entitled De Clerició Disceptioni), and the Osia Romance (q.v.), a grotesque jumble of classical stories, Arabian apologies, and monkish legends, in the disguise of romantic fiction; but most of all perhaps to the Contes and Fables of the French poets, that we must look for the first sources of those almost innumerable novellis which mark the earlier literary history of Italy.

The earliest Italian work of this sort is the Cento Novelle Antiche, commonly called II Novellino. It is a compilation by different hands—all unknown—of stories floating about, or taken with modifications from the sources above-mentioned, with one or two of the more graceful episodes in the romances of chivalry, and was executed towards the close of the 13th century. It was followed in 1358 by the Decameron of Boccaccio (q.v.)—the finest, in point of humor, sentiment, and style, of the whole set, but not more original in the matter of story than II Novellino. Its influence on early European literature was prodigious. Chaucer and Shakespeare in England have been in particular greatly indebted to it for incidents and plots; while in France—from whose Trouvères he had himself derived so much—Boccaccio had a number of distinguished imitators. In his own country his influence was so overwhelming that for some centuries Italian novelists could do nothing more than attempt to copy him. The principal of these imitators are Francesco Sacchetti (1355–1410), Ser Giovanni (who began to write his novellis in 1378, from which Molière got the plot of his École des Femmes, and Shakespeare probably part of his story of the Merchant of Venice—though the story of the bond is far older, and is of Persian origin—Chaucer is also indebted to it this Italian); Massuccio di Salerno (flor. about 1470), more original than most of the post-Boccaccian novelists; Sabadino deli Arianti (flor. about 1483); Agnolo Firenzuolo; Luigi da Porta; Molza, and Giovanni Brevio (flor. at the close of the 15th and in the first half of the 16th c.); Girolamo Parabosco (flor. 1510); Marco Cademosto de Lodis (1514); and Giovanni Giraldi Cinthio (died 1573), noted particularly for his extravagant employment of sanguinary incidents, and the introduction of scenes of incredible credulity and accumulated horrors. The seventh of his third collections of stories contains the story of Orlando, in honor of Vincenzo; the plot of Measure for Measure was also derived indirectly from him. Cinthio was, in fact, the greatest favorite of all the Italian novelists with the Elizabethan dramatists. Besides these, we may further mention Antonio Francesco Grazzini (died 1583); Strapparolo (wrote 1554 et seq.) from whom Molière, and also the French writers of fairy tales, derived numerous hints; while the lurid and incident embodied in the Scottish song of The barrin' o' our door forms one of the stories of this writer; Bandello (died 1555), the most widely known and read (out of Italy) of all the Italian novelists next to Boccaccio, and in whom we find the original of Massinger's play of The Picture, and of Shakespeare's Twelfth Night; Granucci (published 1574); Malespini (published 1609); and Campiogni (early part of 17th c.). The best French imitations of these Italian tales are the Cent Nouvelles Nouvelles (printed 1458, and translated into English under the title of The Heptameron Tales, 1557). They are full of life, gaiety, and imagination, and are written in the most naïve and agreeable manner; and the Heptameron of Marguer, queen of Navarre, from which Shirley, the English dramatist, has taken the plots of two of his comedies.

A few words may also be devoted here in passing to a very different class of fiction—the Spiritual Romance. It originated, without doubt, in the bosom of the church, and from the desire to edify, by stories of religious knight-errantry, a rude and ignorant community, incapable of understanding or relishing abstract doctrines. The first of the series is Barbam and Josephat, already alluded to; but by far the greatest work of the kind produced during the middle ages is the Legenda Aurea, or Golden Legend (q.v.), itself believed to have been drawn from different and now partly forgotten sources. Besides these may be mentioned a species of spiritual tale—the Contes Dévots, prevalent in France during the 12th and 19th c., and which were written by monks, probably with the view of counteracting the witty and licentious stories of the Trouvères; but curiously enough, the tales are oftentimes marvelously tender and pathetic, the incidents are more than those of the secular satirists. The things, too, which the virgin Mary is represented as doing are most astounding, and throw a strange but valuable light upon the religious notions of the age. In one story she conceals the shame of a favorite nun; in another, she performs the part of a procuress; in a third, she officiates as midwife to an abbess who had been frail and imprudent; and in general, she performs the most degrading offices for the most worthless characters.

Romance of the 16th and 17th Centuries.—During the middle ages, the universal sway of the church and the institutions of feudalism gave a certain character of uniformity to the modes of life, and thereby to the social literature of western Europe; but after the epoch of the reformation, and even earlier, this uniformity disappears, and we find in every direction a tendency to the opposite extreme of individualism. This tendency manifests itself especially in the literature of the period, which, vastly increasing in quantity and varying in quality, becomes difficult to classify. We shall, however, endeavor to group the products of modern prose-fiction works under what appears to us a convenient chronological heading.
During the 16th and 17th centuries, four different kinds of romance or novel were cultivated—1. The Comic Romance; 2. The Political Romance; 3. The Pastoral Romance; 4. The Heroic Romance.

Comic Romance substantially begins in modern times with Rabelais (q.v.), styled by sir William Temple the father of ridicule. Others, indeed, had preceded him in the same path, but they had acquired no celebrity. In him we see unmistakably one form of the modern spirit—its daring freedom of speculation, criticism, and satire, also that lack of reverence exhibited by those who, at the period of the reformation, clearly discerned the abuses of the church, but had not faith in the possibility or efficacy of reforms. Thus Rabelais, in his inimitable burlesque romance, scoffs (with the tone of a skit) at the deism of the oracles, the crooked ways of philosophers, and the absurdities of the Condes Decotes, and of the mediæval tales generally. The next remarkable romance of a comic nature is the Vita di Bertoldo of Julio Ceásoe Croce (flor. at the close of the 16th c.), a work recounting the humorous and successful exploits of a clever but ugly peasant, and regarding which we are told that for two centuries it was as popular in Italy as Robinson Crusoe or the Pilgrim’s Progress in England. The substance of the story can be traced back to an oriental source. A few years later appeared Don Quixote (see Cervantes), in which “war to the knife” was proclaimed against the romances of chivalry, and in which, perhaps, we see more distinctly than in any other fiction of the period the new turn that the mind of western Europe had taken. Almost contemporaneous with Don Quixote was another Spanish romance—Matteo Aleman’s Life of Guzman Alfarache, successively beggar, swindler, pander, student, and galley-slave. In this work, as in others of the same sort, we find several of the ideas that had the influence in the Italian novelists. It is sometimes supposed that Guzman Alfarache suggested to Le Sage the idea of Gil Blas, and there is some resemblance between the two; but, at any rate, it gave birth to a host of Spanish romances with beggars and scamps for heroes, of which the best is the Lazarillo de Tormes, by Diego de Mendoza (1589). In the following century France produced, among others, Scarron’s Roman Comique, and Furetiere’s Roman Bourgeois. England and Germany have nothing to show in this department.

Political Romance was manifestly suggested partly by the great politico-ecclesiastical changes that took place in Europe in the first half of the 16th c., and partly by the immense increase in the knowledge of the manners and customs of remote nations; occasioned by geographical discoveries and mercantile adventure. The earliest of the series is the Utopia of sir Thomas More; next comes the Arcadia of Barchay, published in 1521; and to the same class belong a variety of French romances produced about the close of the 17th and the beginning of the 18th c., of which by far the most famous is the Thé- rèse de Fécoult.

Pastoral Romance.—All through the middle ages, the fame of Virgii kept up a certain interest in compositions devoted to the delineation of rustic or shepherd life. We even find in the poems of the troubadours several specimens of the erotic pastoral; and the Amorci of Boccaccio furnishes us with a prose illustration of the same. But it was after the revival of letters that this branch of fiction, so essentially classical, was most assiduously cultivated by men of scholarly genius; and though their works have not retained the popularity they originally enjoyed, they are still interesting and valuable from a historical point of view, and abounding in descriptive passages of great beauty and sweetness. The pastoral life which they portray, however, never existed either in Greece or elsewhere. Their shepherds and shepherdesses are as unreal and unhistoried beings: as the knights of mediæval romance. The first important work of the kind is the Arcadia of Samazzaro, written in Italian about the end of the 15th century. It was followed by the Diana of Montemayor, written in Spanish, about the middle of the 16th c., several of the episodes of which are borrowed from the Italian novelists; while Shakespeare has in turn directly taken from it the plot of the Two Gentlemen of Verona, copying occasionally the very language, as well as some of the most amusing incidents in his Midsummer Night’s Dream. The Diana was imitated in French by Honoré d’Urfé, whose Astdre (1610-25) was for a long while held in the highest esteem, and is really, in spite of its tediousness, a work of great learning and considerable merit. Twenty years before the appearance of Astére, sir Philip Sidney wrote and published his Arcadia, as tiresome, and in substance as unreal, as any production of the same school, but in stateliness and melody of language, in luxury of fancy, in nobility and purity of sentiment, far exceeding them all.

Heroic Romance owed its origin partly to the immediate antecedent pastoral romance, partly to an increased acquaintance with classic history, produced by the translation of such books as Plutarch’s Lives, and partly to the interest excited in the Moors of Granada by a splendid romance in Spanish (professing, however, to be a history): The Discourses of the Regis and the Abencerrages, and was printed at Alcala in 1604, and which soon became extremely popular, especially in France. It was in the latter country alone that the Romans de Longue Italine (Long-winded Romances), as they have been happily nicknamed, were cultivated. The first of this heavy series was the Polexandre of Gomberville, published in 1622, in which the influence of the early Greek romances is visible. His successor, Calprenede, the best of a bad lot, wrote Cleopatra, Cassandra, and Pharamond. But the most prolific, and consequently the most intolera-
Novels.

ble of the school, is Mme. de Scudéry, whose principal romances are Ibrahim, ou 

Villeure Bassa; Clélie; Histoire Romaine; Artamene, ou le Grand Cyrus; and Almahide.

The pompous dignity, the hyper-polite address, the dreadful dulness, and the hollow ceremonialism of these ridiculous performances, admirably (if unintentionally) mirror the features of French court-life during the time of the Grand Monarque. These heroic romances did not long retain their meretricious reputation. Molière, and still more, Boileau, in his satire Les Héros de Roman, Dialogue, ridiculed them to death, and in consequence, Mme. de Scudéry had no successor.

Novels and Romances of the 18th Century.—The two European nations that most brilliantly distinguished themselves in the department of fiction during this century were England and France, and to these we shall chiefly confine our attention.

1. English Prose Fiction.—During the age of Elizabeth and her immediate successors, the imaginative genius of England, from various causes, had taken an almost exclusively poetical direction, and with the exception of Sidney's pastoral of Arcadia, and Bunyan's Pilgrim's Progress, we meet with nothing in the shape of a novel or a romance for a hundred years. The 17th c. has nothing to show till it approaches its close. This is doubtless owing, in part at least, to the intensity of the great political struggle that agitated and rent England during the first half of that century, and gave an austere theological bias to society. The Puritans, in their day of triumph, would not tolerate either comic or heroic romances. They set their faces "like flint" against all imaginative fiction, which they considered as little better than lying; and even to this day that class of people commonly described as "the religious portion of the community," in some sense the representatives of the Puritans, betray the legitimacy of their spiritual descent by their aversion to all sorts of secular tales. After the restoration, however, an extraordinary change came over the English nation, or at least over the upper and wealthier classes. These rooted in the excess of a coarse and licentious reaction against the rigorous piety and fanaticsism of the commonwealth. This turbid viciousness by and by calmed down, but it left a certain taint of sensualism and materialism in the habits of the people, which, in the opinion of some competent critics, marks them to this day. It is on this that a large amount of the English of 18th c. Englishment enters, characterizing the most prosaic, unimaginative, and unheroical period of her history. Its characteristics are faithfully reflected in most of her novels, which, as pictures of the gross dull life, the palpity thoughts, the low sentiments, the modish manners, and the loose morality that prevailed, possess a great historical value apart altogether from their literary merits.

The first name that occurs is that of the notorious Aphra Behn (q.v.), the greater number of whose novels, of which Oroonoko is the best known, appeared towards the close of the reign of Charles II., but are included here in the literature of the 18th c., as they belong to it by the nature of their contents, and not to the 17th c. types of fiction. She was imitated by Mrs. Heywood (born 1696, died 1758), of whose Love in Excess, The British Recluse, and The Injured Husband, it has been remarked that "the male characters are in the highest degree licentious, and the females as impassioned as the Samson princesses in the Spanish romances of chivalry." A later work, however, The History of Miss Betterton, rational and is supposed to have suggested the plan of Miss Burney's Evelina. But the first novelist of great genius belonging to the new era is Daniel Defoe (q.v.), the father of modern English prose fiction, in whose writings—The Adventures of Captain Singleton, The Fortunes of Moll Flanders, The History of Colonel Jack, etc.—the coarse, homely, unpoeitical, but vigorous realism of the time is strikingly apparent. Perhaps the Spanish ragamuffin romances may have furnished him with some hints. Robinson Crusoe is the finest and the most famous of all that class of fiction which was extensively cultivated both in France and England during the earlier part of the 18th c., and which received, in the former country, the name of Voyages Imaginaires. To the same class ( outwardly at least) belong Swift's Gulliver's Travels, though at bottom this is a satirical romance, like the works of Racine, and the 

Gaventdel di Lucer, a sort of politico-geographical fiction, generally attributed to Bishop Berkeley. After Defoe comes Richardson (q.v.), very unlikemany of the novelists of his age, and perhaps one of the last decorated with, and never utters anything rude, or vulgar, or licentious; but though she was inspired with the best intentions, her notions of how virtue should be rewarded indicate the coarseness of the time, hardly less than the debaucheries and seductions of Fielding and Smollett. The principal novels of Richardson are, Pamela; Sir Charles Grandison; and Clarissa Harlowe. Fielding (q.v.) thought Richardson untrue to nature, and wrote his first novel of Joseph Andrews as a burlesque on the style of his predecessor. Like his subsequent performances, Tom Jones and Amelia, it represents society as Fielding's sharper eyes saw it, on the whole, gross, vulgar, and impure. Smollett (q.v.), with a different style of genius, continues to paint in the same spirit. His chief works are, Roderick Random; Peregrine Pickle; The Adventures of Ferdinand Count Fathom; and Humphry Clinker. Sterne (q.v.), belonging to the same period, exhibits a genius so whimsical, peculiar, and original, that it is almost impossible to class him with any of his contemporaries. His Travels into Shropshire is a picture of the coarseness, purity and triviality of the age more conspicu-

ous. Four years later appeared Goldsmith's Vicar of Wakefield, in which a change for the better, in a moral point of view, is first noticeable. With the exception of Richard-

U. K. X.—46
son, all the novelists above mentioned are usually, and we may add correctly, described as **histrionists**. Other qualities they have besides, but this is the most common and predominant. When this school was passing away about 1760–70, another was on the eve of being born. The publication of Percey's *Reliques* had reawakened an interest in the age of chivalry and romance. Readers had become tired of the long prevalence of prosaic fiction, in spite of the splendid genius devoted to its illustration. It had, however, left behind it, and in the interest of the first of the modern romancers, Mr. Horace Walpole, whose *Castle of Otranto* appeared in 1760. It was followed by Clara Reeve, the authoress of the *Old English Baron*, a romance that every school-boy, we hope, remembers with the deepest gratitude; but the greatest genius in this line was undoubtedly Mrs. Radcliffe (q.v.), whose *Mysteries of Udolpho* and other works, though now almost forgotten, were once greedily devoured and abundantly imitated. The ablest of her successors were Matthew Gregory Lewis, author of *The Monk* (1796), and Maturin, author of *Montorio* (1803). In all the romances of this school, the incidents are of the most startling, terrible, and often supernatural character, and the scenery is in keeping with the incidents. Fierce barons, mysterious bandits, persecuted maidens, gloomy castles, secret passages, deep forests, murders, ghosts, haunted chambers, etc.; everything that could charm, by way of contrast, and pleasantly horrify the languid, matter-of-fact, skeptical 18th c., is to be found in their exaggerated pages.

A few novelists remain to be mentioned who are incapable of particular classification. These are Dr. John Moore (q.v.), author of *Zeloe*, etc., Godwin (q.v.), author of *Caleb Williams*, *St. Leon*, etc., in whom the free-thinking and revolutionary spirit that seized many minds after 1789 is conspicuous; Mrs. Inchbald (Nature and Art, *A Simple Story*, etc.); Charlotte Smith (Old Manor House, etc.); Miss Austen (Pride and Prejudice, Emma Persuasion); and Maria Edgeworth, whose sketches of Irish character first suggested to Walter Scott—the idea of attempting for Scotland a series of like illustrations.

2. French prose fiction in the 18th century.—It is not easy—perhaps not possible—to trace the causes that led to the cultivation of the different kinds of fiction which flourished in France during this century, and particularly during the first half of it. The natural love of change—of novelty; the accidental influences of foreign literature; the disposition, so peculiarly French, to satirize prevalent follies and vices; the wish, on the other hand, to amuse the leisure moments of a luxurious, superstitious, and profligate society; all these and many other causes unquestionably assisted in determining its diverse development. Four kinds have been distinguished: 1. Pseudo-historical Romance, the literature in which department, although copious enough, neither deserves nor requires special notice. 2. Romance in which the incidents, though natural, are purely imaginary. 3. Satirical-moral Romance. 4. Fairy Tales, to which may be associated the imitations of Oriental Tales, and the Voyages Imaginaires.

2. Romance in which the incidents, though natural, are purely imaginary.—This class more nearly corresponds with the modern conception of the novel than any of its predecessors, and probably had its prototype in *La Princesse de Cleves* and *Zaide*, by the comtesse de Lafayette, who flourished in the latter half of the 16th c.; but the first great name that adorns it is that of Marivaux (1688–1763), whose *Vie de Mariamne* and *Paysan Parvenu* were long in high favor. They have this in common with the contemporary English fiction, that everything in them is produced by ordinary means, and the interest of the reader is sought to be awakened by the vivid and powerful portraiture of natural feelings, while the incidents, if often highly romantic, are always sufficiently probable to insure the credence of the imagination. Next to Marivaux comes the Abbé Prevot, q.v. (1693–1763), who first "carried the horrors of tragedy into the novel." He was a most voluminous writer, but the work by which he is now chiefly remembered is *Manon L'Ecsau*, recounting the adventures of a kepil-misstress and swindler, the purpose of which appears to be similar to that of *La Dame aux Camelles* of Dumas fils, viz., to show how noble, true-hearted, and self-sacrificing a prostitute may be! Other writers belonging more or less strictly to the same division are Madame Riccoboni (flor. 1750) and Rousseau (q.v.) in whose *Hoboise* we begin to see the dawn of that fierce natural impure passion, and that extravagant scorn of conventional life, that culminated in the singular paroxysms of the revolution.

3. Humorous and satirical romance.—By far the most celebrated specimens of this kind of fiction produced in France during the 18th c. are the *Gil Bias*, the *Diable Boleux* and *Les Fables* of La Fontaine; *Le Sage* of *Le Sage*, q.v. (1668–1740), all of which were suggested by the prolific comic romancers of Spain, Juan de la Luna, Quevedo, Cervantes, Espined, from some of whom he has borrowed, with hardly any variation, whole scenes and stories, as well as from more ancient sources. The best parts, however, are his own, and the spirit of the work is thoroughly French in the gay and lightsome vivacity of its humor. It is with some hesitation that we place the younger Cebillon (q.v.) in the same category, for the licentiousness of his *Figurements du Cœur et de l'Esprit*, and other novels, is far more apparent than their satire or humor. Bastide and diderot (q.v.) hold an equally doubtful position as satirists or humorists; but Voltaire (q.v.) may fairly claim to rank among the former, in virtue of his *Candide*, *Zadig*, *L'Ingénieux, La Princesse de Béthune*, etc., most of which contain covert attacks on superstition and despotism, under the forms in which Voltaire best knew them. Voltaire, however, had not a rich
imagination, and, in consequence, has been obliged to help himself liberally in the matter of incident from older writers.

4. *Fairy tales, etc.*—A very careful inquiry might probably succeed in tracing back this kind of literature to the early intercourse of Christian and Moorish nations, but the first work in which we find definite examples of fairy tales is the *Night of the Italian novelist Straparola*, translated into French in 1555. In this collection are found at least the germ of the ideas of a large number of the best-known stories of the sort, such as *Le Chat Botté* (Puss in Boots), *Principe de Marrakech, Beatrice et culpa*, and *Fortunates.* The immediate forerunner, prototype, however, of the French fairy tales was the *Pentamerone* of Signor Basile, written in the Neapolitan dialect, and published in 1672. This work attracted and stimulated the fancy of M. Charles Perrault (q.v.), whose *Histoires ou Contes du Temps passé* appeared in 1697, and is incomparably the most naïve and charming of all the collections of fairy tales. The titles of some of his *contes* will recall many a literary feast of our childhood—*La Barbe Blanche* (Bluebeard), *La Belle au Bois Dormant* (The Sleeping Beauty, to which, by the by, Tennyson has given a poetic immortality), *Le Chat Botté* (Puss in Boots), *Riquet à la Houpe* (Riquet with the Tuft), and *Le Petit Chaperon Rouge* (Little Red Riding Hood). The principal successors of Perrault were the *contes* of *Anony* (see *Aunoi*), Madame Murat, and Mademoiselle de la Force; but their stories are much more extravagant and forced than those of the illustrious academicians. The same census, however, is not applicable to *Les Contes Marins* (1746), by Madame Villeneuve, among which occurs the tale entitled *La Belle et la Bête* (Beauty and the Beast), perhaps the most beautiful creation in the whole circle of this fantastic form of fiction.

Meanwhile, the translation of the *Fabulous Nights Entertainments* (q.v.) by Galland, 1704—17, and of numerous other Arabic and Persian works, the great encouragement extended to the literature of the East in the 17th and 18th centuries, the publication of the *Bibliothèque Orientale* of D’Herbelot, etc., created a taste for the brilliant exaggerations of oriental fiction, and a variety of works were soon in the field, swarming with necromancers, dryadss, sylvans, bushwaks, viziers, caids, eunuchs, slaves. The most notable of these are— *Les Mille et un Quart d’Hare, Contes Tartares; Les Contes Chinois, ou les Aventures Merveilleuses du Mandarin Poon-hoon;* and *Les Sultanes de Gazarrette, Contes Mongols,* of M. Gueguette.—Of the class of fictions known as *Voyages Imaginaires,* the principal are the *Histoire Comique des Eaux et Empires de la Lune, and the Eaux et Empires du Soleil de Cympio Berezegr* the latter, which materially influenced the genius of Swift, who has, in fact, borrowed not a little from the first of them in his *Gulliver’s Travels,* and which were themselves partly suggested by the Spanish romance of *Domini* Gonzales, entitled *The Man in the Moon.* such novels as the *Paul et Virginie* of Bernardin St. Pierre, which appeared towards the end of the 18th c., do not come under any of the four heads, but may most conveniently be mentioned here.

Prose fiction of Germany during the 18th and 19th centuries.—The limits of our space will not permit us to do more than superficially indicate the development of this branch of literature in Germany, which, however, is the less to be regretted, as, during the greater part of the 18th c., it did not attain much distinction. Toward the close of the century, however, writers became more numerous, and as the literary activity of many of them continued on till the first or second quarter of the 19th c., it will be most convenient and natural to treat both centuries together, as they, properly speaking, form one period in the literary history of that nation.

The finest feature of German fiction of this period was *Wieland* (q.v.), whose Greek romances, *Agathon, Aridippus, Socrates,* etc., are of that didactic and sceptical character which was beginning to mark the reflective genius of the continent, and which has since produced such immense changes in all departments of thought. Wieland was followed by a crowd of writers, in whose productions is more or less distinctly apparent the influence of the English novelists, particularly of Richardson and Fielding, who had been translated and carefully studied in Germany, where, however, the "novel of manners," whether serious or comic, dealt more largely in the representation of "family life." The principal names are *Auguste la Fontaine, Wetzel, Müller* (whose *Siegfried von Linden-berg* is still remembered and read), *Schulz,* and *Hippel.* Almost contemporary with these quiet and somewhat prosaic novelists, there flourished for a brief period (1780—1800), a school of an entirely opposite character, whose works, fiercely and outrageously romantic, had their poetic counterpart in Schiller’s *Robbers.* They resemble, in the style of handling the feudal ages, the English romances of Mrs. Radcliffe and others, which probably suggested them. The chief writers of this "turbulent school of fiction," as it has been called, are *Cramer, Spiers, Schlenkert,* and *Veit Weber.*

Alone, and far above all others in redundancy and originality of fancy, humor, and pathos, towers Jean Paul Richter (q.v.), who is incapable of classification, and to whom, therefore, his countrymen have affixed the epithet of *Der Einzige* (The Unique). Apart from all schools—in this respect, but in this only, like Richter—stands Johann Wolfgang Goethe (q.v.), whose novels, as well as his poems, are poetic-philosophical efforts to represent, perhaps to solve, the great facts and problems of human life and destiny.

The reaction from the materialism and irreligious levity of French thought, first showed itself in Germany toward the close of the 18th c., in a certain earnest love and study of the old, simple, superstitious, and poetical beliefs of the Middle Ages. Hence
originated the exquisite class of fictions called Volksmärchen (popular legends or tales), in which the Germans have never been equaled. The most illustrious cultivator of this species of fiction is Ludwig Tieck (q.v.), for Museen (q.v.), though gifted with admirable powers of narration, is marked by so much humor and irony, not altogether compatible with an imaginative conception of his subject. Other distinguished names are those of De la Motte Fouqué (q.v.), Chamisso (q.v.), Heinrich Steffens (q.v.), Achim von Arnim (q.v.), Clemens Brentano (q.v.), Zechokke, and Hoffmann (q.v.). More recent novelists of note are Auerbach, Freytag, and Paul Heyse. The tales of Fritz Reuter, written in the Platt or Low German, are original and delightful.

**Novels and Romances of the 18th Century.**—These have been produced in such overwhelming quantity that they required merely to classify and characterize them. The vast and rapid increase in the material facilities of intercourse among European nations which has taken place during the last 30 years has, among other results, tended to diffuse through each country the literary products of all the others especially those of an entertaining kind; and these have in turn more or less stimulated the imagination of native genius, so that at present there is hardly a people in Europe, not even excluding Turkey, which has not contributed something to the enormous stock of fiction belonging to the 19th century. Would be altogether out of the question to attempt, in a compendious work like the present, a notice, however brief, of the principal novels and romances of every European nation; we can only refer to the historical surveys of literature, to be found under such heads as Belgium, Bohemia, Hungary, Netherlands, Norway, Poland, Sweden, Turkey, etc., and to individual biographies of eminent continental novelists. Even in regard to England and France, we can do little more than catalogue a few prominent names.

1. **English Fiction.**—Almost the first novelist that we encounter in the 19th c., sir Walter Scott (q.v.), is probably the greatest that England, or even the world, has ever seen. Here, however, we have less to do with his personal rank in literature than with the kind of fiction that he cultivated. In a qualified sense, he may be regarded as a continuation of the romantic school, but it must be observed that he is free from all their monstrosities, spasms, tricks, and horrible machinery. Possessed at once of far greater antiquarian learning, imaginative genius, sound sense, and instinctive taste than any of his "romantic" predecessors, he knew precisely what to shun and what to cherish, and though his feudal age, as depicted in Ivanhoe, *The Fair Maid of Perth*, etc., is a considerably idealized portrait of the rugged facts, it is a portrait, and not like Horace Walpole's and Mrs. Radcliffe's performances, a furious caricature. The political reaction that took place in Britain, after the sanguiinary excesses of the French revolution, assuming the form of a new and passionate attachment to venerable and time-honored traditions, showed itself in literature too, and sir Walter Scott was its greatest representative. He strove to delineate the past as it seemed in the eyes of men who were dubious of the present and afraid of the future—noble, stately, glittering, and gay, with the pulse of life ever beating to heroic measures. The overpowering genius of Scott necessarily but unhappily (for the comfort of readers) led to "endless imitation," but the only one of his followers that held for a time a tolerably decent position in literature is G. R. James (q.v.). Galt (q.v.) and Wilson (q.v.), the former with vulgar but merry humor, the latter with a highly sentimental and overdone pathos, portrayed aspects of Scottish life as far as their own capacities went. Of the more successful of these was Miss Ferrier (q.v.). Miss Ferrier (q.v.), and Mrs. Johnstone, do not call for special notice; neither does Hope (q.v.), though his Memoirs of Anastasius is a most brilliant and powerful book; nor Moore (q.v.), though his *Epenecran* has all the sparkling and superficial splendors of his verse. After Scott, the next novelist who distinctly marks a new stage in the development of fiction is sir Edward Bulwer Lytton (q.v.), in whose earlier works at least we find something like a reflection of the cold, sneering, selfish, and sensual spirit that marked the upper classes during the period of the regency; but the versatile genius of this author, and the different fields in which he has won renown, would make it quite unfair to define him as a merely "fashionable" novelist, though his first and least meritorious *Saciones* were acquired in that capacity, and students of *Saitor Reservous* are apt to remember him. Of fashionable novelists, strictly so called, the best-known are Mrs. Gore (q.v.) and Theodore Hook (q.v.). This class was succeeded by another infinitely worse than the former. Many of them had a taste for the," the scenes among highwaymen, thieves, desperadoes, and murderers, like Jack Sheppard, Boulton, Dick Turpin, Claude Duval, etc., and, flagitably indifferent alike to fact and morality, labored with pernicious success to invest the lives of these scoundrels with a ha, of romantic interest and dignity. The chief of this school, "by merit raised to the eminence," is William Harrison Ainsworth (q.v.). During the last 30 years novels have been multiplied to a degree which is almost alarming, and literally incalculable. The best names are unquestionably those of Dickens (q.v.), Thackeray (q.v.), and this Evans (q.v.); but besides these might be mentioned a host of others, who have attained either celebrity or popularity, or both. Every mode of life, and every kind of situation, social, artistic, scientific, philosophical, and religious, has sought to recommend itself by adopting this fascinating garb. We have the nautical novels of Maturin (q.v.); the sporting and military novels of Lever (q.v.); the brill...
the "muscular Christian" novels of Kingsley (q.v.); the "governess-novels," as they have been aptly denominated, of Miss Brontë (q.v.); the "school" novels of Hughes and Farney; and the "sensational" novels of Wilkie Collins, Miss Braddon, and others. Other authors not less eminent, but not so easily classified, are Mrs. Gaskell, Mrs. Norton, Miss Mulock (now Mrs. Craik), Mrs. Oliphant (q.v.), Charles Reade (q.v.), George Macdonald; Meredith, Whyte-Melville, M'Carthy, Blackmore, "Ouida," are well known in various departments of fiction; and recently William Black has shown himself an artist of a high class. The extraordinary increase of this potent and therefore perilous branch of literature cannot fail to excite much curious reflection in thoughtful minds.

2. French Fiction during the 19th Century. — A few words are all that we can devote to this part of our subject, though it is far from uninteresting either in a literary or a moral point of view. The effect of the revolution of 1789 on literature was not immediately beneficial, but the reverse, though it planted the germ of a multitude of new thoughts and aspirations in the mind of Christendom, which have since yielded, both in France and elsewhere, a prolific harvest of what is known as "sensational" fiction. The ideologue of Napoleon himself would have been the master of a style that might have been termed "imagery;" he who had crushed nearly all the ideologues of Victor Hugo is well known, but the novel was that species of ideologic composition that came least into collision with the principles of imperialism. Even it, however, could hardly be said to flourish; and the only tolerably gifted writer of fiction who figures during the first empire is Le Brun, and he was reduced to the necessity of caricaturing the bourgeoise, to which Napoleon had no particular objection, as they were by no means his warmest admirers. Chateaubriand (q.v.) and Mme. de Staël (q.v.) are insignificant in this department, and Charles Nodier, though voluminous, was not an original novelist. After the return of the Bourbons, and especially after the revolution of 1830, France began to display a wonderful literary activity, and, in particular, its long-repressed faculty of imagination burst into a sudden blossom of poetry and fiction. Even Napoleon, now that he was dead, received a peculiar homage from the class to whom he had never shown favor or regard, of which the songs of Biancheri and Les Manifestes of Victor Hugo afford us specimen. Unhappily for the purity of its literature, the régime of the restoration, which followed the deliverance of France from a military despotism, was itself a base, corrupt, and profligate thing. The Bourbons came back only to re-enact the follies of their ancestors in the previous century, and the nation soon came to despise, detest, and disbelieve them and the church which supported them. Hence a certain reckless levity and hollow mocking laughter, as of heartless skepticism, pervading those fictions which profess to delineate the realities of current life. Moreover, the sparkling wit, the sunny humor, the pathos, often exquisitely tender and refined, the delicate or deep delineation of character, the occasional fine flush of sentimental enthusiasm, and the poetical witchery of a religious mysticism, cannot blind us to the fact that the substance of most of the recent French fictions is incurably immoral. Paul de Kock (q.v.), Balzac (q.v.), Dumas (q.v.), father and son, Sue (q.v.), Daudet (q.v.), Daumier, Zola, though wholly dissimilar in the quality of their genius, are in this respect too wofully alike. Victor Hugo (q.v.) and Lamartine (q.v.) are indeed morally far above the rest of their contemporaries, but they are perhaps the only great exceptions that can be mentioned. The "second empire" did not improve the tone of the French novel, any more than it improved the tone of French society; but if it be true that when things have reached their worst they begin to mend, the country that has produced La DAME aux Camelias is perhaps, as regards the literature of fiction, in a hopeful condition. The Erckmann-Chatrian tales, graphic delineations of provincial life, are honorably distinguished by the absence of all indecency. Verne's tales of impossible semi-scientific voyages to the moon and elsewhere are unique.

The prose fiction of Spain and Italy during the 19th c. scarcely requires notice, as the former country has not produced a single work that has forced its way into the general European market, while the latter can boast of only one that has attained that dignity, the Principe Sempere of Manzonii (q.v.); but in a comprehensive sketch like the present, it would be a blemish to omit at least the names of the more eminent transatlantic novelists, as they have contributed not a little of late years to the stock of English prose fiction. The most notable are Brodcken Brown (q.v.), the American Godwin; Fenimore Cooper (q.v.), from whom Europe has been content, on the whole not unwisely, to take its notions of the forests, the prairies, and the red men of the west; Washington Irving (q.v.), Edgar Allan Poe (q.v.), Nathaniel Hawthorne (q.v.), Mrs. Beecher Stowe (q.v.), Oliver Wendell Holmes (q.v.), and Brete Harte, in all of whose writings, except in the tales of Poe, is visible the influence of the life, traditions, scenery, and other salient characteristics of the new world. See Dunlop's History of Fiction (Lon. 1814), and Wolff's Allgemeine Geschichte des Romans (Jena, 1841, 2d edit. 1850).

November (Lat. norn, nine) was among the Romans the 9th month of the year, at the time when the year consisted of 10 months; and then contained 30 days. It subsequently was made to contain only 29, but Julius Caesar gave it 31: and in the reign of Augustus the number was restored to 30, which number it has since retained. November was one of the most important months in connection with the religious rites of the Romans, and continues in the same position, though for other reasons, in the Roman Catholic ritual. It was known among the Saxons as Blot-monath, "blood-month," on
account of the general slaughter of cattle at this time, for winter provision (known for a long time afterwards as *Martiamus beef*) and for sacrifice. This custom was not confined to the Saxons, but prevailed in northern Germany, and even as far south as Spain.

**Novgorod**, a government of great Russia, extends immediately s.e. of the government of St. Petersburg. Area, 48,789 sq. m.; pop. 70,1,011,445. The surface is gently undulating, with the Valdai hills in the south, which rise to about 300 ft., and may be said to form the water-shed between the Baltic, Caspian, and White seas. The government contains many lakes and rivers; of the former, the lakes Ilmen and Bieloe are the largest; and of the latter, the Wolchof, Mata, Szeksna, and Mologa are the most important. The rivers are connected by canals, which are of great service to trade. The soil, especially in the n.e., is not fertile; and the climate is severe; agriculture and cattle-rearing are carried on only to a limited extent. Forests and pasture-lands are numerous and extensive, and the timber and hay sent to the capital realize a considerable income. Quarries of the best stone for paving occur on the river Tosna, and near Stara-Russia there are mineral and saline springs.

**Novgorod**, an important t. of European Russia, capital of the government of the same name, is situated on the Volkhol, near where it issues from lake Ilmen, 122 m. s.s.e. of St. Petersburg. It is the cradle of Russian history. In 862 the Norman prince Rurik, of the tribe of Varango-Ross (whence the name Russia), was invited hither by the neighboring tribes, and from him begins the history of the country, and the line of its sovereigns. A monument, commemorative of this event, was erected here, with great pomp, in Sept. 1862. In the 9th c. Oleg, the successor of Rurik, transported the capital to Kiev; but bestowed many privileges and liberties upon Novgorod, and from that time it began to prosper. The greatness of Novgorod provoked the jealousy of the princes of Moscow, and in 1471 the czar Ivan III. nearly destroyed the town, bereft it of its liberties, and exiled the most influential citizens. During the time of its prosperity, the town was called Novgorod the Great; and had 400,000 inhabitants, and extended its sway to the White sea and the river Petchora. Its government was a sort of republic, the prince being less a sovereign than the chief commander of the troops. Its greatness was due to its vast foreign trade alone, and when Archangel was opened for English trading vessels, but especially after the foundation of St. Petersburg, its trade fell away, and the town rapidly declined. Of the existing ancient buildings, the most remarkable are the church of St. Sophia, founded in the 11th c., possessing a fine old library, as well as some remarkable paintings and tombs; and the Kresti, in the steeple of which hung the famous bell used to summon the citizens for the deliberation of state affairs. Pop. '67, 16,722.

**Novgorod Ssiewersk**, or **Novgorod-Severskoe**, a t. of Russia, in the province of Tchernigov, 89 m. n.e. from Tchernigov, on the right bank of the Desna, a branch of the Dnieper. It is the capital of a district, and is a place of considerable trade and activity. Pop. '67, 6,301.

**Novograd-Volynski**, a t. of European Russia, in the government of Volhynia, 52 m. w.n.w. from Jitomir. It is the capital of a circle, and is situated on the banks of the Slutch, a feeder of the Pripic, and so of the Dnieper. Pop. '67, 8,063.

**Novi**, a t. of northern Italy, in the province of Genoa, is a station on the railway from Turin to Genoa, and is 33 m. n.w. of the latter city. It presents few attractions, with the exception of a number of picturesque old houses. It carries on a considerable transit trade; and the silk produced in the vicinity is amongst the most celebrated in Italy. Pop. 11,445.

**Novibazar**, also **Jenibazar**, a t. of Bosnia, European Turkey, situated on the river Rasika, an affluent of the Morava, 130 m. s.e. of Bosna-Serai. Several of the great roads of the country cross each other here. Novibazar has celebrated fairs, important trade, and considerable wealth, but the houses are mostly of mud. It is the chief point of communication between Bosnia and the rest of Turkey. Pop. estimated at 15,000.

**Novice.** See **Novitate, anno.**

**Novikoff, Nikolai Ivanovitch, 1744-1818;** by Russia; entered the government service at the age of 18, but soon retired to devote himself to literature. One of his first publications was *The Pointer*, containing satirical sketches of manners somewhat after the fashion of the *Spectator*. This was followed by his *Specimen of a Lexicon of Russian Authors*. These works won him the favor of the empress Catharine II., and he removed to Moscow, where he founded a typographical society, for the purpose of printing cheap books. He organized the first circulating library in Russia, but was obliged to leave Moscow, as a supposed adherent of the French philosophers. He published 1773-75 a collection of historical materials, called *The Old Russian Library*.

**Novitate, the time of probation, as well as preparatory training, which in all religious orders precedes the solemn Profession (q.v.).** Under the head of **Monachism** will be found the general principles by which the training for the "religious" life is regulated. It will be enough to say here, that the novitate in all orders must continue (Conc. Trid. Sess. xxv. c. 85, *De Regul. and Mon.*) at least one year. In most orders it is
of two, and in several of three. Any attempt to solemnize the profession before the expiration of the novitiate, without a dispensation, is invalid. During the novitiate, the novices are immediately subject to a superior, called master (or mistress) of novices. They are not permitted to engage in systematic study, their whole time being devoted to prayer, and to ascetic and liturgical training. During the novitiate, the novice continues free to withdraw, nor is he or she admitted to profession at the close of the novitiate, except after proof given of fitness, and of proper dispositions for the particular institute aspired to.

**Novoarkhangelsk** (New Archangel), or *Stika*, a seaport of Alaska, formerly center of the administration of the Russo-American company, situated on the island of *Stika*, on the n.w. coast of the American continent, in lat. 57° 3' n., long. about 135° west. It has a harbor port, and was the entrepot of all the stores for the other Russian-American colonies, and of their produce, of which furs were the principal item. There are at Novoarkhangelsk hitherto 66 clear days in the year. Mean temperature throughout the year, 43° 45' F. Pop. (before cession of Alaska to the U.S.) 1,000, mostly servants of the company.

**Novo Georgievski**, a t. in Russian Poland, at the junction of the Bug and Vis-tula rivers, 19 m. n.w. of Warsaw; pop. 10,225. It was founded in 1809, by Napoleon, who gave the name of Modlin, which was changed to the present name by the Russians, when they gained possession of it after the fall of Warsaw in 1831. It had also been in the hands of the Russians, 1813-30, when the Polish revolutionists seized it. It is a strongly fortified post, with an arsenal and citadel.

**Novomoskovsk**, an important market-t. of s. Russia, in the government of Ekaterin-oslav, and 29 m. n.e. of the town of that name, on the Samara, an affluent of the Donieper. Three extensive fairs, chiefly for the sale of cattle and horses, are held here annually. The "remounting" officers attend these fairs for the purpose of supplying their regiments with horses. Tanning and tallow-melting are carried on. Pop. '67, 10,379.

**Novotcherkask**, a t. of s. Russia, capital of the territory of the Cossacks of the Don, on the Aksaf, a tributary of the Don, at a distance of 12 m. from its right bank, and about 70 m. e.n.e. of Taganrog. The central administration of the territory was transferred hither from Tcherkask in 1804 by count Platoff, commander-in-chief of the Cossacks. The choice was not a happy one, the distance of the town from the Don, the great commercial artery, being much felt. In 1855, a statue was erected in memory of count Platoff, who achieved an illustrious name by his military exploits from 1770 till 1816, and especially during the French invasion in 1812. Pop. '67, 27,918, who carry on trade and manufactures, agriculture, cattle-breeding, fishing, and wine-growing.

**Novum Organum**, or The New Instrument, lord Bacon's treatise sketching the inductive method of studying nature, which before his time had been pursued only occasionally and blindly—a method whose introduction divides philosophy into the old and the new. 1. Bacon in the first part of his work surveys the imperfections of human knowledge. 1. He notes the vagueness and uncertainty of all speculation, and the want of connection between the sciences and the arts, due to "the perverseness and imperfection of the human mind," or "the false principles and erroneous notions," etc. If such were the case, they would have had facts, and not opinions, to reason about." The method then in vogue he describes as "ill-suited to discovery, but wonderfully accommodated to debate." 2. He enumerates the causes of error, naming them in the figurative language so commonly employed by him—*idols*, things to which the mind had long been accustomed to bow down; of these he shows four classes: (1) Idols of the *tribe* or of the race: causes of error found in human nature in general; such as man's propensity to find in nature a greater degree of order and regularity than actually exists. Thus, as soon as men perceived that the orbits of the planets were returning curvies, they assumed them to be perfect circles, and the motion in them to be uniform; and to these false suppositions the ancient astronomers laborcd to reconcile the facts which they observed. (2) Idols of the *den*: causes of error springing from individual character; as if each person had his own cavern or den, into which light imperfectly enters; some minds being best fitted to mark differences, others resembling, etc. (3) Idols of the *form*: causes of error arising out of public and social intercourse, and especially out of its implement—language. Men believe that their thoughts govern words; while often their words govern their thoughts, and few abstract terms convey precise and well-defined ideas. (4) Idols of the *theater*: causes of error arising from the systems or doctrines of particular schools, which are like imaginary worlds brought upon the stage, yet influencing the mind as if they were real. 3. Bacon, pointing out the circumstances which had favored these perverse methods, (1) notes three periods of pursuit of science—the Grecian, Roman, and European—after the revival of letters: the first, short; the second, disturbed in its earlier part by politics and war, and, after the rise of Christianity, by religious interests and theological pursuits; the third, overshadowed by royal and hierarchical power enslaving the mind. In his opinion no part of knowledge could make much progress if its start was not made from facts in nature. (2) He shows that the end and object of knowledge had been misunderstood; that some had pursued the knowledge of words rather than of
things; some, of objects imaginary and unattainable, promising to prolong life indefinitely, to extinguish disease, and to rule the spiritual world by magical charms. 'All this is the mere boastings of ignorance; for, when the knowledge of nature shall be rightly pursued, it will lead to discoveries that will as far exceed the pretended powers of magic, as the real exploits of Caesar and Alexander exceed the fabulous adventures of Arthur of Britain or Maundy of Gaul." (4.) Reverence for antiquity and the authority of great names had greatly retarded the progress of knowledge; the "older times" were really the young and inexperienced times; the latest age is the oldest; having gathered the most of facts and experiences. (4.) Knowledge has been greatly hindered by the fact that in general men have inquired only into the causes of rare and great phenomena, without troubling themselves about the explanation of such as are common, and make a part of the general course of nature; while the laws always in action are those which it is most important to understand. It was an error of the same sort which had led men to delight in mere contemplation and to regard manual experiment as beneath the dignity of science.

II. The second book of the Novum Organum treats of the induction essential to the right interpretation of nature. 1. A history full and accurate of the phenomena concerned must be prepared—a "natural history." 2. There must be a comparison of the various facts to find out the cause of a phenomenon—its "form or essence;" also, to discover the invisible processes and the invisible structure of the bodies concerned. 3. The facts being in hand, consideration is then to be had of them as to what things are by these facts excluded from the number of possible causes. After many such exclusions have left but a few principles common to every case, one of these is to be assumed as the cause, and the trial is to be made by synthetical reasoning whether it will account for the phenomenon. This process by exclusion—through successive negatives to the final affirmative—Bacon regarded as essential to success. 4. This method of induction he declared to be applicable to all investigations where experience is the guide, whether in the physical or moral world.

NOWANAGAR, or NOWANUGGER, a seaport of India, in the peninsula of Kattywar, Guzerat, at the mouth of the Nagna, a small river on the s. shore of the gulf of Cutch, 160 m. w.s.w. from Ahmedabad, and in n. lat. 22° 28', e. long. 70° 11'. It is the principal place of the district of Hallar, the greater part of which is held as a jaghire by the chief of Nowanagar, who bears the title of the jam of Nowanagar. His territory comprises 540 villages, and a pop. of about 200,000. The town of Nowanagar is large and populous, nearly 4 m. in circuit. It is a place of very active trade, famous for the fine quality of the cloth which it produces, and for the brilliant colors of which its fabrics are dyed. In the adjacent sea are beds of pearl oysters. Copper ore has been discovered in a range of hills behind the town.

NOWELL, Increase, 1590-1655; b. England; having been chosen an assistant of the proposed colony of Massachusetts bay, upon the formation of the company he came to this country with Winthrop in 1630, and became an elder in the rev. John Wilson's church. He was commissioner of military affairs during the first Pequot war in 1634, and secretary of the colony, 1636-49.

NOX, in mythology, daughter of Chaos and mother, by her brother Erebus, of Æther (the air) and Himeria (day). She was also the mother of the Fates, of Death, Dreams, Nemesis, Fraud, the Hesperides, etc. The victims sacrificed to her were a black sheep and a cock. The poets called her mother of all things, and Homer represents Zeus as standing in fear of her. There was a famous statue of her by Rhoeaus in the temple of Diana at Ephesus, and her attributes seem to have been blended with those of the moon goddess. She is represented as riding in a chariot with the constellations going before her, and wearing a starry veil, or with two children in her arms, one black representing death, one white representing sleep, or as riding in a chariot drawn by bats and owls, and dressed in mourning, with a crown of poppies on her head.

NOXUBEÉ, a co. in e. central Mississippi, bordering on Alabama; intersected by the Tombigbee and its branch the Noxubeé, rivers, and by the Mobile and Ohio railroad; about 630 sq. m.; pop. '80, 29,874-29,781 of American birth, 24,574 colored. The surface is level, with extensive forests, including, besides many hard-wood trees, the cypress, magnolia, and tulip trees. The soil is very rich. Indian corn, cotton, and pork are staples. Co. seat, Macon.

NOYADES (i.e., "drownings," from Fr. noyer, to drown), the execution of political offenders in great numbers at once by drowning them, one of the atrocities of the French revolution, practiced at Nantes by Carrier, the deputy of the convention. See Carrier. This mode of execution was also called, in cruel sport, verticale deportation .

NOYAU. See Liqueur.

NOYES, Eln., D.D., 1814-54, b. Me. He was self-educated, and began to preach in 1834; he married with his wife, Sept. 22, 1855, for Calcutta, and settled at Orissa, where he had great success in mission work. In 1841 he returned with impaired health, and for several years was pastor of a Free-will Baptist church, in Boston. He edited for 10 years the Morning Star, the Free-will Baptist organ. He published Lectures on the Truths of the Bible; A Hebrew Grammar and Reader.
NOYES, GEORGE RAPALL, D.D., 1798-1868; b. Mass; graduated at Harvard college in 1818, and afterwards at the Harvard divinity school. In 1827 he was settled over a Unitarian church in Brookfield, Mass., from which he removed to a church in Petersham. During this time he pursued the study of the biblical text in the original languages, and was recognized as one of the first Hebrew scholars in America. In 1840 he was appointed Hancock professor of the oriental languages in Harvard college, and Dexter lecturer on biblical literature. He published in 1827 An Amended Version of the Book of Job; A New Translation of the Hebrew Prophets, 1833-37; A New Translation of the Prophets, Ecclesiastes, and the Canticles, 1846; Theological Essays, 1856; and a Translation of the New Testament, issued by the American Unitarian association in 1869.

NOYES, JOHN HUMPHREY, b. Vt., 1811; graduated at Dartmouth college; studied theology at Andover and New Haven; was licensed to preach in 1833. In 1834, announcing himself a Perfectionist, his license to preach was recalled, and he began to propagate his new views in various periodicals. He has published several volumes, the most important of which are The Beren; The Second Coming of Christ; Selections from Sir, Bible Commentary, Male Controversies and Scientific Propagation; Historical, Political and Socialisms. In 1828 he founded a community of Perfectionists at Putney, Vt.; removed in 1847 to Lena, Madison co., N. Y., and established the OSENA COMMUNITY. He afterwards established another branch at Wallingford, Conn. The Perfectionists practice community of women as well as of goods, and maintain the full equality of the sexes in social and business life. They are profitably engaged in farming and manufactures, and have two printing-offices. Recently the public indignation against the sexual immorality of their system has taken such stern expression and such legal attitude that the practical abandonment of their indecent theories has been announced. Noyes is a man of fascinating manners and fine literary taste.

NOYES, WILLIAM CURTIS, LL.D., 1805-64; b. Shodack, N. Y.; began the practice of law in 1827 in Onondaga co., where he quickly took high rank. He removed to New York in 1838, and immediately took a place among eminent lawyers, and was at one time engaged to codify the laws of the state. In politics he was an antislavery whig. And on the organization of the republican party became a member of it; but was drawn into the fulfic and temporizing peace convention of 1860. He was elected president of the New England society the day before his death, which took place in New York, Dec. 23, 1864. He bequeathed a valuable law library to Hamilton college.

NOYON, a t. of France in the department of Oise, 78 m. n.e. of Paris by the North- ern railway. It has a fine cathedral of the 12th and 13th centuries, in the Romanesque style of architecture; an episcopal palace, and some linen and cotton manufactures; Pop. 76, 5,785. Noyon was a residence of Charlemagne, and the place where Hugo Capet was crowned King of France in 987. It is also noted as the birthplace of John Calvin.

NUBIA, the modern appellation of a country subject to the khedive of Egypt, extending from Phalæ to the Sennaar, lat. 18° s., bounded on the e. by the Arabian gulf, n. by Egypt, s. by Abyssinia, and on the w. by the desert. It appears to have been anciently known as Ethiopia. The ancients gave the name of Ethiopia to the w. bank of the Nile from Meroë to the bend of the river. The name seems to have been derived from the Egyptian and Coptic noub, or gold, a name still retained in Wady Noubâ, which extends from the frontier of Dongola, n. of the Wady Soubata, above Derri. The tract between Seboun and Assouan is called the Wady Kenous. Dioceanus removed hither a Libyan tribe, called Nolate, to the district above Syene, to oppose the Blemmyes, who inhabited the western desert, now held by the Alabde and Bisharein Arabs. The dominion of the Pharaohs, when most extended, reached to the isle of Argo, the last place where the monuments of the Egyptians have been found. Under these monarchs it was called Cush, and was governed by a royal scribe, entitled prince of Cush or Ethiopia, till the twelfth dynasty, when it appears to have been recovered by a series of native rulers, who ultimately conquered Egypt; and although driven back, finally extended their rule from Meroë to Syene, the most southern city held by the Egyptian monarchs, the Ptolemies, and the Romans. These Ethiopians adopted the civilization of the Egyptians, and the names of some of their monarchs have been preserved. The subsequent fortunes of this country will be seen under ETHIOPIA. The modern inhabitants consist principally of Arabs, who invaded the country after the rise of Mohammed, the principal tribes being the Djowabère and El Ghârbye, who inhabit from Assouan to the Wady Halfa; the Kenous, Djaferre, and others, a branch of the Koreshe, who occupied the land from Esne to Assouan. By the aid of Russian soldiers the Djowabère were driven into Dongola in the reign of Selim; and their descendants still flourish at Ibrim, Assouan, and Sai, in lower Egypt and a race called Barbers, or Barabas; s. of Cossier are the Alabde. From Dongola and Sennaar, a negro state, the people are called Noubas, a hardy race, differing from the pure blacks; but the country throughout is inhabited by mixed races of Arabian and Nigriric blood. Another tribe, the Shegya, e. of Dongola—a fine black race, addicted to horsemanship and war—are still more interesting. The Alabde Arabs are renowned as guides and camel drivers; the Bisharein are supposed by some to be the ancient Blemmyes, a tribe living on flesh and milk, but without the oriental jealousy of the Arabs; the Takus, supposed
to be the ancient Bojahs, dwell in the mountains. Three principal languages are spoken by these various tribes—the Nuba by the Berbers, who entered from the s.w.; the Kungara, a Nigritic dialect, by the negroes of Dafar; and the Bashirie, said to exhibit Aryan affinities. The inhabitants, estimated at about 1,000,000, although less in stature than the Egyptians, are a fine muscular race; the women are pleasing, but not beautiful; and the climate is remarkably healthy. In their political government they were governed by their own chiefs, malds or maleck, till they were subdued by Ismael Pasha, in 1820, to the sway of Egypt, and the civil government is now administered by the Turks. The country is arid, in many places only cultivatable at the sides of the Nile, and consists of granite and sandstone. The soil raises durra, cotton, and date palms. It is traversed by the Bahr-el-Azrek, or Blue Nile, and the Bahr-el-Abiad, or White Nile. The products are numerous, comprising maize, dates, tamarinds, gums, aloes, civet, musk, wax, myrrh, frankincense, senna, black wool, hides both of the elephant and rhinoceros, and their ivory; ostrich feathers, ebony, gold dust, salt peter, salt, tobacco, coffee, cotton—which are carried by way of commerce to Egypt. The taxes are rated by the number of water wheels for the irrigation of the land. There being no native currency, the coins of Egypt and Europe, especially the Spanish dollar, are received, but glass beads, coral, cloth, todes or shirts, and cloth (samoon) also pass as money. In Kordofan value is reckoned by cows. The most primitive modes of measurement are in use, maize being sold by the handful (segga), 18 of which go to a monitor; and cloth being measured from the elbow to the fingers. Polygamy is general, and a wife at Kenous is purchased of her parents for 30 piastres; amongst the Arabs for 6 camels, 3 of which are returned to the bridegroom if the marriage is continued. Women can inherit the property of their fathers, and are allowed to receive harem's on account of their virtue. In their costume they use turbans, linen, and woolen garments, and are armed with lance and shield, the latter made of the hide of the hippopotamus. No looms exist, but they plait neatly. Their chief musical instrument is a guitar of five strings with sounding-board of a gazelle's hide. They are generally averse to commerce, eat little animal food, and are Mohammedans. Their houses are low huts of mud or stone. The chief attraction of this country to travelers is the numerous temples and other ancient remains of the Egyptians, extending from Philae to the island of Argo. These consist of the temple of Isis, in the isle of Philae, founded by Nectanebo, I., and continued by the Ptolemies; the temple of Deboni, built in honor of Amen Ra, by Ataramen, and continued by the Romans; Tafa or Taphis, the modern Kahubse, built by Rameses II.; the rock temple of Beit e Welly, recording the conquests of the same monarch; Wady Halfa, built by Osereosen I.; the rock temple of the temple of Debod; Wadi Abd el Asaph, built by Hermon the son of Rameses II.; Wabbel Abd el Asaph, built by the conquerors of the eighteenth dynasty; Ilerim, built by Amenophes II.; Amada, founded by Thothmes III.; Gherusch, Sehoun, and Derri, built by Rameses II.; Dakkeh, the ancient Pseulis, built by Ermenen; and the colossalus of the isle of Argo; the pyramids of Meren and Tanquissi.—Bückerhardt, Travels; Champollion le Jeune, Lettres Étrangères, p. 107, and foll.; Lepsius, Reise, p. 107, and foll.

KUBLE, a small inland department of Chili on the w. slope of the Andes, bounded n. by the river Maule, e. by the Andes, s. by the Nuble river, which flows into the Inta, and w. by the department of Maule, which lies between it and the Pacific; 3,700 sq.m., pop. 128,182. It is one of the most fertile and prolific parts of Chili. Its climate is suited to grain, to the fruits of the temperate zone, to the vine for wine-making, and to grazing and the rearing of horses. Capital, Chillan.

NUCHA or NUKHA, a t. of Russia; after Tiflis and Shemacha, the most important town of Transcassia, and the only town of the former khamat of Nucha or Sikhli, in the n.w. of Shirwan. It is 120 m. e.s.e. from Tiflis, and stands at the southern base of Causcasus in the valley of the Kish-Tshai, an affluent of the Alashan, which itself is a branch of the Kur. Pop. '67, 23,371. The town is surrounded by mulberry groves and fruit gardens, extending to a distance of several miles. It has long been famous for the rearing of silk worms, silk spinning, and the manufacture of silken goods.

NUCKOLLS, a co. in s. Nebraska, adjoining Kansas, drained by the Little Blue and Republican rivers; 576 sq.m.; pop. '80, 4,235—3,779 of American birth. The surface is mostly prairie, with little timber. It produces good crops of grass, and is suitable for agriculture or grazing. Co. seat, Nelson.

NUCLEOBANCHIA'TA, or HETEROPODA, an order of gastropods having the sexes distinct; the locomotive organ fin-like, single, and ventral; the gills packed in small compass along with the heart. They are all marine, and usually swim with the back downwards and the fin-shaped foot upwards. Some of them, as Atlanta, have a shell large enough to protect the body; some, as Carinaria, have a small shell covering the gills and heart only; and some, as Piroda, have no shell at all.

NUCLEUS. See Cells.

NUDIBRANCHIA'TA (naked-gilled), an order of gastropods, hermaphrodite, destitute of shell, and having the gills exposed on the surface of the body. The gills are differently situated in different genera. The genus Doris (q.v.) is an example of this order.
NUECES, a river of Texas, rises in south-western Texas, lat. 30°, long. 101° w., and after a south-easterly course of 500 m., flows into Corpus Christi bay, and through the pass of the same name into the gulf of Mexico.

NUECES, a co. in s. Texas, on the gulf of Mexico, s. of the Nueces river, drained by the Santa Gertrudis river and others; 2,800 sq. m.; pop. '80, 7,669—4,110 of American birth, 628 colored. The surface is mostly level, and the soil a rich loam. There is not sufficient rain for agriculture, but the country is admirably adapted for cattle and sheep raising. Large quantities of wool are produced. Corpus Christi bay on the n.e., and numerous other inlets afford good fishing. Co. seat, Corpus Christi.

NUEVA SPARTA. See MARGARITA, ante.

NUEVO LEON, a Mexican state bounded n. by the Rio Grande, e. by Tamaulipas, s. by San Luis Potosi and Zacatecas, and w. by Coahuila; between 24° and 27° 30′ n. lat., and 99° and 100° 40′ w. long.; about 20,000 sq. m.; pop. about 180,000. The surface is irregular and mountainous, and in the s. is made up of table-lands. The chief rivers are the Tigre and other branches of the Rio Grande. In the valleys are extensive forest and pasture lands, as well as good soil for cultivation. The soil would be very fertile were it well watered; maize (three crops), sugar cane, and wheat are the staples. There are mines of gold, silver, lead, copper, iron, and salt, but none fully developed. Marble, alabaster, and sulphur are also found. There are large manufactories of boots, shoes, leather, hats, and cotton cloths. The climate is hot and unhealthy, except in the higher districts. Nuevo Leon is divided into nine districts; Monterey, Cadereita, Villahermosa, Saltillo, Durango, Salinas, Arroyo, Linares, and Cerralvo. The capital is Monterey; Florida, Saltillo, Morelos, and Linares are important towns.

NUGJNA, a t. of British India, in the district of Bijnur, division of Rohilkund, n.w. provinces. It is 48 m. n.n.w. from Moradabad, on the route from Moradabad to Hardwar. Nugjna is the Birmingham of upper India, and is famous in modern times for the manufacture not only of gun-barrels but of percussion-locks. Pop. '72, 19,696.

NULLIFICATION, in American politics, the doctrine of the extreme states' rights party, of the right of a state to declare a law of congress unconstitutional and void, and if the federal government attempted to enforce it to withdraw from the union. In 1832, during the presidency of gen. Jackson (q.v.), the free trade and states' rights party in South Carolina (q.v.), under the leadership of John C. Calhoun (q.v.), her senator in congress, asserted the doctrine of nullification in a state convention which declared the tariff acts of that year unconstitutional, and therefore null and void; that the duties should not be paid; and that any attempt on the part of the general government to enforce their payment would cause the withdrawal of South Carolina from the union, and the establishment of an independent government. President Jackson met this declaration with a vigorous proclamation, in which he declared that the laws must be executed, and that "the union must and shall be preserved." South Carolina, standing alone, receded from her position under protest, and a "compromise bill," introduced by Henry Clay (q.v.) in 1833, provided for the gradual reduction of duties, for the time settled the controversy.

NULLIFICATION (ante), in general, might be used to indicate any act of absolute invalidation or making void, but is almost exclusively applied to the doctrine first set forth by John C. Calhoun in a paper known as the South Carolina Exposition, which was presented by him in 1828 to the legislature of that state, and by them ordered printed. This doctrine asserted the right of any state to declare the unconstitutionality of any United States law, though it should have been passed in the proper manner, have received the assent of the president, and even have been tested as to its constitutionality before the U.S. supreme court. And it was further claimed that any attempt to enforce such law in a state which had refused to acknowledge its force was such an unconstitutional violation of the sovereign rights of that state as would justify her in at once leaving the union. The immediate cause of this remarkable assertion of power was the existing system of tariff laws, which, it was claimed, bore with great unfairness on the non-manufacturing and raw-material-producing southern states. The argument was in great measure based on language used by Jefferson in drawing up the Kentucky and Virginia resolutions of 1798—99 in regard to the Alien and Sedition acts. Jefferson asserted that the general government was not the "final or exclusive judge of the extent of the powers delegated to itself, but that, as in all other cases of compact among powers having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress." These resolutions further express the conviction that other states "returning to their natural rights in cases not made federal, will concur in declaring such laws void and of no force, and will each take measures of its own in providing that neither these acts nor any others of the general government not plainly and intentionally authorized by the constitution, shall be exercised within their respective territories." Senator Hayne of South Carolina was the first to advocate openly the destructive doctrine based on these expressions of Jefferson, and his speech on the subject in the senate called forth Webster's famous oration of Jan. 26, 1830. The theory was then generally accepted in the extreme states' rights party, and toward the close of 1832 the governor of South Carolina, acting on the advice of Calhoun, summoned a convention to meet at Charleston. This convention reported for the
Nuisance.

 action of the legislature an ordinance, declaring that the existing tariff law was "null and void, and no law," authorizing the citizens of the state to refuse payment of any taxes under that law after Feb. 1, 1832, and denying the right of the U. S. supreme court to pass upon the validity of the ordinance itself. This bold declaration of independence from the authority of the general government was accompanied by the threat that if any steps were taken to enforce the collection of duties, the state would be justified in resisting them on the ground that it was in violation of the ordinances recently enacted. When congress met in 1832, Hayne was governor of South Carolina. Calhoun entered the senate, and the state legislature was on the point of enacting laws to carry out the nullification ordinance. The danger was averted partly by the adoption of the so-called Clay's compromise, a modification of the tariff law, but chiefly by the firm and wise action of Andrew Jackson, then serving his second term as president. His orders to the revenue officers of Charleston showed his intention to carry out the laws and maintain the authority of the general government; it was well known that he was not a man to be trifled with or intimidated, and his special message to congress on the subject is one of the ablest state-papers produced in the country's history. The authorship of the proclamation is generally attributed to Edward Livingston, the secretary of state. Jackson's position as a southern democrat and as a military hero also had much weight. Calhoun made an able and ingenious speech in the senate, Feb., 1833, sustaining his view of nullification, but the movement had lost its force, and though there was for some years a party of nulliters under Calhoun's leadership, that form of the doctrine of state sovereignty was no longer a factor in politics, though undoubtedly the forerunner and logical parent of the doctrine of the right of secession.

NUISANCE is a legal term used to denote whatever is an annoyance to one's neighbors, or in a general sense to the public at large, in the exercise of their rights of property. The whole doctrine of nuisance is founded on the theory that every person is entitled to have the full use and enjoyment of his property, and of the right of passing to and fro on the highway without being interfered with or impeded by others, and whatever so impedes this full enjoyment of one's property and right of passage on the highway is a nuisance. Nuisances are thus capable of being divided into two kinds—private and public. Thus, if a neighbor leave a heap of rubbish emitting noxious smells close to A's windows, or make loud noises in his house, these may be said to be private nuisances in which his enjoyment of the fresh air and quiet of the immediate vicinity are part of his right of property. On the other hand, if something is put on the same kind on a public highway, or so as to annoy divers people equally and in the same manner, then it is called a public nuisance. One of the leading incidents of a nuisance is that the party annoyed by it can in many cases, especially where the nuisance is injurious to health or life, take the law into his own hands and abate the nuisance without resorting to a court of law. The reason is that the matter is of too urgent importance to await the slow progress of a suit at law, and mischief may be done in the mean time which would be often irreparable owing to the delay. Another important qualification of the right of abating a nuisance is that the nuisance must be such that unless it is abated at once the party cannot exercise his legal rights; and hence if the nuisance is of such a kind that it does not directly interfere with the comfort or enjoyment of one's legal rights at the time, he has no right to abate it, but in that case is bound to resort to a court of law. This is best illustrated in the case of a nuisance on the highway, which is in a manner in which his enjoyment of the fresh air and quiet of the immediate vicinity. Thus if while A is riding or driving along the highway his progress is interrupted by a fence or gate which nobody has a legal right to put there, it is obvious that unless A can knock down or demolish at once this obstruction he cannot proceed in the exercise of his legal right of using the highway. In such a case he has a right to demolish the gate and abate the nuisance, for it directly interferes with his own legal right. But if instead, a gate, a booth, or tent had been erected, not across the highway, but merely on one side of it, so as to leave room for passengers to pass, then, though such tent or booth would be as undoubted a nuisance as in the other case, yet inasmuch as A can pass without direct interference, he has no right to abate the nuisance by destroying the tent. He must, in this latter case, resort to the legal remedy only. The same rule applies to all kinds of nuisances. Another rule is that in abating a nuisance the party is not to do unnecessary damage to property, i.e., more than simply abate the nuisance to such an extent as to enable himself to exercise his legal right, and no further. If he go beyond the immediate occasion and cause unnecessary destruction to property, then he subjects himself to an action of damages. Hence it is often a difficult thing to know when one is justified in abating a nuisance and taking the law into his own hands.

Where the nuisance is sought to be removed by legal means, then the remedy is in some cases two-fold, and in some cases not so. Where the nuisance is of a private nature, an action of damages is in general the only remedy given by the common law. But whereas the nuisance is public, and affects all the public equally, or nearly so, in general either an action may be brought, or an indictment will lie. Thus in case of a nuisance on a highway, as this affects all the lieges alike, an indictment is the proper remedy, though if an individual suffered special damage over and above what he suffers
as one of the public, then he may bring an action. In Scotland, instead of an indictment, an action in the nature of a public action is raised, which is substantially similar in its results to an indictment.

As will be seen from what has preceded, the legal remedy in cases of nuisances has long been felt to be insufficient. To add to the other defects, there is great difficulty in determining whether a particular mode of using one's premises is in the nature of a nuisance or not; for if the line is drawn too narrowly, the rights of property and the natural freedom of the subject may be interfered with. On the other hand, things which formerly were considered no nuisances are now treated as such, owing to the spread of more enlightened views of public health and habits of cleanliness. These considerations recently induced the legislature to alter the common law in an important degree, and substitute a new code under the name of the public health and nuisances removal acts, 11 and 12 Vict. c. 66; 18 and 19 Vict. c. 116; 35 and 36 Vict. c. 79. The general scheme of these acts is to enable districts to appoint local boards, with extensive powers of self-government, and to undertake and execute sanitary improvements, such as drainage and water supply on a large scale, paying for the expense thereof by a local rate or assessment.

As regards the power of removing nuisances, a statute was passed in 1855 for England, called the nuisances removal act, which has been amended by two subsequent acts. By these acts, some sanitary authority, called rural or urban, under 33 and 36 Vict. c. 79, is appointed the local authority for carrying out the provisions of the act, and these are of an extensive kind. The act defines a nuisance to include any premises in such a state as to be a nuisance or injurious to health; any pool, ditch, gutter, water-course, privy, urinal, cess-pool, drain, or ashpit, so foul as be a nuisance or injurious to health; any animal so kept as to be a nuisance, or injurious to health; and any accumulation or deposit, overcrowding, foul condition, or smoke. The local authority is to appoint a sanitary inspector at a proper salary. Any person aggrieved may give notice to the local board, or the sanitary inspector may do so. The local board has extensive powers; it can authorize its inspector, on reasonable complaint, to demand an entrance into any private premises so as to inspect their condition, and may order the removal of nuisances found to exist there. The local board, on finding a nuisance exists, direct their officer to go before a justice of the peace and procure an order directing the private party to abate the nuisance. If he refuse to do so, the local board may remove the nuisance at the expense of the party on whose premises it exists, and sue him for such expenses. If any candle-house, melting-house, soap-house, slaughter-house, or place for boiling offal, blood, bones, etc., be certified by the medical officer, or any two medical practitioners, to be a nuisance, or injurious to the health of the inhabitants of the neighborhood, the local board may cause the person carrying on such trade to appear before a justice of the peace, and if it is not satisfactorily proved that he does not use the best practicable means for preventing or counteracting the effluvia, he is fined. So if houses are overcrowded, this may be stopped. Provisions are also enacted with a view to prevent the spread of diseases in times of epidemic, and to prevent common lodging-houses being kept in a foul state. Another important provision relates to the seizure of diseased meat and provisions exposed to sale, and the medical officer of health, or inspector of nuisances, has at all times power to inspect any animal, carcass, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, or flour; and if found unfit for food, or diseased, or unsound, they may be carried away then and there and destroyed, and the shopkeeper fined. The local authority may also order owners of houses to supply proper water-closets, and to cleanse gutters and cess-pools which are foul. Besides the above provisions as to nuisances generally, there are separate statutes for the English metropolis and the river Thames; thus furnaces in mills, factories, bake-houses, etc., in London, must consume their own smoke. These statutes are the 16 and 17 Vict. c. 128, and 19 and 20 Vict. c. 107. The public health act, 1875 (39 and 40 Vict. c. 55), practically codifies the law on all such matters. The rivers pollution act, 1876 (39 and 40 Vict. c. 75), deals with another important species of nuisance.

In Scotland, a nuisances removal statute was passed in 1856, and was re-enacted by the public health act, 1867, 30 and 31 Vict. c. 101. By that act the town council, or police commissioners of the place, are constituted the local authority for enforcing the act, and in other places the parish council. Besides dealing with the same class of nuisances as the English act, the Scotch act provided for checking all trades and businesses offensive and injurious to the health of the neighborhood. Similar powers were given to the local board to enter private houses and explore the causes of nuisances. Diseased and unwholesome meat and provisions may also be seized. Common lodging-houses were to be registered, and to be subject to rules and regulations to be made by the local authority. With regard to towns in Scotland, an extensive code of police laws was enacted in the general police and improvement acts, 25 and 26 Vict. c. 101, 21 and 22 Vict. c. 101. The acts may be adopted by burghs; and villages above 700 of population may, by vote of house-holders, be converted into burghs for this purpose. A smoke nuisance act for Scotland was passed applicable to all burghs, 20 and 21 Vict. c. 73; 24 Vict. c. 17; 28 and 29 Vict. c. 102.

The above is the usual legal acceptance of the term nuisance, but the word is sometimes used popularly to denote that class of nuisances, caused by disorderly houses or
brothels, which are familiarly described as common nuisances. In the law of England those who keep a brothel are liable to be indicted for a misdemeanor, but as there was often a difficulty in setting the law in motion in such cases, a statute of 25 Geo. II. c. 36, enacted that if any two inhabitants should give notice to a constable of such a house being kept, it should then be the duty of the constable under a penalty, to go with such inhabitants before a justice and engage to prosecute the keeper, and their expenses are paid by the parish out of the poor-rates. The same act provided that whoever in point of fact acted as the master or the mistress of the house, should be taken to be the keeper of the house. The punishment is fine and imprisonment. Of late an attempt has been made to convict a landlord under this statute when he knows of the character of his tenants, and refuses to give them notice to quit; but the courts have held that the mere fact of the landlord refusing to give notice to quit, and so to eject such tenants, was not enough to make him liable in any criminal punishment. In Scotland, the offense of keeping a brothel is punishable in a similar manner. But apart from the keeping of a brothel, there is no criminal offense committed in this country by those who frequent such houses for the purposes of prostitution unless where the circumstances amount to rape (q.v.), or abduction (q.v.), or an aggravated assault.

**Nulla Bona**, a legal phrase in England, descriptive of the return made to a sheriff, who in executing process against a debtor finds he has no goods.

**Numa Pompilius**, in the mythic history of Rome, was the successor of Romulus, the founder of the city. He was a native of Cures in the Sabine country, and was universally revered for his wisdom and piety. Unanimously elected king by the Roman people, he soon justified his conduct by the wisdom of their choice. After dividing the land into districts, he proceeded with the assistance of the sacred nymph Egeria, to draw up religious institutions for his subjects, and thus stands out in the primitive legend as the author of the Roman ceremonial law. His reign lasted for 39 years, and was a golden age of peace and happiness. The only feature in the myth of Numa Pompilius which we can regard as probably historical, is that which indicates the infusion of a Sabine religious element into Roman history at some remote period.

**Numantia**, the chief t. of the Celtiberian people called Arveni in ancient Spain, was situated on the Donoro (Durius), in the neighborhood of the present Soria in old Castile. The site is probably marked by the present Puente de Guarray. Numantia is celebrated for the heroic resistance which it made to the Romans, from 153 B.C., when its citizens first met a Roman army in battle, to 134 B.C., when it was taken and destroyed by Scipio the younger, after a siege of 15 months, in the course of which famine and the sword had left alive very few of its 8000 brave defenders. The besieging force under Scipio amounted to 60,000 men.

**Numbers**, theory of, the most subtle and intricate, and at the same time one of the most extensive, branches of mathematical analysis. It treats primarily of the forms of numbers, and of the properties at once deducible from these forms; but its principal field is the theory of equations, in as far as equations are soluble in whole numbers or rational fractions, and more particularly that branch known as indeterminate equations. Closely allied to this branch are those problems which are usually grouped under the description of Diophantine problems, i.e., problems in which the following are examples: 1. Find the numbers the sum of whose squares shall be a square number; a condition satisfied by 5 and 12, 8 and 15, 9 and 40, etc. 2. Find three square numbers in arithmetical progression; Answer, 1, 25, and 49; 4, 100, 196, etc.

**Forms of numbers** are certain algebraic formulas, which, by assigning to the letters successive numerical values from 0 upwards, are capable of producing all numbers without exception, e.g., by giving to $m$ the successive values 0, 1, 2, 3, etc., in any of the following groups of formulas: $2m, 2m + 1; 3m, 3m + 1, 3m + 2; 4m, 4m + 1, 4m + 2, 4m + 3$, we can produce the natural series of numbers. These formulas are based on the self-evident principle, that the remainder after division is less than the divisor, and that, consequently, every number can be represented in the form of the product of two factors $+ a$ number less than the smaller factor.

By means of these formulas, many properties of numbers can be demonstrated without difficulty. To give a few examples. (1) The product of two consecutive numbers is divisible by 2: Let 2 divide one number, then the other is either $2m + 1$ or $2m - 1$, and the product $2m (2m + 1)$ contains 2 as a factor, and is thus divisible by 2. (2) The product of three consecutive numbers is divisible by 6: Let 3 be one of the numbers (as in every trial of consecutive numbers one must be a multiple of 3), then the others are either $3m - 2, 3m - 1, 3m + 1$; or $3m - 1, 3m + 2$. In the first and third cases, the proposition is manifest, as $(3m - 2)(3m - 1)$, and $(3m + 1)(3m + 2)$, are each divisible by 2, and therefore their product into 3 is divisible by 6 ($= 1.2.3$). In the second case the product is $3m (3m - 1)(3m + 1)$, or $3m (9m^2 - 1)$, where 3 is a factor, and it is necessary to show that $m (9m^2 - 1)$ is divisible by 2; if $m$ be even, the thing is proved; but if odd, then $m^2$ is even, $9m^2$ is odd, and $9m^2 - 1$ is even; hence, in this case also the proposition is true. It can similarly be proved that the product of four consecutive numbers is divisible by 24 ($= 1.2.3.4$), of five consecutive numbers by 120 ($= 1.2.3.4.5$), and so on generally. These propositions form the basis for proof of many properties of numbers, such as that the difference of the squares of any two odd numbers is
null.

Numerals.

divisible by 8. The difference between a number and its cube is the product of three consecutive numbers, and is consequently (see above) always divisible by 6. Any prime number which, when divided by 4, leaves a remainder unity, is the sum of two square numbers; thus, $41 = 25 + 16 = 5^2 + 4^2$, $233 = 169 + 64 = 13^2 + 8^2$, etc.

Besides these, there are a great many interesting properties of numbers which defy classification; such as, that the sum of the odd numbers beginning with unity is a square number (the square of the number of terms added), i.e., $1 + 3 + 5 + 7 + 9 = 25 = 5^2$, $1 + 3 + 5 + 7 + 9 = 25 = 5^2$, etc.; and, the sum of the cubes of the natural numbers is the square of the sum of the numbers, i.e., $1^3 + 2^3 + 3^3 = 1 + 8 + 27 = 36 = (1 + 2 + 3)^2$, $1^3 + 2^3 + 3^3 \times 4^3 = 100 = (1 + 2 + 3 + 4)^2$, etc.

We shall close this article with a few general remarks on numbers themselves. Numbers are divided into prime and composite—prime numbers being those which contain no factor greater than unity; composite numbers those which are the product of two (not reckoning unity) or more factors. The number of primes is unlimited, and so consequently are the others. The product of any number of consecutive numbers is even, as also are the squares of all even numbers; while the product, together with numbers for the squares of odd numbers, are odd. Every composite number can be put under the form of a product of powers of numbers; thus, $144 = 2^4 \times 3^2$, or, generally, $n = a^b \cdot b^c \cdot c^d$, where $a$, $b$, and $c$ are prime numbers, and the number of the divisors of such a composite number is equal to the product $(p + 1)(q + 1)(r + 1)$, unity and the number itself being included. In the case of 144, the number of divisors would be $(4 + 1)(2 + 1), or 5 \times 3, or 15$, which we find by trial to be the case. Perfect numbers are those which are equal to the sum of their divisors (the number itself being of course excepted); thus, $6 = 1 + 2 + 3$, $28 = 1 + 2 + 4 + 7 + 14$, and 496, are perfect numbers. Amicable numbers are pairs of numbers, either one of the pair being equal to the sum of the divisors of the other; thus, $220 (= 1 + 2 + 4 + 5 + 10 + 11 + 22 + 44 + 55 + 110 = 284)$, and $284 (= 1 + 2 + 4 + 71 + 142 + 284)$, are amicable numbers. For other series of numbers see Number.
in almost universal use among civilized nations for this purpose. Both the origin of these figures and the period at which they became known in Europe have been made subjects of laborious investigation; and it seems to be now proved beyond a doubt that they are of Indian, not Arabic, origin, and were invented by the Brahmins some time a.c. But the more important inquiry as to the time of their introduction into Europe has hitherto baffled all research. The simple and convenient method that they were introduced into Spain by the conquering Arabs, and from that country, then a great seat of learning, a knowledge of them was disseminated throughout Europe, is contradicted by the fact that the eastern Arabs themselves had no knowledge of them previous to the time of the caliph Al-Mamun (813-39), while a knowledge of them existed in Europe from a considerably earlier period. The most probable reason for this is that they were brought from India, probably by the Neo-Pythagoreans, and introduced into Italy, whence they became known to a few of the learned men of eastern Europe. We have, however, every reason to suppose that the figures were known totally different in form from those now used. These latter, called gober by the Arabs, may have been brought to Bagdad during the reign of Al-Mansor (760), or his immediate successors, and certainly not later than the time of Al-Mamun. During the latter reign we know the present system of arithmetic was introduced into Persia from India, and most probably a knowledge of the gober figures at the same time. Thence the system of arithmetic was brought to north-western Africa and Spain, and doubtless the figures along with it, about the end of the 10th or beginning of the 11th c., and from Spain a knowledge of both was speedily communicated to the rest of Europe, the gober figures superseding those forms of eastern figures which had previously been employed. The knowledge of the figures, rapid, as was well known, the more rapid than the notation and arithmetic of which they were the foundation, and we consequently find in writings of the middle ages the gober figures partly substituted for, and mixed up with, the Roman numerals; as, for instance, XXXII, for 32; X4, for 14, etc.; and occasionally such expressions as 302, 303, for 32 and 33. The earliest work on modern arithmetic was published in Germany in 1390; it explained the decimal notation and exemplified the elementary rules. The Arabic numerals were not generally introduced into England till the commencement of the 17th c., and it was long after that the decimal notation became general. See a dissertation Sur les Chiffres Indiens, by M. Woepcke, in the Asiatic Journal.

NUMERALS (cont.). The only valuable essays on the introduction of our present numerals are the works of Woepcke, in the Encyclopædia Metropitonum, London, 1845, vol. 11., p. 412; in the Journal Asiatique, 6th series, vol. 1., 1865, pp. 27, 294, 442; and his monograph, Sur l'Introdotion de l'Arithmétique Indien en Occident, Rome, 1859. His knowledge of Sanskrit, Arabic, and the higher mathematics, may be seen in his reconstruction of that passage where the education of the infant Buddha is exemplified by a kind of competition-wallah, on the basis of the logical figure of the "heap."] But we are only just beginning to get reliable dates in Indian archeology, and the edition of Prisse by Thomas, 1863, the archaeological part of the surveys of India, the labors of German scholars in the line of Schemitic influence on early Indian alphabets, all point to conclusions at variance with those of the scholars of the last generation. There are three figures in use among what may be called the mathematical nations, the Sanskrit (this name is used because it does not identify them with any particular alphabet), the Naksari (as used with the present Arabic alphabet), and the European. None are new as they were in the year 1000 A.D., and none is an immediate borrowing from another. All seem to have been once used without notational place, that is, without the zero, Arab-Greek δεκατος. Sansk. suneja, both meaning root. The earliest Sanskrit figures appear to be of A.D. 600. The Indian numerals are used till n.c. 116, they are Semitic, and without notation. The Pali numerals which accompany the series of inscriptions from the 3d c. a.c. to the 5th c. A.D., are partly tallies, partly alphabetic, partly Semitic, and are also without notation. The Sanskrit figures must be traced back through a Devanagari 10th c. type, through a still older Kashmir shape, to identifiable initials of their Pali (?) names in characters which are not quite identical with either Pali, Allahabad, or Sindhi-mulnati. The resemblance of 1, 2, 3 to our own figures vanished as we go back, and the only shadow of likeness is an accidental form of the old 7. Evidently, there remains at that point not the slightest resemblance to any modern Devanagari letters, nor are the letters those usually proposed, as the six is spelled with chh, and seven with t. The other two types are, as to a few of their figures, bound together by a common origin, though dissimilar in shape and derivation. It may be well to remind the reader that Alexandria, with the party-colored nationalities which traded there, serves as a great receptacle, not only of all the mysticism born of all the advanced forms of the ancient east. While a jumble of perverted intelligence remained long after any practical instruction had vanished may be easily seen by studying any of the patristic compilations, or any of the early Arabic encyclopedists. The Arabs of n. Egypt and Barbary, Mughrabin, had always certain heretical traditions, a different arrangement of the supplementary letters of the alphabet, and certain differences in the figures, which distinguished them from their fellows of the east. Their civilization seems earlier and more practical. The oldest figures known (except Chinese current marks) are the Egyptian, and they go
Numerals.

Numidia.

1. ii. iii. iiiij., which in Demotic are changed to one long stroke, with the others reduced each to a short scrawl on its upper left side. The Hieratic changes the tallies to a series of vertical scrawls, and from these come the Demotic signs for months, 1, 2, 3, almost identical with our figures. These furnish the radical distinction between Arabic and Gobar figures. The Arabic, at least the Neski, takes the first four Demotic figures, and, necessarily reversing them in its writing from right to left, adds to them others, of which only 5 bears a chance resemblance to an European figure. The Gobar takes the three Demotic month figures, adds the Demotic common 4, and the rest are identical with the old MughWa, with the apices of Boethius, and with our modern figures. Variant types are old Arabic 4 like a Greek sigma, 2, and 5 like our 8 with a tail; the Gobar and the Boethian signs have another 2, like a Saxon t; the 14th c. European 4 is like a Greek lambda, δ. The apices, occurring in an old manuscript of Boethius, but unfortunately not to be fixed in date, have every appearance of being Goastic. The signs are strangely deformed, and their names, affixed, are from 4 to 9, Syrian, but 1 and 2 are Indo-German, and 3 unreadable. As the Gobar seem older than the Neski, and as their first four figures are undoubtedly Egyptian, it may be that the rest, our figures of to-day, are also debased Demotic. They would be either alphabetic—or of the sequence of the Demotic alphabet we are not entirely certain—or initial—but, if so, of Coptic numbers, or of Arabic numbers spelled in Copte? It seems impossible to tell, and no guessing, or discovery of chance relation in appearance, is of the slightest value. A series of deductions would attribute the other Neski figures to either a Syrian alphabet becoming Kufic, or perhaps to some arrangement of Perso-Bactrian signs with which we are not yet acquainted. The manuscript of Washiyi will show with how many signs an inquisitive Arab of his time might be familiar, while without real knowledge of a single alphabet, even, besides his own.

Numerals, the reading off of numbers that are expressed by figures. As shown in notation (q.v.), the first figure on the right hand expresses units; the next, tens; the third, hundreds; and following the same nomenclature with the next three figures, we have the four expressing units of thousands; the fifth, tens of thousands; the sixth, hundreds of thousands. The seventh figure, in like manner, expresses units of millions; the eighth, tens of millions; and the ninth, hundreds of millions. When this method is consistently followed out, as is the case with French and other continental arithmeticians, the fourth period, or group of three figures, is denominated billions, the first figure of it (the tenth from the extreme right) being units of billions; the next, tens of billions; etc. Read in this way, the figures 50,084,763,204,504 express fifty-six trillions, eighty-four billions, seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units. In Britain there is a slight variation in the mode, the only effect of which is to render it a little more complicated; thus, after units of millions, come tens and hundreds of millions, but then instead of billions we have, according to the current usage, thousands of millions; after this, tens of thousands of millions and hundreds of thousands of millions, and then billions, which occupy the 13th figure from the right, and are reckoned in the same way as millions, so that the next unit, the billions, does not come in till the 16th figure. The above number, according to the British mode, would be read fifty-six billions, eighty-four thousand-seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units. The first method is perfectly symmetrical, keeping throughout to divisions of three figures; the second only keeps to this division up to hundreds of millions, when it changes it for a division into parcels of six figures, which are named from units up to hundreds of thousands of units. The latter mode is, however, gradually falling into disuse.

Numida. See Guinea Povi, ante.

Numidia (Gr. Nomadia, the land of Nomads), the name given by the Romans to a part of the n. coast of Africa, corresponding to some extent with the modern Algiers. It was bounded on the w. by the river Mulucha (now Mabugha), which separated it from Mauritania; on the e. by the river Tusca (now Wadi-el-Berber), which separated it from the territory of Carthage, the Africa Propeo of the Romans; on the s. it reached to the chains of mt. Atlas and the Lacus Tritonis, which separated it from the land of the Gaculians and interior Libya. The chief rivers were the Rubricatus and the Ampsaga. The inhabitants of Numidia, as of Mauritania, belonged to the race from which the modern Berber are descended. They were a warlike race, and excelled as horsemen; but, like most barbarians, were faithless and unscrupulous. Of their tribes, the Massali in the e., and the Massageta in the w., were the most warlike. In the grand struggle between the Carthaginians and the Romans, they at first fought as allies of the former, but subsequently the king of the eastern Numidians, Massinissa, joined the Romans, and rendered them effectual service in the war with Hannibal. Favored by the conquerors he united all Numidia under his sway. Of his successors in this kingdom Jugurtha and Juba are the most famous. After the victory of Caesar over Juba I., in the African war, Numidia became a Roman province (46 B.C.); but Augustus afterwards gave the western part—from the river Ampsaga, now Wadi-el-Kibbir—with Mauritania, to Juba II., and the name Numidia became limited to the eastern part; and when Mauritania became a Roman province, the western part was called Mauritania Caesariensis.

U. K. X.—47
Among the Roman coloniae were Hippo Regius, near the mouth of the river Rubrictas; Cirta (the residence of the Numidian kings), afterwards called Constantina, a name still preserved in Constantine; Sicca, and Rusicada. For the modern history of Numidia see Algiers.

NUMISMATICS (Lat. nummum and numisma, money; Gr. nomisma, from nomos, law; a medium of exchange established by law), the science which treats of coins and medals. A coin is a piece of metal of a fixed weight stamped by authority of government, and employed as a circulating medium. A medal is a piece struck to commemorate an event. The study of numismatics has an important bearing on history. Coins have been the means of ascertaining the names of forgotten countries and cities, their position, their chronology, the succession of their kings, their usages—civil, military, and religious—and the style of their art. On their respective coins we can look on undoubtedly accurate representations of Mithridates, Julius Caesar, Augustus, Nero, Caracalla, and other characters and charisms.

The metals which have generally been used for coinage are gold, silver, and copper. In each class is comprised the alloy occasionally substituted for it, as electrum (an alloy of gold and silver) for gold, billon for silver, bronze for copper, and potin (an alloy softer than billon) for silver and copper. The side of a coin which bears the most important device or inscription is called the reverse, the other side the reverse. The words or letters on a coin are called its inscription; an inscription surrounding the border is called the legend. When the lower part of the reverse is distinctly separated from the main device, it is called the exergue (Gr. ex ergon, without the work), and often bears a secondary inscription, with the date or place of mintage. The field is the space on the surface of the coin unoccupied by the principal device or inscription.

The use of coined money cannot be traced further back than the 9th c. B.C. Money, however, as a medium of exchange, existed much earlier, and when of metal it passed by weight, no piece being cast to any precise weight. In the early periods of emigration, Early metallic money was in the form of bars, spikes, and rings; the ring money could be opened, closed, and linked in a chain for convenience of carriage.

The Lydians are supposed to have been the first people who used coined money, about 700 or 800 years before the Christian era; and their example was soon followed by the different states of Greece, the earliest Greek coins being those of Ephesus. In its early stages the process of coining consisted in placing a lump of metal of a fixed weight, and approaching to a globular form, over a die, on which was engraved the religious or national symbol to be impressed. A wedge or punch placed at the back of the metal was held steadily with one hand, and struck by a hammer with the other, till the metal was sufficiently fixed in the die to receive a good impression. The impression was a guarantee of the weight of the piece. From the nature of the process, the earliest coins had a lumpsish appearance, and on their reverse was a rough, irregular, hollow square, corresponding to a similar square on the punch, devised for the purpose of keeping the coin steady when struck by the coining hammer. The original coins of Asia Minor were of gold, those of Greece of silver. The earliest coins bear emblems of a sacred character, often embodying some legend regarding the foundation of the state, as the place or seal on the coins of the Phocians, which alludes to the shool of seals said to have followed the fleet during the emigration of the people. A very early double stater of Miletus, in Ionia, of which the type is the lion's head, was derived from Persia and Assyria, and associated with the worship of Cybele, a symbol which is continued in the later coinage of Miletus. Types of this kind were succeeded by portraits of protecting deities. The earliest coins of Athens have the owl, as type of the goddess Athene; at a later period, the head of the goddess herself takes its place, the owl afterwards re-appearing on the reverse. The punch-mark, at first a rudely-rounded square, soon assumed the more slightly form of deep, wedge-like indent, which in later specimens become more regular, till they form themselves into tolerably symmetrical square. In the next stage, the indent becomes shallower, and consist of four squares forming one large one. These form the punch, with hand bearing a name and the introduction of a head in the center, gradually led to the perfect reverse. There is a remarkable series of so-called ‘encased’ coins struck in Magna Graecia, of which the reverse is an exact repetition in concave of the relief of the obverse. These coins are thin, flat, sharp in relief, and beautifully executed.

The leading coin of Greece and the Greek colonies was the stater, so called because founded on a standard of weight generally received before the introduction of coined money. There were double staters, and half, third, and quarter staters, and the stater was equivalent in value to six of the silver pieces called drachmae. The obolus was one-sixth of the drachma, at first struck in silver, in later times in copper.

The inscriptions on the earliest Greek coins consist of a single letter, the initial of the city where they were struck. The remaining letters, or a portion of them, were afterwards added, the name, when in full, being in the genitive case. Monograms sometimes occurred in addition to the name, or part name, of the place. The first coin bearing the name of a king is the tetradrachm (or piece of four drachmae) of Alexander I., of Macedon.

Among the early coins of Asia, one of the most celebrated is the stater Darius or Daric, named from Darius Hystaspes. It had for symbol an archer kneeling on one
knee, and seems to have been coined for the Greek coloniae of Asia by their Persian conquerors. In the reign of Philip of Macedon the coins of Greece had attained its full development, having a perfect reverse. One of the earliest specimens of the complete coin is a beautiful medall struck at Syracuse, with the head of Proserpine accompanied by dolphins, and for reverse a victor in the Olympic games in a chariot receiving a wreath from victory—a type which is also found on the reverse of the staters of Philip of Macedon, known as Philip's, and largely imitated by other states. Coins of Alexander the great are abundant, many having been struck after his conquests in the Greek towns of Asia. A rose distinguishes those struck at Rhodes, a bee those struck at Ephesus, etc.; these are all types generally accompanying the figure of Zeus on the reverse; on the obverse is the head of Herakles, which has sometimes been supposed to be that of Alexander himself. It would rather seem, however, that the conqueror's immediate successors were the first who placed their portrait on the coins, and that under a shallow pretence of dedication, Lysimachus as a descendant of Bacchus, and Seleucus of Apollo, clothed in the attributes of these deities. Two most beautiful and important series of Greek coins are those of the Seleucids, in Asia, of silver, and of the Lagidæ or Ptolemies, in Egypt, of gold.

In Palestine there is an interesting series of coins founded on the religious history of the Jewish nation, and assigned to Simon Maccabæus. They are small and half-shells, equivalent to two attic drachms and one drachma respectively. The shells bear on the obverse the pot of manna, with the inscription "Schekel Israel" (the Shekel of Israel); on the reverse is Aaron’s rod with three flowers, and the legend "Ierousa-aim kedoshah" (Jerusalem the holy). The inscriptions are in the Samaritan character. The successors of Simon assumed the title of king, and placed their portraits on the coins, with inscriptions in Greek as well as in Hebrew.

Roman coins belong to three different series, known as the republican, the family, and the imperial.

The so-called republilca, the earliest coinage, began at an early period of Roman history, and extended till about 80 B.C. Its standard metal was copper, or rather as or bronze, an alloy of copper. The standard unit was the pound weight divided into twelve ounces. The as, as, or pound of bronze, is said to have received a state impress as early as the reign of Servius Tulius, 578 B.C. This gigantic piece was oblong like a brick, and stamped with the representation of an ox or sheep, whence the word prœmna, from pecus, cattle. The full pound of the as was gradually reduced, always retaining the twelve (noninally) uncial subdivisions, till its actual weight came to be no more than a quarter of an ounce. About the time when the as had diminished to nine ounces, the square form was exchanged for the circular. This large copper coin, called the "as grave," was not struck with the punch, but cast, and exhibited on the obverse the Janus bicornis; and on the reverse, the prow of a ship, with the numeral I. Of the fractions of the as, the sextans, or the sixth part, generally bears the head of Mercury, and the uncia, or ounce piece, that of Minerva; these pieces being further distinguished by dots or knops, one for each ounce. Other pieces were given in height as the decemis, or piece of twelve as, representing a head of Roma (or Minerva), but none are known to have been coined till the weight of the as had diminished to four ounces. The Roman uncial coinage extended to the other states of Italy, where a variety of types were introduced, including mythological heads and animals. In the reign of Augustus, the as was virtually superseded by the sesterii, called by numismatists the first bronze, about the size of our penny, which was at first of the value of two and a half, afterwards four asses. The sesterii derived its value from the silver denarius, of which it was the fourth. The half of the sesterius was the dupondius (known as the second bronze), and the half of the dupon-

Silver was first coined at Rome about 281 B.C., the standard being founded on the Greek drachma, then equivalent in value to ten asses; the new coin was therefore called a denarius, or piece of ten asses. The earliest silver coined at Rome has on the obverse the head of Roma (differing from Minerva by having wings attached to the helmet); on the reverse is a quadriga or biga, or the Dioscuri. Among various other types which occur in the silver of the Italian towns subject to Rome are the horse's head, and galloping horse, both very beautiful. During the social war, the revolted states coined money independently of Rome, and used various devices to distinguish it as Italian and not Roman money.

The earliest gold coins seem to have been issued about 90 B.C., and consisted of the sculpum, equivalent to 20 sesterii, and the double and treble sculpum. These pieces bear the head of Mars on the obverse, and on the reverse an eagle standing on a thunderbolt, with the inscription "Roma" on the exergue. The large early republican coins were cast, not struck.

The family coins begin about 170 B.C., and about 80 B.C. they entirely supercede the coins described. Those families who successively held offices connected with the public mint acquired the right first to inscribe their names on the money, afterwards to introduce symbols of events in their own family history. These types gradually superseded the natural ones; the portrait of an ancestor followed; and then the portrait of a living citizen, Julius Cæsar.
Under the empire, the copper sestertius, which had displaced the as, continued the monetary standard. A magnificent series exists of the first bronzes of the emperors from Augustus to Gallienus. While it was the privilege of the emperors to coin gold and silver, copper could only be coined ex sevatus consulto, which from the time of Augustus was expressed on the coins by the letters S.C., or EX S.C. The obverse of the imperial coins bears the portraits of the successive emperors, sometimes of the empress or other members of the imperial family; and the reverse represents some event, military or social, of the emperor’s reign, sometimes allegorized. The emperor’s name and title are inscribed on the obverse, and sometimes partly concealed on the reverse; the inscription on the reverse generally relates to the subject delineated; and towards the close of the 3d c., the exergue of the reverse is occupied by the name of the town where the coin is struck. The coins of Augustus and those of Livia, Antonia, and Agrippina the Elder have much artistic merit. The workmanship of Nero’s sestertii is very beautiful. The coins of Vespasian and Titus commemorate the conquest of Judea. The colossus appears on a sestertius of Vespasian. The coins of Trajan are noted for their architectural types. Hadrian’s coins commemorate his journeys. The coins and medals of Antonine, Marcus Aurelius, and the two Faustine are well executed; as are also those of Commodus, of whom a remarkable medallion relates to the conquest of Britain. There is a rapid falling off in design after the time of Commodus, and base silver comes extensively into use in the reign of Caracalla. Gallienus introduced the practice of coining money of copper washed with silver.

The colonial and provincial money of this period was very inferior to that coined in Rome. The coinage of the colonies which had been formed out of the Greek empire, the obverse bears the emperor’s head and the reverse generally the chief temple of the gods in the city of coinage; the inscriptions are in Greek. In the imperial coins of Alexandria appear such characteristic devices as the heads of Jupiter Ammon, Isis, and Canopus, the sphinx, the serpent, the lotus, and the wheat-ear. Colonial coins were at first distinguished by a team of oxen, afterwards by banners, the number of which indicated the number of legions from which the colony had been drawn. After the time of Gallienus, the colonial money and the Greek imperial money, except that of Alexandria, ceased, and much of the Roman coinage was executed in the provinces, the name of the town of issue appearing on the exergue. Diocletian introduced a new piece of money, called the follis, which became the chief coin of the lower empire. The first bronze has disappeared after Gallienus, and the second disappears after Diocletian, the third bronze diminishing to \( \frac{1}{6} \) of an ounce. With the establishment of Christianity under Constantine, a few new types were introduced. The third bronze, which is sometimes called the Labourum (q.v.), with the monogram IHS, Lactarius, called contorniati, encircled with a deep groove, belong to this period, and seem to have been prizes at distribution at the public games. Pagan types recur on the coins of Julian; and after his time the third bronze disappears. The money of the Byzantine empire forms a link between the subject of ancient and that of modern coins. The portrait of the emperor on the obverse is, after the 10th c., supported by some protecting saint. The reverse has at first such types as Victory with a cross, afterwards a representation of the Saviour or the Virgin; in some instances, the Virgin supporting the walls of Constantinople. Latin is gradually superseded by Greek in the inscriptions, and wholly disappears by the time of Alexius I. The chief gold piece was the solidus or nomisma, which was long famed in commerce for its purity, and circulated largely in the west as well as the cast of Europe.

Of the coins of the middle ages, the most important is the silver denier or penny, derived from the Latin denarius. Its half was the obole, first of silver, afterwards of billon. Coins of this description were issued in the German empire, France, England, and the Scandinavian states, and in many cases by ecclesiastical princes and feudal lords as well as sovereigns. The obverse of the regal coin of the early middle ages is generally the bust of the sovereign, and the reverse a Greek cross, accompanied by the royal name or title, and the place of mintage or the moneyer (see Mint). The arms of the country were introduced in the 12th c., in conjunction with the cross, and afterwards superseded it. In the 13th and 14th centuries, coins began to be issued by free imperial cities or corporations of towns; and there prevailed extensively throughout Germany and other parts of Europe a thin piece called a bracteate, in relief on one side, and hollow on the other, often not bearing a single letter, and rarely a full inscription. Down to the 14th c., the relief of the medieval coins is very inconsiderable, the pieces thin, and the art poor.

Britain received the Roman money in its subjugation. Constantine seems to have had a mint in London, and the Roman currency continued to circulate for a time after the departure of the conquerors. The first independent coinage, however, shows hardly a trace of the influence of Rome; it consists of two small coins, called the sceatta and styca, the former of silver, the latter of copper. Both seem to belong solely to the Saxon kingdom of Northumbria; they are without inscriptions; a bird, a rude profile, and several unintelligible symbols appear on them, and their art is of the most debased kind. In the other kingdoms of the heptarchy silver pennies were coined, first intended to be \( \frac{1}{2} \) of a pound weight; on the disappearance of sceatta and styca, they form, with the occasional addition of half-pennies, the sole currency of England down to the
of Edward III. The pennies of the heptarchy bear the name of the king or of the moneyer; a cross sometimes appears after the introduction of Christianity, and in later times a rude head of the king or queen. The pennies of the Saxon and Danish sole monarchs of England have a somewhat similar character. Alfred's earlier coins have a grotesque-looking portrait, and on the reverse a monogram of London; in his later coins the head disappears, and a cross and circle take its place. A cross variously ornamented with three pellets in each angle continues to be the usual reverse of the Saxon, Norman, and Plantagenet coins. The coins of Edward III. are a great artistic advance on those that preceded them. The silver coinage of that kind consisted not only of pennies, half-pennies, and farthings, but also of groats and half-groats. The obverse of the great bears a conventional crowned head within a flowered circle of nine arches, the words "Dei Gratia" and the title "Rex Francie" appearing for the first time in the legend. The reverse has the motto "Pouci Denum adjutorum meum," which continued on the coinage till the time of Edward V. But the great numismatic feature of Edward III.'s reign is the issue of gold nobles, worth six shillings and eightpence. The obverse of those beautiful coins represent the king in a ship, a sword in his right hand, in his left a shield with the quartered arms of France and England. The reverse is a rich cross flory within a circle of eight arches, and a lion under a crown in each angle of the cross, the legend being "Ihesus autem transiens per medium illorum habet." Half and quarter nobles were also coined. The noble having increased in value, a coin called an angel, of the former value of a noble, was issued by Henry VI. and Edward IV. The obverse represented St. Michael transfixing a dragon, the reverse a ship, with a cross for the mast.

As we approach the period of the reformation, the coinage gradually becomes more ornate. The nobles coined by Edward IV. after the value of that coin had been fixed at 10 shillings, were called rials (a name derived from a French coin), and the double rial or sovereign was first coined by Henry VII. The obverse has the king on his throne with sceptre and orb, and on the reverse in the center of a heraldic full-blown rose, I— a shield with the arms of France and England. The testoon, or shilling, valued at twelve pence, also first appeared in this reign, with the royal profile crowned on the obverse, and the royal arms quartered by a lion and dragon on the reverse. A noble was coined with St. George and the dragon on the obverse, and on the reverse a ship with three crosses for masts, and a rose on the center mast. On the coins of Henry VIII. the title "Hiberniae Rex" first appeared, former kings having only styled themselves "Dominus Hiberniae," Ireland not being accounted a kingdom. Under Edward VI. the silver coins called crowns and half-crowns appear, having for device the king crowned on horseback in the armor of the period. They derived their name from coins circulating on the continent, which had for device a crown. The royal arms in an oval shield without the cross are introduced as the reverse of the shilling. From this period there is a very obvious decline in the artistic feeling of the English coins. On some of the shillings of Mary, her bust and that of Philip face each other, the insigne of Spain and England impaled occupying the reverse; afterwards the king's head occupies one side of the coin, and the queen's the other. Half sovereigns, or rials, and angels were coined of the old type of Edward I. The first coin of Edward III.'s reign contains the name of the mint in the legend; the introduction of the mill and screw, instead of the hammer and punch, producing coins of a more regular and workmanlike appearance. The profile bust of James I., crowned and in armor, appears on his shillings and smaller pieces; on his crowns and half-crowns he is represented on horseback; on the reverse are the quartered arms of the three kingdoms (the harp of Ireland appearing for the first time on the coinage), with the motto "Quae Deus conjunxit nemo separat." Copper farthings, with crown, scepter, and sword on the obverse, and a harp on the reverse, were coined for England as well as Ireland, the first copper money issued in England since the stye. Private tokens of copper, issued by tradesmen and others, had, however, been in circulation before, and came again into use to a large extent at a later period. Charles I. coined ten and twenty shilling pieces of silver, the former a very noble coin, with a representation of the king on horseback. A crown, struck at Oxford, bears on the obverse the king on horseback, with a representation of the town and on the reverse the heads of the Oxford declaration. The guinea, first coined in this reign, was so called from the metal being procured from the coast of Guinea; its original value was but twenty shillings.

The coins of the commonwealth exhibit a shield with the cross of St. George surrounded by a palm and olive branch, and have for legend "the commonwealth of England." On the reverse are two shields accosté, with the cross of St. George and the harp of Ireland, and the motto "God with us." Coins far superior in character were executed by Cromwell, with his laureated bust and title as protector, and on the reverse a crowned shield quartering the cross of St. George, of St. Andrew and the harp, with the protector's paternal arms in sartor; but few of these were issued. In the early coins of Charles II., that monarch is crowned, and in the dress of the time; in his later money he is in conventionalized Roman drapery, with the head turned to the left, and from that time it has been the practice to turn every king's head the reverse way from
that of his predecessor. The four shields on the reverse are disposed in the form of a cross (an arrangement which continued till the reign of George II.), and on the edge of the crowns and half-crowns is the legend "Deus et tutamen." Charles II., issued a copper coinage of half-pennies and farthings; on the former appears the device of Britannia, taken from the Roman coins relating to Britain. Pennies were not coined till George III.'s reign. The coins of William and Mary have the profiles of the king and queen one over the other, and the shields of the three kingdoms in the form of a cross on the reverse, with Nassau in the center. The coinage of William alone, after the death of Mary, is of somewhat improved design, sir Isaac Newton being then master of the mint. Little change in the general design of the coin occurs in the reigns of Anne and George I. On the accession of the house of Hanover, the Hanoverian arms are placed in the fourth shield, and George IV. substituted a quartered shield with Nassau en surtoit for the four shields on the reverse of his gold coins. During the greater part of George III.'s reign the coinage was nearly neglected, and the silver pieces, especially the half-crowns, were in a perfectly smooth state. When the coinage was last issued the Roman conventionalism of the previous reigns gave way to a new fashionable Greek conventionalism. The quartered shield supplanted the four shields, and on the reverse of the crown appeared a Grecianized St. George and the dragon. George IV.'s bust is taken from Chantrey's statue; the rose, thistle, and shamrock, united under a crown, appear on the reverse of his shilling. Silver greats were issued in the reign of William IV. The ensigns of Hanover disappeared at the beginning of the present reign; the reverse of the shilling is even poorer than that of George IV., the words "One shilling" occupy the field, surrounded by an oak branch and a laurel branch; silver pieces of three pence have been introduced. But the principal monetary event is the issue of the silver florin, in value equivalent to two shillings, looked on as a step towards the institution of a decimal coinage. It represents the head of the queen crowned, with the legend in old English character, and for reverse the four shields are once more placed in the form of a cross.

No native Scottish coinage existed earlier than the 11th century. Coins are extant of Somerled, prince of the Isles of that century, and of Alexander I. of the century following. The silver pennies of William the lion, and Alexander II. and III., are like contemporary English money, but ruder, and bear the names of the moneymakers and place of mintage, generally Edinburgh, Perth, or Berwick. The profiles on the coins of John Balliol, Robert Bruce, and David II. are attempts at portraiture. A remarkable gold piece, first coined by Robert II., is the St. Andrew, with the arms of Scotland on the obverse, and St. Andrew on his cross on the reverse. In the four succeeding reigns the weight of the silver coins rapidly decreased, and coins of billon, or base metal, were issued, nominally pennies, but three and a half of which eventually passed for a silver penny. The evil increased, and baser and baser alloy was used. Greats of billon, known as placks and half-placks, were coined by James III. James IV.'s coins have a characteristic portrait, and a good deal of artistic feeling. James III. and IV. issued well-executed gold pieces, called unicorns and riders, the type of the one being the unicorn, of the other the king on horseback. A still more beautiful coin was the gold bonnet piece of James V., so called from the cap in the king's portrait. Of Mary there are a great variety of interesting pieces. The portrait is sometimes crowned, sometimes uncrowned; and on the coin issued soon after Francis's death, has a widow's cap and high-frilled dress. The types in James VI.'s reign are also very various. On his accession to the English throne, the relative value of English and Scottish coins was declared to be as 12 to 1. The coins afterwards issued from the Scottish mint differed from the English, chiefly in having Scotland in the first quarter in the royal shield. The last Scottish gold coinage consisted of pistoles and half-pistoles of Darien gold, about the size of a guinea and half-guinea, struck by William III.; the pistole distinguished by a rising sun under the bust of the king.

The coinage of Ireland is scanty and uninteresting compared with that of Scotland. The coinage of England is scarcer in Dublin than in London; and these are much those current in England. Henry VIII. first placed a harp on the Irish coins.

In France, the earliest coins are those of the Merovingian kings, rude imitations of the late Roman and early Byzantine money, and mostly of gold. Under the Carolingian dynasty, deniers and obole are the prevailing coinage, remarkably rude in fabric without portrait, and bearing the name of the king and place of mintage. Some coins of Charlemagne, struck at Rome, are of better workmanship. They contain one letter of "Roma" at each extremity of the cross, with the legend "Carolus IV." The coinage improved under the Capetian kings; the fleur-de-lis appears in addition to the cross. In the 13th c. gold pieces were issued, and in the time of Philip VI. both the design and the execution of the coins are beautiful. The coins of Louis XIV. are the first that bear the royal portrait. The modern coinage may be said to begin under Henry II., whose portrait is good. The seignorial coins of France in the middle ages are of considerable local importance, and the medals of Louis XIV. and Napoleon I. are much more interesting than the modern coinage.

The mediaeval coinage of Italy is of great interest. The money of the Lombard kings of Italy and dukes of Benevento, is little inferior to that of the Greek emperors. There is a beautiful series of gold and silver pieces belonging to Venice, bearing the names of
the doges, and having generally for type the doge receiving the gonfalon, or standard of St. Mark. The gold florins of Florence, with the lily for device, are no less celebrated, and were imitated by other states. Florence had also a remarkable series of medals, with admirable portraits of persons of note. The coins of the popes, from Hadrian I. down to the 14th c., bear the name of the pope and emperor of the west; those of later date are beautiful in execution, and have seated portraits of the pontiffs, with the cross-keys and mitre for reverse. A remarkable series of medals commemorates the chief events of each reign, one of which, struck after the murder of St. Bartholomew, has for type an angel slaying the Huguenots, and the inscription "Ugonottorum strages." The coins of the Norman princes of Naples struck in Sicily, have the legends partly or wholly in Arabic. Malta has a series, with the arms and effigies of the grand-masters.

The medieval money of Germany comprises coins of the emperors, the electors, the smaller princes, the religious houses, and the towns. The imperial series is extensive and very interesting, though, till near the close of the middle ages, it is rather backward in its art. About the reformation period, however, there are vigorous portraits both on its current coins and on the medals, and those double-dollars which are virtually medals. The coins of the dukes of Saxony, with their portraits are equally remarkable. The coins of the archbishops of Cologne, Mainz, and Treves form a very interesting series, the first more especially, with a representation of the cathedral.

The coins of the Low Countries resemble those of France and Germany. The Dutch medals are of interest, more especially those struck in commemoration of events in the war with Spain.

The coins of the Swiss cantons and towns during the early period of Swiss independence bore the heraldic shield of each, drawn with vigorous grotesqueness. There are also pieces struck by ecclesiastical lords, and by different families who had a right of coining.

The coins of Spain begin with those of the Gothic princes, which are chiefly of gold, and on the model of the tritonomy and semisses of the lower empire. Some of the early pieces have a rude head of the monarch on one side, and of the emperor on the other. Afterwards, the obverse bears the profile of the monarch, and the reverse a cross of some description, with the name of the place of mintage, and the word "Plus" for legend. In later times, there are two interesting series of coins belonging to the kingdom of Aragon and to the kingdom of Castile and Leon.

The coinages of Norway and Sweden at first resembled the British, and afterwards the German type. From the 10th to the 14th c., bunciates were issued by the ecclesiastics. The coinage of Hungary begins in the 11th c., and has the portraits of the monarchs. The Russian coinage is Byzantine in character, and rude in its art. The earliest pieces are the silver dana of the 14th c., of an oblong shape, with representations of the prince on horseback, and various legendary subjects. Peter the great introduced the usual European type. There is an important series of bronze coins of the crusaders, beginning with Tamerel, and coming down to the end of the 15th c., including money of the kings of Cyprus and Jerusalem, and other princes established in the east.

In India, the succession of the kings of Bactria, the remotest of the dynasties founded on the ruins of Alexander's empire, has only become known through their recently discovered coins. There are early rude Hindu coins of the Gupta line, with figures of the Brahmanic divinities of a type still in use.

Of the coins of the Mohammedan princes, the oldest gold pieces are the bilingual coins of cities of Syria and Palestine, of the middle of the 7th c. (A.D. 628), barbarous imitations of the latest Byzantine money of Alexandria. Most of the Mohammedan coins are covered exclusively by inscriptions expressive of the elementary principles of the Mohammedan faith. For some centuries no sovereign except the caliph was allowed to inscribe his name on the coin. Large gold coins of great purity were issued by the Moslem kings of Granada in Spain.

The high prices given for ancient coins have led to numerous forgeries from the 15th c. downwards. Against such imitations, collectors require to be on their guard.

Among the best works on numismatics are Eckhel, Doctrina Numorum Veterum (Vienna, 1792–99); Hennin, Manuel de Numismatique Ancienne (Paris, 1830); Graesse, Handbuch der alten Numismatik (Leipsic, 1852–53); Leake, Numismata Hellenica (London, 1854); Ruding's Annals of the Coinage of Great Britain (London, 1840); Patrick's Records of the Coinage of Scotland (1877); Leblanc, Traité Historique des Monnaies de France (Paris, 1690); Cappe, Die Muenzen der Deutschen Kaiser (1850); Marsden, Numismata Orientalia Illustrata (London, 1823–25); Boutkoff, Dictionnaire Numismatique (Lep. 1877).

**NUMITOR.** See Romulus, ante

**NUMULITE LIMESTONE,** an important member of the Middle Eocene period, consisting of a limestone composed of nummulites held together by a matrix formed of the comminuted particles of their shells, and of smaller foraminifera. It forms immense masses of the strata which are raised up on the sides of the Alps and Himalayas, and may be traced as a broad band often 1800 m. in breadth, and frequently of enormous thickness, from the Atlantic shores of Europe and Africa, through western Asia, to northern India and China. It is known also to cover vast areas in North America.
NUMMULITES, or NUMMULINA (Gr. money-fossil), a genus of fossil foraminifera, the shells of which form immense masses of rock of Eocene age. See NUMMULITE LIMESTONE. Upwards of 50 species have been described. They are circular bodies of a lenticular shape, varying in magnitude from the merest point to the size of a crown-piece. The shell is composed of a series of small chambers arranged in a concentric manner. The growth of the shell does not take place only around the circumference, but each whorl invests all the preceding whorls, so as to form a new layer over the entire surface of the disk, thus adding to the thickness as well as the breadth, and giving the fossil its lenticular form. A thin intervening space separates each layer from the one which it covers, and this space at the margin swells out to form the chamber. All the internal cavities, however, seem to have been occupied with the living sarcode, and an intimate connection was maintained between them by means of numerous tubuli, which everywhere pass from one surface to another, and which permitted the passage of the sarcode as freely as do the minute pores or foramina of the living foraminifera.

The name is given to them from their resemblance to coins. In Egypt, where the whole of the Mokkaad mountains, from the stone of which the pyramids were built, is formed of them, they are called by the natives "Pharaoh's Pence."

NUN, a member of a religious order of women. The etymology of this name is a subject of some controversy, but there seems every reason to believe that it is from a Coptic or Egyptian root, which signifies "virgin." It is found in use as a Latin word as early as the time of St. Jerome (Ep. to Eustachius, p. 22, c. 6). The general characteristics of the religious orders will be found under the head MONACHISM (q.v.), and under those of the several orders. It is only necessary here to specify a few particulars peculiar to the religious orders of females. Of these the most striking perhaps is the strictness in the regularly authorized orders of nuns of the "cloister," or inclosure, which no extern is ever permitted to enter, and beyond which the nuns are never permitted to pass, without express leave of the bishop. The superiors of convents of nuns are called by the names abbess, prioress, and, in general, mother superior. They are, ordinarily speaking, elected by chapters of their own body, with the approval of the bishop, unless the convent be one of the class called exempt houses, which are immediately subject to the authority of the Holy See. The ceremony of the solemn blessing or inauguration of the abbess is reserved to the bishop, or to a priest delegated by the bishop. The authority of the abbess over her nuns is very comprehensive, but a precise line is drawn between her powers and those of the priestly office, from which she is strictly debarred. The name of nun is given in general to the sisters of all religious congregations of females who live in retirement and are bound by rule; but it is primitively and properly applicable only to sisters of the religious orders strictly so called. See MONACHISM.

NUN DIMITIS, the name given to the canticle of Simeon (Luke ii., 20-32), which forms part of the compline office of the Roman breviary, and is retained in the evening service of the Anglican church when it follows the second lesson. On the great festivals in Lent, the music of this canticle is especially grand and imposing.

NUNCIO (Ital. nunzio, Lat. nuncios, a messenger), the name given to the superior grade of the ambassadors sent by the pope to foreign courts, who are all called by the general name of legate (q.v.). A nuncio is an ambassador to the court of an emperor or king. The ambassador to a republic, or to the court of a minor sovereign, is called INTERNUNCIO.

NUNCIPATIVE WILL is a will made by word of mouth. As a general rule, no will is valid unless it is in writing and signed by the testator; but in cases of soldiers and sailors, a verbal or nuncipative will is held to be good, on the ground that there is often no time to draw up a formal will in writing.

NUNEATON, a small market-t. of England, in the county of Warwick, and 18 m. n. c. of the town of that name. It contains a small parish church in Gothic, and its free grammar school was founded by Edward VI. in 1553. Ribbons and cotton goods are manufactured. Pop. 71, 7,000.

NUÑEZ, ALVAR (CABECA DE VACA), 1490-1564; b. Spain, second in command to Pánfilo de Narváez in the unfortunate expedition to Florida in 1527. After the latter was lost while attempting to make his way to Mexico, Nuñez, with a few other survivors of the expedition, succeeded in landing on the continent at some point w. of the Missisippi river, and went n. w. to a country supposed to have been what is now New Mexico. The party had endured great hardship on the journey, but were well cared for by friendly Indians, among whom they passed eight months. They then went on towards the s. w., and after terrible suffering, only Nuñez and three companions survived to arrive at the Spanish colonies on the Pacific. This was in 1536, eight years after the shipwreck of Narváez. Nuñez went back to Spain, but in 1540 started for La Plata, of which he had been appointed governor. His vessel was wrecked, and he landed in Paraguay, which he at once began to explore, passing down the La Plata through the country of the Guarani, to Asuncion, which he made his headquarters. He conquered several Indian tribes, but was at one time defeated, and soon afterward
on the accusations of Domingo de lara, his second in command, he was sent to Spain for trial, found guilty, and banished to Africa. Recalled by the king at the end of eight years, he was made judge of the supreme court of Seville, and continued in that office till his death. The Shipwrecks of Alvar Nuñez, with the Commentaries of Alvar Nuñez, written by his secretary, Fernandez, appeared at Valladolid in 1544. His story is found in an abridged form in Hakluyt's Voyages, and an English translation of the whole was published by Buckingham Smith at Washington in 1832.

**NUNQUAM INDEBITATUS**, a law term meaning, in an action for debt, a plea that the defendant never was indebted. By the Judicature act of 1875, the defendant is no longer allowed to deny generally the facts alleged by the plaintiff.

**NUPHAR.** See **Water-Lily, ante.**

**NURAGHE.** the name of certain structures, of conical shape, in the island of Sardinia, rising 30 or 40 ft. above the ground, with two or three stories of domed chambers connected by a spiral staircase. Some are raised on basement of masonry or platforms of earth. They are made of granite limestone, basalt, porphyry, sandstone, and schist. Their entrances are small and low, and when they have chambers of two stories, the upper chamber is reached by the spiral staircase, which has loopholes to admit the light. The tops are supposed to have had a terrace. Although 3,000 of them exist, none are perfect. Their masonry is irregular, but not polygonal, and resembles the style of work called Asiatic. Like the round towers of Ireland, and other unscribed monuments, their object and antiquity are enveloped in much doubt. They have been supposed to be the work of the Pelasgi, the Phoenicians, or Carthaginians, and to have been ancient sepulchres, Tholi or Bucalddia, constructed in heroic times. Skeletons, and other funeral paraphernalia, have been found in them. They have many points of resemblance to the "Burgis" or "Dunus" of the northern shores of Scotland, which the Burgh of Mousa, in Shetland, is perhaps the best example.—De la Marmon, *Voyage en Sardaigne*, ton. ii.; Petit Radel, *Nuraghes* (Paris, 1826-29); Micael, *Ant. Pop. Ital.* ii. pp. 43; Dennis, *Cities and Con. of Etruria*, ii. pp. 161.

**NUREDIN.** See **Noureddin**, ante.

**NUREMBERG** or **Nürnberg** (**Norimberga**, *Nureta*), a fortified city of the Bavarian province of middle Franconia, situated in 49° 28' n. lat., and 11° 5' e. long. *Pop. 71,800; 75,91,017*. Nuremberg is one of the most remarkable and interesting cities of Germany, on account of the numerous remains of medieval architecture which it presents in its picturesque streets, with their gabled roofs, built of bronzen and stone carvings. The city retains a stronger impress of the characteristics which distinguish the wealthy burgher-classes in the middle ages, while its double lines of fortified walls, separated from each other by public walks and gardens, and guarded by 70 towers, together with the numerous bridges which span the Pegnitz, on whose banks the city is built, give it distinctive features of its own. Among the most remarkable of its numerous public buildings are the old palace or castle, commanding, from its high position, a glorious view of the surrounding country, and interesting for its antiquity, and for its gallery of paintings, rich in gems of early German art; the town-hall, which ranks amongst the noblest of its kind in Germany, and is adorned with works of Albert Dürer, and Gabriel Weyher: the noble Gothic fountain opposite the cathedral by Schöffer, with its numerous groups of figures, beautifully restored in modern times; and many other fountains deserving notice. Of the numerous churches, the following are the most remarkable: St. Lawrancieux, 1270-1478, with its beautiful painted-glass windows; its noble towers and door-way, and the celebrated stone pax completed in 1500, by Adam Kraft, after five years' assiduous labor; and the exquisite wood carvings of Voit Stoss; St. Schädel's, with its numerous fine glass-paintings and frescoes by Peter Visscher and other German masters; the cathedral, or Our Lady's, built in 1631, similarly enriched. Nuremberg is well provided with educational establishments, and besides a good gymnasium and polytechnic institution, has good schools of art, normal and other training colleges, a public library of 50,000 vols., galleries of art collections, museums, etc.; while the numerous institutions of benevolence are liberally endowed and well maintained. Although the glory of the foreign commerce of Nuremberg may be said to have been long extinct, its home trade, which is still of considerable importance, includes the specialties of metal, wood, and bone carvings, and children's toys and dolls, which find a ready sale in every part of Europe, and are largely exported to America and the East. In addition to its own industrial commerce, is the seat of a large transfer and exchange business, which owes much of its importance to the facilities of intercommunication afforded by the net-work of railway lines with which the city is connected.

Nuremberg was raised to the rank of a free imperial city by the Emperor Henry V., in 1219, previous to which time, Henry IV. had enabled 38 of the principal burgher families, who witharth arrogated to themselves supreme power over the Nuremberg territory. In the 13th c., we find it under the title of a burg-graunt in the hands of the Hohenzollern family, who, in 1417, ceded for a sum of money all their territorial and manorial rights to the magistracy of the city. This measure put a stop to the feuds which had hitherto raged between the burggrafs and the municipality, and for a time...
Nuremberg continued to grow rich with the fruits of the great internal trade which it had long maintained between the traders of the east and the other European nations of commerce. The discovery of the passage by the Cape of Good Hope, by opening new channels of communication between Asia and Europe, deprived Nuremberg of its ancient monopoly. The thirty years' war completed the decay of the city, which suffered severely from both parties in turn. The ancient reputation of Nuremberg as a wealthy and loyal city of Germany secured to it, however, special consideration, and in 1803 when the imperial commissioners reorganized some of the dismembered parts of the old empire, it was allowed to retain its independence, with a territory of 483 sq. m., containing 40,000 inhabitants, and drawing a revenue of 800,000 gulden; but in consequence of the disputes in which the free city became involved with the king of Prussia, who had some hereditary claim on the ancient burg-graft, Nuremberg, alarmed at the prospect of still greater embarrassments, entered into the Rhénish confederation, and as the result of this alliance, was transferred, in 1806, with the surrender of its entire domain and all rights of sovereignty, to the king of Bavaria.

NUREMBERG, DIET, 1532-33, important church councils of the reformation.

After the invasion of Hungary by Soliman the Turk the emperor Charles V, convened a diet at Nuremberg, Mar. 22, 1523, to concert measures against the Turks, and settle internal religious difficulties. The emperor wrote to pope Adrian VI, urging him to confirm the decisions of the diet, and to use his money to destroy the heresy of Luther. Pope Adrian sent his chamberlain with a brief to the elector of Saxony, requesting him in the next diet to protect and maintain the dignity and majesty of the apostolic see, and with it the peace of Christendom," as his ancestors had done. Frederick replied that while he chiefly sought the glory of God and the peace of the empire, Luther and his adherents were not only heretics, but dangerous to the state, and therefore must be suppressed. In another brief to the elector he charged him with being the friend of heretics. He also forbid his protecting Luther under penalty of ecclesiastical and civil punishment. At the diet which convened Dec. 13, 1523, Hans von Plaunitz, a friend of Luther, represented Frederick. Chieregati, the pope's legate, presented a papal brief to the diet demanding that the Lutheran preachers should be arrested and sent to Rome to be judged. This the diet refused, and made a vigorous reply to the brief. Appearing again in 1523 before the diet the legate demanded the enforcement of the decrees of the diet of 1521 against Luther's heresy, declaring at the same time that the bad state of the church was due to the laxity of discipline in the clergy, and also to the bad example of some of the popes. The pope also confessed freely the need of reformation in the church, and promised to do all in his power for its improvement. Both parties were displeased with these statements of the legate; the papal, because the pope confessed the evil condition of the church, and censured his predecessors; the reformers, ridiculing the promise of the pope to introduce reforms. A committee was appointed by the state to prepare a reply to the legate; and this favored the Protestant principles, declaring that the abuses of the Roman court, the immorality of the clergy, the violation of the concordats, etc., had been fully shown by Luther, making in all 81 different counts. The reply also demanded that a free council should be held at some city of Germany, engaging that Luther and his adherents should not make disturbance by preaching or writing. The legate, in reply, insisted on the execution of the terms of the edict of the diet of Worms. Philip von Harnit, of the council of Saxony, pointed out to the legate that Luther and his followers should publish nothing until the hearing of the council. Luther also wrote to the elector Frederick, claiming the same freedom to defend himself that the opposite party had to attack him; that the stipulation not to publish until the settlement of the difficulties could not apply to the publishing of the Bible or the preaching of the gospel, as the word of God could not be bound. The acts of the diet disappointed the pope; the emperor disregarded his appeals, because of his interference in the affairs of France, and Adrian died of grief.

The condition of things in Germany and the change in the papal see led to another diet at Nuremberg, Nov. 11, 1523. Cardinal Lorenzo Campeggio was the legate of the new pope, Clement VII. The diet was opened Jan. 14, 1524. The majority showed itself opposed to the pope. They discussed the necessity of furnishing assistance to the king of Hungary, of contributing to the war against the Turks, and of removing the seat of government from Nuremberg to Esslingen. This displeased the emperor as well as the pope, and Harnit, in a speech of forty minutes, showed against the payment of the penalty. Campeggio showed the danger to the empire in any departure from the ancient faith; the states referred him to the grievances complained of in a former diet. The legate replied that the pope had received no official communication of those grievances, and insisted on the carrying out of the edict of Worms. Frederick's representative declared that he had received no official communication of the edict of Worms; that the late diet had not forbidden evangelical preaching, and that its decisions could not be set aside without discussion. The diet dissolved April 18. The seat of government was removed to Esslingen, aid was granted to the king of Hungary and for the war against the Turks. The states decided also, that the pope should, with the assent of the emperor, cause a free council to be held in Germany as soon as possible, and that,
in the meantime, another diet at Spires should specify the grievances of the princes against the pope, and decide on the manner of holding the aforementioned council; until then the princes should carefully watch all new doctrines and books, but see also that the gospel should be freely and peacefully preached and explained, as generally received by the church. The emperor was prevented by complications with France from much impeding the reformation. The pope's legate sought to organize a Roman Catholic league in opposition to the evangelical princes and states, and even attempted to gain over Melancthon. The reformation rapidly gained ground. In 1542 and 1543 two other diets were held, but they were not very important. Political difficulties and dissatisfaction because the promised reforms had not been carried out, led to another diet, which was held Jan. 31, 1543, in which the Roman Catholics opposed all reform, and the other party acted with vigor. King Ferdinand urged the prosecution of the war against the Turks with increased energy, of protecting Hungary and the neighboring regions, and of granting aid against the French, who had invaded the Netherlands. The evangelical princes and states presented to the king and to the imperial commissioners a list of their grievances. They complained of the peace of Nuremberg having been broken by the imperial chamber of justice, and of the promised reforms not having been carried out. They required also religious liberty. All the questions gave rise to numerous debates, which related mostly to the political affairs of the empire. The proposed council, which was to be held at Trent, the evangelical party refused to accept, and, as no sure guarantees of peace were given them, they declined to take any further part in the proceedings of the diet. The resolutions of the diet were therefore passed without the participation of the reform party.

NURSE, a colloquial name given to several species of shrubs. In New England it is used of the onosma microcephalus; in Florida to the ginglymostoma cirratum; and in the Pacific to the eustracion phillippe.

NURSE, Military. In continental armies the "sisters of charity" usually carry their mission of mercy into the military hospitals. Protestant England having no such organization to fall back upon, the soldiers have been dependent on the regular male hospital attendants for their care during sickness, or when suffering from wounds. The Crimean campaign, however, disclosed so melancholy a picture of the want of women's co-operation, that a band of self-sacrificing ladies, headed by Miss Nightingale (q.v.), proceeded to Turkey, and were soon acknowledged as messengers of health and life by the unfortunate soldiers. The example thus set has not been without effect. In the Franco-German war of 1870-71 lady-nurses of various nations ministered in all the military hospitals, and the like took place during the Russo-Turkish war of 1877-78.

NURSERY, a garden or portion of a garden devoted to the raising of young plants, to be afterward planted elsewhere. The ripening of garden-seeds for sale is generally also an important part of the trade of the public nurseryman. Many culinary vegetables are very commonly raised from seed in public nurseries, and sold as young plants; the trouble of raising them in small gardens being found too great, although, when there is no public nursery at hand, even the cottage gardener may be compelled to undertake this trouble for himself, in order to secure a supply of young kale, cauliflower, lettuce, flower, etc., in fresh and healthful condition. Many flowering plants, as wallflower, stock, sweet-william, etc., are also raised and sold by nurserymen. Another great use of the nursery is the rearing of fruit-trees. In the nursery the stocks are raised from seed, the grafting is performed, and the training of the young tree, whether for standard, espalier, or wall tree, is begun. As, with regard to fruit-trees, the selection of grafts is of the utmost importance, the reputation of the nurseryman is particularly to be considered by the purchaser; nor is there any trade in which this is more generally necessary, months, or sometimes years elapsing before the quality of the goods purchased can be experimentally ascertained. The principal, and many of the smaller towns of Britain are well supplied with public nurseries, which is the case also in many countries of continental Europe and in North America. Some of these nurseries are on a very profitable scale, as those of London, Edinburgh, and Booth of Hamburg. The largest nurseries, however, are very much devoted to the rearing of ornamental shrubs and trees, and of forest-trees. Plantations of forest-trees, even when very extensive, are now generally, although not always, made with plants obtained from public nurseries. The exertions made by nurserymen to obtain new plants from foreign countries, have contributed much, not only to the advancement of gardening in its various departments, and of arboriculture, but also of botany.—Much benefit also results from the exchange of the produce of the nurseries of different countries. Thus, bulbous roots are brought to Britain from Holland, from what may be described as nurseries specially devoted to them; roses and orange-trees are imported from the nurseries of France, etc. It often happens that seeds imported from climates more thoroughly adapted to the plants, produce better crops than those raised in a colder climate or under a cloudier sky.

NUSSAIRIEH, Nossairians or Ansonians. See ANSARIES.

NUT, in popular language, is the name given to all those fruits which have the seed inclosed in a bony, woody, or leathery pericarp, not opening when ripe. Amongst the
best known and most valuable nuts are the hazel-nut, Brazil nut, walnut, chestnut, and cocoa-nut, all of which are edible. Other nuts are used in medicine, and for purposes connected with the arts. Some of the edible nuts abound in a bland oil, which is used for various purposes.—In botany the term nut (nux) is used to designate a one-celled fruit, with a hardened pericarp, containing, when mature, only one seed. The *aechmenum* (pistachio) was one of the older botanists generally included in this term. Some of the fruits to which it is popularly applied strongly receive it as their particular designation. The hazel-nut is an excellent example of the true nut of botanists. The name nut, without distinctive prefix, is popularly given in Britain to the hazel-nut, but in many parts of Europe to the walnut.

Many nuts have a considerable commercial value, from their being favorite articles of food; these are the hazel-nut and its varieties, the black Spanish, the Barcelona, the Smyrna, the Jerusalem filbert, and the common filbert; the walnut, chestnut, hickory, and pecan; the souris, the cocoa or coker nuts, and the Brazil or Para nut.

The Barcelona and black Spanish, as their names imply, are from Spain; the former is the commonest nut of our shops. About 120,000 bags, averaging 1/4 bushel each, or 30,000 bushels, are annually imported into Great Britain. The import value is about $38. per bag. They are always kiln-dried when we receive them. This is not the case with the black Spanish, of which only about 12,500 three-bushel bags, or about 37,000 bushels, are imported in the beginning of the season, when its value is about 15s. per bushel. From the Black sea we receive annually about 68,000 bushels of hazel-nuts, worth 10s. per bushel, with from 500 to 1000 bags of the so-called Jerusalem and Mount Atlas filberts. Of chestnuts, from Leghorn, Naples, Spain, France, and Portugal, we receive annually about 20,000 bushels. The trade in walnuts is very uncertain, and probably never exceeds 5,000 bushels. Of the curious three-cornered or Brazil nut from Para and Maranhon, the importation is also very irregular, varying from 300 to 1000 tons, or 1200 to 4,000 bushels per annum. About two millions of cocoa-nuts are also imported. The other kinds of nuts are too irregular in their importations to supply any reliable statistics. The annual value of all the nuts imported for use as fruit is computed at about £150,000.

**Nutation.**

NUTATION is a slight oscillatory movement of the earth's axis, which disturbs the otherwise circular path described by the pole of the earth round that of the ecliptic, known as the "precession of the equinoxes." It is produced by the same causes, viz., the attraction of the sun, moon, and planets (the attraction of the last mentioned being so small as to be quite imperceptible) upon the bulging zone about the earth's equator, though in this case it is the moon alone that is the effective agent. It also, for reasons which need not be given here, depends, for the most part, not upon the position of the moon in her orbit, but of the moon's node. If there was no precession of the equinoxes, nutation would appear as a small elliptical motion of the earth's axis, performed in the same time as the moon's nodes take to complete a revolution, the axes of the ellipse being respectively 18'5 and 13'7, the longer axis being directed towards the pole of the ecliptic. But this motion, when combined with the more rapid one of precession causes the pole of the earth's axis to describe a wavy line round the pole of the ecliptic.

The effect of nutation, when referred to the equator and ecliptic, is to produce a periodical change in the obliquity of the ecliptic, and in the velocity of retrogradation of the equinoctial points. It thus gives rise to the distinction of "apparent" from "mean" right ascension and declination, the former involving, and the latter being fixed from the fluctuations arising from nutation. This motion is common to all the planets.

**Nut-Cracker, *Autefraga* or *Carpocaphus*, a genus of birds of the family corvidae, with a straight conical bill, both mandibles terminating in an obtuse point, and tail nearly square at the end. The form and characters are nearly similar to those of crows, but the habits are rather those of jays, and in some respects indicate an approach to woodpeckers. One species (*A. carpocaphus* or *C. auc~fraga*) is occasionally seen in Britain, and is not uncommon in many parts of Europe off Asia, particularly in mountainous regions covered with pines. It is about the size of a jaycock, but has a longer tail. The plumage is light brown, speckled with white, except on the wings, rump, and tail, which are nearly black. The nut-cracker frequents the tops of high pines, and is a shy bird.

**Nut-gall.** See *Galls, next*.

**Nut-hatch.** *Sitta*, a genus of birds of the family Turdidae, having a straight conical or prismatic bill, short legs, the hind-toe very strong. They run up and down trees with great agility, moving with equal ease in either direction, and without hopping, so that the motion is rather like that of a mouse than of a bird. They feed on insects, in pursuit of which they examine the crevices, and remove the scales of the bark; also on seeds, as those of pines, and the kernels of nuts, to obtain which they fasten the nut firmly in some crevice of bark or other such situation, and peck at it until the shell is broken, so placing themselves that they sway not merely the head, but the whole body, to give force to the stroke. The English name is said to have been original nut-hack. One species, the *European Nut-hatch* (*S. europaea*), is common in most parts of Europe, and is found in most of the wooded districts of England. Its whole length is about six inches.
NUTMEG. This well-known and favorite spice is the kernel—mosty consisting of the albumen—of the fruit of several species of myristica. This genus belongs to a natural order of olerous called myristicoeae, which contains about forty species, all tropical trees or shrubs, natives of Asia, Madagascar, and America. They generally have red juice, or a juice which becomes red on exposure to air. The order is allied to lancuosa. The leaves are alternate and without stipules. The flowers are bisexual, the perianth generally trifid, the filaments united into a column. The fruit is succulent, yet opens like a capsule by two valves. The seed is nut-like, covered with a falcate fleshy aril, and has an albumen penetrated by its membranous covering. The species of this order are generally more or less aromatic in all their parts; their juice is stptic and somewhat acid; the albumen and aril contain both a fixed and an essential oil, and those of some species are used as spices. The genus myristica has the anthers united in a cylindrical column, and the cotyledons folded. The species which furnishes the greater part of the nutmegs of commerce is M. fragrans or mooshaka; but the long nutmeg (M. lati), from the Banda isles, is now not uncommon in our markets. The common nutmeg-tree is about 25 ft. in height, with oblong leaves, and axillary few-flowered racemes; the fruit is of the size and appearance of a roundish pear, golden yellow in color when ripe. The fleshy part of the fruit is rather hard, and is of a peculiar consistence, resembling candied fruit; it is often preserved and eaten as a sweetmeat. Within is the nut, enveloped in the curious yellowish-red aril, the Maca; (q.v.), under which is a thin shining brown shell, slightly grooved by the pressure of the mace, and within is the kernel or nutmeg.

Up to 1766, the Dutch being the possessors of the Banda isles, jealousy prevented the nutmeg from being carried in a living state to any other place; but during the conquest and retention of the islands by the British, care was taken to spread the culture of this valuable spice, and plants were sent to Penang, India, and other places, where they are now successfully cultivated; indeed, they have now become established in the West India Islands, and both Jamaica and Trinidad produce excellent nutmegs. Brazil is also found favorable to their culture. The nutmeg is very liable to the attack of a beetle, which is very destructive, and it is a common practice to give them a coating of lime before shipping them to Europe, in order to protect them from its ravages. The Dutch or Batavian nutmegs are nearly always limed, but those from Penang are not, and are consequently of a greater value. The nutmeg yields, by expression, a peculiar yellow fat, called oil of mace, because, from its color and flavor, it was generally supposed to be derived from mace; and by distillation is obtained an almost colorless essential oil, which has very fully the flavor of the nutmeg. Her own settlements now furnish Great Britain with the greater portion of this spice, but some lots of Batavian also come into the market. The quantity imported may be stated as 300,000 pounds weight, worth, in round numbers, 270,000.

Nutmegs are chiefly used as a spice; but medicinally they are stimulant and carminative. They possess narcotic properties, and in large doses possess stupefactive and delirium, so that they ought not to be used where affections of the brain exist or are apprehended.

Other species of myristica besides those already named yield nutmegs sometimes used, but of very inferior quality.—The fruits of several species of lancuosa also resemble nutmegs in their aromatic and other properties; as the cotyledons of Neotandara Pachyphary, the Pichurum beans of commerce, and the fruit of acrotiblidium camara, a tree of Guiana, the camara or ackawai nutmeg. The clove nutmegs of Madagascar are the fruit of agathophyllum aromaticum, and the Brazilian nutmegs of Cryptocarya mooscheata. All these belong to the order lancucosa. The Calabash nutmeg is the fruit of monodora myristica, of the natural order anacardae.

NUTRIA. See COTYX AND RACCONDA.

NUTRITION. The blood which is carried by the capillaries to the several tissues of the body is the source from whence all the organs derive the materials of their growth and development; and it is found that there is direct proportion between the vascularity of any part and the activity of the nutrient operations which take place in it. Thus, in nervous tissue and muscle, in mucous membrane and in skin, a rapid decay and renovation of tissue are constantly going on, and these are parts in which the capillaries are the most abundant; while in cartilages and bone, tendons and ligament, the disintegration of tissue is comparatively slow, and the capillaries are much less abundant. Each elementary cell or particle of a tissue seems to have a sort of gland-like power not only of attracting materials from the blood, but of causing them to assume its structure, and participate in its properties. Thus, from the same common source, nerves form nervous tissue, muscles muscular substance, and even morbid growths, such as cancer, have an assimilating power.

Before entering further into the subject of nutrition, it is necessary to understand how it differs from the allied processes of development and growth. All these processes are
Nutrition.

the results of the plastic or assimilative force by which living bodies are able to form themselves from dissimilar materials (as when an animal subsists on vegetables, or when a plant grows by appropriating the elements of water, carbonic acid, and ammonia); but they are the results of this force acting under different conditions.

Development is the process by which each tissue or organ of a living body is first formed, or by which one, being already incompletely formed, is so changed in shape and composition as to be fitted for a function of a higher kind, or finally is advanced to the state in which it exists in the most perfect condition of the species.

Growth, which commonly concurs with development, and continues after it, is properly more increase of a part by the insertion or superaddition of materials similar to those of which it already consists. In growth, properly so called, no change of form or composition occurs; parts only increase in weight, and usually in size; and if they acquire more power, it is only more power of the same kind as that which they before enjoyed.

Nutrition, on the other hand, is the process by which the various parts are maintained in the same general conditions of form, size, and composition, which they have already by development and growth attained. It is by this process that an adult person in health maintains for a considerable number of years the same general outline of features, and nearly the same size and weight, although during all this time the several tissues of his body are undergoing perpetual decay and renovation. In many parts this removal and renewal of the particles is evident. In the glands—the kidneys (q.v.), for example—the cells of which they are mainly composed are being constantly cast off; yet each gland maintains its form and proper composition, because for every cell that is thrown off a new one is produced. In the epidermis of the skin, a similar process is perpetually going on before our eyes. In the muscles a similar change may be readily traced, for, within certain limits, an increased amount of exercise is directly followed by an increased excretion of the ordinary products of the decomposition of the nitrogenous tissues—viz. urea, carbonic acid, and water. Again, after prolonged mental exertion, there is often a very marked increase in the amount of alkaline phosphates in the urine, which seems to show that in these cases there is an excessive oxidation of the phosphorus of the brain; and yet, in consequence of the activity of the reparative process, neither the muscles nor the brain diminish in size.

It may be regarded as an established fact in physiology that every particle of the body is formed for a certain period of existence in the ordinary conditions of active life, at the end of which period, if not previously destroyed by excessive exercise, it is absorbed or dies, and is cast off. (The hair and deciduous or milk teeth afford good illustrations of this law.) The less a part is exercised the longer its component particles appear to live. Thus Mr. Paget found that if the general development of the tadpole be retarded by keeping it in a cold, dark place, and if hereby the functions of the blood corpuscles be slowly and imperfectly discharged, the animal will retain its embryonic state for several weeks longer than usual, and the development of the second set of corpuscles will be proportionally postponed, while the individual life of the corpuscles of the first set will be, by the same time, prolonged.

For the due performance of the function of nutrition certain conditions are necessary, of which the most important are—1. a right state and composition of the blood, from which the materials of nutrition are derived; 2. a regular and not far distant supply of such blood; 3. a certain influence of the nervous system; and 4. a natural state of the part to be nourished.

1. There must be a certain adaptation peculiar to each individual between the blood and the tissues. Such an adaptation is determined in its first formation, and is maintained in the concurrent development and increase of both blood and tissues. This maintenance of the sameness of the blood is well illustrated by the action of vaccine matter. By the insertion of the most minute portion of the virus into the system, the blood undergoes an alteration which, although it must be inconceivably slight, is maintained for a long period, even after a second and subsequent insertion of the virus may have no effect, because the new blood formed after the vaccination continues to be made similar to the blood as altered by the vaccine matter. So, in all probability, are maintained the morbid states of the blood which exist in syphils and many other chronic diseases; the blood once inoculated, retaining for years the taint which it once received. The power of assimilation which the blood exercises in these cases is exactly comparable with that of maintenance by nutrition in the tissues; and evidence of the adaptation between the blood and the tissues, and of the delicacy of the adjustment by which it is maintained, is afforded by the phenomena of symmetrical diseases (especially of the skin and bones), in which, in consequence of some morbid condition of the blood, a change of structure affects in an exactly similar way the precisely corresponding parts on the two sides of the body, and no other parts of even the same tissue. These phenomena (of which numerous examples are given in two papers by Dr. Budd and in the 29th vol. of the Medico-chirurgical Transactions) can only be explained on the assumption—1st, of the complete and peculiar identity in composition in corresponding parts of opposite sides of the body; and 2ndly, of so precise and complete an adaptation between the blood and the several parts of each tissue, that a morbid material being present in the blood, may destroy its fitness for the nutrition of one or
two portions of a tissue, without affecting its fitness for the maintenance of the other portions of the same tissue. If, then, the blood can be fit for the maintenance of one part, and unfit for the maintenance of another part of the same tissue (as the skin or bone), how precise must be that adaptation of the blood to the whole body, by which in health it is always capable of maintaining all the different parts of the numerous organs and tissues in a state of integrity.

2. The necessity of an adequate supply of appropriate blood in or near the part to be nourished, is shown in the frequent examples of atrophy of parts to which too little blood is sent, of mortification when the supply of blood is entirely cut off, and of defective nutrition when the blood is stagnant in a part. The blood-vessels themselves take no share in the process, except as the carriers of the nutritive matter; and provided they come so near that the latter may pass by inhibition, it is comparatively unimportant whether they ramify within the substance of the tissue, or (as in the case of the nonvascular tissues, such as the epidermis, cornea, etc.) are distributed only over its surface or border.

3. Numerous cases of various kinds might be readily adduced to prove that a certain influence of the nervous system is essential to healthy nutrition. Injuries of the spinal cord are not unfrequently followed by mortification of portions of the paralyzed parts; and both experiments and clinical cases show that the repair of injuries takes place less completely in parts paralyzed by lesion of the spinal cord than in ordinary cases. Division of the trunk of the trigeminal nerve has been followed by incomplete nutrition of the corresponding side of the face, and ulceration of the cornea is a frequent consequence of the operation.

4. The fourth condition is so obvious as to require no special illustration. For further information on this most important department of physiology, the reader is referred to Mr. Paget’s *Surgical Pathology*, or to his original lectures on nutrition, hypertrophy, and atrophy (published in vol. 39 of *The Medical Gazette*) or to the chapter on “Nutrition and Growth,” in Kirke’s *Handbook of Physiology*, which contains an excellent abstract of Mr. Paget’s views, and to which we are indebted for the greater part of this article.

**NUTRITION (ante).** This subject is exhaustless. It comprehends all vital phenomena, for none of the functions of life are performed without involving replacement by living matter, and therefore nutrition. The subject of hygiene in all its aspects is connected with it, whether in eating, drinking, exercise, sleeping, or breathing. A change in each of these processes involves a corresponding change in the elaboration and absorption of new material, and the dissimilation, or elimination of old, or its reconversion. This includes the functions of digestion (q.v.), chylification, sanguification, circulation (q.v.), respiration (q.v.), assimilation, secretion (q.v.), metabolic change, and excretion. Nutrition, to be healthy, requires the respiration of pure air, the proper mastication of wholesome food, and its reception into the stomach. Not only must the food be wholesome, but a proper quantity, and no more, must be taken, and that at proper intervals. After its reception into the stomach a certain amount of attention to the requirements of the act of digestion is necessary for its normal performance. Too violent exercise immediately after, or the swallowing of too much fluid, particularly of cold water, will interfere with digestion and render it more or less imperfect. The system must be free from poisonous or malarious influences, and the mind unoccupied with distressing thoughts. As soon as digestion has progressed, some food is taken with it; the absorption of digested material has taken place, and consequently assimilation commenced, a certain amount of motion among the organs and tissues of the various parts of the body should be going on, so that the fluids which carry the nutritive materials may be sent on in their channels and thrown and drawn into the tissues they are destined to supply. This motion is principally produced by the exercises given by the ordinary duties of life, but those duties are so variously distributed among different persons that some get a great deal too much exercise, and others do not get near enough. In neither of these classes, therefore, can nutrition be perfectly normal. It is true that the tissues of the body are endowed with abundant, it may be said naturally superabundant, vitality, or restorative power, by which abnormal tendencies are overcome, except when they are too great. Then a certain degree of unhealthy nutrition will follow, and this is the general rule. There are few persons, especially in large cities whose inhabitants are so unfortunate as to be unable to secure sanitary policing of their neighborhoods, whose solids and fluids are not more or less impregnated with malarial poisons. The processes of nutrition in them require much more assistance than in those who live in more cleanly towns. Often some of the organs get into a condition far below the natural standard, and are composed of more or less degenerated tissue. This does not have the normal assimilative power and cannot derive from the blood, which itself is necessarily more or less abnormal, constituents for healthy regeneration. Under such circumstances various means require to be resorted to assist the weakened tissues and forces. Medicines are often given, sometimes with a view of antagonizing certain of the malarial symptoms, of stimulating the nervous system to action, and of promoting excretion; often quinine is administered with benefit; it sometimes being the only available remedy unless the person removes to where the air is pure. But it is a sound axiom in medicine that recovery from disease is *regeneration.*
of tissue." The real remedy for most cases of faulty nutrition, and which are included in the various forms of disease, is diet, and, when it can be had, exercise. But in many cases of sickness voluntary exercise is out of the question, and rest, as nearly absolute as possible, is demanded. In nearly all cases, however, of chronic disease, exercise, both voluntary and passive, is the only rational treatment having as its end complete recovery, or in other words, return to healthy nutrition. And all the exercise required in most cases of debility is not secured by mere movements of the limbs. The motion which is imparted by friction of various kinds, and by kneading the body so thoroughly that internal parts have their surfaces moved over each other, and alternations of pressure exerted so that the contents of the different vessels are propelled in their natural directions, is of very great advantage, and supplies a natural stimulus to the nerves, which regulate to a certain extent the nutritive forces.

It must be apparent that as the blood is the great carrier of nutritive material to all parts of the body, it is of the highest importance that it should be in a perfectly healthy condition, and this implies that all the secreting and excreting glands shall take from it all that it has borne away of effete matter from parts through which it has passed, and further elaborate all that is retained. But that these organs shall be able to do this, the blood itself must furnish them with the proper materials. There is therefore an intimate interdependence between the blood and every organ, and also between each organ and every other. The blood must have its normal quantity of fibrin (q.v.), of hemoglobin (q.v.), of iron, and of alkaline salts. If these are deficient, or any one of them, they must be supplied either in the food or in the form of medicine. Of great importance to nutrition is the lymphatic gland system. (See LympHATICS, ante.) The liver (q.v.), the most important gland in all the body, if poisoned by malaria, or otherwise, can neither perform its biliary nor its glycogenic functions, nor can the cholesterine, which has been brought to it as a product of nerve disfunction, be properly separated from the blood or combined with the bile. The ductless glands exercise important offices in the elaboration of the blood. It has not been precisely determined what they do, or all that they do, but the spleen (q.v.) probably acts a part in renovating blood corpuscles, and is a sort of store-house of nutritive material. One of the quite constant effects of a misus upon the human system is enlargement of the spleen. Thus we see an example in this single organ of the disturbing influences of malarial poison upon nutrition. The evolution of vital force is generally spoken of as the great purpose of nutrition, but perhaps it would be more comprehensive to say that the great purpose is the repair of the organism and the keeping it in a normal condition that it may be the instrument for the transmission of force. See Diet and Food and Drink, ante.

NUTTALL, THOMAS, 1789-1859, b. England: apprenticed to a printer, but came to the United States and devoted himself to the study of natural history. He made a scientific exploration of the great lakes and the n. tributaries of the Mississippi. In 1810 he went up the Missouri to the Mandan villages, and in 1819 he traveled through the country drained by the Arkansas river. He published an account of his journey in 1831, under the title of Journal of Travels into the Arkansas Territory. He also explored the Pacific coast, upon the natural history of which he published a number of papers. In 1822 he became professor of natural history and curator of the botanic garden at Harvard college. His most important books are A Manual of the Ornithology of the United States and Canada, 1834, and The North American Sylva, 1842-49. He left his professorship in 1834, and finally settled in England, where an estate had been given him on condition of his living on it.

NUX VOMICA is the pharmacopoeial name of the seed of Strychnos nux vomica, or poison nut. The following are the characters of these seeds, which are imported from the East Indies: "Nearly circular and flat, about an inch in diameter, umbilicated and slightly convex on one side, externally of an ash-gray color, thickly covered with short shiny hairs, internally translucent, tough, and hairy, taste intensely bitter, inodorous."—The British Pharmacopoeia, p. 99.

For the genuine characters, see the article STRYCHNOS. The nux vomica tree is a native Coromandel, Ceylon, and other parts of the East Indies. It is a tree of moderate size, with roundish-oblong, stalked, smooth leaves, and terminal corymbs. The fruit is a globular berry, about as large as a small orange, one-celled, with a brittle shell, and several seeds lodged in a white gelatinous pulp. The bark is known as false angostura bark, having been confounded with angostura bark; in consequence of a commercial fraud, about the beginning of the present c.; but its properties are very different, as it is very poisonous.

The seeds contain (in addition to inert matters, such as gum, starch, woody fiber, etc.) three alkaloids closely related to each other, which act as powerful poisons on the animal frame, and specify occasion violent tetanic convulsions and death. These alkaloids or bases are named strychnin, brucin, and iguanin, and exist in the seeds in combination with lactic and strychnic (or iguanic) acid. For a good method of obtaining pure strychnia, which is by far the most important of the three bases, the reader is referred to p. 328 of The British Pharmacopoeia.

Strychnia (C₂₀H₂₂N₂O₄) occurs "in right square octahedrons or prisms, colorless and
inodorous, scarcely soluble in water, but easily soluble in boiling rectified spirit, in ether, and in chloroform. Pure sulphuric acid forms with it a colorless solution, which, on the addition of bicromate of potash, acquires an intensely violet hue, speedily passing through red to yellow."—Op. cit. In nitric acid, it ought, if pure, to form a colorless solution; if the solution is reddish, it is a sign that brucia is also present. Strychnia combines with numerous acids, and forms well-marked salts, which are amenable to the same tests as the base itself.

Brucia \( \text{C}_4\text{H}_4\text{N}_2\text{O}_4 \cdot \text{H}_2\text{O} + 8 \text{Ag} \) is insoluble in ether, but more soluble in water and in strong alcohol than strychnia; and it is the most abundant of the three alkaloids in nux vomica. It acts on the animal economy similarly to but much less actively than strychnia, from which it may be distinguished not only by its different solubility, but by the red color which is imparted to it by nitric acid, and which changes to a lime violet on the addition of protochloride of tin. Like strychnia, it forms numerous salts.

Igusuria seems closely to resemble brucia in most respects. Little is known regarding its action.

Strychnia, brucia, and igusuria, occur not only in nux vomica, but in the seeds of strychnos ignatii (St. Ignatius’s beans), and in the seeds and other parts of several plants of the genus strychnos. The amount of strychnia present in these substances varies from 0.5 to 1.5 per cent.

Nux vomica, according to the experiments of Marect, acts on vegetables as a poison. His experiments were, however, confined to the haricot bean and the liliac. It is poisonous in a greater or lesser degree to most animals, though larger quantities are required to kill herbivorous than carnivorous animals. Thus, a few grains will kill a dog, but some ounces are required to destroy a horse. It is believed, however, that the bird called \( \text{bacoros rhinoceros } \) eats the nuts with impunity; and a peculiar kind of \( \text{acorus } \) lives and thrives in the extract of the nuts. Dr. Pereira describes three degrees of the operation of this substance on man: 1. In very small doses, its effects are tonic and diuretic, and often slightly narcotic. 2. In larger doses, there is a disorder of one of the muscular system; the limbs tremble; a slight rigidity or stiffness is felt when an attempt is made to put the muscles in action; and the patient experiences a difficulty in keeping the erect posture. If the use of the medicine be continued, these effects increase in intensity, and the voluntary muscles are thrown into a convulsed state by very slight causes, as, for example, by inspiring more deeply than usual, or even by turning in bed. It is remarkable that in paralysis the effects are most marked in the paralyzed parts. 3. In poisoning doses, the symptoms are tetanus and asphyxia, followed by death. After swallowing a large dose of strychnia (on which the poisonous effects of nux vomica essentially depend), the following phenomena occurred in a case recorded by Taylor in his Medical Jurisprudence: "A young man, aged seventeen, swallowed forty grains of strychnia. The symptoms came on in about a quarter of an hour; lock-jaw and spasmodic contraction of all the muscles speedily set in, the whole body becoming as stiff as a board; the lower extremities were extended and stiff, and the soles of the feet concave. The skin became livid, the eyeballs prominent, and the pupils dilated and insensible; the patient lay for a few minutes without consciousness, and in a state of universal tetanus. A remission occurred, but the symptoms became aggravated, and the patient died asphyxiated from the spasm of the chest in about an hour and a half after taking the poison." It is difficult to say what is the smallest dose that would prove fatal to an adult. Thirty grains of the powdered nuts, given by mistake to a patient, destroyed life. Three grains of the extract have proved fatal; and in a case quoted by Taylor (op. cit.), half a grain of sulphate of strychnia caused death in 14 minutes.

The preparations of nux vomica are the powdered nuts, the extracts, the tincture, and strychnia; the alkaloid being usually preferable, in consequence of its more constant strength. In various forms of paralysis, especially where there is no apparent lesion of structure, nux vomica is a most successful remedy; although there are cases in which it is positively injurious. It is also of service in various affections of the stomach, such as dyspepsia, gastrodynia, and pyrosis. The average dose of the powder is two or three grains, gradually increased; that of the tincture, 15 or 16 minims; and that of the extract half a grain, gradually increased to two or three grains. The dose of strychnia, when given in cases of paralysis, is at the commencement one-twentieth of a grain three times a day, the dose being gradually increased, till slight muscular twitchings are observed. For gastric disorders, a still smaller dose is usually sufficient, as, for example, one-fortieth of a grain.

NYACK, a village in Rockland co., N. Y., on the Hudson river, 28 m. n. of New York, on the Northern railroad of New Jersey; pop. 70, 6,750. It is connected with New York city by steamboat, and with Tarrytown by ferry. It has churches, a female seminary, two newspapers, a number of summer hotels, etc.
forth to have made a conquest of their present territory within a quite recent period. Though cannibals, they are more civilized than the surrounding tribes.

**NYANZA, Victoria**, a great fresh-water lake in central Africa, discovered by cap. Speke in 1858, explored by Speke and Grant in 1862. The most authentic information that we have about the Victoria Nyanza is, however, derived from the exploration and circumnavigation of it by Stanley in 1875. The native name, Nyanza, signifies "the water." Its southern point is in lat. 2° 44' s., long. 33° 33' E. Its northern shore runs nearly parallel to the equator, and is about 20 m. to the n. of it. It is estimated to be about 230 m. in length, and 150 in breadth. It is of no great depth; the surface is about 3,500 ft. above sea-level. There are a number of islands near its shores, the chief of which are Ukerewe in the s.e., and Sasse in the north-west. At its n.e. extremity, lake Barilo, described by the natives as a long narrow basin, seems to be connected with the Victoria Nyanza by a narrow channel. The countries on the w. shores of the lake enjoy a mild and genial climate, and the rainfall is below that of many parts of Britain, being only 49 inches. M'tsa, the head of Uganda, seems to be the most powerful monarch on the shores of the lake, his sway extending over a large portion of the country between the lake and the west coast of the lake. His subjects possess a considerable degree of civilization. The most considerable tributary of the Victoria Nyanza is the Shimiyu (see Nile), which flows into its southern extremity in long. 33° 55' E. The Nile emerges from the n. end of the Victoria Nyanza at Napoleon bay, precipitating itself over the Ripon falls. North-west from lake Nyanza lies what Speke called Lutwa N'Zirige lake, which was described as a narrow reservoir about 230 m. long, through the northern end of which the Nile passes. This lake is now known as the Albert Nyanza (q.v.).

**NYANZA (ante). See Africa.**

**NYASSA, or NYANJA (apparently identical with name Nyanza), another lake in the interior of Africa, which Dr. Livingstone discovered in 1861, by ascending the river Shiré (q.v.). The southern end of the Nyassa, or Star Lake, is in lat. 14° 33' S., and its northern end extends to the parallel of 9° 20' south. The lake is upwards of 300 m. long, its average breadth being 26, and is 1300 ft. above sea-level. The first representatives of a mission on Nyassa, founded in honor of Dr. Livingstone, carried with them in sections a steamer of steel plates, which was successfully launched on the lake in 1875. None of the rivers flowing into Nyassa are navigable. The lake is in most parts very deep—in many places over 100 fathoms. To the east is a range of mountains 100 miles long, and ranging from 10,000 to 12,000 ft. over the lake. The scenery of Nyassa is described as grand in the extreme, though much of the land surrounding it is low and marshy. The population of its shores, once dense, has been sorely scourged by the slave-trade. Something had previously been known about this lake under the name of the Maravi; but the accounts were so vague that latterly it was omitted from the maps of Africa.

**NYAYA** (from the Sanskrit ni, into, and dya, going, a derivative from i, to go; hence, literally, "entering," and, figuratively, "investigating analytically") is the name of the second of the three great systems of ancient Hindu philosophy; and it is apparently so called because it treats analytically, as it were, of the objects of human knowledge, both material and spiritual, distributed by it under different heads or topics; unlike, therefore, the *vedânta* (q.v.) and *sâkhyâ* (q.v.), which follow a synthetic method of reasoning; the former of these systems being chiefly concerned in spiritual and divine matters, and the latter in subjects relating to the material world and man. The Nyâya consists, like the two other great systems of Hindu philosophy (see Mânasâ and Sâkhyâ), of two divisions. The former is called Nyâya (proper), and will be exclusively considered in this article; the other is known under the name of Vaiśeṣika (q.v.). With the other systems or philosophy, it concurs in promising beatitude—that is, final deliverance of the soul from re-birth or transmigration—to those who acquire truth, which, in the case of the Nyâya, means a thorough knowledge of the principles taught by this particular system.

The topics treated of by the Nyâya are briefly the following: 1. The *pramâna*, or instruments of right notion. They are: a. Knowledge which has arisen from the contact of a sense with its object; b. Inference of three sorts (a priori, a posteriori, and from analogy); c. Comparison; and d. Knowledge, verbally communicated, which may be knowledge of "that whereof the matter is seen," and knowledge of "that whereof the matter is unseen" (revelation). 2. The objects or matters about which the inquiry is concerned (pramâyogas). They are: a. The Soul (âtman). It is the site of knowledge or sentiment, different for each individual, consisiting of person, infinite, eternal etc. Souls are therefore numerous, but the supreme soul is one; it is demonstrated as the creator of all things. b. Body (arîra). It is the site of action, of the organs of sensation, and of the sensations of pain or pleasure. It is composed of parts, a framed substance, not inchoative, and not consisting of the three elements, earth, water, and fire, as some say, nor of four or all the five elements (viz. air and ether in addition to the former), as others maintain, but merely earthy. c. Organs of sensation (indriyas); from the elements, earth, water, light, air, and ether, they are smell, taste, sight, touch, and hearing. d. Their objects (carthas). They are the qualities of earth, etc.—viz. odor, savor, color, tangibility, and sound. e. Understanding (buddhi), or apprehension (upâdhi), or
conception (jñāna), terms which are used synonymously. It is not eternal, as the Sāṅkhya maintains, but transitory. Objectivity is the distinguishing feature simultaneously to more notions than one. Objectify (pratiṣñāna) or that which organises the utterances of the voice, the cognitions of the understanding, and the gestures of the body. It is therefore oral, mental, or corporeal, and the reason of all worldly proceedings. Faults or failings (doḍa), which cause activity—viz. affection, aversion, and bewilderment.  

3. Doubt (umāsāya). It arises from unsteadiness in the recognition or non-recognition of some mark, which, if we were sure of its presence or absence, would determine the subject to be so or not, or to be so or so; but it may also arise from conflicting testimony.  

4. Motive (prapujāna), or that by which a person is moved to action.   

5. A familiar case (drvāśātā), or that in regard to which a man of an ordinary and a man of a superior intellect entertain the same opinion.  

6. Text or dogma (śabdākāra). It is either "a tenet of all schools," i.e., universally acknowledged, or "a tenet peculiar to some school," i.e., partially acknowledged; or "a hypothetical dogma," i.e., one which rests on the supposed truth of a particular; or "an unproved dogma," i.e., the uncorrectness of which is not expressly proved, but tacitly admitted by the Nyāya.   

7. The different members (āsrayāya) of a regular argument or syllogism (nyāya).   

8. Conflation or reduction to absurdity (tarbha). It consists in directing a person who does not apprehend the force of the argument as first presented to him, to look at it from an opposite point of view.  

9. Ascertainment (nirvāyana). It is the determination of a question by hearing both what is to be said for and against it, after having been in doubt. The three next topics relate to the topic of controversy, viz. Discussion (vīdha), which is defined as consisting in the defending by proofs on the part of the one disputant, and the contradicting it by objections on the part of the other, without discordance in respect of the principles on which the conclusion is to depend; it is, in short, an honest sort of discussion, such, for instance, as takes place between a preceptor and his pupil, and where the debate is conducted without ambition of victory.  

10. Wrangling (jalpa), consisting in the defense or attack of a proposition by means of tricks, fallacies, and such like means: it is therefore a kind of discussion where the disputants are merely desirous of victory, instead of being desirous of truth.  

11. Carrying (citāvādā), when a man does not attempt to establish the opposite side of the question, but confines himself to earing disingenuously at the arguments of the other party.  

12. Fallacies or semblances of reasons (hetvāsākāra), five sorts of which are distinguished, viz. the erratic, the contradictory, the equally available on both sides, that which, standing itself in the need of proof, does not differ from that which is to be proved, and that which is added when the time is not that when it might have availed.  

13. Tricks, or unfairness in disputation (ekhala), or the opposing of a proposition by means of assuming a different sense from that which the objector well knows the proponent intended to convey by his terms. It is distinguished as verbal misconstruing of what is ambiguous, as perverting, in a literal sense, what is said in a metaphorical one, and as generalizing what is particular.  

14. False objections (jāth), of which twenty-four sorts are enumerated; and 15. Failure of argument or reason of defeat (niyākha-sthāna), of which twenty-two distinctions are specified.   

The great prominence given by the Nyāya to the method, by means of which truth might be ascertained, has sometimes misled European writers into the belief, that it is merely a system of formal logic, not engaged in metaphysical investigations. But though the foregoing enumeration of the topics treated by it could only touch upon the main points which form the subject-matter of the Nyāya, it will sufficiently show that the Nyāya intended to be a complete system of philosophical investigation; and some questions, such as the nature of intellect, articulated sound, etc., or those of genus, variety, and individual, it has dealt with in a masterly manner, well deserving the notice of western speculation. That the atomistic theory has been enucleated from it, will be seen under another head. On account of the prominent position, however, which the method of discussion holds in this system, and the frequent allusions made by European writers to a Hindu syllogism, it will be expedient to explain how the Nyāya defines the "different members of a syllogism" under its seventh topic. A regular argument consists, according to it, of five members—viz. a, the proposition (prattijā), or the declaration of what is to be established; b, the reason (hetu), or the means for the establishment of what is to be established; c, the example (udākaranā), i.e. some familiar case illustrating the fact to be established, or, conversely, some familiar case illustrating
the impossibility of the contrary fact; d. the application (upanaya), or "restatement of that in respect of which something is to be established;" and e. the conclusion (nigamanca), or "the restating of the proposition because of the mention of the reason." An instance of such a syllogism would run accordingly thus: a. This hill is fiery, b. for it smokes, c. as a culinary hearth, or (inversely) not as a lake, from which vapor is seen arising, vapor not being smoke, because a lake is invariably devoid of fire; d. accordingly, the hill is smoking; e. therefore, it is fiery.

The founder of the Niyya system is reputed under the name of Gotama, or, as it also occurs, Gautama (which would mean a descendant of Gotama). There is, however, nothing as yet known as to the history of this personaige or the time when he lived, though it is probable that the work attributed to him is, in its present shape, later than the work of the great grammarians Panini. It consists of five books or Aukhyaykas, each divided into two "days," or diurnal lessons, which are again subdivided into sections or topics, each of which contains several aphorisms, or Sutras. See Sutra. Like the text-books of other sciences among the Hindus, it has been explained or annotated by a triple set of commentaries, which, in their turn, have become the source of more popular or elementary treatises.—The Sanskrit text of the Sutras of Gotama, with a commentary by Visvanathha, has been edited at Calcutta (1829); and the first four books, and part of the fifth, of the text, with an English version, an English commentary, and extracts from the Sanskrit commentary of Visvanatthi, by the late Dr. J. R. Ballantyne (Allahabad, 1850-54). This excellent English version and commentary, and the celebrated Essay on the Niyya, by H. T. Colebrooke (Transactions of the Royal Asiatic Society, vol. i. Lond. 1827; and reprinted in the Miscellaneous Essays, vol. i. Lond. 1837), are the best guide for the European student who, without a knowledge of Sanskrit, would wish to familiarize himself with the Niyya system.

NYBOURG, a t. in Denmark, 16 m. s.e. of the city of Odense on the e. coast of Fynen, an island of the Baltic; pop. about 4,500. It is fortified, has a strong citadel, and here the Sound dues were paid by passing ships before the exclusive right of Denmark to the entrance of the Baltic was extinguished by purchase. The place contains ruins of the ancient palace of the kings of Denmark, a hospital, infirmary and dockyards. Near the walls was built, in 1659, the great victory of the Danes over the Swedes.

NYCTAGINACEAE, a natural order of exogenous plants, consisting partly of herbaceous plants, both annual and perennial, and partly of shrubs and trees. Lindley ranks them in his Chenopodalian. The flowers are either clustered or solitary, and either the cluster or the flower itself bears a red fruit, which is often deeply colored. The perianth is tubular, plaited in bud, colored; the limb entire or toothed, deciduous. The stamens are equal in number to the lobes of the perianth. The ovary is superior, with one ovule, and one style. The fruit is a thin corfips, inclosed within the enlarged and indurated base of the perianth. There are about 100 known species, natives of warm countries. Some have flowers of considerable beauty, as those of the genus mirabilis, known in our gardens as Marvel of Peru, one of which, M. Jalapa, was at one time erroneously supposed to produce jalap. The roots of many are feebly, pungative, and emetic. Those of Buerhavia paniculata are used instead of ipecacuanha both in Guinea and in Java.

NYCTALOPIA and HEMERALOPIA. Terms employed for affections of the eye, and which have been indiscriminately employed. Mr. Lawrence, an English surgeon, and one of the pioneers in scientific ophthalmology, says "A great confusion has arisen in the application of these learned terms, each word being nearly as often used to express one affection as the other. Hippocrates used the term hemeralopia to denote night-blindness, and we may as well follow his example." And this is good etymology, for nyctalopia signifies "I see by night," while hemeralopia signifies "I see by day." Still it is not uncommon for nyctalopia to be defined as "night-blindness." "Hemeralopia," says Mr. Lawrence, "is that state of vision in which the patient sees well during the day, but imperfectly as twilight comes on; and when the affection is fully formed he loses his sight entirely at the approach of night, not being able to see a lighted candle brought close to the eye. In the commencement of the affection the person can see by moonlight, or when the room is lighted by a candle, but as it proceeds he can discern nothing after sunset; in the morning vision returns. There is no unnatural appearance in the eye; indeed if a person can see perfectly during the day, the organ can have undergone no important change (structural). There is little increased irritability in the commencement, but as the affection proceeds the pupil becomes rather dilated. The duration of the disease varies from one night to six or twelve months, or even longer. More generally it lasts from two weeks to three or six months, when left to itself. Relapses are frequent so long as persons remain exposed to the exciting cause, which seems to be the exhaustion of the power of the retina by exposure to strong light during the day." The disease is most prevalent in hot climates, and where there is much glare of sunlight, as in the East and West Indies. It is not also infrequent in high latitudes where the snow reflects the sun's rays for a great many hours during the day. Dr. Matthew Guthrie states that peasants in the interior of Russia are subject to it, where it is called Eiritskaya slepota, or heaven blindness, and occurs during the harvest in June and July. He also says that several hundred Russian soldiers in the war in Finland were attacked by the affection. It has been recorded as occurring epidemically, and an instance is related in the 8th vol. of
the *Dublin Journal* of medical and chemical science of such an epidemic among some Prussian soldiers stationed on the Rhine; but Mr. Lawrence observes that all the cases which he had seen commenced in the East or West Indies and were brought to England. Mackenzie, another high British authority, says that the disease does not appear to be necessarily connected by any constitutional symptoms, and Mr. Bumpfield, in the *British Medical-Chirurgical Transactions*, states that of more than three hundred cases in his practice in different parts of the globe, but chiefly in the East Indies, all perfectly recovered. The prognosis is, therefore, very favorable. In some instances night-blindness, or hemeralopia, is congenital. Richter relates three cases in a family of nine children. The only abnormal appearance of the eyes was the excessive dilatation of the pupils after sundown. When the account was given these children had reached the age of from 20 to 30 years, without any alteration in their sight. One of them had never seen any stars. Dr. Cunier, of Ghent, relates some remarkable cases of hereditary hemeralopia (*Annales de la sociétd de médecine de Gand* 1840). In the official capacity of an army surgeon, in the case of a conscript claiming exemption from night-blindness, Dr. Cunier made an examination in the commune of Vendémain, near Montpellier, and reported upon information and observation that one Jean Nougaret was the first of the family known to be hemeralopic; his children, one daughter, and two sons, were all affected with night-blindness. The second generation included 16 individuals of whom ten were thus afflicted; in the third generation there were 14 out of 81; in the fourth 23 in 208; in the fifth, not then completed, 24 in 218; in the sixth, including 103 persons, there were 11. But one of the remarkable facts in the case, and worthy of much consideration by those studying the heredity of the human constitution varying in this, is that, according to hereditary laws, is that among all these descendants, numbering more than 600, and of whom every one-seventh were affected with night-blindness, there was not a single case in these families where both parents were free from the affection; that is, there was no intermediate transmission in. Nyctalopia, or "night-seeing" (day-blindness) is a state opposite to hemeralopia, and is a disease of a very different nature. Mr. Lawrence states that in opacity of the cornea, in certain forms of cataract, in incipient opacity of the lens, in central opacity of the capsule, in contractions of the pupil from prolapse of the iris, the patient will often see best in a weak light, and find vision very imperfect in a strong light. In scrofulous affections of the eyes (strumous ophthalmia) the intolerance to light amounts to blindness during the day, while in the evening, with a faint light the patient sees quite well. Alliines are frequently nyctalopic, the absence of pigmentum nigrum, rendering the eye extremely sensitive, from its want of absorptive power. Barron Larrey records a remarkable case of day blindness, occurring in an old man, one of the galleys slaves at Brest, who had been shut up in a subterranean dungeon 33 years. He had become so affected that he could only see in a shady light. As this condition is generally accompanied with some observable affection of the ocular apparatus its treatment will vary with circumstances.

**NYCTERIBIA**, an extremely curious genus of insects, ranked in the order *diptera*, although very different from most of that order, and having neither wings nor balances. Its near-t alliance is with *Hipoposeilise* (see *Forest Fly and Sheep Tick*), which it resembles particularly in parasitic habits, and in the retention of the eggs within the abdomen of the female, until they have not only been hatched, but have passed from the larva into the pupa state. The form, however, is so spider-like, that these insects were at first ranked among the *arachnida*. The few species known are all parasitic on bats, on which they run about with great activity. The head is very small, curiously affixed to the back of the thorax, and when the creature sucks the blood of the bat, upon which it lives, it places itself in a reversed position.

**NYCTICEBINÆ**, a sub-family of lemuroid monkeys. They are distinguished from the rest of the family by their very short tails. There are two African and two Asiatic genera. The African genera are *perodicticus*, or the potto, and *arctocebus*, or the angwantibo. The Asiatic genera are the slender lemur (*loris*), and the slow lemur (*nycticebus*). In all these genera the fore-finger of each hand is short, and in the potto it is rudimentary, so that each hand has but three fingers. They are inactive during the day, but at night prowl stealthily among the branches in search of food, which consists principally of insects and small birds. They also eat eggs and fruit. When irritated during their period of repose in the day their motions are very slow, and they utter a cry similar to that of the American sloths. They have a very tenacious grasp, ascribed by some to a peculiar mechanical arrangement of the muscles and tendons by which the mere stretching of the leg causes the toes to flex and produce a tight grasp. Others attribute it to the power of continuing muscular contraction, and this idea seems to be strengthened by the observations of sir Anthony Carlisle, who injected the arterial system of a *nycticebus tardigradus* and found a very peculiar and abundant distribution of blood vessels to the limbs. The axillary artery divided into 23 equal-sized cylinders, surrounding the principal trunk, and passing down the arm, each cylinder was found distributed to an individual muscle in the fore-arm. A similar distribution takes place in the lower or hind limbs. In this species there is also a remarkable peculiarity in the tongue, which is double. Beneath the principle tongue, which somewhat resembles a cat's, there is another tongue, white colored, narrow, and very sharp pointed, which is used with the
upper tongue in catching flies and in eating, but which the animal has the power of retaining in the mouth while the other tongue is in use. Dental formula $i^1-1, c^1-1; pm^3-3, m^3-3 = 36$. The limbs are nearly equal in size, the ears are short and rounded, the eyes large and staring, and placed close together.

NYE, a co. in s.e. Nevada, bounded on the e. by Utah, and on the s.w. by California, drained by Amargosa and Reese rivers, 24,000 sq.m., pop. ’80, 1875—66 Chinese. The surface in the n. is made up of mountains and valleys running n. and s. and s. The s. part is mostly elevated sterile table-land, sloping e. to the Colorado river and w. to California. In the valleys there are large tracts of land suitable for grazing and cultivation. The ordinary cereals are raised, and there is considerable live-stock. A rich vein of quartzite is found in the mountain ranges, and there are many gold and silver mines. Co.-seat, Belmont.

NYE, James W., 1815-76; b. Madison co. N. Y., where he was reared on a farm, received a common school education, studied law and commenced practice. While quite young he was elected district attorney and co. judge. In 1846 he was the anti-slavery candidate for congress in the same district, and defeated. Then he removed to Syracuse. In 1860 he was state police commissioner in the city of New York; was appointed governor of Nevada by president Lincoln in 1861; when Nevada became a state he was elected a U. S. senator from it for six years, ending Mar. 3, 1873. As a public speaker he was distinguished for his contagious humor, and in private for his genial disposition. On his retirement from the senate his mind was impaired. He died at White Plains, N. Y., Dec. 25, 1876.

NYREGYHAZA, a t. of Hungary, in the co. of Szabolcs, on the railway between Debreczin and Tokay. The trade in agricultural produce is considerable. Nyregyhaza has salt, soda, and salt-peter works. There are mineral springs in the neighborhood. Pop. ’69, 21,896.

NYKERK, or NIEUWKERK, on the Vechue, is a very flourishing and well-built t., near the Zuyder Zee, in the province of Gelderland, Netherlands. 25 m. a.n. of Arnhem. Pop. 8,000. It has a good harbor, which is connected with the sea by a wide canal of 1½ m. in length. In the neighborhood are fine rich meadow-pastures and lands suited for all kinds of grain, tobacco, potatoes, etc. Tobacco is extensively grown; many cattle are raised; and a brisk trade carried on both with the surrounding country and Amsterdam, the market to which the cattle, tobacco, dairy, and other agricultural produce, together with much firewood are sent. Nykerk has a handsome Reformed church, a Roman Catholic chapel, a synagogue, orphan-house, and good schools. There are several manufactures carried on, which also employ a large number of the people. In Netherlands' church history, Nykerk is famed as the place where a great religious movement began at the middle of last century. The history of the movement, which spread throughout the land, contains all the marks of the later revivals in America, Scotland, and Ireland. See Teype and Dermout's Geschiedenis der Nederland. Her. Kerk, vol. iv.

NYKÖPING, a sea-port of Sweden, pleasantly situated on the Baltic, in lat. 58° 45', long. 17° e., about 60 m. s.w. of Stockholm. It comprises among its manufacturing products cotton goods, stockings, tobacco, etc., and has good ship-yards, mills, and manufactories for machinery, while in the vicinity of the town are extensive paper-mills. The ruined old castle of Nyköping, nearly destroyed by fire in 1655, and which ranked in point of strength next to those of Stockholm and Calmar, has experienced many eventful vicissitudes of fortune. King Valdemar of Sweden, after his retreatment in 1288, was imprisoned here till his death in 1302, but the most tragic incident connected with Nyköping castle was the horrible death within its walls of the dukes Eric and Valdemar, who, after being entrapped by their pusillanimous brother, King Birger, in 1317, were left to perish of hunger in a dungeon, the keys of which the king threw into the sea before he left the castle. The horror of this deed roused the indignation of the people, who seized upon the castle, sacked it, and demolished its keep and donjons. In 1719 the town was taken and dismantled by the Russians; and since then it has ceased to be the scene of any events of historical interest. It is noted for the pure Swedish spoken by its inhabitants. Pop. ’76, 4,591.

NYLGHAI, Antilope picta, or Portax tragocamelus, a species of antelope, with somewhat oxlike head and body, but with long slender limbs, and of great activity and fleetness. It is one of the largest of antelopes, and is more than four feet high at the shoulder. The horns of the male are about as long as the ears, smooth, black, pointed, slightly curved forwards. The female has no horns. The neck is deep and compressed, not rounded as in most of the antelopes. A slight mane runs along the neck and part of the back, and the breast is adorned with a long hanging tuft of hair. The back is almost elevated into a hump between the shoulders. The Nylghai inhabits the dense forests of India and Persia, where it has long been regarded as one of the noblest kinds of game. It is often taken, like other large animals, by the inclosing of a large space with nets, and by great numbers of people. It is a spirited animal and dangerous to a rash assailant. It is capable of domestication, but is said to manifest an irritable and capricious temper.
NYPHEACEAE, a natural order of exogenous plants, growing in lakes, ponds, ditches, and slow rivers, where their fleshy root-stocks are prostrate in the mud at the bottom; and their large, long-stalked, heart-shaped, or petalate leaves float on the surface of the water. Their flowers also either float, or are raised on their stalks a little above the water. The flowers are large, and often very beautiful and fragrant. There are usually four sepals, and numerous petals and stamens, often passing gradually into one another. The ovary is many-celled, with radiating stigmas, and very numerous ovules, and is more or less surrounded by a large fleshy disk. The seeds have a firmaceous albumen. More than fifty species are known, mostly natives of warm and temperate regions. The root-stocks of some of them are used as food, and the seeds of many,—see Water-lily, Lotus, Victoria, and Euryale.—Very nearly allied to Nymphaceae are Nelumbinae. See Nelumium.

NYPHHS, in classic mythology, female divinities of inferior rank, inhabiting the sea, streams, groves, meadows and pastures, grotoves, fountains, hills, glens, trees, etc. Among the nymphs, different classes were distinguished, particularly the Oceanides, daughters of Oceamus (nymphs of the great ocean which flows around the earth), the Nereids, daughters of Nereus (nymphs of the inner depths of the sea, or of the inner sea—the Mediterranean), Potameides (river nymphs), Naiads (nymphs of fountains, lakes, brooks, wells), Orcales (mountain nymphs), Dryads or Hamadryads (forest nymphs, who were believed to die with the trees in which they dwelt). They were the goddesses of fertilizing moisture, and were represented as taking an interest in the nourishment and growth of infants, and as being addicted to the chase (companions of the divine huntress Diana), to female occupations, and to dancing. They are among the most beautiful conceptions of the plastic and reverent (if credulous) fancy of the ancient Greeks, who, in the various phenomena of nature—the rush of sea-waves, the bubble of brooks, the play of sunbeams, the rustle of leaves, and the silence of caves—felt, with a poetic vividness that our modern science will hardly permit us to realize, the presence of unseen joyous powers.

Neysa. See Tupelo.

Nytsadt, a t. of Finland, on the eastern coast of the gulf of Bothnia, 50 m. s. of Bjorncborg. Here, in 1721, a treaty was agreed to, between Russia and Sweden, by virtue of which all the conquests of Peter the great along the coasts of the gulf of Finland were annexed to Russia. Pop. 73, 5,708.

O

O, The fifteenth letter in the English and in most western alphabets, is one of the five simple vowel signs of the English language. As the language is at present pronounced, it stands for at least four distinct sounds, heard in the words note, nor, (nöö), more, son. The primary and simple sound of O is that heard long in nor, and short in not, top. The sound given to it in such words as note, go, is really a diphthong—a long o terminating in a slight u or oo sound (O unicorn). The corresponding letter in the Hebrew and Phoenician alphabet (q.v.) was called Ayn, i.e., “eye,” and accordingly the primitive form of the Phenician letter was a rough picture of an eye, which naturally became a circle with a dot in the center—still to be seen in some ancient inscriptions—and then a simple cir-ec.

O, a prefix in many Irish family names, serves to form a patronymic, like Mac in Gaelic names; as O'Brien, a descendant of Brien. By some, it is considered to be derived from of; but it is more likely from Ir. ur, Gael. éighe, a grandson. In the Lowland Scottish the word 0" is used for grandson, and in some localities for nephew.

Oahu, one of the Sandwich islands (q.v.).

Oajaco, or Oaxaca, a Mexican state, bounded s. by the Pacific, e. by Tehuantepco and the gulf of Tehuantepec, w. and n. by Puebla and Vera Cruz; 31,882 sq. m.; pop. not far from 500,000; La Verda is the only river of consequence. The surface is almost entirely made up of mountains and table-lands and the climate is remarkably fine; the rainfall is large, and the heat less oppressive than in most other states of Mexico. The products of the soil are greatly varied; cochineal and indigo are the chief exports, and wheat, coffee, sugar, tobacco, cotton, coco, honey, plantains, and fruit of all kinds, are found. Gold and silver mines exist, but are of little importance. The soil is so rich that two crops of wheat and maize are produced annually. The inhabitants are mostly Indians, half-breeds, and mestizoes. The capital, Oaxaca, is beautifully situated in the center of the state.

Oajaco, Oaxaca, or Guaxaca, a city of Mexico, capital of a state of the same name, stands on the river Rio Verde, 210 m. s.s.e. of Mexico. It covers an area 2 m. in length by 1½ in breadth, is well built, with open streets, interspersed with plantations, on which the cochineal insect feeds, and has about 25,000 inhabitants. Silk, cotton, sugar, and chocolate are manufactured.

Oak, Quercus, a genus of trees and shrubs of the natural order cupuliferac. having a three-celled ovary, and a round (not angular) nut—which is called an acorn—placed in
a scal'y truncated cup, the lower part of it invested by the cup. The species are very numerous, natives of temperate and tropical countries. A few species are found in Europe. North America produces many; and many are natives of mountainous regions in the torrid zone; some are found at low elevations in the valleys of the Himalayas, some even at the level of the sea in the Malay peninsula and Indian islands. But in the peninsula of India, a few are found, and none in tropical Africa, in Asia, or in South America. The oaks have alternate simple leaves, which are entire in some, but in the greater number variously lobed and sinuated or cut; evergreen in some, but more generally deciduous. Many of them are trees of great size, famous for the strength and durability of their timber, as well as for the majesty of their appearance, and their great longevity. Throughout all parts of Europe, except the extreme n., two species are found, or varieties of one species, the Common Oak (Q. robur); one (Q. pedunculata) having the acorns on longish stalks, the other (Q. sessiliflora) having them almost without stalks. Other differences have been pointed out, but they are regarded by some of the most eminent and careful botanists as merely accidental, and not coincident with these; while, as to the length of the fruit-stalks, every intermediate gradation occurs. Both varieties occur in Britain, the first being the most prevalent, as it is generally in the n. of Europe; the second being more abundant in more southern countries. The short-stalked oak is sometimes called Dutchmast Oak in England. It has been much disputed which is entitled to be considered the true British oak; and much alarm has occasionally been expressed lest new plantations should be made of the wrong kind; whilst the most contradictory statements have been made as to the comparative value and characters of the timber. The oak succeeds best in loamy soils, and especially in those that are somewhat calcareous. It cannot endure stagnant water. It succeeds well on soils too poor for ash or elm; but depends much on the depth of the soil, its roots penetrating more deeply than those of most other trees. Noble specimens of oak trees, and some of them historically celebrated, exist in almost all parts of Britain; but are much more frequent in England than in Scotland. The former existence of great oak forests is attested by the huge trunks often found in bogs. The oak attains a height of from 50 to 100 or even 150 or 180 ft.; the trunk being 4, 6, or even 8 ft. in diameter. It sometimes grows tall and stately; but often rather exhibits great thickness of bole and magnitude of branches. It reaches an age of from 120 to 400 years, but lives to the age of 600, or even 1000. The timber is very solid, durable, peculiarly unsusceptible of the influence of moisture, and, therefore, eminently adapted for ship-building. It is also employed in carpentry, mill-work, etc.—The bark abounds in tannin; it also contains a peculiar bitter principle called quecine, and is used in medicine, chiefly in gargarises, etc., on account of its astrinency, sometimes also as a tonic; it is used along with gall-nuts in the manufacture of ink; but most of all for tanning (see Bank); and on this account the oak is often planted as coppice-wood (see Corse) in situations where it cannot be expected to attain to great size as a tree. The timber of copse oak is excellent fire-wood. The oak is particularly fitted for cope-stool; by the readiness with which it springs again from the stumps after it has been cut. Acorns are very nourishing food for swine, and in times of scarcity have been often used for human food, as, indeed, they commonly are in some very poor countries, either alone or mixed with meal. The bitterness which makes them disagreeable to man is in part removed by burying them in the ground; and in some of the trees are adapted for the manufacture of food; and oaks of the common species occur which produce acorns as sweet as chestnuts. Other varieties of the common oak are assiduously propagated by nurserymen as curious and ornamental, particularly one with pendulous branches (the weeping oak), and one with branches growing up close to the stem, as in some kinds of poplar. Among the Greeks and Romans the oak was sacred to Zeus or Jupiter; and it has been connected with the religious observances of many nations, as of the ancient Celts and Germans.—The Turkish Oak or Adriatic Oak (Q. cerris), now very frequently planted in Britain, is a large and valuable tree, very common in the s.e. of Europe, and in some parts of Asia. The timber is imported in considerable quantity into Britain for ship-building and other purposes. The leaves differ from those of the common oak in their acute lobes, and the cups of the acorns are mossy, i.e., have long, loose, acute scales. Similar to this, in both these respects, are the Austrian Oak (Q. Austrasica), abundant near Vienna, and the Spanish Oak (Q. Hispanica).—The Cork Oak or Cork-Tree (Q. suber), one of the species found in the s. of Europe, in the article Cork; the Holm Oak or Evergreen Oak (Q. ilex), another of the species found in the s. of Europe, in the article Ilex. Of the North American oaks, some are very valuable as timber trees. Perhaps the most important is the White Oak or Quebec Oak (Q. alba), a large tree, the leaves of which have a few rounded lobes. It is found from the gulf of Mexico to Canada; and in some places forms the chief part of the forest. The timber is less compact than that of the British oak; that of young trees is very elastic.—The Overcup Oak (Q. lyrata), a majestic cup, highly esteemed for its timber, and having its acorns almost covered by their globular cup, grows chiefly in lands liable to inundation in the southern states.—The Chestnut-leaved White Oak (Q. prinus) is also a much-esteemed timber tree of the southern states.—The Swamp White Oak (Q. bector), a closely allied species, extends further north.—The Live Oak (Q. tivena), an evergreen species, with entire leathery leaves, is regarded as a tree of the first importance in the United States, from
Oak.

Oakland.

the excellence of its timber and its value for ship-building, so that efforts have been made by the government to protect it and to promote the planting of its acorns. Yet it is not a very large tree, being seldom more than 45 ft. in height, with a trunk of 2 ft. in diameter. It grows on the coasts of the gulf of Mexico, and as far north as Virginia. It once abounded on the Sea islands, now so celebrated for their cotton.—The Red Oak (Q. rubra), a large tree with sinuated and lobed leaves, the lobes toothed and bristle-pointed, yields great part of the red oak states exported from Canada and the n. of the United States to the West Indies; but red oak staves are also produced in the middle and southern states by the Scarlet Oak (Q. coccinea), a very similar species, by the Black Oak or Quercitrion Oak (Q. tinctoria), another species with the lobes of the leaves bristle-pointed, better-known for the dye-stuff which its bark yields (see Quercitrion), and by the willow oak (Q. phellos), a large tree with lanceolate leaves and a willow-like aspect. The timber of all of these species is of very inferior quality. These are the American oaks of greatest economical and commercial importance, but there are numerous other species, some of them trees, some mere shrubs, of which some grow on poor soils, and cover them in compact masses; resembling in this a single European species (Q. viminiata), a native of the Vosges, 6 to 8 ft. high, with slender, tough branches, which makes excellent hedges.—The Black Jack (Q. nigra) is an American oak, chiefly notable for the abundance in which it grows on some of the poorest soils. It is a small tree, and its timber of little value. The bark is black.—Some of the Nepalese oaks are large and valuable trees, as are some of those of China and Japan, of Java, of Mexico, and the others of Java and the other Indian islands have generally the leaves quite entire.—The bark of most of the species of oak is capable of being used for tanning, and is used in different countries. The cups and acorns of the Valonia Oak (Q. agilops) are exported from the Morea and other parts of the Levant in great quantities for this purpose, under the name of valonia. See LEATHER. The tree resembles the Turkey oak, and has very large hemispherical mossy cups. The cups are said to contain more tannin than any other vegetable substance.—Galls (q.v.) or gall-nuts are in great part obtained from the oak, therefore called the Gall-Oak (Q. infectoria), a scrubby bush, a native of Asia Minor, with blunty serrated, ovate-oblong leaves.—The Kermes Oak (Q. coccifera), on the leaves of which the kermes (q.v.) insect is found, is a low bush, with evergreen spinous leaves, much resembling a holly, a native of the s.e. of Europe.—Of oaks with sweet and edible acorns, may be mentioned the Oak (Q. betula), and (Q. laevis), an evergreen with round spiny-toothed leaves, a native of the n. of Africa, the acorns of which are regularly brought to market in Algeria and in Spain, and are long and cylindrical; the Italian oak (Q. osculina), closely allied to the common oak; and the Dwarf Chestnut Oak (Q. chinopini or prinoides) of North America, a small shrub, species, which has been specially recommended to cultivation on this account. Other North American species, and some of the Himalayan species, also produce edible acorns. From the acorns of some species, oil is made in considerable quantity in different parts of the world, and is used in cookery.—The leaves of the manna oak (Q. muntjfera)—a native of the mountains of Kurdistan, having oblong, blunt-lobed leaves—secrete in hot weather a kind of manna, a sweet mucilaginous substance, which is made into sweetmeats, and very highly esteemed. The name oak is sometimes popularly applied to timber trees of very different genera. Thus, African Oak is another name of African teak. See Teak. Some of the acorns (q.v.) are called oak in Australia. The Stone Oak ( lithocarpus jacquiniana) of Java, so named from the extreme hardness of its timber, is a tree of the same family with the true oaks.

OAK APPLE. See Gall- Fly; Galls; aste.

OAK BEAUTY, Biston prodromania, a moth of the family geometridae, a native of England, about an inch and a half or two inches in expance of wings; the upper wings with two brown curved bands, and margined with black, the lower wings with one brown band. The erpillar feeds on the oak.

OAKES, Urial, D.D., 1631–81; b. England. He emigrated to Massachusetts in 1634, graduated at Harvard in 1649, and published at Cambridge a set of astronomical calculations while quite young. He accepted a pastorate at Fitchfield, Eng., which his non-conformist views compelled him to relinquish in 1668, and later he preached to another congregation. On account of his learning and piety, he was chosen pastor of the church in Cambridge, whither he returned, commencing his labors in 1671. He accepted the presidency of Harvard college in 1673, being formally installed five years later; and held this position until his death.

OAKHAM, the county-town of Rutlandshire, Eng., in the vale of Catmos, 25 m. w.n.w. of Peterborough. It is a station on the Syston and Peterborough branch of the Midland railway. In former times, there was a castle here; it is now in ruins with the exception of the portion used as the county-hall. The church, the interior of which was beautifully restored in 1858, is an edifice in the perpendicular style, and has a fine tower and spire. The free grammar school, with an endowment of about £700 a year, was founded in 1581. Pop. (1871) 2,911.

OAKLAND, a co. in s.e. Michigan, drained by the Clinton, and branches of the Huron and Flint rivers; crossed by the Detroit and Milwaukee, and the Flint and Peré
Marquette railroads; 900 sq.m.; pop. 70,487. The surface in the northern portion is undulating, and numerous small lakes diversify it; in most parts the soil is fertile, and in good cultivation; about a quarter of the county is still covered with forests. Wheat, Indian corn, oats, live stock, and butter, are the chief productions; it contains flour mills, carriage, saddelry, plaster and casting manufactories. Co. seat, Pontiac.

OAKLAND, the seat of justice of Alameda co., Cal., on the e. shore of San Francisco bay, terminus of the Central Pacific railroad, 7 m. e. of San Francisco; pop. 75, 32,000. The city takes its name from a grove of majestic evergreen oaks, in which it was first built, but beyond which it now extends. It is a favorite residence for the merchants of San Francisco, and has many drivers, insurance and manufactories.

Oakland, through the O'ASES, The OAB, and the OAR, is a grueous and detrimental location to the city, taking from the city the last 30,000,000 sacks annually; marble, iron, smelting and metallurgical works; and daily, weekly, and monthly periodicals. It was incorporated as a city in 1854.

OAKUM, a tangled mass of tarred hempen fibers, is made from old rope by untwisting the strands and rubbing the fibers free from each other. Its principal use is in caulking (q.v.) the seams between planks, the space round rivets, bolts, etc., for the purpose of preventing water from penetrating.

OANNES, the name of a Babylonian god, who, in the first year of the foundation of Babylon, is said to have come out of the Persian gulf, or the Erythrean sea; adjoining Babylon. It was described as having the head and body of a fish, to which were added a human head and feet under the fish's head and at the tail. He lived amongst men during the day-time, without, however, taking any food, and retired at sunset to the sea, from which he had emerged. Oannes had a human voice, and instructed men in the use of letters, and in all the principal arts and sciences of civilization, which he communicated to them. Such is the account of him preserved by Berosus and Apollodorus.

Five such monsters are said to have come out of the Persian gulf; one, called Anedote or Idotion, in the reign of Amenon, the fourth king of Babylon; another in that of the fifth king; and the last, called Odacon (or Ho Dagon), apparently the Phenician Dagon, under the sixth. Many figures of Oannes, resembling that of a Triton, having the upper part of a man, and the lower part of a fish, or as a man covered with a fish's body, have been found in the sculptures of Koutoungijk and Khorsabad, as well as on many cylinders and gems. Oannes is supposed to have symbolized the conquest of Babylon by a more civilized nation, ascending in that part of the mouth of the Euphrates, which is now the Egyptian Delta, symbolizing the east wind in the presence of the Phenician Dagon, and the Greek Proteus and Triton.

OAR, a wooden instrument by which a person sitting in a boat propels it through the water. The form found in practice to combine greatest power with lightness, is that shown in the figure. From a to b is the blade of the oar, thin and nearly flat, though occasionally somewhat curved, so as to present a concave surface to the water; from b to d is round or square, gradually thickening towards d, that the part ce may nearly balance the part ac. At de is the handle, which is grasped by one or both hands. The oar rests at e on the row-locks; and in many cases some device is resorted to to retain the oar from slipping outwards. In the Thames, a leathern stop, called a button, is used; sometimes a pin in the gunwale of the boat passes through the oar (but this weakens the oar, and precludes feathering); at other times the oar is fastened to the pin by a leathern thong. The action of an oar in moving a boat is that of a lever, the rower's hand being the power, the water being the resistance, and the row-lock the point at which the opposition caused by the weight of the boat and its cargo is felt. Feathering an oar consists in turning it, immediately on leaving the water, so that the flat blade of the oar is horizontal, and in preserving this position until just before the fresh dip, when of course the vertical position must be resumed. Feathering diminishes the resistance offered by air, wind, and small waves; it also adds greatly to the beauty and grace of rowing.

The best oars are of Norway fir, though some are made of ash and beech.

OASES, certain cultivated spots in the Libyan desert (called also Animus, Oasus, or Hosisis) which produce vegetation, owing to the presence of springs issuing from the
ground. The principal oases are those lying to the w. of Egypt, a few days' journey from the Nile, and known to the ancients by the name of the greater and lesser oases, and that of Ammon. It is supposed that they were known to the Egyptians during the 12th dynasty under the name of Suten-Khenau, but no evidence of their occupation by the Egyptians earlier than Darius has been found in situ. By some of the ancients they were called the islands of the blessed, or compared to the spots on a panther's skin. Their name is supposed to be the Copioe Onath (inhabited place). They are first mentioned by Herodotus in his account of the destruction of the army of Cambyses by the storm or tornado, or simoom. Equally celebrated is the visit of Alexander the great to the oasis, which he successfully accomplished after the conquest of Egypt, and passed through the desert a nine days' journey before he reached the temple of Ammon, the priests of which declared him the son of that god, and the future conqueror of the entire world. Herodotus describes that of El Wahr, or the oasis Magna of the Romans, which contained the oracle of Ammon, and which lies seven days' journey w. of Thebes. It appears to have been anciently frequented by caravans going to the pillars of Hercules. Strabo mentions three oases: the first seven days' journey w. of Abydos; the second, w. of the lake Moris; the third, near the oracle of Ammon. Pliny mentions two oases; so does Ptolemy, who calls them the lesser and greater. Under the Roman empire, they were used for temporary banishment of criminals of state, and the poet Juvenal was sent there. Olympiodorus, a native of the Thebaid, gives a glowing description of them in the days of Theodosius the younger. Under the Byzantine government they continued to pass through the hands of various nations or parties, and they have been given by the Egyptians and their successors till that period; and they are described by Edrisi (1150 A.D.) as uninhabited; by Abu-Karafa (1240 A.D.) and by Leo Africanus (1513 A.D.), as inhabited and cultivated, and quite independent, having three fortresses. The first modern traveler who visited them is supposed to have been Ponce (1698 A.D.). Subsequently, in 1792, Brown discovered the oasis of Ammon at El Siwah, and it was visited in 1798 by Hornemann, and in 1819 by Caulin. It lies in 29° 12' 20" n. lat., and 26° 6' 9" e. long. Drovetti and Minniti also visited the same spot.

These oases are now inhabited by the Arabs, who have left the oases: the desert, capable of raising 30,000 men, who supply caravans and guides to travelers. The principal oases are: 1. El Kharga, or the Oasis Magna, the Greater Oasis of Ptolemy; 2. El Kasr, or Oasis Parva, the Lesser Oasis; 3. Siwah, or the Oasis of Ammon, the most northerly; 4. The Western Oasis, or Dukkel, mentioned by Olympiodorus, and visited by sir Archibald Edmonstone in 1819, and Rohls in 1874. Of El Kharga full particulars have been given by M. Ho-Kins, who discovered it lying about 125 m. w. of the Nile, having a stream of water rising near the village of Gemah, on the north-west of the oasis, and lost in the sand. It is bounded on the e. by Hagel-bel-Badah. North of El Gem lies the metropolis, El Kharga, which consists of a series of covered streets and open bazaars. The temple lies two hours' journey from it, in a fine situation; the sekos has a vestibule of 500 ft., with pylon, or gateways, the first of which has a decree in Greek, dated in the reign of Galba (68 A.D.), against forcing persons to farm the revenue, preventing imprisonment for debt, preserving the doctor and the oracles. The temple has three entrances, one on the south, another on the north. The temple has other decrees preventing the officers of government from smuggling. It has an avenue of sphinxes and three pylons; on the third, Darius is represented offering to Amen Ra, Osiris, and Isis; while Neckht-her-hebi (Nectabes) continued the ornaments of the temple about 414-340 B.C. The sekos is 140 ft. long, and represents Darius offering to Amen Ra, or Khnumis, the ram-headed god, and Osiris; while in the accompanying scenes are seen Anta, or Annitis, Raspu, or Resep. In the vicinity is a magnificent necropolis of 150 sepulchres, of a late period, with Doric and Corinthian capitals. There are several temples at other spots of the oases. 2. El Kasr, the Oasis Parva, lies four or five days' journey s.e. of Siwah, called the Wah-el-Bahmās, or Wah-el-Meneshēh, contains no monuments older than the Roman, consisting of a triumphal arch, subterraneous and other aqueducts, several hot springs, a necropolis, and Christian church. This oasis was first conquered by the Arabs; and in its vicinity is another oasis called Wady Zerzoora, with others adjoining of inferior interest. 3. Siwah, or the Oasis of Ammon. One of the first discovered, and repeatedly visited, has, unfortunately, not been seen by any one acquainted with hieroglyphics—lies w. of the Natron lakes. It would appear from Minniti that the temple was built by Neckht-her-hebi, or Nectabes 1., in honor of the god Khnum, Ammon Khnumis or Chebeis, who as the deity of water, presided over the water from which the oasis originated. The oasis is 9 m. long and 2 broad, contains El Garah, Gharmy, and Menchey, has a population of about 8,000 inhabitants, possesses date and other trees, grows cereals, and has sulphurous springs, a salt lake at Arachel, and many ruined temples, a necropolis, and other remains. The oracle of Ammon is supposed to have been at a place called Om-Beydah, or the temple of Neckht-her-hebi. From this, it would seem that the oasis did not fall into the power of Egypt till about the 5th c. B.C. The
Oat, or OATS, Avena, a genus of grasses, containing many species, among which are some very valuable for the grain which they produce, and some useful for hay. The Linnæan generic name, less natural than most of the Linnæan genera, has been much broken up. The generic term is applied to the spikelets in which the florets are included, the florets, and containing two or more florets; the paleace firm, and almost cartilaginous, the outer palea of each floret, or of one or more of the florets, bearing on the back a knee jointed awn, which is twisted at the base. The awn, however, tends to disappear, and often wholly disappears in cultivation. Those species which are cultivated as corn plants have comparatively large spikelets and seeds, the spikelets—at least after flowering—pendulous. The native country of the cultivated oats is unknown, although most probably it is central Asia. There is no reference, however, to the oat in the Old Testament; and although it was known to the Greeks, who called it bromos, and to the Romans, it is probable that they derived their knowledge of it from the Celts, Germans, and other northern nations. It is a grain better suited to moist than to dry, and to cold than to warm climates, although it does not extend so far north as the coarse kinds of barley. The grain is either used in the form of groats (q.v.) or made into meal. Oatmeal cakes and other forms of the food are common in Scotland, and in some parts of Spain, and of some other countries. No grain is so much esteemed for feeding horses. Besides a large quantity of starch—about 65 per cent—and some sugar, gum, and oil, the grain of oats contains almost 20 per cent of nitrogenous principles, or proteine (q.v.) compounds, of which about 16 or 17 parts are avenine, a substance very similar to caseine (q.v.), and two or three parts gluten, the remainder albumen. The husk of oats is also nutritious, and is mixed with other food for horses, oxen, and sheep. From the starchy particles adhering to the husk or seeds after the separation of the grain, a light dish, called scorzona, is made in Scotland by means of boiling water, was once very popular, and is very suitable for weak stomachs. The grain is sometimes mixed with barley for distillation. The Russian beverage called quass is made from oats. The straw of oats is very useful as fodder, bringing a higher price than any other kind of straw.—The varieties of oats in cultivation are very numerous, and some highly esteemed varieties are of recent and well-known origin. It is doubtful if they really belong to more than one species; but the following are very generally distinguished as species: 1. COMMON OAT (A. sativa), having a very loose panicle, which spreads on all sides, and two or three fertile florets in each spikelet, the paleace quite smooth, not more than one floret awned; 2. TARTARIAN OAT (A. orientalis), also called HUNGARIAN OAT and SIBERIAN OAT, distinguished chiefly by having the panicle much more contracted, and all turned to one side; 3. NAKED OAT (A. nuda), differing from the Tartarian oat chiefly in having the paleace very slightly adherent to the seeds, which, therefore, fall readily out of them, whilst in the other kinds they adhere closely; 4. CHINESE OAT (A. chanus), which agrees with the last in the characters of the paleace and seeds, but is more like the common oat in its panicle, and has more numerous florets, 4-8, in the spikelet; 5. SHORT OAT (A. brevis), which has a close panicle turned to one side, the spikelets containing only one or two florets, each floret awned, the grains short. Almost all the varieties of oat in cultivation belong to the first and second of these species. The naked oat is cultivated in Austria, but is not much esteemed. The Chinese oat, said to have been brought by Missionaries from China, is distinguished by the fact of the rachis and sheath being shaken out by winds. The short oat is cultivated as a grain-crop on poor soils at high elevations in the mountainous parts of France and Spain, ripening where other kinds do not; it is also cultivated in some parts of Europe as a forage plant. Besides these, there is another kind of oat, the BRISTLE-POINTED OAT (A. strigosum), regarded by some botanists as belonging even to a distinct genus, danthonia, because the lower palea is much prolonged, and instead of merely being bifid at the point, as in the other oats, is divided into two long teeth, extending into bristles. The panicle is inclined to one side, very little branched; the florets, 3 or 3 in a spikelet, all awned, the grain rather small. This plant is common in corn-fields, is cultivated in many countries, but chiefly on poor soils, and was at one time much cultivated in Scotland, but is now scarcely to be seen as a crop. Not unlike this, but with the panicle spreading equally on all sides, the outer palea merely bifid, and long hairs at the base of the glumes, is the WILD OAT (A. fatua), another oat which is a wild plant on the shores and in the northern countries for mead, but which is more generally regarded by farmers as a weed to be extirpated, springing up so abundantly in some districts as to choke crops of better grain. Its awns have much of the hygrometrical property which gains for A. sterilis, a species found in the south of Europe, the name of the ANIMAL OAT, because the seeds
when ripe and fallen on the ground resemble insects, and move about in an extraordinary manner through the twisting and untwisting of the awns. The seed of the Wild Oat has been sometimes used instead of an artificial fly for catching trout. Amongst the species of oat useful not for their grain but for fodder are the Downy Oat-grass (A. pubescens) and Yellow Oat-grass (A. flavescens), both referred by some botanists to the genus trisetum—the short awn being like a middle tooth in the hind pala—and both natives of Britain, the former growing on light ground and dry hills, especially where the soil is calcareous, the latter on light meadow lands. Other species are found in Britain, continental Europe, North America, Australia, etc. In some parts of the Sahara are bottoms of ravines richly productive of a species of oat-grass (A. Forskalii) much relished by camels.

Far more ground is occupied with oats in Scotland than with any other grain. In all the higher districts, it is almost the only kind of grain which is cultivated. Throughout Scotland it is the crop that is chiefly sown after land has been in pasture for one or more years. The seed is generally sown broadcast over the plowed land, which is afterwards well harrowed and pulverized. It is of the utmost importance to have the latter operations well done, as it prevents the attacks of insect larvae. On soils that are infested with annual weeds, such as charlock, it is common to drill the seed, which permits the land to be hand-hoed and thoroughly cleansed. Oat thrive best upon deep and rich soils, and yield but poorly on thin sandy soils, where they suffer sooner from drought than barley, rye, or wheat. On good soils, it is common to dress oats with 2 to 3 bushels of grain to the quarter. The plant is not easily injured by large applications of heterogeneous manures. The oat plant is a variety generally cultivated in the best soils and climates. It is an early and productive variety. The Hopetoun oat is also much sown in the earliest districts. The sandy oat is still more largely sown, more particularly when the climate is inferior and wet. It is not liable to be lodged with rains, and the straw is of fine quality for fodder. All these are varieties of the common oat. The white and black Tartarian are much cultivated in some districts. They are very productive. On the continent of Europe this grain is seldom seen of quality equal to what is produced in Scotland; and even in most parts of England the climate is less suitable to it, and it is less plump and rich.

OATES, (alias Amrose.) Titus, was the son of a ribbon weaver, who, having first become an Anabaptist minister, under Cromwell, took orders and a benefice in the English church after the restoration. Titus appears to have been born about 1650 in London. He was brought up at Merchant Taylor's school, whence he passed to Trinity college, Cambridge, took orders, and received a small living from the duke of Norfolk. This position, however, he forfeited, in consequence of a malicious prosecution, in which he narrowly escaped conviction for perjury; and having been afterwards appointed to the chaplaincy of one of the king's ships, he was expelled from it on a charge still more disgraceful. In this extremity he conformed to the Roman Catholic church, and was admitted as a scholar of the Jesuits' college at Valladolid; but was expelled for misconduct after a trial of a few months. He was again received by the Jesuits, on his earnest protestations of repentance, at St. Omer, where he was no less unsuccessful, and was finally dismissed by them in the early part of 1678. He now, as a mere vagabond adventurer, set himself to live by his wits, in the evil exercise of which he devised, about this time, the atrocious scheme with which his name is identified in history. He then went to France, and alarmed and alarmed the Protestant party in England. It was well known that Charles was not a Roman Catholic; and his brother, the duke of York, afterwards James II., was an active and ardent zealot on the same side. The growing confidence of the Roman Catholics was unconcealed; and with or without instant reason, the ery so often since heard arose, and was everywhere re-echoed that the 'Protestant religion was in danger.' In this fevered state of general feeling, Oates saw his opportunity, and dexterously and boldly availed himself of it. He communicated to the authorities the details of a pretended plot, the figment of his own brain, the main elements of which were a rising of the Catholic party, a general massacre of Protestants, the burning of the city of London, the assassination of the king, and the invasion of Ireland by a French army. In certain of its items the fiction was devised with considerable ingenuity to catch the proper belief. By the strangest coincidence, moreover, there just then occurred in aid of it a series of events which seemed conclusively to attest its genuineness. A correspondence, the object of which was the propagation of the Roman Catholic religion, came to light between the secretary of the duke of York and Pere La Chetwa of Geneva, the professor and confidant of Louis XIV. Danby, the prime minister, also it appeared, had been busy with intrigues in the same quarter. Finally, Godfrey, the zealous magistrate through whom publicity was first given to "the plot," was found mysteriously murdered. After this, could reasonable doubt exist? Was not the English St. Bartholomew already begun? All London went wild with fear and rage; and it seemed at one time likely that a massacre of Roman Catholics would be substituted for the dreaded extermination of the Protestants. The parliament, which might have done something to allay the excitement, was itself swept headlong away by it. The king alone, whose life was threatened, but who, dissolute and indolent as he was, wanted neither courage nor shrewdness, much to his honor, scornfully insisted that the plot was merely
some insane delusion, and tried, so far as he could, to control the excesses which followed. Too probably his interference was of the characteristically easy, inoffensive kind; in any case, it did not avail. The story of Oates was universally believed and he became the popular hero of the day. A pension of £300 a year was granted him: a suite of apartments in the palace at Whitehall was set apart as sacred to his use; and whenever he went, the Protestant public wildly cheered him as their savior. With the aid of a set of sobered ruffians, only one degree less foul than himself, convictions of his victims were readily obtained, judges and juries vying with each other in their unquestioning reception in evidence of the grossest and most manifest perjuries; and many innocent Roman Catholic gentlemen died at the death of traitors at the block. Over the space of two years, the base success of Oates was signalized by a series of judicial murders. Naturally, however, as reason resumed its sway, doubts began to be felt; and on the execution of a venerable and respected nobleman, viscount Stafford, with a strong shock of pity and remorse, public suspicion awoke, and a violent reaction set in. It was only, however, on the accession of James II., in 1688, that retribution overtook the malefactor. Active steps against him were then taken. He was tried before the court of king's bench, convicted of perjury, and sentenced to be pilloried, whipped at the cart's tail, and afterwards imprisoned for life. We might wonder a little at the leniency of the sentence, were it not thus to be explained: it was intended that the severity of the first two items of punishment should render the last one superfluous, and that the wretch should die under the lash of the executioner. But the hide of Oates was beyond calculation tough; and horribly lacerated, yet living, his carcass was conveyed to the prison, from which it was meant to be conveyed to execution the morrow. The wretched creature fainted, was conveyed back the monster to the light of day and to prosperity. When the revolution of 1688 placed William on the throne, the Protestant influence triumphed once more. In the outburst of enthusiasm which ensued, what more natural than that Oates should be glorified as a Protestant martyr? Parliament solemnly declared his trial an illegal one; he was pardoned, and obtained his liberty; and in order to his perfect enjoyment of it, a pension of £300 a year was granted him. He was, however, no more heard of; he passed his 17 remaining years in obscurity, and died in 1705 at the good old age of 56.

OATH (Ang.-Sax. ath, Ger. eidel), in the religious use of the word, may be defined an expressed or implied calling upon the Almighty to witness the truth of an asseveration, or the good faith of a promise; with which is ordinarily conjoined an imprecation of his vengeance, or a renunciation of his favor, in case the asseveration should be false, or the promise should be broken. This practice has prevailed, in some form or other, in almost all the religions of the ancient, as well as of the modern world. It supposes, however, a belief of the existence of a provident Supreme Being, in order to its moral efficacy as a safeguard of truth. Among the Jews, we find instances in Gen. xiv. 22, xxii. 24, xlvii. 31, l. 5, confirmed even by the example of God himself, Numb. xiv. 28, Jer. xliv. 26, Isa. lxii. 8. It was strictly forbidden to the Jews to swear by false gods (Amos viii. 14, Jer. xii. 16). The form of oath was probably variable, either a direct adjuration as “The Lord liveth,” or an imprecation, “The Lord do so to me;” but in all cases, the strongest denunciations are held out against the false swearer (Exod. xx. 7, Lev. xix. 12). Oaths were employed, both judicially and extrajudicially, by the ancient Egyptians, Assyrians, Medes, and Persians, as well as by the Greeks, and also by the Romans. The forms were very various—one of the most solemn consisting in the act of placing the hand on the altar of the deity who was invoked as witness. In the judicial proceedings of both the last-named nations, oaths were employed, but not universally; and in examples of their extrajudicial use, the literatures of both abound. In the Christian dispensation, the solemnity of an oath is enhanced by the elevated idea of the sanctity and perfection of the deity.

The lawfulness and fitness of the practice, under circumstances of due solemnity, are commonly recognized by Christians. Some communions, of which the most remarkable are the Moravians and the Society of Friends, applying literally the words of Christ (Matt. v. 34), regard all oaths as unlawful. But other communions generally restrict this prohibition to ordinary and private discourse, and find in Rom. i. 9, 2 Cor. xi. 31, Gal. i. 20, Phil. i. 8, and 1 Thess. ii. 5, full warrant for the lawfulness of oaths in judicial and other solemn use. The forms were very various—one of the most solemn consisting in the act of placing the hand on the altar of the deity who was invoked as witness. In the Christian dispensation, the solemnity of an oath is enhanced by the elevated idea of the sanctity and perfection of the deity.
by raising the hand to heaven, or by laying it upon the breast or the head. In canonical processes, the oath was often administered to the party kneeling. The forms varied very much; the most general being that which the English oath still retains (See me Deus adjure). Divines commonly require, in order to the lawfulness of an oath, three conditions (founded upon Jer. iv. 2), viz., *truth, justice, and judgment*—that is to say (1), that the asseveration, if the oath be assertive, shall be true, and that the promise, if the oath be promissory, shall be made and shall be kept in good faith; (2), that the thing promised shall be objectively lawful and good; (3), that the oath shall not be sworn without due discretion and deliberation, and without satisfactory reasons founded on necessity, or at least on grave and manifest utility.

The Mohammedans do not employ oaths in their judicial proceedings; but they regard deliberate perjury, even when extra-judicially committed, as sinful, and deserving of God's vengeance. For this, however, they require that the oath should be an express adjuration of God himself by some one of his well-known holy names; that the jurant should be of full age and intelligence; and that the oath should be sworn deliberately, and with the intention of swearing.

**OATH**, in point of law, is that kind of solemn declaration which is necessary as a condition to the filling of some office more or less public, or of giving evidence in a court of justice. Nearly all the great public offices of the state in this country can only be filled by persons who are willing to take an oath before acting in such office. The most important office of all—that of king or queen of Great Britain—requires a coronation oath (q.v.). Members of parliament also require to take the oath of fidelity and true allegiance, and promising to maintain the succession, in a full house, before taking their places (3). When this oath is taken, it has an administrative, or even a constitutional effect. In 1898 and 1871 great changes were made as to oaths. The oath of allegiance and the official oath must now be taken by the great officers of State, such as the first lord of the treasury, chancellor of the exchequer, lord chancellor, secretaries of state, etc., in England. In Scotland the same is taken by the lord keeper of the great seal and privy seal, lord clerk register, lord advocate, and lord justice-clerk; so in Ireland by the lord lieutenant, lord chancellor, and two others.

The oath of allegiance and the judicial oath are taken by the superior judges in each kingdom, justices of the peace, and Scotch sheriffs. No others, except under the clerical and parliamentary oaths, are to take the oaths of allegiance, supremacy, and adjuration, or any oath substituted for these. All others who used formerly to take oaths now make declarations of fidelity in their office, and in some cases also one of secrecy.

The most important oaths affecting the general public are those which are required to enforce the truth from witnesses in courts of justice. It may be stated that jurymen, where they are called upon to exercise their functions, are also required to take an oath. The oath is read to the juror thus:—"You shall well and truly try the issue between the parties, and a true verdict give, according to the evidence, so help you God;" and the juror kisses the New Testament. Witnesses who are called to give evidence must all be first sworn in a similar manner, the words being, "The evidence you shall give shall be the truth, the whole truth, and nothing but the truth, so help you God." Hence the person who is a witness must have sufficient understanding to know the nature and obligations of an oath; and on this ground, young children are incompetent to be witnesses. Another condition or qualification required in the party who takes an oath as a witness is, that he has a competent sense of religion: in other words, he must not only have some religious knowledge, but some religious belief. He must, in substance, believe in the existence of a God, and in the moral government of the world; and though he cannot be questioned minutely as to his particular religious opinions, yet, if it appear that he does not believe in a God and future state, he will not be allowed to give his evidence, for it is assumed, that without the religious sanction, his testimony cannot be relied upon.

Long, however, as a witness appears to possess competent religious belief, the mere form of the oath is not material. The usual practice in England and Ireland is, for the witness, after hearing the oath repeated by the officer of court, to kiss the four gospels by way of assent; and in Scotland, the witness repeats similar words after the judge, standing and holding up his right hand, "swearing by Almighty God, as he shall answer to God at the great day of judgment," but without kissing any book. Jews are sworn on the Pentateuch, keeping on their hats, and their oath ends with the words, "so help you Jehovah." A Mohammedan is sworn on the Koran; a Chinese witness has been sworn by kneeling and breaking a china saucer against the witness-box. Thus the mere form of taking the oath is immaterial; the witness is allowed to take the oath in whatever form he considers most becoming under his own circumstances—the essential thing being, however, that the witness acknowledge some binding effect derived from his belief in a God or a future state.

The policy of insisting upon the religious formalities attending the taking of an oath, has been much discussed of late years, and it has been disputed whether atheists, who avow an entire absence of all religious belief, should be entirely rejected as witnesses (as is sometimes the case), and justice be thereby frustrated. The objections of Quakers, Moravians, and Separatists to taking an oath have long been respected as not being fundamentally at variance with a due sense of religious feeling, and hence they have by
statute been allowed to make an affirmation instead of taking the oath. In 1854 another concession was made to those who, not being Quakers, yet refuse to take the oath from sincere conscientious motives, and these are now also allowed to affirm instead of swear. But the law remains as before, that atheists and persons who admit that they have no religious belief whatever, are excluded from giving evidence in courts of justice.

When a witness, after being duly sworn, gives false evidence in a court of justice or in a judicial proceeding, and his evidence so falsely given is material, he commits the offense of *perjury*; but it is necessary, in England, not only that two witnesses shall be able to prove the falsity of such evidence, but also that the party should be proceeded against in the first instance, before a justice of the peace, or by order of a judge, or the attorney-general, it being found that frivolous and unfounded indictments were often preferred against witnesses by disappointed or hostile parties. As a general rule, perjury cannot be committed except in some judicial proceeding, or rather the giving of false evidence cannot be punished except it has been given in some judicial proceeding. The practice formerly existed of persons voluntarily taking oaths in various matters not connected with any judicial proceeding; and creditors often in this manner sought to add to other securities by insisting on a formal oath before a justice of the peace, in some isolated matter of fact. This practice was put an end to by the statute 5 and 6 Will. IV, c. 62, by which justices of the peace were prohibited from administering or receiving such oaths touching any matter or thing wherein such justice has not jurisdiction or cognizance by some statute. It is left to some extent to the discretion of the justice whether the particular matter is one as to which it is proper to administer an oath by him, for a false declaration may be made in the form given, by that statute; and if the party make a false declaration, he commits a misdemeanor. Unlawful oaths generally mean oaths taken by members of secret and illegal societies of a treasonable description; and statutes long ago passed to inflict penalties on all who took or administered such oaths.

**OATH or COLUMNY, in Scotch law, means an oath taken by a party at the instance of his opponent, that the allegations were well founded. Oaths of verity and credulity are oaths that a debt or claim is well founded.**

**OATHS, MILITARY.** The taking of the oath of fidelity to government and obedience to superior officers, was, among ancient armies a very solemn affair. A whole corps took the oath together, sometimes an entire army. In modern times, when so many other checks are used for maintaining discipline, the oath has become little more than a form. In the United Kingdom a recruit enlisting into the army or militia, or a volunteer enrolling himself, swears to be faithful to the sovereign, and obedient to all or any of his superior officers; also to divulge any facts coming to his knowledge which might affect the safety of his sovereign, or the stability of that sovereign's government. The members of a court-martial take an oath to try the cases brought before them justly, according to the evidence, to keep secret the finding until confirmed by the crown, and to keep secret always the opinions given by the members individually. The only other military oath is the common oath of a witness before a court-martial to tell the truth, the whole truth, and nothing but the truth.

**OAXACA. See OMAJAC.**

**OB, or OBT.** The great river of western Siberia, rises in two branches, the Bia and the Katume or Katunga, both of which have their origin in the Altai mountains, within the frontier of the Chinese dominions, about lat. 49° n., and long. 80° e. These branches flowing in a n.w. direction, unite to form the Ob at the town of Bisk in lat. 53° 30' n., long. 87° e. Pursuing a winding course, with a general n.w. direction, the Ob reaches the meridian of 75° e., when it turns w., and maintains that direction to its confluence with the Irtish, the greatest of its tributaries. It then flows n.w., n., and n.e. to its mouth in the gulf of Ob, which it reaches after a course of 2,000 miles. Its chief affluents on the right are the Tom—a swifter stream than the Ob, 400 m. in length, and navigable for the last 280 m. from the beginning of May till July—the Tehulim, and the Ket. The principal affluent on the left is the Irtish, which, rising within the frontier of the Chinese territories, traverses the Altai mountains, and after a course longer than that of the Ob itself, joins that river 250 m. below Tobolsk. The trade of the Irtish, of which the center is Tobolsk, is important. The principal towns on the banks of the Ob are Narim, Sargut, Berezow, and Obdorsk.—The gulf of Ob is a long inlet of the Arctic ocean, 450 m. in length by about 100 m. in breadth. At present only a few steamers ply on the great water-system of the Ob; but that system, communicating as it does between Siberia, the Chinese territories, and European Russia, is, without doubt, destined to become a great commercial thoroughfare. The explorations of prof. Nor- denskajd, but more especially the tentative voyages of capt. Wiggins in 1874 and 1876, from Dundee through the Kara sea to the gulf of Ob, have amply proved the feasibility of this direct route. This river is very rich in fish. Below its junction with the Irtish it divides itself into several parallel streams; and in the flood season it inundates great tracts of country, and presents the appearance of a waste of waters, its desolate uniformity broken only by the occasional tree-tops that rise above the surface. At Obdorsk, about 20 m. s. of the southern border of the gulf of Ob, the river freezes in the middle of October, and breaks up about the middle of May.
OBADIAH, one of the "minor prophets" of the Old Testament, regarding whom absolutely nothing is known. His book or "vision"—the shortest of the Jewish Scriptures—appears, from internal evidence, to have been composed after the destruction of Jerusalem by the Chaldeans, 588 B.C., and consists of two parts. The first is a prophecy of the downfall of Edom. The second foretells the future redemption and glory of the house of Jacob, in which Edom—for his unbrotherly conduct—shall not share; but, on the contrary, be burned up as "stubble."

OBADIAH (2nd), the fourth of the minor prophets, according to the Hebrew and English arrangement, and the shortest book in the Old Testament. Some have conjectured that the author of it was the steward of Ahab's household; but this opinion has nothing to support it except the identity of name. There are several striking resemblances between Obadiah and Jeremiah, Joel and others of the minor prophets; but critics have not succeeded in determining to whom priority of date is to be assigned. The better opinion, however, seems to be that Obadiah preceded Jeremiah, or was contemporaneous with him. His prophecy is a denunciation of Edom, the inhabitants of which are addressed as deceived by their pride and fancied security, from which they would be utterly cast down; and as denounced for their violence against Israel, their refusal to help him, their joy over his calamities, and their profit from his fall. Their doom is to be in the line of their sin; as they had done to others so it should be done to them. In contrast with their sin and destruction, the deliverance and holiness of Zion would be conspicuous: Jacob and Joseph would be as a fiery flame, and Esau would be consumed as stubble. The inhabitants of the south would possess Idumea, and those of the plain, Philistia; Judah would extend to Samaria, Benjamin to Gilgal, and the captives of the ten tribes, to the borders of Sidon; saviors would dwell in Zion, and the kingdom would be the Lord's.

O'BAN, a parliamentary burgh and sea-port, Argyllshire, Scotland, on a bay of the same name, 20 m. (in direct line) n.w. of Inveraray. The bay is protected from every wind by the island of Kerrera on the w., and by the high shores of the main-land, and is overlooked on the n. by the picturesque ruins of Duneddy castle. It is from 12 to 24 fathoms deep, and although the girdle of hills that seems to surround it gives it the appearance of a lake, it is easily accessible, and could afford anchorage to 300 sail. Oban is the great rendezvous for tourists in the west Highlands. Its importance dates chiefly from the beginning of the present century. The burgh now contains a number of churches, several hotels and inns, schools, banks, etc. Within 3 m. of Oban is Dunstaffnage castle, the seat of the Stewarts, the family of the chiefs of the chief clans, from whom it derived its name. It is a gabled house, in a magnificent situation, on a mound of land, opposite a rocky promontory, and the short distance over the sea to it, which is a spit of land, is a proposition for crossing. Oban is a very old burgh, and the priory church of St. Finnan is said to have been founded here. In the year 1146, it is said, the body of St. Finnan was translated to its present site, and the church consecrated in his honor. It is said to be the earliest burying-ground in Scotland. St. Finnan was, by the consent of all Scotchmen, an apostle of the Scottish nation. There is a tradition, which has never been proved, that the stones on which the church was built were brought from Scone, the ancient seat of the kings of Scotland.

OBE, or Oor (etymology unknown), the name given to the magical arts or witchcraft practised by a class of persons among the negroes of the West Indies. The practiser is called an oobah-man or oobah-woman. It differs in no essential respect from the corresponding superstitions all the world over. See Magic, Witchcraft.

OBEDIENCE, in canon law means the duty by which the various gradations in ecclesiastical organization are held subject, in all things consistent with the law of God or of the church, to the several superiors placed immediately above each, respectively, in the hierarchical scale. Thus priests and inferior clergy owe canonical obedience to the bishop, and priests are bound thereto by a solemn promise administered at ordination. The bishop primitively took a similar oath to the metropolitan: but by the modern law, the jurisdiction of the metropolitan is confined to the occasions of his holding a visitation, or presiding in the provincial synod. Bishops, by the present law of the Roman Catholic church, take an oath of obedience to the pope. This obedience, however, is strictly limited by the canons, and is only held to bind in things consistent with the divine and natural law. In ecclesiastical history the word obedience has a special signification, and is applied to the several parties in the church, which, during the great western schism (q.v.), adhered to the rival popes. Thus we read of the "Roman obedience," which included all who recognized the pope chosen at Rome, and the "Avignon obedience," which meant the supporters of the Avignon pope. So, again, historians speak of "the obedience of Gregory XII.," and "the obedience of Benedict XIII.," etc. Applied to the monastic institute, obedience means the voluntary submission which all members of religious orders vow, at the religious profession, to their immediate superiors, of whatever grade in the order, as well as to the superior general, and still more to the rules and constitutions of the order. This forms, in all orders, one of the essential vows. It is, however, expressly confined to lawful things; and although it is held that a superior can command certain things under pain of sin, yet Roman Catholics hold the notion that the command of a superior can render lawful that which is of its own nature, or by the law of God, sinful or bad. The name obedience is sometimes given to the written precept or other formal instrument by which a superior in a religious order communicates to one of his subjects any special precept or instruction—as, for example, to undertake a certain office, to proceed upon a particular mission.
to relinquish a certain appointment, etc. The instruction, or the instrument containing it, is called an obediencé, because it is held to bind in virtue of religious obedience.

OBEID', EL, a t. in s. Kordofan, e. central Africa, capital of the province; 230 m. s.w. of Sennara and about 120 m. w. of the Nile, which forms the e. boundary of the state; pop. about 30,000. The town consists mainly of straw or reed huts, but there are 5 mosques, a market-place, and a hospital. The place is in the midst of a wild plain, and a strong thorn hedge is necessary to keep off the wild beasts at night. The exports are ivory, gold, silver, hides, ostrich feathers, and gums.

O'BEIRNE, Thomas Lewis, D.D., 1748-1838; b. Ireland; was educated at St. Omer's, a Roman Catholic college in France; became Protestant, and took orders in the Episcopal church; was chaplain to lord Howe's fleet at the beginning of the American war for independence; in 1776 he preached in St. Paul's, the only Episcopal church in New York city not destroyed by the great fire of that year; in 1782 acted as private secretary to the lord lieut. of Ireland, and received from him in 1783 two valuable livings, in Northumberland and Cumberland; in 1796 he was made bishop of Ossory, and in 1798 was translated to the see of Meath, where he died. He was the author of a Vindication of the conduct of admiral and gen. Howe, some political tracts, and a poem, The Crucifixion.

OBELISK, a word derived from the Greek obelos and obelidos, signifying a spit, applied to prismatic monuments of stone and other materials, terminating with a pyramidal or pointed top. These monuments, called tekhenu, were placed upon bases before gateways of the principal temples in Egypt, one on each side of the door. They served in Egyptian art for the same purposes as the stele of the Greeks and columns of the Romans, and appear to have been erected to record the honours or triumphs of the monarch. They have four faces, are cut out of one piece, and are broader at the base than at the top, at a short distance from which the sides form the base of a pyramidion in which the obelisk terminates. They were placed upon a cubical base of the same material, which slightly surpassed the breadth of their base. Each side of the obelisk at the base measures 5/8th of the height of the shaft, from the base line to that where the cap, or pyramidion commences. The cap is also 5/8th of the same height. Their bases are slightly concave, to increase their apparent height. Their height varies from upwards of 100 ft. to a few inches, the tallest known being that of Karnak, which rises to 105 ft. 7 inches. The sides are generally sculptured with hieroglyphs and representations, recording the names and titles of kings, generally in one line of deep-cut hieroglyphs down each side. The pyramid of obelisks was sometimes decorated with subjects. The mode by which they were made appears to have been to hew them first in the rough out of a solid piece in the quarries, and one unfinished specimen thus prepared still remains in the quarries of Syene. They were transported down the Nile during the inundation, on rafts to the spot where they were intended to be placed, and raised from their horizontal position by inclined planes, aided by machinery. Some obelisks, before their erection, had their pyramid capped with bronze gilded, or gold, the marks of such covering still being evident on their surfaces. Under the Roman empire, they were raised by pulleys and heavy tackle. The difficulty of erecting the fallen ones in the ages of renaissance, as also the mechanical application of raising and lowering stone obelisks in Luxor, and erecting it in the Place de la Concorde in 1831 by Le Bas, show the difficulties experienced by the ancients. The use of obelisks is as old as the appearance of art itself in Egypt; these grand, simple, and geometric forms being used in the 4th dynasty, and continued till the time of the Romans. Their object is enveloped in great obscurity. At the time of the 18th dynasty, it appears that religious ceremonies and oblations were offered to the obelisks, which were treated as divinities. Their sepulchral use is evinced by their discovery in the tombs of the 4th dynasty, and the vignettes of early papyri. No large obelisk is older than that of Matarieh or Heliopolis, erected by Osoretesen I. about 1900 B.C.; and that of Beggrig or Crocodilopolis is, in reality, only a stele. Thothmes I. placed two of large size before the granite sanctuary of Karnak, and his daughter Hatsu, two others of about 90 ft. high before the second propylon. Additional sculptures were made on these obelisks by Setos I., who restored them. Thothmes III. appears to have erected many obelisks. The obelisk of Constantine, erected to record his conquests of Naharania or Mesopotamia. Two others, which formerly stood at Heliopolis, were subsequently re-erected by Rameses II. at Alexandria, and have been popularly known as Cleopatra's Needles. One still stands there erect; the other, which long lay prostrate, was after an adventurous voyage brought to London in 1878, and erected on the Thames embankment. The highest of all obelisks, that of St. John of the Lateran, appears to have been removed from Thebes, and set up by Thothmes IV. A small obelisk of Amenophis II., said to have been found in the Thebaïd, apparently from Elephantine, is in the collection of the duke of Northumberland at Sion. Setos I. commenced the Flaminian obelisk, subsequently completed by Rameses II., and placed at the temple of Heliopolis. It was removed to Rome by Constantius, and found 16 ft. under the surface in the pontifical of Gregory XIII., and erected in that of Sextus V. by the architect Fontana. The other obelisks of Rameses II. are, the one at the Luxor quarter of Thebes, the companion of which was removed to the Place de la Concorde at Paris in 1833; the two obelisks of
San or Tanis; that of the Boboli gardens of Florence, transported from the circus of Flora at Rome; the obelisk of the Rotunda at Rome, erected by Clement XI., 1711 A.D.; and that of the Villa Mattieli, which decorated the Ara Celi of the capitol. A fragment of another obelisk was in the Collegio Romano. No obelisks are known of other monarchs till the 29th dynasty. That of the Monte Citorio at Rome, erected by Psammethicus II. at Heliopolis, was transported by Augustus to the Campus Martius, having been examined 1813 A.D. and erected with great fanfare by the Viceroy Prince of Pius VI. Two other obelisks of small size, made of black basalt, dedicated by Nekttherhebi or Nectanebos II., at Hermopolis, commonly known as the obelisks of Cairo, are in the British museum. Ptolemy Philadelphia is said to have erected in the Arsinoecum at Alexandria a plain obelisk of 80 cubits, cut in the quarries by Nectabis. It was set up by the architect Satyrus. Two obelisks, erected by Ptolemy Euergetes II. and his wife Cleopatra, stood before the temple of Philae, one of which was removed to Corfe castle by Mr. Bankes. The so-called Pamphiliano obelisk at Rome, erected by E. Berini in 1651, in the Piazza Navona, under the pontificate of Innocent X., was removed from the Circus of Maxentius, having, as their hieroglyphical legends testify, been originally erected by Domitian before the Serapeum at Rome. The last of the Roman obelisks was the Barberini, which was found in 1633 on the site of the Circus of Aurelian, and finally erected in 1642 on the Monte Pincio. It was placed by the emperor Hadrian before the mausoleum or cenotaph either of himself or Antinous, between 132-8 A.D. Barbarous hieroglyphs, found on the Sallustian obelisk, are copied from the Flaminian obelisk. It is supposed to have been transported to Rome, adorned with hieroglyphs, by Sallustius Crispus, prefect of Numidia, and to have been set up in the gardens of Sallust, in the reign of Vespasian. It was erected by Antonini, 1789, before the Church of Trinita del Monte. It has been seen how, on the renaissance of the arts, the obelisks were restored and applied to the embellishments of modern Rome, either as columns in the centers of piazzas or squares, or else as the ornaments of fountains; one obelisk being set up alone in the center of the piazzas and places of Italy and France, while in antiquity they always stood in pairs before the Pylons.

Two small obelisks, and the apex of a third, have been found in Assyria, in shape of truncated prisms, the apices step-shaped. The most interesting is that of the n.w. palace of Nimrud, of the mathematician is 5 ft. 9 in. high. Each side has five compartments of bas-reliefs, representing the tribute and offerings made to the Shalmanasar. It is covered with a cuneiform inscription, recording the annals of the king's reign, from his first to his 31st year. On it is represented the tribute of Jehu, king of Israel. A second obelisk, of white marble, measures 8 ft. 2 in. high, is covered with bas-reliefs, representing scenes of war and tributes, winding round it like those of a Roman triumphal column. On it is an inscription of Shamas-Pul. The broken apex of a third has a dedication from Ashur-izir-pul II. An obelisk of Semiramis at Babylon is mentioned by Diodorus, and another of Aricarus was interpreted by Democritus. Under the Roman empire, obelisks were used as gnomons, placed in the public spaces, or erected in the spina of the circus. The first removal of obelisks to Rome took place in the reign of Augustus, who placed one in the circus, said to have been originally erected in the reign of Semenbertius, 853 ft. high; and another of 9 ft. less, in the Campus Martius, and had it adjusted and transported to the circus in 203-39; the obelisk erected by Nero in the Circus of Caligula and Nero in the Vatican, and originally dedicated to the sun by Nuncorais, the son of Sesosis, on the recovery of his sight. Two other small obelisks, which decorated the mausoleum of Augustus, and were erected by Claudius or Vespasian and his sons, have been found. Other obelisks are known to have been removed by Constantius, 354 A.D. P. Victor, in his description of the quarters of ancient Rome, reckons 6 of the largest size and 42 others. The Romans added to them brazen spheres and other decorations. Some were removed to Constantinople by Theodosius the younger, and Valentinian, 390 A.D. The translation of the inscription of one of the Roman obelisks made by a Greek or Egyptian, named Hermapol, has been preserved by Ammianus Marcellinus.—Eicher, QuaiaE dapticas (tom. iii. Rom. 1632-54); Zoega, De Origine et Ult. Obeliscorum (to Rom. 1757); Girpiani, Sui Dediti Obelisci di Roma (to. Rom. 1823); L'Hen, Notice sur les Obelisques Egyptiens, (Paris, 1824); (6) Tributes upon Obelisks in the Museum of Classical Antiquities (Svea, Lond. 1853, pp. 206-32); Layard, Nineveh and its Remains, vol. i. p. 346; Sir H. Rawlinson, A Commentary on the Cuneiform Inscriptions (12mo, Lond. 1850).

OBEJLISK (ante). One of the obelisks of Rameses II. at Alexandria, was removed to the United States, 1873, and another was given for the khedive of Egypt and brought to this country by Lord Orman. H. Gorringe Jr., New York, July 21, 1880, and was set up in Central park, with appropriate ceremonies, and addresses by William M. Evarts and others, Feb. 22, 1881. The expense of removal and erection was defrayed by William H. Vanderbilt, of New York.

OBERLIN. See MYSTERIES and MIRACLE PLAYS, ante.

OBERLIN, a village in Lorain co., Ohio, on the Lake Shore and Michigan Southern railroad, 34 m. s.w. of Cleveland; the seat of the well-known Oberlin college; pop. 70, exclusive of the students, 2,888. The village has 6 churches, a national bank, a union school-house, a conservatory of music, a hotel, and 2 newspaper offices. The First
Oberlin.  

**OBERLIN.** JOHANN FRIEDRICH, distinguished for his active benevolence and usefulness, was b. at Strasburg, Aug. 31, 1740; and in 1766 became Protestant pastor of Waldbach, in the Ban de la Roche or Steinhthal, a wild mountainous district of Alsace. Here he spent the remainder of his life, combining an affectionate diligence in the ordinary duties of the pastorate, with wise and earnest endeavors to promote the education and general prosperity of the people. The district had suffered terribly in the thirty years' war, and the scanty population which remained was sunk in poverty and ignorance. Oberlin introduced better methods of cultivating the soil, and various branches of manufacture. The population, which was scarcely 500 when he entered on his labors, had increased to 5,000 at the close of the century. Yet, though animated in all his actions by the most pure and disinterested piety, it may be questioned if he did not carry his moral supervision too far when he kept a register of the moral character of his parishioners, and searched with the minuteness though not the motives of an inquisitor, into the most insignificant details of their private life. Oberlin was ably assisted in his reformatory labors by his pious housekeeper, Luise Schepler, who survived her master eleven years. He died June 1, 1826. Notwithstanding the humble sphere in which his days were spent, his fame as a philanthropist has extended over the world, and his example has stimulated and guided many. See *Memoirs of Oberlin,* by the rev. T. Sims, M.A. (Lond. 1830), the *Memoirs of Oberlin* (1852), the biography by Bodemann (1868), and that by Spach (Paris, 1860).

**OBERLIN COLLEGE,** at Oberlin, Lorain co., Ohio, was founded in 1834 as a Christian institution for the liberal education of both sexes under conditions favorable to persons of limited pecuniary resources. It admits students without distinction of sex or color. It has a preparatory department, embracing a classical school with a three years' course, and an English school. The department of philosophy and the arts embraces the classical and scientific or regular "college" course, and the literary course; the study of Greek and in part that of Latin and mathematics being omitted from the latter. The theological department is in close though not official relations with the Congregationalists. It has an endowment of $30,000. The college itself has a fund of $115,000, and scholarships are available to students at a low rate. The college buildings, though plain are spacious and convenient. Number of instructors in 1878, 25; students, 316. President, James H. Fairchild, D.D.

**OBERLIN THEOLOGY,** designates the peculiar views generally supposed to have been taught at Oberlin college during the earlier years of its history, by its president the rev. Charles G. Finney and his colleagues. Many from without on the one hand looked at the institution through the mists of prejudice and misapprehension; and on the other hand the views actually held and taught within the college were probably improved by increased reflection and growth in the Christian life. 1. The general system of doctrine taught was of a modified Calvinistic type in which the leading thoughts seemed to be that responsibility pertains to the voluntary action of the will, and that every moral action is free from itself, released from the pressure of the motives around him, all that is blameworthy or commendable in his character and conduct; that sin is a voluntary failure in duty and holiness a voluntary performance of it; and that a voluntary total moral depravity exists among unregenerate men. The repentance which is a condition of salvation is a forsaking of sin, the obligation to forsake it resting on the sinner, and the power to forsake it being always within his reach. The power to commit sin implies the power to forsake it. The Holy Spirit's work in conversion is a moral work effected by the presentation of motives through the truth; and the consequent work of sanctification is of a similar kind. As God's sovereignty works in harmony with human freedom, one factor in a man's salvation is his own voluntary consent. As sin cannot be imputed where it is not committed, so righteousness cannot be where it is not possessed. Hence the atonement does not include the transfer of human guilt to Christ or of his righteousness to men; but rather so exhibits in the cross of Christ the faithfulness and love of God, in contrast with the sinfulness of man. Thus the nature of virtue taught at Oberlin were at their basis those of president Edwards, making the well-being of the sentient universe the highest ultimate good; and consequently the voluntary regard for this good, which is called benevolence, the vital element in all virtue. 3. The Oberlin doctrine of sanctification is determined by the view of moral action as necessarily right or wrong; and therefore of moral character as being necessarily at any one instant, either perfectly holy or perfectly sinful. If this be so, conversion necessarily becomes entire consecration, and obedience and faith are essentially complete. The difficulty with the Christian is that he is weak, inexperienced, and liable to temptation. Sanctification therefore becomes a gradual attainment of experience and strength, through repeated enlightenments by the Holy Spirit, accompanied by patient continuance in well doing. And the baptism of the Holy Spirit is to be sought by prayer with faith in the promise of Christ. The Oberlin theology has of late years lost its distinctness, and has been merged in the general current of Christian doctrine.
OBERON, the king of the elves or fairies, and the husband of Titania. The name is derived by a change of spelling from Acheron, more anciently Acheron, and that from the German Acher, i.e., king of the Elves. Oberon is first mentioned as "roi du royaume de la fée" in the old French poem of *Boum de Bordeaux, par de France*, which was afterwards made the basis of a popular prose romance. From the French, Oberon was borrowed by the English poets, Chaucer, Spenser, and others, but he is most familiarly known from his appearance in Shakespeare's *Midsummer Night's Dream*. From old French sources also, Wiedan derived part of the materials of his poem of *Oberon*.

**Obesity, or Corpulence.** May be defined to be "an accumulation of fat under the integuments or in the abdomen, or in both situations, to such an amount as to embarrass the several voluntary functions." A certain degree of fatness is not only quite compatible with health, but, as has been shown in the article *Fats, Animal*, the fatty tissue is of considerable use in the animal body, partly in consequence of its chemical properties; and it is only when the fatness begins to interfere with the discharge of any of the vital powers, that it can be regarded as a morbid condition. Obesity may occur at any period of life, but it is most commonly after the fortieth year that the tendency to an inordinate accumulation of fat begins to show itself. After that time, in the case of men, the pleasures of the table are usually more attractive than in earlier life, and much less muscular exercise is taken; while in women, the cessation of the power of child-bearing induces changes which tend remarkably to the deposition of fat. The extent to which fat may accumulate in the human body is enormous. Daniel Lambert, who died at the age of forty years, weighed 739 lbs.; his exact height is not recorded, but, according to the investigations of the late Dr. Hutchinson (the inventor of the spirometer), the normal weight of a man 6 ft. high should not exceed 175 lbs. Dr. Elliotson has recorded the case of a female child, a year old, who weighed 28 lbs.; and those who are interested in the subject will find a large collection of cases of obesity in *Walde's Cursory Remarks on Corpulence*.

The predisposing causes of obesity are a peculiar habit of body, hereditarily transmitted; inactivity; sedentary occupations, etc.; while the more immediate or exciting causes are a rich diet, including fatty matters, and matters convertible in the body into fats, such as saccharine and starchy foods, and the partaking of such a diet to a greater extent than is necessary for balancing the daily waste of the tissues. "Fat meats, butter, oily vegetable substances, milk, saccharine and farinaceous substances are the most fattening articles of food; whilst malt liquors, particularly rich and sweet ale are, of all beverages, the most conducive in promoting obesity. The fattening effect of figs and grapes, and of the sugar-cane, upon the natives of the countries where these are abundant, is well known. In various countries in Africa and the east, where obesity is much admired in females, warm baths, indulgence, and living upon saccharine farinaceous articles, upon dates, the nuts from which palm oil is obtained, and upon various oily seeds, are the means usually employed to produce this effect."—*Copland's Dictionary of Medicine*, article "Obesity." The knowledge of the means of inducing obesity affords us the best clue to the rational treatment of this affection. It is a popular belief that the administration of acids—vinegar, for example, or one of the mineral acids—will check the deposition of fat; but if the desired effect is produced, it is only at the cost of serious injury to the digestive, and often to the urinary organs. The employment of soap and alkalies, as advocated a century ago by Dr. Flemyn (1 *Discourse on the Nature, Causes, and Cure of Corpulence*, 1760), is less objectionable than that of acids, but the prolonged use even of these is usually prejudicial. The efficacy of one of our commonest sea-weeds, sea-wrack (*Fucus vesiculosus*), in this affection has also been strongly advocated. It is prescribed in the form of an extract, and its value is probably dependent on the iodide contained in it.

A very interesting *Letter on Corpulence*, published in 1868 by Mr. Bunting, in which he records the effect of diet in his own case, after all medicinal treatment had failed, is well worthy of the attention of those who are suffering from the affection of which this article treats. The following are the leading points in his case. He was 66 years of age, about 5 ft. 5 in. stature (and therefore, according to Dr. Hutchinson's calculations, ought to have weighed about 142 lbs.), and in Aug., 1862, weighed 262 lbs. "Few men," he observes, "have led a more active life . . . . so that my corpulence and subsequent obesity were not through neglect of necessary bodily activity, nor from excessive eating, drinking, or self-indulgence of any kind, except that I partook of the simple aliment of bread, milk, butter, beer, sugar, and potatoes, more freely than my aged nature required . . . . I could not stoop to tie my shoe, nor attend to the little offices humanity requires without considerable pain and difficulty; I have been compelled to go down stairs slowly backwards, to save the jar of increased weight upon the ankle and knee joints, and been obliged to puff and blow with every slight exertion" (pp. 10 and 14).

By the advice of a medical friend, he adopted the following plan of diet: "For breakfast I take 4 or 5 ounces of beef, mutton, kidneys, broiled fish, bacon, or cold meat of any kind except pork; a large cup of tea (without milk or sugar), a little biscuit, or one ounce of dry toast. For dinner, 5 or 6 ounces of any fish except salmon, any meat except pork, any vegetable except potato, one ounce of dry toast, fruit out of a puddin,
any kind of poultry or game, and 2 or 3 glasses of good claret, sherry, or Madeira: champagne, port, and beer forbidden. For supper, 2 or 3 ounces of fruit, a rusk or two, and a cup of tea without milk or sugar. For dessert, 3 or 4 ounces of meat or fish, similar to dinner, with a glass or two of claret (p. 18). I breakfast between 8 and 9 o'clock, dined between 1 and 2; took my slight tea meal between 5 and 6; and sup at 9" (p. 40).

Under this treatment he lost in little more than a year (between Aug. 26, 1862, and Sept. 12, 1863) 46 lbs. of his bodily weight, while his girth round the waist was reduced 12½ inches. He reported himself as restored to health, as able to walk up and down stairs like other men; to stoop with ease and freedom; and safely to leave off knee-bandaiges, which he had necessarily worn for 20 years past. He made his own case widely known by the circulation of his pamphlet (which has passed through several editions); and numerous reports sent with thanks by strangers as well as friends," show that "the system is a great success;" and that it is so we do not doubt, for it is based on sound physiological principles. (Mr. Banting died in 1878.)

OBI, or OBEAH. See One, ante.

OBION, a co. in n.w. Tennessee bordering on Kentucky; drained by the Obion river and its creeks, intersected by the Mobile and Ohio, and the Nashville and St. Louis railroads; 550 sq.m.; pop. '80, 22,923—22,807 of American birth, 4,065 colored. The surface is mostly level and fertile; there are extensive forests; Indian corn, wheat, cotton, tobacco, sweet-potatoes, and wool are the staples. Co. seat, Troy.

OBIT (Lat. obitus, a "going down," "death") literally means the decease of an individual. But as a certain ecclesiastical service was fixed to be celebrated on the day of death (in die obitus), the name came to be applied to the service itself. Obit therefore signifies, in old church language, the service performed for the departed. It consisted, in the Roman church, of those portions of the officia defunctorum which are called matins and lauds, followed by a mass for the dead, chanted or occasionally read. Similar services are held on the day to the funeral, and on the 30th day, and the anniversary; and although the name of the obit is only the name of the day, and the 39th day of the anniversary, is used of them all indiscriminately.

OBITER DICUM, a Latin expression meaning, literally, "said by the way" and used in law to denote an expression of opinion by the court in deciding a case which does not bear upon any point directly involved in the case. Such an opinion does not have the force of a precedent, and as it is given without hearing argument is not as likely to be as well considered and precise as opinions on questions direct and not collateral. On the other hand the train of reasoning which leads to a given conclusion can often appear only by examining the side issues and using analogous principles as illustrations. The practice of courts in this respect, and especially where the right of appeal exists, is certainly freer than in the past; and though such utterances may not be authoritative they are often of practical value.

OBJECT, in the language of metaphysics, is that of which any thinking being or subject can become cognizant. This subject itself, however, is capable of transmutation into an object, for one may think about his thinking faculty. To constitute a metaphysical object, actual existence is not necessary; it is enough that it is conceived by the subject. Nevertheless, it is customary to employ the term objective as synonymous with real, so that a thing is said to be "objectively" considered when regarded in itself, and according to its nature and properties, and to be "subjectively" considered, when it is presented in its relation to us, or as it shapes itself in our apprehension. Skepticism denies the possibility of objective knowledge; i.e., it denies that we can ever become certain that our cognition of an object corresponds with the actual nature of that object. The verbal antithesis of objective and subjective representation is also largely employed in the fine arts, but even here, though the terms may be convenient, the difference expressed by them is only one of degree, and not of kind. When a poem or a novel, for example, obrudes the peculiar genius of the author at the expense of a clear and distinct representation of the incident and character appropriate to itself, we say it is a subjective work; when, on the contrary, the personality of the author retires into the background, or disappears altogether, we call it objective. The poems of Shelley and Byron; the novels of Jean Paul Richter, Bulwer Lytton, and Victor Hugo; and the paintings of the pre Raphaelites belong essentially to the former class; the dramas of Shakespeare, the novels of Scott, and the poems of Goethe to the latter.

OBJECT-GLASS, the glass in a telescope (q.v.) or microscope (q.v.), which is placed at the end of the tube nearest the object, and first receives the rays of light reflected from it.

OBLATES (Lat. oblatus, oblata, "offered up"), the name of a class of religious bodies in the Roman Catholic church, which differ from the religious orders strictly so called, in not being bound by the solemn vows of the religious profession. The institute of oblates was one of the many reforms introduced in the diocese of Milan by St. Charles Borromeo, toward the close of the 16th century. The members consisted of secular priests who lived in community, and were merely bound by a promise to the bishop to devote themselves to any service which he should consider desirable for the interest of religion. St. Charles made use of their services chiefly in the wild and inaccessible
Alpine districts of his diocese. This institute still exists, and has been recently introduced into England. Still more modern are the "oblates of the blessed virgin Mary," a body of French origin, which arose in the present century, and has been very widely extended; and whose chief object is to assist the parochial clergy, by holding missions for the religious instruction of the people in any district to which they may be sent. This body also has been established in England and in Ireland. Other similar institutes might be enumerated, but the constitution of all is nearly the same. There is also a female institute of oblates, which was established in Rome, about 1440, by St. Francisca of Rome, and which consists of ladies associated for charitable and religious objects, and living in community, but bound only by promise, and not by vow.

OBLIGATION is a term used in Scotch law to denote the binding effect of any legal contract, and is often used synonymously with contract or promise. An obligation is said to be pure when it may be instantly demanded (called in England an absolute contract). An obligation is conditional when it depends for its legal effect on some events which may or may not happen. Obligations are also divided into verbal and written.

OBLIGATION or CONTRACTS, the legal bond which demands that the contracting parties shall carry out their agreement, and including the right to enforce the contract by legal procedure. This extension of the word obligation to include the legal effect and remedy is important, and upon the subject the United States supreme court has said that "the laws which exist at the time and place of making the contract and where it is to be performed enter into and form a part of it. This embraces alike those which affect its validity, construction, discharge, and enforcement." In the United States constitution, art. I, sec. 10, is found this provision: "No state shall pass . . . any bill of attainder, ex post facto law, or any law impairing the obligation of contracts." The question then arises, to what obligations of a contract; to what contracts does the prohibition apply, and what laws are of such a nature as to violate that prohibition? The first question is answered in the definition given above, and it should be added that the legal bond is derived from those laws only which were in existence at the time of the contract and thus supposed to be in the contemplation of the parties. As to the second, all contracts are embraced within the meaning of the law, if they respect rights or claims which could be brought before a court of law or equity, whether they are expressed or implied, executed or executory. Conveyances, statutory grants, and private charters issued by a state undoubtedly come within the prohibition. Against this the states have protested, but in the great Dartmouth college case the supreme court decided that a private charter is a contract between the state and the corporation, and cannot be repealed or impaired by subsequent legislation, and that such collateral stipulations as exemption from taxation are of the essence of the contract. This decision has been many times reaffirmed but is still doubted by many eminent lawyers on the ground that a state cannot sell by contract its sovereign functions. Municipal corporations have no such immunity as to their charters, as they are political in their nature. The contract of marriage has been held not to be of such a nature as to create obligations in the sense used in the constitution, but on the other hand it has been said that a law creating new grounds for the divorce of parties married before its passage would impair the obligation of the marriage contract and would therefore be unconstitutional. As to remedies for violation of contract obligations, it is not considered that the state impairs the obligation by changing the nature and extent of the relief offered, or by varying the time and mode in which these remedies may be pursued, or by barring all relief after a prescribed time. The case would be different were all remedies to be abolished. The right of the state to pass regulations for preserving public order, health, and morality is not to be restrained by a forced interpretation of the clause of the constitution under discussion. The right of a state legislature to forever exempt from taxation any property, and thus to bind its successors and, as it were, compromise the sovereignty of the state, is not yet fully settled; but the prevailing doctrine seems to be that such exemption may be made for good or valuable consideration, as all property rights are subject to the state powers of taxation and eminent domain. Congress has been given the power of passing general bankrupt laws, but this power is not exclusive; such laws, however, passed in aid of debtors, as stay laws, exemption laws, or statutes of limitation, conflict with the prohibition of impairment of obligations when they are so framed as to act retrospectively. Licenses, public offices, and permission by statute to do certain acts, as to sue the state, are not in their nature contracts; no consideration exists, and the grant may be repealed without impairing any contract obligation. Thus it has repeatedly been held that license to establish a lottery or to carry on a dangerous manufacture may at any time be revoked. It will be noticed that the constitution does not extend the prohibition of impairment to congress as well as to the states, and however opposed to common honesty and public policy such an act would be, there is little doubt that congress has the legal power to pass such laws.

OBLIGATO, in music. When a musical composition is constructed in more than one part, any part is said to be obbligato which is not merely employed to strengthen the others, but is necessary to the melodic perfection of the whole. An accompaniment is said to be obbligato which does not consist of mere chords, but has its own melody.
OBOE. See HATTEBO.

OBOULUS (Gr. oboulos or obelos, a spit), the smallest of the four common Greek coins and weights, was originally, as is generally supposed, a small piece of iron or copper, similar in form to the head of a spit, or spear head, whence its name. In this form it was used as a coin, and a handful of "oboli" was equivalent to a drachma (q.v.). It was subsequently coined of silver, and in the ordinary round form, but still retained its original value; its value, both as a coin and a weight, was now fixed as 1 part of a drachma. So that in the Attic system it was equivalent to 12d. and 15½ Troy grains respectively; while the Egyptian obolus was worth 26d. as a coin, and 25½ Troy grains as a weight. Multiples and submultiples of this coin were also used, and pieces of the value of s, 3, 4, 5, and 4 of an obolus respectively, are to be found in collections of oboli.

O'BOULUS, in natural history. See INVERTEBRATE ANIMALS, sub-kingdom molusca, division A; class III. family 10.

OBOOKTAH, Henry, b. in the island of Hawaii, about 1735. In his childhood in a civil war his parents were killed before his eyes. Taking his infant brother upon his back, and attempting to escape, his brother was pierced through with a spear, and he was made prisoner and taken to the house of the man who had killed his parents. His uncle, the high priest of the island, found him here and took him home. He was kindly treated by his uncle, but he was unhappy, often weeping day and night. He gladly in 1805 embarked to come to the United States with capt. Brittain of New Haven, Conn., and for a while resided with the captain. He attended church, and showed a great desire for instruction, lingering about the college buildings. Finding the desire unattained, and this man seemed more interested in their minds than in the treasures which were inaccessible to him, he sat down weeping on the threshold. The Rev. Edwin W. Dwight, a resident graduate, found him there, and taking him to his house, gave him instruction. Samuel J. Mills visiting New Haven soon became acquainted with him, and Henry expressed a desire to "learn to read the Bible, and go back to his native islands and tell the people of God. Mills took Henry to his father's house in Torrington, where he rapidly improved in religious and secular knowledge. Afterward he accompanied Mr. Mills to Andover, where he spent two years. By invitation of James Morris, he spent the winter of 1813 at the Litchfield grammar school. In the autumn of 1814 by advice of friends he placed himself under the care of the North congregation (Congregational) of Litchfield co., for the direction of his studies; and Nov. 15, 1815, he was received under the care of the American board. A foreign mission school having been established at Cornwall, Conn., Obooktah was placed there to be educated. But on Feb. 17, 1818, he was stricken with fever, and soon died. But he had not lived in vain. His earnest desire for an education, shown in New Haven, led to the establishment of the Cornwall school, and the education of several of his countrymen, and to the awakening of the Christian community to a deep interest for the Sandwich islands; to which a mission was commenced soon after his death.

O'BRIEN, a co. in n.w. Iowa, drained by Little Sioux river, and Willow creek; on the Chicago, Milwaukwe, and St. Paul railroad; 578 sq. m.; pop. 70, 715—610 of American birth. The surface is mostly prairie, and the soil fertile. The principal productions are corn, wheat, oats, and barley. Co. seat, Primghar.

O'BRIEN, Fitz-James, 1829-62; b. Ireland; emigrated to America in 1850, and, in April 1861, joined the New York 7th regiment. In the following January he was placed on the staff of gen. F. W. Lander, was wounded in a skirmish Feb. 16, 1862, and died from the effects of a surgical operation. He was a contributor in prose and verse to the Atlantic Monthly. He was happy in his choice of themes, especially for his poetical work, and he gave them noble treatment, vigorous but refined. He was a brave soldier. He is called the ablest of those of the New York Bohemians, from 1850 to 1862, who are now dead. He was a member of that literary coterie to which Charles G. Halpine, E. C. Stedman, Walt Whitman, and T. B. Aldrich belonged, and in a publication of the present year entitled Life, Poems, and Stories of Fitz-James O'Brien, edited by William Winter, who knew him well, are included his stories, most distinguished for imaginative ability and literary art, The Diamond Lens and the Golden Ingot.

O'BRIEN, Jeremiah, 1740-1818; b. Ireland; came to this country and settled in Maine; in 1775, with only a few assistants, struck the first hostile blow in the American waters, capturing the Margareta, a British armed vessel, for which act he was appointed capt. of privateers. Soon afterwards he captured other English vessels, and was commissioned capt. in the state navy, but finally was made prisoner, and confined in the prison-ship Jersey for six months, then sent to England and placed in Mill prison, but a year later escaped, and returned to Maine. He held the office of collector at Machias, at which place he died.

O'BRIEN, William Smith, b. in 1803, was the second son of the late sir Edward O'Brien, bart., of Dromoland, in the county of Clare, Ireland, and uncle of the present lord Inchiquin; that ancient barony having recently passed to the Dromoland O'Briens on the failure of the elder branch. William S. O'Brien was educated at Harrow school,
where he passed to Trinity college, Cambridge. He entered parliament for the borough of Ennis in 1828, and was a warm supporter of Catholic emancipation. In 1835 he was returned on advanced liberal principles for the county of Limerick, and for several years strongly advocated the claims of Ireland to a strictly equal justice with England, in legislation as well as executive measures. Professing his inability to effect this in the united legislature, and having embroiled himself with the speaker by refusing to serve on committees (for which refusal he was committed to prison in the house by the speaker's order), he withdrew from attendance in parliament in 1841, and joined actively with Daniel O'Connell (q.v.) in the agitation for a repeal of the legislative union between England and Ireland.

In the progress of that agitation, a division having arisen on the question of moral as against physical force between O'Connell and the party known as "young Ireland," O'Brien sided with the latter; and when the political crisis of 1848 eventuated in a recourse to arms, he took part in an attempt at rebellion in the s. of Ireland, which in a few days came to an almost ludicrous conclusion. He was in consequence arrested, and, having been convicted, was sentenced to death. The sentence, however, was commuted to transportation for life; and after the restoration of tranquility in the public mind in Ireland, he, in common with the other political exiles, was permitted to return to his native country. From that date (1856) he spent much of his time in foreign travel; and although he wrote more than once in terms of strong disapproval of the existing state of things, he invariably abstained from all active share in the political proceedings of any party. He died June, 1864.

**Obscene Prints, Books, or Pictures**, exhibited in public render the person so doing liable to be indicted for a misdemeanor. Persons exposing them in streets, roads, or public places, are also liable to be punished as rogues and vagabonds with hard labor. An important change in the law was effected by lord Campbell's act (20 and 21 Vict. c. 88), which was passed to suppress the traffic in obscene books, pictures, prints, and other articles. Any two justices of the peace, or any police magistrate, upon complaint made before him on oath that such books, etc., are kept in any house, shop, room, or other place, for the purpose of sale, or distribution, or exhibition for gain, or on hire, and that such things have been sold, etc., may authorize a constable to enter in the day-time, and, if necessary, use force by breaking open doors, or otherwise to search for and seize such books, etc., and carry them before the magistrate or justices, who may, after giving due notice to the occupier of the house, and being satisfied as to the nature and object of keeping the articles, cause them to be destroyed.

**Obscene Prints, Books, or Pictures (ense).** By U. S. revised statutes, sec. 2,491, all persons are prohibited from importing into the United States from any foreign country any obscene book, pamphlet, paper, writing, advertisement, circular, print, picture, drawing, or other representation, figure, or image, on or of paper or other material, or any instrument or drug for any immoral purpose. No invoice or package containing such articles shall be admitted at the custom house. Any judge of any U. S. district or circuit court, before whom complaint in writing is made upon knowledge or belief, and if upon belief, setting forth the grounds of such belief, supported by complainants' oath, may issue a warrant to any marshal or deputy marsh[al] to search for and seize such immoral articles, and to make return so that they may be condemned and destroyed. The proceedings, as in other cases of municipal seizure, are subject to appeal or writ of error. It was held in _The U. S. vs. One Case of Stereoscope Slides_, Sprague, 467, that where an invoice contains any immoral articles, the whole is forfeited. By sec. 3,885, obscene publications, etc., are excluded from the mails. By sec. 3,886 any person who shall knowingly deposit in or take out from the mails such things for the purpose of circulation or distribution, shall be guilty of a misdemeanor, and for each offense be fined not less than $100 or more than $5,000, or imprisoned not less than one year or more than 10 years, or both at the discretion of the court. The prohibition of these statutes is against every article or thing intended or adapted to any obscene, indecent, or immoral use. By sec. 5,898, every person in the district of Columbia, or any of the territories, or elsewhere within the United States jurisdiction, who sells, lends or gives away, or in any manner exhibits or publishes or offers to publish any obscene publication etc., shall be punished with hard labor in the penitentiary for not less than 6 months, or more than 5 years for each offense, or shall be fined not less than $100 or more than $2,000 with costs. By sec. 1755, any officer, agent, or employee of the United States who violates laws against obscene literature etc., is guilty of misdemeanor, and for each offense, shall be fined not less than $100, nor more than $5,000, or shall be imprisoned at hard labor for not less than one year, nor more than 10 years or both.

**Obscurantists,** the name given, originally in derision, to a party who are supposed to look with dislike and apprehension on the progress of knowledge, and to regard its general diffusion among men, taken as they are ordinarily found, as prejudicial to their religious welfare, and possibly injurious to their material interests. Of those who avow such a doctrine, and have written to explain and defend it, it is only just to say that they profess earnestly to desire the progress of all true knowledge as a thing good in itself; but they regard the attempt to diffuse it among men, indiscriminately, as perils,
and often hurtful, by producing presumption and discontent. They profess but to reduce to practice the motto—

A little learning is a dangerous thing.

It cannot be doubted, however, that there are fanatics of ignorance as well as fanatics of science.

OBSEQUIES. See Funeral Rites, andc.

OBSERVANTISTS, or OBSERVANT FRANCISCANS. Under the head Franciscans (q.v.) has been detailed the earlier history of the controversies in that order on the interpretation of the original rule and practice established by St. Francis for the brethren, and of the separate organization of the two parties at the time of Leo X. The advocates of the primitive rigor were called Observantes, or Strictioris Observantia, but both bodies were still reputed subject, although each free to practice its own rule in its own separate houses, to the general administrator of the order, who, as the rigorists were by far the more numerous, was a member of that school. By degrees, a second reform arose among a party in the order, whose zeal the rigor of the observantists was insufficient to satisfy, and Clement VII permitted two Spanish friars, Stephen Molena and Martin Guzman, to carry out in Spain these views in a distinct branch of the order, who take the name of reformati, or reformed. This body has in later times been incorporated with the observantists under one head. Before the French revolution, they are said to have numbered above 70,000, distributed over more than 3,000 convents. Since that time, their number has, of course, been much diminished; but they still are a very numerous and widespread body, as well in Europe as in the new world, and in the missionary districts of the East. In Ireland and England, and for a considerable time in Scotland, they maintained themselves throughout all the rigor of the penal times. Several communities are still found in the two first-named kingdoms.

OBSERVATION AND EXPERIMENT are the leading features of modern science, as contrasted with the philosophy of the ancients. They are indispensable as the bases of all human knowledge, and no true philosophy has ever made progress without them, either consciously or unconsciously exercised. Thus, by Socrates, Plato, and Aristotle, no less than by Archimedes and the ancient astronomers, observation and experiment are extensively though not prominently or always obviously employed; and it was by losing this clue to the spirit of their master's teaching, that the later disciples in these schools of philosophy missed the path of real progress in the advancement of knowledge. It was in the latter half of the 16th c. that the minds of philosophers were first consciously awakened to the importance of observation and experiment, as opposed to authority and abstract reasoning. This result was first occasioned by the discoveries and controversies of Galileo in Florence; and to the same end were contributed the simultaneous efforts of a number of philosophers whose minds were turned in the same direction—Tycho Brahe in Holland, Kepler in Germany, William Gilbert in England, who were shortly afterwards followed by a crowd of kindred spirits. The powerful mind of Francis Bacon lent itself to describe the newly awakened spirit of scientific investigation, and though he ignored or affected to despise the results achieved by the great philosophers just mentioned, he learned from them enough to lay the foundation of a philosophy of inductive science, which, if we look at the course of scientific progress since his day, seems to have been almost prophetic. The difference between observation and experiment may be said to consist in this, that by observation we note and record the phenomena of nature as they are presented to us in her ordinary course; whereas by experiment we note phenomena presented under circumstances artificially arranged for the purpose. Experiment is thus the more powerful engine for discovery, since one judiciously conducted experiment may provide the data which could only result from a long course of observations.

OBSERVATORY, an institution supplied with instruments for the regular observation of natural phenomena, whether astronomical, meteorological, or magnetic. In some observatories all three classes of observation are carried on, but in most cases special attention is paid to astronomy alone, and only such meteorological observations are taken as are required for the calculation of the effect of atmospheric refraction on the position of a heavenly body; there are, however, a few observatories which are devoted solely to meteorological or magnetic observations. Confining our attention to astronomical observatories, it will be convenient to divide them into two classes—public and private observatories—the former being devoted to those observations which from their nature require to be continued on the same system for long periods of time, whilst the latter are usually found for some special object, which may be attained with a comparatively small expenditure of time and labor.

The most important work which is carried out in public observatories is the determination of the movements of the sun, moon, and planets among the stars; and as a corollary to this, the relative positions of the stars to which the other heavenly bodies are referred. In early times the Greek astronomers fixed these positions by means of armillary spheres and astrolabes, having concentric graduated circles, on which the latitudes and longitudes could be read off, when a pair of sights was pointed to the heavenly body. Ptolemy made use of a quadrant, with which he measured zenith distances on the meridian; and many centuries after, Tycho Brahe converted this form of instrument
into an altitude by mounting it on a vertical axis in connection with a horizontal or azimuth circle. With this instrument Tycho Brahe made a long series of observations of the altitudes and azimuths of the heavenly bodies at the observatory which he founded in Denmark erected for him, and he also measured with great accuracy their angular distances from each other by means of a sextant, a method of observation which Flamsteed afterward employed with a much improved form of the instrument, and which is now extensively used with the reflecting sextant, for finding the longitude at sea. It was not till the middle of the last c., that the improvement of the clock by Graham enabled astronomers to rely on it for the determination of right ascensions by the times of passage across the meridian, instead of by measuring them with a graduated circle. The quadrant was then fixed in the meridian, and being attached to a massive wall, its dimensions were increased, and greater accuracy thereby secured in the determination of meridian zenith distances. Two such instruments pointing respectively n. and s. were erected at the royal observatory, Greenwich, and used by Bradley and his successors from 1750 till the telescope was displaced by the mural circle (see CIRCLE, MURAL), an instrument vastly superior in principle, since the troublesome errors of centering of the quadrant were got rid of by combining the readings of opposite parts of a graduated circle, whilst the effect of division errors was much reduced by taking the mean of the readings at 6 or 8 equidistant points of the circle. At the same time, the accuracy of the readings was greatly increased by the invention of the micrometer-microscope, which made it possible to measure spaces to \( \frac{1}{1000000} \) of an inch. Neither the quadrant nor the mural circle, however, could be relied upon for accurate motion in the plane of the meridian, but Römer remedied this defect by inventing a separate instrument, the transit (q.v.), which enabled astronomers to observe the times of meridian passage or transit with great accuracy, and thus to determine the differences of right ascension of the heavenly bodies by means of the apparent diurnal movement. With the transit and quadrant Bradley commenced that series of observations of the positions of the sun, moon and planets, and of stars, which have been continued ever since at Greenwich, and on which, in combination with less extensive series at Paris and Königsberg, all our tables of the motions of the heavenly bodies are founded. In modern observatories, the transit and mural circle are combined into one instrument, the transit-circle, a change which has been rendered possible chiefly by the improvement in graduated circles since the invention of Trroughton's dividing engine, the unwieldy size of the old quadrants and mural circles necessitating an attachment to a massive wall. Although Reichenbach made transit-circles at the beginning of this c., for several foreign observatories, including that of Dorpat, the lightness of their structure and their want of stability prevented their being introduced generally, and the mural circle held its place in the principal observatories till sir George Airy designed the Greenwich transit-circle in 1851, an instrument of a most massive character, which has served as model for nearly all that have been constructed in recent years. The main features of the modern transit-circle are: (1) that it is not reversible; its collimation error being determined by means of two collimators, or reversed telescopes pointing at each other and at the transit telescope, n. and s. respectively; (2) that a spirit-level is not used, the level error being found by means of the reflection of the wires from the horizontal surface of mercury. These two negative characteristics, while admitting of great massiveness in construction (the Greenwich instrument weighs more than a ton), have removed three troublesome sources of error—inequality in the pivots, lateral flexure of the telescope in the process of reversion, and the effect of currents of heated air on a spirit-level. An important auxillary to the transit-circle is the chronograph, an American invention, which, in various forms, is now found in all well-equipped observatories, the principle in all cases being the same—viz., the registration on a revolving cylinder of paper of the times of transit across the system of spider-lines of the transit-circle, as well as of the seconds of the sidereal clock, by means of electric currents, which pass through electro-magnets, when the circuit is closed either by the observer himself, thus causing a momentary attraction of a piece of soft iron, and producing a corresponding mark on the paper either with a pen or a steel point. This system, while improving somewhat the accuracy of the individual observations, admits of a large number being made at intervals of two or three seconds, and leaves the observer free to make several observations of zenith distance during the passage of a star across the field of view. Allusion has been made to the importance of the sidereal clock in modern astronomy. Considerable improvements have been made in its construction since Graham's time, the original gridiron pendulum having been replaced successively by the mercurial and the zinc and steel, and the dead-beat escapement by Dennison's gravity and Airy's detached escapement. Recently an apparatus depending on the attraction of a movable magnet connected with a float in a siphon barometer has been applied by sir George Airy to the sidereal clock at Greenwich to test the influence of the temperature on the motion of the pendulum. This clock is placed in a basement which is kept at a nearly uniform temperature, an important condition, which has contributed to make its performance very far superior to that of any other clock hitherto constructed, and fully equal to the requirements of the methods of observation now in use. With instruments such as have just been described, regular observations of the sun, moon, and planets, and of fundamental stars, are made at Greenwich, Paris, Washington and Oxford, supplemented at the first-named observatory by extra-meridian observations of the moon with a massive altazimuth, which can be employed when the moon is too near
new moon to be seen on the meridian in full daylight, and which is in fact used to secure an observation on every night when the moon is visible.

The observations of stars at these four observatories are directed to the most accurate determination of the places of a limited number, and the deduction of their proper motions by comparison with the results obtained by Bradley, Piazzi (with an altazimuth by Ramsden at Palermo), and Groombridge; but at other observatories differential or zone observations of large numbers of stars have been made, with the object of making a complete and tolerably accurate survey of the heavens, the rhomb or ring micrometer being used for this purpose. Among those who have devoted themselves to this work may be mentioned Lacaille at the cape of Good Hope, Lalande at Paris, Bessel at Königsberg, and Argelander at Bonn. These zone-observations are now being repeated with the transit-circle at a number of observatories, associated together for the purpose of getting far more accurate places than was possible with the equatorial. A large number of observatories chiefly in Great Britain, France, and Germany are equipped with four-foot equatorial reflectors for this purpose, as well as for the examination of nebulae. The most important work of an observatory however consists, not in making observations, which are easily multiplied, but in reducing and publishing them—a task of far greater labor, and requiring far higher qualifications. However various may be the observations, the method of eliminating their errors is the same in all cases, and similar mathematical considerations apply to their reduction, whether they be meridian observations, micrometer measures, measures of photographs, or spectroscopic observations; and it is when such treatment is required in any inquiry that it should be undertaken at a public observatory, where this rigorous method will be applied.

The work of private observatories hardly admits of being specified, though its general character has already been indicated: it may suffice to mention the observations of double stars and nebulae by the two Herschels, Groombridge’s catalogue of circum-polar stars, Smyth’s double-star measures, Carrington’s Redhill catalogue and solar observations, the nebular observations of Lord Rosse and Mr. Lassell, De la Rue’s long series of photographs, and the spectroscopic observations of Huggins and Lockyer.

In addition to regular astronomical observations of all kinds, national observatories are usually charged with the distribution of time signals, and the rating of chronometers for the navy—matters of great practical importance, especially in this country, where Greenwich time is communicated directly by telegraph to more than six hundred towns.

OBSIDIAN, a mineral accurately described by Pliny under the name which it still bears. It is a true kind of native glass, composed of silica (from 70 to 80 per cent), alumina, lime, soda, potash, and oxide of iron. It is hard and brittle, with remarkably vitreous luster, and perfectly conchoidal fracture, the edges of the fractures very sharp and cutting like glass. It varies from semi-transparency to translucency only on the edges. It is often black, or very dark gray; sometimes green, red, brown, striped, or spotted; and sometimes chatoyant or aventurine. It occurs in volcanic situations, and often in close connection with pumice, in roundish compact pieces, in grains, and in fibers. It is capable of being polished, but is apt to break in the process. It is made into boxes, buttons, ear-drops, and other ornamental articles; and before the uses of the metals were well known, it was employed in different parts of the world for making arrow and spear-heads, knives, etc. It is found in Iceland, the Lipari isles, Vesuvius, Sardinia, Hungary, Spain, Teneriffe, Mexico, South America, Madagascar, Siberia, etc. Black obsidian was used by the ancients for making mirrors, and for this purpose was brought to Rome from Ethiopia. It was used for the same purpose in Peru and Mexico. Mirrors of black obsidian are indeed still employed by artists. Chatoyant or aventurine obsidian is very beautiful when cut and polished, and ornaments made of it are sold at a comparatively high price.

OBSTETRICS. See Midwifery, ante.

OBVERSE, or Face, the side of a coin or medal which contains the principal device or inscription, the other side being in contradistinction called the reverse. See NUMISMATICS.

O’CALLAGHAN, EDMUND BAYLEY, LL.D., b. Ireland. After studying two years at Paris he went in 1823 to Quebec; commenced the practice of medicine in 1827; became in 1836 a prominent member of the provincial parliament; in 1834-37 was editor of the Vindicator, the national organ at Montreal. In 1837 he removed to New York. He has published several works, among which the following are the most important: History of
OCCAM, WILLIAM OF, surnamed Doctor Singularis et Invincibilis, a famous schoolman, was born in England, at the village of Oecam, in the county of Surrey, about the year 1270. We do not possess any precise or satisfactory knowledge of his early life. He is said to have been educated at Merton college, Oxford, and to have held several benefices in his native country, but soon after resigned them on entering the Franciscan order. Early in the 13th c. it is supposed he proceeded to Paris, where he attended the lectures of Duns Scottus, of whose philosophy he was afterwards the most formidable opponent. Here he soon became prominent by the boldness of his ecclesiastical views, Philippe, le Del, king of France, having forbidden pope Boniface VIII, to levy contributions in his dominions, the latter, by way of retaliation, excommunicated him. Occam rushed to the defense of the monarch, and in his Disputatio inter Clericum et Mutilum, super Pontificis Praedita Ecclesiae atque Principibus Terrarum Commissa, denies that the popes have any authority in temporal affairs, and boldly declares that all who favored such a doctrine ought to be expelled from the church as heretics. Meanwhile, from being a listener, he had become a lecturer in philosophy. The system which he advocated—for he was not properly its originator—is known by the name of nomination (q.v.), but it had never before received so rigorously logical and rational a treatment; hence his epithet of Invincibilis. The work in which his views are set forth is entitled Expositio Avrece, et subodorum articulorum, et Deutero, et Tertio, et Quarto, etc. It contains a series of commentaries upon the Logica of Porphyry, and on the Categories and Interpretation of Aristotle, with a special treatise headed Tractatus Communis Periphris, and a theological opusculeum on predestination. It is intended as a demolition of the moderns—i.e., the scholastics—and shows that in their method they have completely departed from the principles and methods of the great Stagyrite, for whom, like every sound and solid thinker, he shows the deepest respect and admiration. About 1320 or 1321 he again plunged into ecclesiastical controversy. A certain Narbonese priest, having affirmed that Jesus Christ and his apostles held everything in common, and that every ecclesiastical possession is a modern abuse, was pounced upon by the inquisitors, and defended by a certain Berenger Talon, a Franciscan monk of Perpignan. But Berenger's defense of apostolical poverty was naturally enough very disagreeable to the pope, John XXII, who therefore condemned it. Berenger was, however, vigorously supported by his order, and among others by Michael de Cesena, the general-superior, Bonagratia of Bergamo, and William of Occam, who attacked the pope with great vehemence and trenchant logic. Shortly after they were arrested as favorers of heresy, and imprisoned in Avignon. But while their trial was proceeding, Michael de Cesena and Occam, knowing what little mercy or justice they had to expect from their accusers and judges, made their escape to the Mediterranean, and were received at a little distance off shore on board a galley of Ludwig, king of Bavaria, the patron of the Franciscan antipope, Peter of Corbans, and one of the most powerful sovereigns in Europe. The remainder of Occam's life was spent at Munich, where, safe from the machinations of his enemies, he continued to assail at once the errors of papistry in religion, and of realism in philosophy. He died April 7, 1347. It is impossible to praise Occam too highly. He was the first logician, and the most rational philosopher among the whole body of schoolmen. We are often reminded by his clear and vigorous common sense and profound Incrédulity that he was a disciple of Locke and Hobbes, and that he came of a people ever noted for the solidity of their understanding. Besides the works already mentioned, Occam's principal writings are: Dialogus in tres Partes distinctus, quorum prima de Hereditatibus Joannis XXII, tertia de Pontifex Papae, Conciliorum et Imperatoris; Opera Nominae Veritatis contra errores Ioannis XXII; Compendium errorem Ioannis Papae; Decisions Octo Quantum de Pontificum dictibus; Super Quatuor Libros Sententiarum Subtilissimae Questiones earumque Decisions (based on Peter the Lombard's famous Sententiae, and containing nearly the entire theology of Occam. These Decisions were long almost as renowned as the Sententiae which gave them birth); Antiqvebum Theologicae; Summa Logicae ad Admonitionem Major Summa Logicae.——See Luke Wadding's Scriptores Ordinis Minorum (1630); Cousin's Histoire de la Philosophie (2d ed. 1840); and B. Hauréau's De la Philosophie Scholastique (1848).

OCCA SIONALISM, or the doctrine of Occasional Causas (see CAUSE), is the name given to the philosophical system devised by Descartes and his school, for the purpose of explaining the action of mind upon matter, or, to speak more correctly, the combined, or at least the synchronous action of both. It is a palpable fact that certain actions or modifications of the body are accompanied by corresponding acts of mind, and vice versa. This fact, although it presents no difficulty to the popular conception, is embarrassing to which each is supposed to act directly upon the other—body upon mind, and mind upon body—which has long furnished to philosophers a subject of much speculation. But on the other hand, it is difficult to conceive the possibility of any direct mutual interaction of sub-
stances so dissimilar, or rather so disparate. And more than one system has been devised for the explanation of the problem, as to the relations which subsist between the mind and the body, in reference to those operations, which are clearly attributable to them both. According to Descartes and the Occasionalists, the action of the mind is not, and cannot be the cause of the corresponding action of the body. But they hold that whenever any action of the mind takes place, God directly produces, in connection with it, and by reason of it, a corresponding action of the body; and in like manner conversely, they explain the coincident or synchronous actions of the body and the mind. It is in opposition to this view that Leibnitz, believing the Cartesian system to be open to nearly equal difficulties with that of the direct action, devised his system of Pre-established Harmony. See Leibnitz. His real objection to the Occasionalist hypothesis is, that it supposed a perpetual action of God upon creatures, and, in fact, is but a modification of the system of ‘direct assistance.’

OCCULTATIONS (Lat. occultatio, a concealment) are neither more nor less than ‘eclipses;’ but the latter term is confined by usage to the obscuration of the sun by the moon, and of the moon by the earth’s shadow, while the former is restricted to the eclipses of stars or planets by the moon. Occultations are phenomena of frequent occurrence; they are confined to a belt of the heavens about 10° 17′ wide, situated parallel to, and on both sides of the equinoxial, and extending to equal distances n. and s. of it, being the belt within which the moon’s orbit lies. These phenomena serve as data for the measurement of the moon’s parallax; and they are also occasionally employed in the calculation of longitudes. As the moon moves in her orbit from w. to e., the occultation of a star is made at the moon’s eastern limb, and the star emerges on the western limb. When a star is occulted by the dark limb of the moon (a phenomenon which can only occur between new moon and full moon), it appears to an observer as if it were suddenly extinguished, and this appearance is most deceptive when the moon is only a few days old. When an occultation occurs between full moon and new moon, the reappearance of the star at the outer edge of the dark limb produces an equally startling effect. “It has often been remarked,” says Herschel, “that when a star is being occulted by the moon, it appears to advance actually upon and within the edge of the disk before it disappears, and that sometimes to a considerable depth.” This phenomenon he considers to be an optical illusion, though he admits the possibility of its being caused by the existence of deep fissures in the moon’s substance. Occultations of stars by planets and their satellites are of rarer occurrence than lunar occultations, and still more unfrequent are the occultations of one planet by another. Occultations are calculated in the same way as eclipses, but the calculation is simplified in the case of the fixed stars, on account of their having neither sensible motion, semi-diameter, nor parallax.

Occum, or Occom, Samson; an American Indian preacher; 1723-97; b. Conn.; converted at the age of 17, and soon expressed a desire to become the teacher of his tribe; educated for the ministry among his countrymen in a private school under the care of the rev. Eleazer Wheelock at Lebanon. This school gradually became a seminary for the education of Indians and of missionaries to the Indians, and was called Moor’s charity school. It was opened as a missionary school in 1748, but not completely established until 1760. He received a common education at Stockbridge, having been sent there with others of his tribe through the influence of sir William Johnson, an active friend and patron of the school. After a four years’ training in the school, Occum in 1748 taught a school in New London, but soon removed to Montauk, L. L., where he taught a school among the Indians for 10 years, being at the same time their religious teacher, and preaching to the Skeneecock or Yenneecock Indians, 30 m. distant. In a revival among the Montauks many became Christians. Occum was ordained by the Suffolk presbytery Aug. 29, 1759, and was a regular member of the presbytery from that time. In 1766 he accompanied the rev. Mr. Whittaker of Norwich to England and Scotland to solicit funds for the support and enlargement of the school. Great interest was excited, and the houses where he preached were thronged. While in England he preached between three and four hundred sermons. Donations were obtained amounting to £32,000, nearly all of which was invested in British funds, the income to be applied to the objects of the school. It was soon transferred to Hanover, N. H., and became Dartmouth college. After his return Occum preached to his countrymen in the region of New London, and sometimes was employed in missionary labors among distant Indians. In 1780 he removed to Brothertown, near Utica, N. Y., where was the home of the Stockbridge Indians, who were of the Mohogan root. Some of the Mohigans and other Indians of Connecticut, Long Island and Rhode Island accompanied Occum. They obtained a tract of land from the Oundis. From this they removed to Michigan, and were merged in the Stockbridge tribe. Occum wrote an account of the Montauk Indians which he preserved in manuscript in the Historical Collections. He published a sermon at the execution of Moses Paul, an Indian, at New Haven.

Occupancy, in law, the taking possession of an unappropriated corporeal thing, with the intention of becoming its owner. This mode of acquiring property came to the common from the Roman law, which considered occupancy a mode of acquiring property belonging to no one, but subject to appropriation by the first conger. Instances are unoccupied lands, which belong to the discoverer. The finder of unclaimed lost goods
has a title to them by occupancy, and so has the captor of beasts of a wild nature, so long as he keeps possession of them, but there can be no complete property in them till they are domesticated; and if they make their escape, with no intention of coming back, animus reperiendi, the ownership of the original owner ceases, and their next captor acquires a title in them by occupancy. But if they be once domesticated the title by occupation becomes indefeasible. The owner of property by accession acquires his title by occupancy, and so does the owner of goods obtained by confusion; it being held, that where a person with fraudulent intent mixes his property indistinguishably with that of another, the latter is not compelled to distinguish his property from that of the former, but is entitled to the ownership of the whole, and he acquires such ownership by occupancy. Blackstone refers the title to literary property to the same kind of occupancy, and here also belongs the title to trade marks, ownership of which is acquired by a person using them to indicate his ownership of certain articles, or certain business. Another instance of title to personal property obtained by occupancy, occurs in the case of property acquired from an enemy in time of war. By the law of nations, property captured from an enemy vests in the government or sovereign of the state of which the captor is a subject; but the captors are generally allowed a part or the whole of the property captured. A good title to property captured on land is acquired by occupancy without the intervention of a court; but in the case of prizes acquired at sea, judgment must be rendered by a prize court of competent jurisdiction. The English method of distributing body, i.e., property captured on land, is by grant from trustees appointed by the crown, and whose acts of distribution are subject to its assent. Instances of the acquisition of a title to land by occupancy are more rare. Land left bare and uncultivated, or located, or deposited by a river, is acquired by occupancy. Another instance, at the common law, was where an estate was limited to one person during the life of another person, and the former died; there was then no person to whom the estate could pass. The executor could not take it, for it was not personal property; nor the heir, because it was not a fee; nor the original grantor, because he could not take back his own grant. Any person, therefore, could come in and take possession; and the person so acquiring possession was known as the "general occupant." The common law rule has been changed in many of the states, and in some the residue of the estate goes to the executor as personal property. Where the limitation was to one person and his heirs, during the life of another, and the former person dies, the residue goes to his heirs, not as heirs, because the estate is not one of inheritance, but as "special occupants" named in the grant. The general theory of title by occupation has long been of little importance. While this country was a colony of Great Britain, the ownership of land was held to be vested in the crown, and individual titles to land were derived from the crown. Since the separation of the colonies from Great Britain, titles are derived from the grant of the United States or the individual states. The occupatio, or occupation, of the Roman law, was the same thing as occupancy.

OCEAN, a term which, like Sea, in its general acceptation, denotes the body of salt water that separates continent from continent, and is the receptacle for the waters of rivers. The surface of the ocean is about three-fifths of the whole surface of the earth. Although no portion of it is completely detached from the rest, the intervening continents and islands mark it off into divisions, which geographers have distinguished by special names: the Atlantic Ocean (q.v.), between America and Europe and Africa; the Pacific Ocean (q.v.), between America and Asia; the Indian Ocean (q.v.), lying s. of Asia, and limited on the e. and w. by Australasia and South Africa; the Arctic Ocean (q.v.), surrounding the north pole; and the Antarctic Ocean (q.v.), surrounding the south pole. The general features and characteristics of the ocean will be described under Sea.

OCEAN, a co. in s.e. New Jersey, bounded on the e. by the Atlantic Ocean, watered by Cedar creek and Tom’s river, traversed by the New Jersey Southern and Tuckerton railroads; about 650 sq.m.; pop. '80, 14,455—13,963 of American birth. The surface is level, and heavily wooded, and the soil sandy. The principal productions are corn, potatoes, cranberries, and lumber. Co. seat, Tom’s River.

OCEANA, a co. in w. Michigan, bounded on the w. by lake Michigan; drained by White river; on the Chicago and West Michigan railroad; 550 sq.m.; pop. '80, 11,669—9,784 of American birth. The surface is rolling or level, and heavily wooded, and the soil fertile. The principal productions are corn, wheat, potatoes, and oats. Co. seat, Hart.

OCEANTIA, the name given to the fifth division of the globe, comprising all the islands which intervene between the south-eastern shores of the continent of Asia and the western shores of the American continent. It naturally divides itself into three great sections—Mahy Archipelego (q.v.), Australasia (q.v.), or Melanesia and Polynesia (q.v.).

OCEANICA. (See OCEANIA, ante.)

OCEANUS, in mythology, the eldest of the Titans, son of Ouranos and Gê, father, by his sister Tethys, of the 3,000 Oceanides, or ocean nymphs. He was the god of the ocean-stream which surrounded the plain of earth. His palace, according to Homer, was in the west. Æschylus represents him as living in a cave under ocean, from which he comes on a hippocamp to console with Prometheus.
OCELLUS, LUCA NUS, b. Lucania, Italy, 6th c. n. c.; a pupil of Pythagoras. He wrote a number of philosophical treatises, of which only one, *on the nature of the universe*, has been preserved. In this he maintains the eternity of the human race, and of the universe. Diogenes Laërtius cites a letter from Archytas to Plato, mentioning four treatises of Ocellus which the former had sent to Plato; the answer of Plato acknowledges the receipt of the books, of which he expresses a high opinion. The subjects of the four works were on *love, piety*, the *nature of the universe*, and *kingly rule*. The extant treatise is written in the Ionic dialect, while Doric was the dialect prevailing in Lucania. The genuineness of the work has been questioned on this ground. The weight of opinion seems to be in favor of the supposition of Rudolphi, that the work was originally written in Doric, but that the Ionic forms were introduced by successive copyists and grammarians. The fragments of the same treatise found in Stobæus, are written in Doric. There is an English translation by Thomas Taylor (1857).

OCELOT, the name of several species of felid species, native of the tropical parts of South America, allied to the leopard by flexibility of body, length of tail, and other characters, but of much smaller size. They are usually included in the genus *leopardus* by those who divide the feline into a number of genera. They are inhabitants of forests, and very expert in climbing trees. Their prey consists in great part of birds. They are beautifully marked and colored. The best-known species, or *Common ocelot* (*felis pardalis*), a native of the warm parts of America, from Mexico to Brazil, is from 2 ft. 9 in. to 4 ft. long, exclusive of the tail, which is from 11 to 15 ins., and nearly of uniform thickness. The ears are thin, short, and pointed. The muzzle is rather elongated. The colors vary considerably, but the ground tint is always a rich red or tawny color, blending finely with the dark brown on the margins of the open spots, of which there are chains along the sides; the head, neck, and legs being also variously spotted or barred with dark brown or black. The ocelot is usually tamed and is very gentle and playful, but excessively mischievous. It may be fed on porridge and milk, or other such food, and is said to be then more gentle than if permitted to indulge in carnivorous appetites. Very similar to the common ocelot are several other American species, as the *Linked ocelot* (*felis uncinata*), the *Long-tailed ocelot* (*felis macrourus*), the *Chat* (*felis multis*), etc. The similarity extends to habits and disposition as well as form.

OCHERS, the name usually applied to clays colored with the oxides of iron in various proportions, giving to the clay a lighter or deeper color. Strictly speaking the term belongs only to a combination of peroxide of iron with water. From many mines large quantities of water charged with ferruginous mud are being continually pumped up, and from this water the colored mud or ocher settles. In this way large quantities are procured from the tin mines of Cornwall, and the lead and copper mines of north Wales and the isle of Man. Ochers occur also readily formed, in beds several feet thick, in the various geological formations, and are occasionally worked, as at Shotover hill, Oxford, in Holland, and many other places in Europe and America. Very remarkable beds are worked in Canada. The ochers so obtained are either calcined for use or not, according to the tint wanted. The operation adds much to the depth of color, by increasing the degree of oxidation of the contained iron. The most remarkable varieties of ocher are the Siena earth (terra di Siena) from Italy; the so-called red chalk, with which sheep are marked; Dutch ocher; Armenian oile; or Lennian earth; Italian rouge, and Bittry ocher. They vary in color from a dirty yellow to a very rich and pure color, and the finest kinds are used by painters, the coarsest by carpenters for marking out their work, by farmers for marking cattle, etc.

OCHIL HILLS, a hilly range in Scotland, occupying parts of the counties of Perth, Clackmannan, Stirling, Kinross, and Fife, and extending from the vicinity of Stirling n.e. to the Firth of Tay. The range is 24 m. in length and about 12 m. in breadth. The highest summit is Benleugh (2,352 ft.), near the s.w. extremity. The hills, which are formed chiefly of greenstone and basalt, contain silver, copper, and iron ores, and afford excellent pasturage.

OCHNACEAE, a natural order of exogenous plants, containing not quite 100 known species, natives of tropical and subtropical countries. Some of them are trees, most of them under-shrubs; all are remarkable, and some species are medicinally used in their native countries. The seeds of *Gomphila jabotapita* yield an oil, which is used in salads in the West Indies and South America.

O'CHRO. See Hibiscus.

OCKLEY, SIMON, 1678-1720; b. England; entered Queen's college, Cambridge, in 1693, and received the degree of b.d. In 1705 he was presented to the vicarage of Swavesey. He became learned in the oriental languages. From Arabic manuscripts in the Bodleian library, at Oxford, he compiled a work containing much serviceable information concerning the early conquests of the Arabs, entitled *The History of the Saracens*, beginning with the times immediately subsequent to the death of Mohammed, and concluding in the year 705, which is much esteemed as a book of reference for the student in oriental languages. Gibbon, the historian, while writing his *Decline and Fall*, consulted it with advantage, and characterized the author as "an original in every sense who had opened
his eyes," and "a learned and spirited interpreter of Arabian authorities." Disraeli says: "He was, perhaps, the first who exhibited to us other heroes than those of Rome and Greece, sages as contemplative, and a people more magnificent even than the iron masters of the world." The scholars of his time received the book with marked approbation, estimating it "the most authentic account of the Arabian prophet yet given to the world." And in 1847 it was regarded as "the standard history of this eventful period." In 1711 he was made professor of Arabic in the university of Cambridge, and in his inaugural address he pathetically referred to his poverty. The 1st vol. of his history was published in 1708, the 2d and last in 1718, and was dated at Cambridge castle, where he was imprisoned for debt. From these circumstances the conclusion is drawn that his literary work brought him little profit, but it is also a matter of history that he had an expensive family. In Chalmers' Biographical Dictionary there is an interesting account of his life, by Dr. Heathcote, and about the preparation of his principal work, his own words express the difficulties encountered, when he says: "Had I not been forced to snatch everything that I have, as it were, out of fire, our Saracen history should have been ushered into the world in a different manner." A third edition with additions by Dr. Long appeared in 1757 in 2 vols., and a fourth edition revised, improved, and enlarged, in 1847. Among his most important works, in addition to sermons on The Christian Priesthood, and the Necessity of Instructing Children in the Scriptures, there were published in 1706, Introductio ad Linguas Orientales in qua set Discursus viae orientales; and in 1707, The History of the present Jours Throughout the World, translated from the Italian of Leo of Modena, a Venetian rabbi; in 1708, The Improvement of Human Reason Exhibited in the Life of Ibn Ebn Yolibin, from the Arabic. In 1716 he published a new translation from the Arabic version of the second Apocryphal Book of Enoch. His writings are distinguished for their almost perfect accuracy as well as their erudition.

Ockmulgee, a river in Georgia, which rises in the northern center of the state by three branches, and after a course of 200 m. s.s.e., joins the Oconee, to form the Altamaha. It is navigable to Macon, 130 m. above its mouth.

Oconee, a river of Georgia, rises in the n.e. part of the state, and flows southerly 270 m., where it unites with the Ockmulgee to form the Altamaha; it is navigable to Milledgeville, 100 miles.

O'Connell, Daniel, eldest son of Mr. Morgan O'Connell of Darrynane, near Cahirciveen, in the co. of Kerry, Ireland, was born Aug. 9, 1775. His family was ancient, but straightened in circumstances, O'Connell received his first education from a hedge-schoolmaster, and, after a further training under a Catholic priest in the co. of Cork, was sent in 1790 to the English college at St. Omer. His school reputation was very high; but he was driven home prematurely by the outbreak of the revolution, and in 1794 entered as a law-student at Lincoln's inn. In 1798 he was called to the bar; and it was the boast of his later career as an advocate of the repeal of the Union with England, that his first public speech was delivered at a meeting in Dublin, convened for the purpose of protesting against that projected measure. He devoted himself assiduously, however, to the practice of his profession, in which he rose steadily. By degrees, the Roman Catholic party having begun to rally from the prostration into which they had been thrown through the rebellion of 1798 and its consequences, O'Connell was drawn into public political life. In all the meetings of his co-religionists for the prosecution of their objects he stood head and shoulders above all other Catholic statesmen; was an active member of all the successive associations which, under the various names of "Catholic board," "Catholic committee," "Catholic association," etc., were organized for the purpose of procuring the repeal of the civil disabilities of the Catholic body. Of the Catholic association he was himself the originator; and although his supremacy in its councils was occasionally challenged by some aspiring associates, he continued all but supreme down to its final dissolution. By means of this association, and the "Catholic rent" which it was enabled to raise, he created so formidable an organization throughout Ireland that it gradually became apparent that the desired measure of relief could not longer be safely withheld; and the crisis was precipitated by the bold expedient adopted by O'Connell, of procuring himself to be elected member of parliament for Clare in 1828, notwithstanding his well-known legal incapacity to serve in parliament, in consequence of his being obliged to refuse the prescribed oaths of abjuration and supremacy, which then formed the ground of the exclusion of Roman Catholics from the legislature. This decisive step towards the settlement of the question, although it failed
to procure for O'Connell admission to parliament, led to discussions within the House, and to agitations outside, so formidable, that in the beginning of the year 1829, the duke of Wellington and sir Robert Peel found it expedient to give way; and, deserting their former party, they introduced and carried through, in the spring of that year, the well-known measure of Catholic emancipation. O'Connell was at once re-elected, and took his seat for Clare, and from that date until his death continued to sit in parliament. He was elected for his native county in 1830, for the city of Dublin in 1832, for the town of Kirkenny in 1832 (having been unseated for Dublin on petition), for Dublin again in 1837, and for the co. of Cork in 1841. During all these years, having entirely relinquished his practice for the purpose of devoting himself to public affairs, he received, by means of an organized annual subsidy, a large yearly income from the voluntary contributions of the people, by whom he was idolized as their "liberator;" and who joined with him in all the successive agitations against the act of Union, against the Protestant church establishment, and in favor of reform, in which he engaged. In the progress of more than one of these political agitations, his associations were oppressed by the government; and the agitation for a repeal of the Union, recommenced in 1841 and carried on by "monster meetings" throughout Ireland, at which O'Connell himself was the chief speaker, assumed proportions so formidable, that he, in common with several others, was indicted for a seditious conspiracy, and after a long and memorable trial, was convicted, and sentenced to a year's imprisonment, with a fine of £2,000. This judgment was reversed by the House of Lords; and O'Connell, on his discharge, resumed his career; but his health had suffered from confinement, and still more from dissensions and opposition in the councils of his party; and as, on the return of the whigs to power in 1846, he consented to support their government, the malcontents of the repeal association openly separated from him, and a bitter feud between "young" and "old" Ireland ensued. In this quarrel, O'Connell steadfastly maintained his favorite precept of "moral force," and was supported by the great body of the Catholic bishops and clergy; but his health gave way in the struggle. He was ordered to try a milder climate; and on his journey to Rome in the spring of 1847, he was suddenly seized with paralysis, and died at Genoa on May 15 of that year. His eminence as a public speaker, and especially as a master of popular eloquence, is universally admitted. Into the controversies as to his public and political character, it is not our place to enter here. His speeches unfortunately were for the most part extempore, and exist but in the reports (uncorrected by himself) taken at the time. He published but a single volume, A Memoir of Ireland, Notice of its People, and a few pamphlets, the most important of which, as illustrating his personal history and character, is A Letter to the Earl of Shrewsbury. —See Life and Times of Daniel O'Connell, by his son, John O'Connell; also Recollections of Daniel O'Connell, by John O'Neill Daniel; Fagan's Life of Daniel O'Connell; and The Liberator, by L. F. Cusack (1872).

O'CONNOR, Arthur, 1763-1832; b. Ireland; called to the bar in 1788. Soon afterwards he entered the Irish parliament, where he advocated Roman Catholic emancipation; his course in this regard caused his uncle, lord Longueville, to disinherit him. Becoming one of the five directors of the "united Irishmen," he was tried for high treason, but acquitted. He then left Ireland for France, where he rose to be lieutenant, and afterwards general of division. He wrote Letters to the Earl of Carlisle, 1793; Letters to Earl Camden, 1798; The Present State of Great Britain, 1804; and other works. He married a daughter of Condorset.

O'CONNOR, Fearous Edward, 1796-1855; b. in co. Meath, Ireland. In 1832 he was elected member of parliament for Cork, and when re-elected, in 1835, lost his seat on account of his disqualifications. He then became a prominent member of the so-called "chartist" party, and carried on the agitation for the extension of the ballot and other privileges to the lower classes. He was again returned to parliament in 1837 from Nottingham. Disheartened by the small success of his efforts he became insane in 1832.

O'CONNOR, Roderick, (Ronry), king of Ireland, 1116-98; b. Connacht; son of Turlogh O'Connor, king of Connacht, whom he succeeded in 1156. After a protracted contest with the O'Briens and O'Neills, he took the title of king of Ireland in 1166. He drove Dermot, king of Leinster, out of his kingdom in 1168, but afterwards restored him on the throne. He worsted Strongbow and the English in a number of battles, but finally entered into a convention with them. In 1173 he had an interview with Henry II. of England, to whom he did homage, and whom he recognized as lord paramount of Ireland. Roderick kept the crown of Connacht till 1186, when, on account of a revolt of his sons, he entered a monastery, where he passed the rest of his life.

O'CONNOR, William Douglas, b. Mass., 1833; a journalist who commenced life as an art student in Boston, in 1853 became one of the editors of the Commonwealth, a newspaper published in that city. In 1854 he entered into an editorial connection with the Saturday Evening Post of Philadelphia, retaining it six years. He was twelve years corresponding clerk of the light-house board at Washington, and in 1873 became chief clerk, holding the position one year, and resigning it to accept that of librarian of the treasury department, of which the light-house board is a branch. He has contributed a number of essays, stories, and poems to the popular magazines; and in 1860, published Harrington, a romance; and in 1866, The Good Grey Poet, a pamphlet in favor of Walt
Whitman; and in 1867, The Ghost. His story of The Carpenter, which appeared in one of the periodicals, attracted much attention and critical comment.

OCONOMOWOC, a t. in Wauke-ha co., Wisconsin, on Oconomowoc creek, and the Chicago, Milwaukee, and St. Paul railroad; pop. ’70, 2,080. There are a number of lakes in the vicinity, and it is a popular summer resort. It has three newspapers, a bank, a seminary for girls, and seven churches.

O’CONOR, CHARLES, J.I.D.; b. New York city, 1804. His father came to this country from Ireland, and was a man of good family and liberal education. As he lost a considerable fortune shortly after his arrival here, he was unable to give his son a university education. At the age of 20, O’Conor was admitted to the bar of New York state. By his industry and high intellectual ability he soon gained high rank in the profession. Among the cases in which he has been concerned are many of national interest, such as that of the slave Jack, 1855. Other of his best known cases are the Lispenard, Parish, and Jump will litigations, and the Forrest divorce suit. In politics, Mr. O’Conor is a democrat, but has rarely accepted office. He was district-attorney under president Pierce for a little over a year, has been member of several state conventions, and in 1872 was nominated for the presidency by the “labor reform” party, and by a convention of democrats dissatisfied by the nomination of Horace Greeley. He received in all but 29,489 votes, which were merely complimentary, as he had declined both nominations. He has always taken interest in the city government and local reform, and was one of the prosecuting counsel in the “ring” cases, as they were called, brought against the municipal officers of New York in 1873.

OCONTO, a cco. in n.e. Wisconsin, bounded on the n.e. by Michigan and the Menomonee river, and on the s.e. by Green bay; watered by the Peshtigo and Oconto rivers, on the Chicago and Northern railroad; 5,000 sq. m.; pop. ’80, 9,848–6,218 of American birth. The surface is heavily wooded with pine. The chief staples are wheat, potatoes, oats, and hay. Large quantities of lumber are exported. Co. seat, Oconto.

OCONOMOWOC, a t. in the state of Chiappa, Mexico; pop. 4,000. It is noted for the aboriginal monuments near it, of which an account has been given by Stephens in his Incidents of Travel in Central America.

OCTAGON, a plane closed figure of 8 sides. When the sides are equal, and also the angles, the figure is called a “regular octagon,” in this case, each angle is 135°, or equal to three half right angles. If the alternate corners of a regular octagon be joined, a square is constructed; and as the angle contained between the sides of the square and of the octagon is one-fourth of a right angle, the octagon may easily be constructed from the square as a basis.

OCTAEDEON (Gr. okto, eight, hedra, base) is a solid figure bounded by 8 triangles, and having 12 edges and 6 angles. A regular octahedron has its 8 triangular faces all equilateral, and may, for convenience, be defined as a figure composed of two equal and similar square pyramids with equilateral triangles for their sides placed base to base. This solid is symmetrical round an angle, and is one of Plato’s 5 regular solids. The octahedron appears in nature as one of the forms of crystals of sulphur.

OCTAVE (Lat. octava, eighth), the interval between any musical note and its most perfect concord, which is double its pitch, and occupies the position of the eighth note from it on the diatonic scale. The name octave is often given to the eighth note itself as well as to the interval. There is between a note and its octave a far closer relation than between any other two notes; they go together almost as one musical sound. In combination, they are hardly distinguishable from one another, and their harmonics agree invariably, a coincidence which occurs in the case of no other interval.

OCTAVIA, the sister of the Roman emperor Augustus, and wife of Mark Antony. She was distinguished for her beauty, her noble disposition, and womanly virtues. Her first husband was C. Marcellus, to whom she was married 50 B.C. He died 41 B.C. shortly after which she consented to marry Antony, to make secure the reconciliation between him and her brother. The event was hailed with joy by all classes. In a few years Antony became tired of his gentle and virtuous spouse, and forsook her for Cleopatra. When the Parthian war broke out, Octavia wanted to accompany her husband, and actually went as far as Corcyra, whence Antony sent her home, that she might not interrupt his guilty intercourse with the Egyptian queen. In 35 B.C., Octavia made an effort to rescue him from a degradation that was indifferent even to the honor of the Roman arms, and sailed from Italy with re-enforcements; but a message reached her at Athens ordering her to return to her husband. She proudly obeyed, but with a magnanimity that reminds us of the Roman character in earlier and better days, she forwarded the supports to her husband. Her brother, Octavian, was indignant at the treatment she received, and would have had her quit her husband’s house, and come and live with him; but she refused. In 32 B.C. war, long inevitable, broke out between Antony and Octavia; and the former crowned his insults by sending Octavia a bill of divorcement. But no injury was too great to be forgiven by this “patient Grizel” of the ancient world, and after her husband’s death, she brought up with maternal care not only her own children, but also Cleopatra’s bastards. Her death took place 11 B.C.
OCTOBER (Lat. octo, eight) was the eighth month of the so-called "year of Romulus," but became the tenth when (according to tradition) Numa changed the commencement of the year to the first of January, though it retained its original name. It has since maintained its position as the tenth month of the year, and has 31 days. October preserved its ancient name notwithstanding the attempts made by the Roman senate, and the emperors Commodus and Domitian, who substituted for a time the terms Faustinus, Invictus, Domitians. Many Roman and Greek festivals fell to be celebrated in this month, the most remarkable of which was the sacrifice at Rome of a horse (which was called October) to the god Mars. The other festivals were chiefly bacchanalian. Among the Saxons it was styled Wign moneth or the wine month.

OCTOPODA (Gr. eight-footed), a section of dibranchiate cephalopods (see CEPHALOPODA), having the body in general very short, the head very distinct; eight arms, not very unequal, furnished with simple suckers; with or without a shelly covering. To this section belong argonauts, poulpes, etc.

OCTOPUS. See Poulpe.

OCTOSTYLE. The name given in classic architecture to a portico composed of eight columns in front.

OCTROI (Lat. autioritas, authority), a term which originally meant an ordinance authorized by the sovereign, and thence came to be restrictively applied to a toll or tax in kind levied from a very early period in France, and other countries of northern Europe, on articles of food which passed the barrier or entrance of a town. The right to levy this toll was often delegated to subjects, and, in order to increase its amount, a device was resorted to of raising the weight of the pound in which the octroi was taken. The large pound, an ounce heavier than that in ordinary use, was called the bore d'octroi, whence the expression pound troy. The octroi came eventually to be levied in money, and was abolished in France at the revolution. In 1798 it was re-established, under the pretext that it was required for purposes of charity, and called the octroi de bienfaisance, and it has been reorganized in 1816, 1842, and 1852. Of the octroi duty which is at present levied at the gates of the French towns, one-tenth goes to the national treasury, and the rest to local expenses. The octroi officers are entitled to search all carriages and individuals entering the gates of a town. From the octrois of Paris government derived, a few years ago, a revenue of 50 million francs. In 1890 the Belgian government acquired popularity by abolishing the octroi.

The epithet octroyé is applied by continental politicians to a constitution granted by a prince, in contravention to one which is the result of a pactation between the sovereign and the representatives of the people. Any public company possessing an authorized monopoly like that held by the East India company is said to be octroyé.

O'CURRY, Eugene. 1736-1832; b. Ireland; appointed in 1831 an assistant in the ordnance survey of Ireland. In 1841 he began to catalogue and copy the Gaelic MSS. of Trinity college, Dublin, and the Royal Irish academy, and assisted in the preparation of the Irish archaeological society's publications. In 1853 he was associated with Dr. O'Donovan in the translation of the ancient Brehon laws. In 1854 he became professor of Irish history and archaeology in the new Roman Catholic university in Dublin. He published a translation of the Battle of the Megh Lecan, together with the Courtship of Moirera (1853), and Lectures on the Manuscript Materials of Ancient Irish History (1861).

OD (from the same root as Odln, and supposed to mean all-pervading), the name given by baron Reichenbach (q.v.) to a peculiar physical force which he thought he had discovered. This force, according to him, pervades all nature, and manifests itself as a flickering flame or luminous appearance at poles of magnets, at the poles of crystals, and wherever chemical action is going on. This would account for the luminous figures said to be sometimes seen over recent graves. The odd force has positive and negative poles, like magnetism. The human body is od-positive on the left side, and od-negative on the right. Certain persons, called "sensitives," can see the odic radiation like a luminous vapor in the dark, and can feel it by the touch like a breath. As the meeting of like odic poles causes a disagreeable sensation, while the pairing of unlike poles causes a pleasant sensation, we have thus a sufficient cause for those likings and antipathies hitherto held unaccountable. Some sensitive persons cannot sleep on their left side (in the northern hemisphere), because the north pole of the earth, which is od-negative, affects unpleasantly the od-negative left side. All motion generates od; why, then, may not a stream running underground affect a sensitive water-finder, so that the divining-rod in his or her hand shall move without, it may be, any conscious effort of will? All the phenomena of mesmerism are ascribed to the workings of this od-force. Reichenbach does not pretend to have had the evidence of his own senses for any of those manifestations of his assumed od-force; the whole theory rests on the revelations made to him by "sensitives." It may be added, that few, if any, really scientific men have any belief in the existence of such a force.—Those curious in such matters are referred for the details of the subject to Reichenbach's large work, translated into English by Dr. Ashburner, under the title of The Dynamics of Magnetism, or to a briefer account in his Odisch-Magnetische Briefe (Stutt. 1852).
ODAL of UDAL RIGHT (Celtic od, property), a tenure of land which was absolute, and not dependent on a superior, and prevailed throughout northern Europe before the rise of feudalism. It was the source of blood connections, which connected free men with free men, and not on the tie of service. It was the policy of the sovereign authority everywhere to make it advantageous for the freemen to exchange the odal right for the tie of service—a change which paved the way for the feudal system. The odalors of Orkney were allowed to retain or resume their ancient privileges, on paying a large contribution to the erection of St. Magnus’s cathedral at Kirkwall; and the odal right prevails to this day to a large extent in the Orkney and Shetland Islands, the right to land being completed without writing by undisturbed possession proved by witnesses before an inquest.

ODD-FELLOWS, the name assumed by one of the most extensive self-governed provident associations in the world. The institution was originated in Manchester in 1812, although isolated “lodges” had existed in various parts of the country for some time previously. These latter were generally secret fraternities, humble imitations of Freemasonry—adopting a similar system of initiatory rites, phrasing, and organization—established for social and convivial purposes, and only occasionally extending charitable assistance to members. On its institution in Manchester, the main purpose of odd-fellowship was declared by its laws to be, “to render assistance to every brother who may apply through sickness, distress, or otherwise, if he be well attached to the queen and government, and faithful to the order;” and this continues to be the basis of all its operations. It still, however, retains some of the characteristics of Freemasonry, in possessing pass-words and peculiar “grips,” whereby members can recognize one another. The headquarters of the society are at Manchester, where the grand-master and board of directors meet quarterly to hear appeals, and transact the general business of the order. In Jan., 1852, the total number of members was 224,441; in Jan., 1878, the number was 526,802. The lodges number 1,121, spread over 456 districts; the annual income being about $520,000, with considerably less expenditure. Should any lodge fail to meet its legitimate obligations, the district becomes liable; failing the district, the responsibility falls upon the entire unity. The order is widely spread over the whole of England and Scotland. It exists independently in America (where there are near 426,000 members of the separated association), Australia, New Zealand, and the Western Isles, but they are “lodges” in Philadelphia, New York, in all the British colonies, and one in Constantinople (originated in 1862), which are affiliated to and in connection with the Manchester board. These widespread ramifications of this society enable emigrant members to be at once received into fellowship in those countries. In the American states, odd-fellowship is said to have exercised considerable political influence. A quarterly periodical, called the Odd-fellows’ Magazine, devoted to its interests, is published in Manchester. In an early number of this publication, an odd-fellow is described as “like a fox for cunning, a dove for tameness, a lamb for innocence, a lion for boldness, a bee for industry, and a sheep for usefulness.”

ODD-FELLOWS, INDEPENDENT ORDER OF. The order was introduced into the United States in 1806. Some persons who had been members of English lodges established a lodge at Baltimore in 1819; and this lodge soon received a charter from the Manchester unity. The lodges already established in New York, Philadelphia, and Boston accepted charters from the Maryland grand lodge. The American lodges have long ceased to hold friendly relations with the Manchester unity. The U. S. grand lodge has established grand lodges in all the states and in most of the territories. About 20 periodicals, devoted to the order, are published in this country. American odd-fellowship seeks to “visit the sick, relieve the distressed, bury the dead, and educate the orphans.” There are now (1881) about 475,000 members of the organization in the United States, and the annual disbursements for relief of families, burials, education, etc., are over $1,500,000. To become a member of a U. S. lodge a person must be a white male, at least 21 years of age, and must believe in a supreme being.

ODE (Gr. a song) originally meant any lyrical piece adapted to be sung. In the modern use of the word, odes are distinguished from songs by not being necessarily in a form to be sung, and by embodying lofter conceptions and more intense and passionate emotions. The language of the ode is therefore abrupt, concise, and energetic; and the highest art of the poet is called into requisition in adapting the meters and cadences to the varying thoughts and emotions. Hence the changes of meter and versification that occur in many odes. The rapt state of inspiration that gives birth to the ode, leads the poet to conceive all nature as animated and conscious, and instead of speaking about persons and objects, to address them as present.

Among the highest examples of the ode are the Song of Moses and several of the psalms. Dryden’s Alexander’s Feast is reckoned one of the first odes in the English language. We may mention, as additional specimens, Gray’s Bard, Collin’s Ode to the Passions, Burns’s Scots wha hae, Coleridge’s Ode to the Departing Year and Dejection, Shelley’s Ode to the Skylark, and Wordsworth’s Ode on the Recollections of Immortality in Childhood.

ODENHEIMER, WILLIAM HENRY, D.D., 1817-80; h. Philadelphia; educated at the university of Pennsylvania. He took orders in the Protestant Episcopal church, became
rector of St. Peter's church, Philadelphia, in 1840, and was elected bishop of New Jersey in 1859. He published The Origin of the Prayer-Book (1841), an essay on Canon Law, (1847), Jerusalem and Vicinity (1855), and other works.

O D E N K I R C H E N, a t. of Rhenish Prussia, 15 m. w.s.w. from Düsseldorf, near the right bank of the Niers. It has manufactures of velvets, paper, leather, etc., and like many of the other manufacturing towns in the same district, has recently much increased in size and population. Pop. 75,784.

O D E N S E E, anciently known as Odin's-Ey or Odin's Oe (i.e., Odin's island), the chief town of the Danish island of Fünen, and the oldest city of the kingdom, is situated in the amt or district of the same name, in 55° 25' n. lat., and 10° 20' e. long. Pop. 70,169. Odensee, which is the seat of the governor of the island and the see of a bishop, has a gymnasium, several literary societies, and is an active, thriving provincial town. A bishopric was founded here in 988, prior to which time Odensee bore the reputation of being the first city established by Odin and his followers. The cathedral, founded in 1086 by St. Knud, whose remains, like those of several of the early Danish kings, were deposited here, is a fine specimen of the early simple Gothic style. The lay convent or college for ladies contains an extensive library, furnished with copies of all printed Danish works. At Odensee a diet was held in 1557, in which the reformed or Lutheran doctrines were declared to be the established creed of Denmark, and equality of rights was granted to Protostants; while another diet held there in 1530 promulgated the laws regulating the affairs of the reformed church.

O D E N W A L D. See H I S S E - D A R M S T A D T.

O D E ' O N, a musical theater among the ancient Greeks, built on the same plan as the theater, but smaller, and covered with a roof. The first was at Sparta, about the middle of the 7th c. B.C. It was called the Sknis, and was designed by Theodorus, an architect of Samos. Athens had an old one near the Ilissus, but Piræus erected a better one. It stood near the base of the acropolis, on the s.e. side, and its form was to be imitated from that of Xerxes' tent. It was burned at the siege of Athens by Sulla, and soon after re-erected by Ariobarzanes, king of Cappadocia. There were two odeons in Athens, one of which, built by Herodes Atticus, had a capacity of 8,000. Each principal Greek city had its odeon; and it was introduced into Rome by Donatian.

O D E R (Lat. Vinduns, Slavon. Vjo'dr), one of the principal rivers of Germany, rises in the Leselberg on the table-land of Moravia, more than 1,000 ft. above the level of the sea, and enters Prussian Silesia at Odersberg, after a course of some 30 miles. After traversing Brandenburg in a n.w. direction, it crosses Pommerania, and empties itself into the Stettiner Haff, from whence it passes into the Baltic by the triple arms of the Dievenow, Peene, and Swine, which inclose the islands of Wolin and Usedom. The Oder has a course of more than 500 m., and a river-basin of 50,000 sq. miles. The rapid flow of this river, induced by its very considerable fall, is accelerated by the influence of several important mountain-streams, and thus contributes, together with the siting at the embouchures of these streams, to render the navigation difficult; great expense and labor being, moreover, necessary to keep the embankments in order, and prevent the overflowing of the river. The Oder has numerous secondary streams, the most important being the Opp. Nersse, Ollin, Kielschitz, Bartich, Warie, and the Illa; and is connected with the Havel and thence with the Elbe by the Finow canal, and with the Spree by the Friedrich-Wilhelmus canal. The chief trading port of the Oder is Swinemunde, which constitutes an important center for the transfer of colonial and other foreign goods to northern Germany and Poland. At Ratibor, 17 m. below Oderberg, the river becomes navigable, and is upwards of 100 ft. in breadth; at Oppeln, in Prussian Silesia, it has a breadth of 258 feet. As a boundary river, it is of considerable importance in a military point of view, and is well defended by the fortresses of Kosel, Grossglogau, Kustrin, and Stettin.

O D E R Z O, a t. in the Italian province of Treviso, 14 m. n.e. of the town of Treviso; pop. about 6,500. In ancient times the place was called Opitergium, and it is stated that in the wars of Caesar and Pompey, 1000 young men from this town slew themselves in preference to remaining the prisoners of Pompey. It was formerly much larger than at present, but still has some business activity. Its chief interest is from its numerous palaces, pictures, and antiquities. The villa Colfrancui contains many inscriptions, bas-reliefs, and bronze, iron, ivory, and gold objects of art, found near by.

O D E S S A, an important seaport and commercial city of s. Russia, in the government of Kherson, stands on an acclivity sloping to the shore, on the n.w. coast of the Black sea, 33 m. n.e. of the mouth of the Dniester. Lat. 46° 29' n., long. 30° 44' east. The harbor is formed by two large moles defended by strong works, and is capable of containing 200 vessels. The bay is deep enough even close in shore to admit the approach of the largest men-of-war, and is frozen only in the severest winters, and then only for a short time. The promenade along the face of the cliff, descending to the shore by a broad stone stair of 204 steps, is the favorite walk of the inhabitants. Here also stands the monument of the due de Richelieu, to whom in great part the town is indebted for its prosperity. In the pedestal of the monument is preserved the ball by which he was shot during the bombardment of the town by the allied fleet in 1854. The university of
Ottenkirchen.

Odessa, founded in 1865, had, in 1877, 43 professors and 252 students; and the library possessed over 150,000 volumes. The city contains many fine edifices, as the cathedral of St. Nicholas, the admiralty, the custom-house, etc. Owing to the intensity of the heat in summer (rising occasionally to 120°), and the dryness of the soil, vegetation in the vicinity of Odessa is very poor. In the neighborhood are quarries of soft stone, which is used for building purposes in Odessa and in the surrounding towns. One of the great deficiencies of Odessa used to be its want of good water; but works for securing an ample supply of the Dnieper were completed in 1873. Gas was first used in Odessa in 1861; and the theater, the hotels, and all the larger houses now use the handiest of the artificial lights. A railway, opened in 1872, has added enormously to the commercial success and importance of Odessa, as it connects it, and of course Kherson, with the governments n. and e. of it in Russia. The estimated value of the various quantities of grain, wood, hides, tallow, and other articles of export for the year 1871 was £7,110,000, of which amount, the value of goods shipped in British vessels was £2,372,000. In 1876 the total exports were valued at about £7,790,000, and the imports at £7,350,000. The rapid strides Odessa has made in commerce within the last five years will be seen, which these latter sums are compared with the corresponding ones of 1853 and 1899: the former year showing the sum of £670,000, and the latter exhibiting a fall down to £463,000. The pop. of Odessa in 1873 was 181,819.

In ancient times, Odessa (Gr. Odessus) was inhabited by a Greek colony, and later by Tartar tribes. In the beginning of the 15th c., the Turks constructed a fortress here, which was taken by the Russians in 1789. In 1793 a Russian fortress was built here, and became the nucleus of a town and port, which two years after received the name of Odessa. The duc de Richelieu, a French emigrant in the Russian service, was appointed governor here in 1803, and during the 11 years of his wise administration the town prospered rapidly. Since 1823 the city has formed part of the general governorship of s. Russia; is the seat of its administration, and is the residence of the gov. gen. and of an archbishop. The advantageous commercial position of the city, and the privileges granted to it by government, but chiefly the privilages of commerce (i.e. the benevolent favours) which the latter few years have been raising, have rendered it a great emporium of all kinds of merchandise.
sons to rule there, and introduce a new religion, in which he, as the chief god Wotan, received divine honors, advanced on his victorious course, and making himself master of Denmark, placed another son, Skjold, to reign over the land, from whom descended the royal dynasty of the Skjoldingar. He next entered Sweden, where the king, Gylfi, accepted his new religion, and with the whole nation worshipped him as a divinity, and received his son Yngani as their supreme lord and high-priest, from whom descended the royal race of the Ynglingars, who long reigned in Sweden. In like manner he founded, through his son Seiming, a new dynasty in Norway; and besides these, many sovereign families of northern Germany, including our own Saxon princes, traced their descent to Odin. As it has been found impossible to refer to one individual all the mythical and historical elements which group themselves around the name of Odin, Wodin, or Wotan, it has been suggested by Suhrn and other historians, that there may have been two or three ancient northern heroes of the name; but notwithstanding the conjectures which have been advanced since the very dawn of the historical period in the n., in regard to the origin and native country of the assumed Odin, or even the time at which he lived, all that relates to him is shrouded in complete obscurity. It is much more probable, however, that the myth of Odin originated in nature-worship. See Scandinavia Mythology.

ODO, SAINT, 579-913, second abbot of Cluny, son of Abbon, a powerful lord at the court of William the strong, duke of Aquitaine, solemnly consecrated by his father to the church even before his birth. His education commenced in the convent of St. Martin of Tours under the guidance of saint Odalric, was completed at Paris. He returned to St. Martin, but, thinking that its rule was not strict enough, left it and entered the Cistercian convent at Banne, in Burgundy. After the death of Bernon, Odo was chosen to succeed him as abbot of Cluny and of Bourges. Under his energetic administration the order rapidly increased in reputation and wealth. The fame of the school of Cluny was diffused far and wide. The aid of Odo was sought in reforming convents in various quarters. The popes sent for him to settle disputes between princes and monasteries, and thus he entered upon the most important diplomatic negotiations. On his return from a journey to Rome he died in the convent of St. Julian at Tours. He was profoundly conscious of the corruption in the church among the clergy, monks, and laity; and while full of zeal for the renovation of the Christian life, did not regard asceticism as Christian perfection, though he sought to correct the secularized life of the clergy by a severe monastic discipline. In the midst of prevailing corruption his pious zeal and pure life gave him great influence and authority. He was a diligent writer, and composed many anthems and hymns.

ODOAUCER (also ODOVACE, ODORA, ODOVACHAR, OTACHAR, etc., and, according to St. Martin, the same as OTTOCHAR, a name frequent in Germany during the middle ages), the ruler of Italy from the year 476 to 493, was the son of Edicceon, a secretary of Attila, and one of his ambassadors to the court of Constantinople. This Edicceon was also capt. of the Scyrri, who formed the bodyguard of the king of the Huns. After the death of Attila he remained faithful to the family of his master, but perished about 463 in an unequal struggle with the Ostrogoths. He left two sons, Onulf and Odaceer, the former of whom went to seek his fortune in the east; while Odaceer, after leading for some time the life of a bandit chief among the Noric Alps, determined to proceed to Italy, whither barbarian adventurers were flocking from all Europe. According to a monkish legend, a pious hermit, St. Severinus, whom he went to visit before his departure, prophesied his future greatness. Odaceer entered the military service of the western Roman empire, and rapidly rose to eminence. He took part in the revolution by which Orestes (475) drove the emperor Julucus Nepos from the throne, and conferred on his son Romulus the title of Augustus, which the people sedulously changed into Augustulus. He soon perceived the weakness of the new ruler, and resolved to profit by it. He had little difficulty in persuading the barbarian soldiery, who had effected the revolution, that Italy belonged to them, and in their name demanded of Orestes the third part of the land as the reward of their help. This Orestes refused; and Odaceer, at the head of his Heruliens, Rugiains, Turcethiains, and Scyrri, marched against Pavia, which Orestes had garrisons, stormed the city, and put his opponent to death (476). Romulius abdicated, and withdrew into obscurity. What became of him is not known. Thus perished the Roman empire. Odaceer showed himself to be a wise, moderate, and politic ruler, quite unlike our general notion of a barbarian. In order not to offend the Byzantine emperor Zeno, he took the title of king only, and caused the senate to despatch to Constantinople a flattering letter, in which it declared one emperor to be enough for both east and west; renounced its right of appointing the emperors, expressed its confidence in the civil and military talents of Odaceer, and begged Zeno to confer upon him the administration of Italy. After some hesitation the Byzantine emperor yielded to the entreaties of the senate, and Odaceer received the title of Patricius. He
fixed his residence at Ravenna. According to his promise he divided among his companions the third part of the land of Italy—a measure far less unjust than at first sight may seem, for the peninsula was then almost depopulated, and many domains were lying waste and ownerless. This barbarian ruler did everything in his power to lift Italy out of the deplorable condition into which she had sunk, and to breathe fresh life into her municipal institutions—those venerable relics of noble days! He even re-established the consulate, which was held by eleven of the most illustrious senators in succession, maintained peace throughout the peninsula, overawed the Gauls and Germans, and reconquered Dalmatia and Noricum. In religion, though an Arian himself, he acted with a kingly impartiality that more orthodox monarchs have rarely exhibited.

Gibbon remarks, with his usual pointed sarcasm, that the silence of the Catholics attests the toleration which they enjoyed. The valor, wisdom, and success of Odoncer appear to have excited the jealousy and alarm of Zeno, who encouraged Theodoric, king of the Ostrogoths, a still greater warrior and sovereign than Odoacer himself, to undertake an expedition against Italy. The first battle was fought on the banks of the Isontius (mod. Isonzo), Aug. 28, 499. Odoacer was beaten, and retreated. During his retreat he, hazarded another battle at Verona, and was again beaten. He now hastened to Rome to rouse the inhabitants, but the gates of the city were closed against him. Returning northwards to his capital, Ravenna, he reassembled the wrecks of his army, and in 499 once more marched against the Ostrogoths, whose advance guard he defeated and pursued to the walls of Pavia. Another great battle now took place on the banks of the Adia, when Odoacer was vanquished for the third time. He now shut himself up in Ravenna, where Theodoric besieged him for three years. Odoacer then capitulated, on condition that the kingdom of Italy should be shared between him and Theodoric. This agreement was solemnly sworn to by both parties, Feb. 27, 493; but on March 5 Odoacer was assassinated at a feast, either by Theodoric himself or by his command.

**ODOMETER** (Gr. odos, a road; metron, a measure), also called perambulator, or surveying-wheel, is an instrument attached to a carriage or other vehicle, for the purpose of registering the distance it has traveled. Such machines have been in use from an early period, and one is described by Vitruvius in that part of his work, De Architectura, which is devoted to machines. The instrument, as commonly employed, consists of a train of wheel-work, which communicates motion from the axle of the carriage wheel to an index which moves round the circumference of a dial fixed in one side of the carriage over the axle. The wheel-work is arranged so as to produce a great diminution of the velocity impressed by the axle of the vehicle, and the dial is so graduated that the index can show the number of miles, furlongs, yards, etc., traversed. The instrument is also constructed to work independently, being in this case provided with wheels and an axle of its own; when this is done the wheel is made of such a size that its circumference is an aliquot part of a mile, an arrangement which greatly simplifies the calculation of the distance traversed. The complete odometer can then be drawn along by a man on foot, or attached behind a carriage. See **PEDOMETER**.

**O'DONNELL, Leopold, Duke of Tetuan, Marshal of Spain, b. in 1809, was descended from an ancient Irish family. He entered the Spanish army when young, and bravely espoused the cause of the infant queen Isabella against her uncle, Don Carlos. When the Carlists were overthrown, he was created count, made general, of brigade, and chief of the staff of Espartero. He took the side of the queen-mother in 1840, emigrated with her to France at the time when her cause seemed desperate, and took up his residence at Orleans, where he planned many of the political risings and disturbances which took place under the rule of Espartero. He headed in person a revolt of the Navarrese against the minister, but on its failure returned to France. In 1843 his intrigues against Espartero (g.v.) were successful, and he was rewarded by the governor-generalship of Cuba, where he amassed a large fortune by favoring the iniquitous trade in slaves. When he returned to Spain (1845) he intrigued against Bravo Murillo and Narvaez; and when the latter was succeeded by Sartorius, O'Donnell, proscribed by the government, headed a military insurrection. Defeated and driven into Andalusia in 1854, he issued a liberal manifesto. The profligacy of the court and the deprofiting of the government favored the appeal; and when Espartero gave in his resignation the Spaniards rose en masse and replaced the ex-regent at the helm. Espartero reversed the confiscation against O'Donnell, and made him a marshal and minister of war. O'Donnell again plotted against his old benefactor, and in July, 1856, supplanted him by a coup d'état. Blood was shed in the streets of Madrid, but O'Donnell remained president of the council. He was in three months' time succeeded by Narvaez: but in 1858 he returned to power again, and in 1859, while still holding the position of prime minister, he assumed the command of the army sent to Morocco. The campaign continued for many months, without leading either to reverses or glory. The Moors displayed an entire absence of military qualities; and O'Donnell, though successful in obscure skirmishes, occupied three months in the march from Ceuta to Tetuan. A battle took place, Feb. 4, 1860; O'Donnell gained a complete victory, took the Moorish camp, and the city of Tetuan surrendered to the Spaniards. The emperor of Morocco submitted to a loss of territory, and O'Donnell was raised to the first rank of the Spanish nobles as duke of Tetuan. He remained prime minister till 1866, when his cabinet was
upset by Narvaez. He then received leave of absence—that is to say, was exiled, and spent the most of his time in Paris. He died at Biarritz in 1867. The O'Donnell ministry improved the finances, army, and administration of Spain.

**ODONTASPIDIDÆ**. A family of sharks nearly related to the mackerel shark, but having shape more like that of ordinary sharks. Head depressed; eyes have no nictitating membrane; nostrils simple and far from the mouth, which is wide and inferior; teeth nail-like, with basal cusps in both jaws. Dorsal fin two, the first in front of the ventrals. Tail has no pits at the root, and no lateral keels. The family is a small one, one species, *O. ferox*, inhabiting the Mediterranean; and there is an American Atlantic species, known as *sand shark*, which is also said to be found at the cape of Good Hope, and at Tasmania and Australia.

**ODONTOLOGY. See Teeth, ante.**

**ODONTORHYNCHÆ**, a sub-class of birds whose fossils have been found by Marsh in the cretaceous formation of Kansas. They include two orders, odontolcae, and odontorhynche. The order odontolcae was founded by Marsh for the reception of the extraordinary *hesperornis regalis*. The fossil of this gigantic bird indicates that in many points of structure it resembled the loons of the present day. It measured between 5 and 6 ft. from the bill to the toes, and it stood nearly as high. Its jaws were furnished with numerous conical, recurved teeth, sunk deep in a continuous groove. The front of the under jaw was not furnished with teeth, and was probably excised in a horny beak. The breast-bone had no central ridge or keel, and the wings were too small for a bird of flight. The tail consisted of about 12 vertebrae, of which the last three or four were amalgamated to form a flat, terminal mass. The tail was probably capable of a considerable up and down movement, enabling it to act as a paddle. The cervical and dorsal vertebrae were of the ordinary bird type. The legs were powerful and the feet adapted for rapid paddling. It was undoubtedly a swimming and diving bird, larger than any of the present day, and probably lived upon fishes. *Lesornis crocipes*, also of the cretaceous, is nearly related to *hesperornis*; and *eudilornis* of the cretaceous of Great Britain is probably allied to the same genus, but the formation of its jaws is unknown. The next order, odontolcae, was founded by Marsh, for the reception of two remarkable birds which he has named *leptornis dispar* and *apatornis celer*. *Leptornis dispar* may be taken as the type of the order. Its teeth were contained in distinct sockets instead of grooves as in *hesperornis*. They were small, compressed, and pointed, and all of them which have been preserved are of similar form. The lower jaw contained about twenty on each side, all more or less inclined backward. Those in the upper jaw resembled those in the lower. The skull was of moderate size, and the eyes placed well forward. The jaws were long and slender, and apparently not excised in a horny sheath. The articular faces of the vertebrae were biconvex, as in fishes. The wings were large in proportion to the legs, and the humerus had an extended radial crest. The metacarpal bones were united as in ordinary birds. Whether the tail was elongated cannot be present, but the last vertebra of the sacrum was very large. The fossil found by prof. Marsh was that of an adult, and about the size of a pigeon. The species was carnivorous, and probably aquatic. *Apatornis resembled* *leptornis*, but was rather more slender.

**ECOLAMPADIUS, JOANNEs**—a name Latinized, according to the fashion of the age, from the German JOHANN HAUSCHEN—one of the most eminent of the coadjutors of Zwingli in the Swiss Reformation, b. in 1482 at Weinsberg, in Swabia. His father destined him for the profession of the law, and he studied for it in Heidelberg and Bologna; but yielding to his own strong inclination, he relinquished this study for that of theology, which he prosecuted at Heidelberg. He then became tutor to the sons of the elector Palatine, and subsequently preacher in Weinsberg. This office he resigned in order to study the Greek language under Reuchlin at Stuttgart. He also learned Hebrew from a Spanish physician, Matthew Adrian. Being appointed preacher at Basel, he formed the acquaintance of Erasmus, who highly appreciated his classical attainments, and employed his assistance in his edition of the New Testament. In 1516, Ecolampadius left Basel for Augsburg, where also he filled the office of preacher, and where he entered into a convent. But Luther's publications exercised so great an influence on him that he left the convent, and became chaplain to FRANZ von Sickingen, after whose death he returned to Basel in 1522, and in the capacity of preacher and professor of theology, commenced his career as a reformer. He held disputations with supporters of the church of Rome, in Baden in 1526, and in Bern in 1528. In the controversy concerning the Lord's supper, he gradually adopted more and more the views of Zwingli, and at last maintained them in 1525, in a treatise, to which the Swabian ministers replied in the *Syngagma Sacræm. In 1529 he disputed with Luther in the conference at Marburg. He died at Basel, Nov. 23, 1531, not long after the death of his friend Zwingli. He was remarkable for his gentleness of character. His treatise *De Ritu Piacht* and his Epistolæ Conciliarum Lindenserum et Ecumen. are the most noted of his works. See Herzog, *Das Leben des Joh. Ecolampadius* (1848); and Hagenbach's *Ecolampadius* (1859).

**EGUMENICAL** (Gr. *oikoumenike*, "of, or belonging to, the oikoumen,"
"the world"), the name given to councils of the entire church, and synonymous with the more ordi-
nary name "general." See Council. The conditions necessary to constitute an ecumenical council are a subject of much controversy. As the subject is of less importance in Protestant divinity, it will be enough to explain here that a council is said by Roman Catholic divines to be ecumenical in three different ways; viz., in convocation, in celebration, and in acceptance. For the first, the summons of the pope, direct or indirect, is held to be necessary; this summons must be addressed to all the bishops of the entire church. To the second, it is necessary that bishops from all parts of the church should be present, and in sufficient numbers to constitute a really representative assembly; they must be presided over by the pope, or a delegate designated by the pope; and they must enjoy liberty of discussion and of speech. For the third, the decrees of the council must be accepted by the pope, and by the body of the bishops throughout the church, at least tacitly. The last of these conditions is absolutely required to entitle the decrees of a council to the character of ecumenical; and even the decrees of provincial or national councils so accepted, may acquire all the weight of infallible decisions, in the eyes of Roman Catholics.

**Oedema** (Gr. a swelling) is the term applied in medicine to the swelling occasioned by the effusion or infiltration of serum into cellular or areolar structures. The subcutaneous cellular tissue is the most common, but is not the only seat of this affection. It is occasionally observed in the submaxillary and subserous cellular tissue, and in the cellular tissue of the parenchymatous viscera; and in some of these cases, it gives rise to symptoms which admit of easy recognition during life. Thus oedema of the glottis (see Larynx) and oedema of the lungs constitute well-marked and serious forms of disease; while oedema of the brain, though not easily recognized during life, is not uncommonly met with in the horrors of examination of insurrectionary names. Oedema may be either passive or active, the former being by far the most common. Passive oedema arises from impeded venous circulation (as from obstruction or obliteration of one or more veins; from varicose veins; from standing continuously for long periods, till the force of the circulation is partly overcome by the physical action of gravitation; from deficiency in the action of the adjacent muscles, which in health materially aids the venous circulation, etc.); from too weak action of the heart (as in dilatation or certain forms of valvular disease of that organ); or from a too watery or otherwise diseased state of the blood (as in chlorosis, scurvy, Bright's disease, etc.). By means of the knowledge derived from pathological anatomy, we can often infer the cause from the seat of the swelling; for example, oedema of the face, usually commencing with the eyelids, is commonly caused by obstruction to the circulation through the left side of the heart, or by the diseased state of the blood in Bright's disease; and oedema of the lower extremities most commonly arises from obstruction in the right side of the heart, unless it can be traced to the pressure of the gravid uterus, or of accumulated faces in the colon, or to some other local cause. Active oedema is associated with an inflammatory action of the cellular tissue, and is most marked in certain forms of erysipelas. It is firmer to the touch, and pressure with the finger produces less pitting than in the passive form.

From the preceding remarks, it will be seen that oedema is not a disease, but a symptom, and often a symptom indicating great danger to life. The means of removing it must be directed to the morbid condition or cause of which it is the symptom.

**Oedenburg.** a co. in w. Hungary, bounded by Lower Austria, Raab, Eisenburg, and Wieselburg; 1280 sq. m.; pop. 70, 230,158; drained by the Raab, Leitha, and Rablitz rivers, and intersected by the Vienna and Cilly railroad. Lake Neusiedler, one of the largest of Hungary proper, is included in the district. The surface is level and fertile in the s. and e., but mountainous in the n., and covered by forests. The staples are wine, tobacco, corn, wheat, honey, and wax. Potash, nitre, refined sugar, cotton and woolen goods, are manufactured. Capital, Oedenburg.

**Oedenburg** (Hung. Sovrony; anc. Sempronium), a t. of Hungary, capital of a county of the same name, situated in an extensive plain, about 2 m. w. from the Neusiedler see, on the Ilkva, a branch of the Raab. It is connected by railway with Vienna. Oedenburg is one of the most beautiful towns in Hungary. It has manufactures of cotton, silk, iron, linen, woolen, pottery, nitrates, tobacco, sugar, earthenware, glass, cutlery, etc.; and a considerable trade in wine, corn, tobacco, wax, honey, and cattle, the products of the neighborhood, which is rich and well cultivated. The wine of Rust, a small town 8 m. n. of Oedenburg, on hills sloping to the Neusiedler see, is one of the best wines of Hungary, and inferior only to Tokay. The Roman station of Sempronium was one of considerable importance; and numerous Roman remains are found near Oedenburg. The inhabitants of Oedenburg are mostly of German race. Pop. '69, 21,108.

**Oedipus** (Gr. Oidipous), the hero of a celebrated legend, which, though of the most revolting nature in itself, has supplied both Enriques and Sophocles with the subject-matter of some of their most celebrated tragedies. The story, as generally related, is as follows: Oedipus was the son of Laius, king of Thebes, by Jocaste; but his father having consulted the oracle to ascertain whether he should have any issue, was informed that his wife would bring forth a son, by whom he (Laius) should ultimately be slain. Determined to avert so terrible an omen, Laius ordered the son which Jocaste bare him to have his feet pierced through, and to be exposed to perish on Mount Cithærum. In this help-
less condition. Oedipus was discovered by a herdsman, and conveyed to the court of Polypus, king of Corinth, who, in allusion to the swollen feet of the child, named him Oedipus (from oide, to swell, and pous, the foot); and along with his wife, Merope, brought him up as his own son. Having come to man's estate, Oedipus was one day tampered with the obscurity of his origin, and in consequence proceeded to Delphi, to consult the oracle. The response which he received was, that he would slay his father, and commit incest with his mother. To escape these fates, he avoided returning to Corinth, and proceeded to Thebes, on approaching which he encountered the charioteer, and the charioteer ordering him out of the way, a quarrel ensued, in which Oedipus ignorantly slew Laius, and thus unconsciously fulfilled the first part of the oracle. The famous Sphinx (q.v.) now appeared near Thebes, and setting herself on a rock, pronounced a riddle to every one who passed by, putting to death all who failed to solve it. The terror of the Thebans was extreme, and in despair they offered the kingdom, together with the hand of the queen, to the person who should be successful in delivering it from the monster. Oedipus came forward; the Sphinx asked him, "What being has four feet, two feet, and three feet; only one voice; but whose feet vary, and when it has most, is weakest?" Oedipus replied that it was "Man;" whereupon the Sphinx threw itself headlong from the rock. Oedipus now became king, and husband of his mother, Jocasta. From their incestuous union sprung Eteocles, Polynices, Antigone, and Ismene. A mysterious plague now devastated the country, and when the oracle declared that before it could be stayed, the murderer of Laius should be banished from the country, Oedipus was told by the prophet Tiresias that he himself had both murdered his father and committed incest with his mother. In his horror he put out his own eyes, that he might no more look upon his fellow-creatures, while Jocasta hanged herself. Driven from his throne by his sons and his brother-in-law, Creon, Oedipus wandered towards Attica, accompanied by Antigone, and took refuge in the grove of the Eumenides, who charitably removed him from earth; but the latter part of his life is differently told.

OE'GIS, in Scandinavian mythology, the ocean god, a jotun, but friendly to Odin.

EHLENSCHLÄGER, ADAM GOTTLOR, the greatest poet of northern Europe, was b. in 1779, at Copenhagen. His early years were spent at the palace of Frederickborg, in the neighborhood of the Danish capital, where his father was employed, first as organist, and afterwards as standard or bailiff. During the absence of the royal family in the winter, Ehleenschläger and his sisters roamed about over the country, beholding the paintings and works of art which it contained, and in improving private libraries, for which he supplied original pieces. After an irregular and desultory course of education, Ehleenschläger's love of the drama led him to offer his services to the manager of the Copenhagen theater; but, discovering soon that he had no chance of rising above the rank of a mere supernumerary, he entered the university of Copenhagen as a student of law. For a time he seems to have pursued his studies with tolerable assiduity, under the direction of his friend, A. S. Oersted, who, together with his distinguished brother, H. C. Oersted (q.v.), had cemented a life-long friendship with him. Ehleenschläger's studies were interrupted in 1801, when, on the bombardment of Copenhagen by Nelson and Parker, he and his friends served in the student-corps of volunteers. After this event, which roused the dormant patriotism of the nation, Ehleenschläger found the study of law too irksome, and devoted all his energies to the cultivation of the history and mythology of his own country. In 1809 appeared his first collection of poems, including one longer dramatic piece, the St. Hans Aften-Spil, which attracted favorable notice for the lively fancy with which national habits and local characteristics were portrayed. The Vantlander Saga in the Poetiske Skrifter, published in 1806, and his Aladdin's fornydelige Lømpe, completed his success, and raised him to the rank of the first of living Danish poets; the former of these works having shown a marvellous capacity for reflecting the dark and stern coloring of the old northern Sagas, while the latter gave evidence of a rich and genial poetic fancy. These early efforts were rewarded by the acquisition of a traveling pension, which enabled him to spend some years in visiting various parts of the continent, and becoming acquainted with the great literary celebrities of the day, such as the Weimar circle, of whom Goethe was the head. During this period, Ehleenschläger wrote his Halkon Jarl, the first of his long series of northern tragedies, at Halle (1807; Eng. trans. by F. C. Lascelles, (1875), and his Coreggjo, at Rome (1809; Eng. trans. by Theodore Martin, 1854). In 1810 (Ehleenschläger returned to Denmark, where he was destined to become the first of his country's poets, and the poet most commonly known; and having soon afterwards obtained the chair of aesthetics at the university, and received various substantial proofs of royal favor, he married, and settled in the capital, where his peace was, however, rudely disturbed by a literary feud with Baggesen, the Danish poet and critic, whose poetical supremacy had been superseded by that of Ehleenschläger. In 1819 appeared one of Ehleenschläger's most masterly productions, Nordens Guder, and this and the numerous dramatic compositions written about the same period, show that the severe criticism to which his writings had been exposed during the celebrated Baggesen quarrel, had corrected some of the faults, and lessened the self-conceit which had characterized his earlier works. His reputation spread with his increasing years both abroad and at home; and after having repeatedly visited the more
southern parts of Europe, he went, in 1829, to Sweden, where his arrival was welcomed by a public ovation; and after having received repeated marks of friendship from various sovereigns, he was honored in his own country by the celebration, in 1849, of a grand public festival, held in the palace at Copenhagen. But this ovation was unfortunately followed in less than two months by his death, which took place in Jan., 1850. His funeral was kept as a national solemnity, and he was followed to the grave by a civic procession, which included members of every class of society, from princes to artisans.

The fame of Ghienschliger will rest principally on his tragedies, of which he wrote 24, 19 of the number being in northern languages. These were all composed originally in Danish, and re-written by himself in German. Besides those already referred to, the best are _Kauk den Store, Palnatoke, Act en Malborg, Varingerne i Miklgaard_. His poems are for the most part indifferent, and his numerous prose writings deserve little notice. His Danish and German works amount in all to 62 volumes, to which must be added 4 volumes of his _Erindringer, or Autobiographical Recollections_, published after his death.

**OEHLER, Gustav Friedrich, 1812—73, b. Württemberg, and, having studied theology at Tübingen, was, 1834—37, a lecturer in the missionary institution at Basle, after which he returned to the theological seminary at Tübingen, teaching also in the university there. In 1840 he became vicar at Stuttgart and professor in the theological seminary at Schontal. In 1845 he was chosen a member of the theological faculty at Breslau, and continued there until 1852, when he was called back to Tübingen where he lectured and was superintendent of the theological faculty. He published many essays and reviews, and several larger works. He was especially devoted to the study of the Old Testament for which he had a profound reverence as containing the commencement of the supernatural revelation which is completed in the New Testament. He held that the connection between the two is so intimate and complete, that the genesis of all the New Testament ideas of salvation is found in the Old, and that the two must stand or fall together. His chief book is _The Theology of the Old Testament._**

**ŒIL DE BEUF, A French term literally signifying ox’s eye, applied in architecture to those small round or oval openings in the frieze or roof of large buildings, which serve to give light to spaces otherwise dark. The most famous is that in the anteroom (where the courtiers waited) of the royal chamber at Versailles, which gave name to the apartment. Hence the expression, _Les Fuites de l’Œil de Bour—i.e. the history of the courtiers of the Grand Monarque, and by extension, of courtiers in general._**

**ŒLAND, a long and narrow island in the Baltic, lying off the eastern coast of Sweden, opposite to, and forming part of, the land of Kathar, and at a distance of from 4 to 17 m. from the shore. It is 55 m. in length, and from 2 to 8 m. in breadth. The area is 588 sq.m., and the pop. 40,050. The island, which is scarcely more than a lime cliff, is scantily covered with soil, but in some parts it is well wooded, and has good pasture-ground, which is turned to account by the islanders, who rear cattle, horses, and sheep. In favorable seasons, barley, oats, and flax yield good crops. The fishing is excellent all round the coasts. There are large alum-works on the island, and an extensive line of wind-mills along the range of the Alvar hills, near which stands Borgholm (pop. 829). The only town on the island, the first foundations of which were laid in 1817, ‘To the n. of the island lies the steep but wooded island-cliff, the Jungfruens, or Blankuln, which bears the mythical reputation of having been the scene of various deeds of witchcraft, and the favorite resort of wizards and witches.**

**ŒELS, a small t. of Prussian Silesia, stands on a plain on the Oelsa, or Oelse, 16 m. e.n.e. of Breslau. Its castle, built in 1538, is surrounded by ramparts and ditches. It contains a gymnasia; several churches, and other public edifices. Pop. 75, 3,574, who carry on manufactures of shoes and of cloth goods.**

**ŒNANTHIC ACID (C_{14}H_{22}O_{5},H_2O), is one of the volatile fatty acids of the general formula C_{14}H_{22}O_{5}. It is a colorless oily fluid, with an aromatic odor, lighter than water, and insoluble in that fluid, but dissolving readily in alcohol and ether. According to Miller (Organic Chemistry, 2d ed. p. 335), it may be exposed to a cold of 0° without becoming solid, while it boils and may be distilled (with partial decomposition) at 298°. It is (like many of the allied fatty acids) one of the products of the oxidation of oleic acid (q.v.) by nitric acid, and is likewise yielded by the action of nitric acid on castor oil, wax, and various fats. Its most characteristic salt is the enanthylate of copper, which crystallizes in beautiful green needles.**

**ŒNOHERA, a genus of plants of the natural order Onagraceae (q.v.), having four petals and eight stamens, the calyx-lobes 4-5 cleft, the segments reflexed; the capsule 4-valved, with many naked seeds. The Evening Primrose (OE. biennis), a native of Virginia, has been known in Europe since 1614, and is now naturalized in many parts of Europe and in some parts of Britain, on the banks of rivers, in thickets, on sandy grounds, etc. It is a biennial plant, and produces in the first year elliptic or obovate obtuse leaves, and in the second year a stem of 14—4 ft. high, which bears at its summit numerous yellow flowers in a leafy spike. The flowers are fragrant in the evening. The root somewhat resembles a carrot in shape, but is short; it is usually red, fleshy and tender; it is eaten in salads or in soups, and as a boiled vegetable. The plant is often
cultivated for the sake of its large yellow flowers. Several other species of *Eutheria*, natives of North America, are occasionally cultivated in our gardens, and have cattable and pleasant roots.

**Oerebro.** an inland t. of Sweden, capital of a län of the same name, is situated at the entrance of the Swart-Elf into the Helmar lake, 100 m. w. of Stockholm. Pop. 76, 10,493. The town still retains many memorials of its earlier prosperity, when it was frequently the residence of the Swedish rulers, who found its central position in the more fertile southern portion of the kingdom favorable for the pursuit of luxury and pleasure. The old castle was built by Berger Jali in the 13th c., and was in after-times frequently chosen as the seat of the national diets. Oerebro has manufactories of wax-cloth, carpets, wooden goods, stockings, guns, and mirrors; and these industrial products, together with the minerals obtained from the neighboring copper, silver, and iron mines, are conveyed to Gothenburg and Stockholm by means of the extensive system of canals which connects the lakes of the interior with the maritime ports.

**Oersted, Anders Sandeé, 1778-1850; h. in the island of Langeland belonging to Denmark; was educated at the university of Copenhagen, embraced the profession of law and rose to eminence as a successful practitioner and as editor of the Juridiskt Arkiv and other legal periodicals; he also wrote several treatises on the philosophy of Kant and Hegel. In 1825 he was intrusted with the drawing up of the ordinances of the Danish law, and in 1831 had an important share in forming the provincial constitutions granted by Frederick VI. to the states. For several years he was high commissioner, or king's representative, at the assembly of the states, and from 1841 to 1848 was a member of the Danish cabinet. In 1853 he again entered the cabinet as prime minister of Frederic VII., and acted as minister of the interior, of public worship, and of public instruction. Up to this time he had been considered as favoring constitutional reform, but he soon showed himself a violent reactionist. Public feeling was very strong and a revolution seemed at hand, but at the close of 1854 the king dismissed the Oersted cabinet. The point on which the contest of liberalism and prerogative turned was the right of the crown to grant new constitutions to Schleswig and Holstein without the consent of the diet. In 1855 Oersted and his colleagues in the cabinet were impeached by the diet; the trial lasted for a year and resulted in an acquittal under the Danish law, the vote standing eight for conviction and eight for acquittal. An autobiography of Oersted was published 1851-57, and contains valuable material for Danish historians.

**Oersted, Hans Christian, one of the most distinguished scientific discoverers and physicists of modern times, was b. in 1777 at Rudkjobing, on the Danish island of Langeland, where his father practiced as an apothecary. In 1794 he entered the university of Copenhagen, where he took the degree of doctor of philosophy in 1799, and soon afterward became assistant to the professor of medicine, in which capacity he gave lectures on chemistry and natural philosophy. In 1806, after having enjoyed a traveling scholarship for several years, and visited Holland, the greater part of Germany, and Paris, he was appointed extraordinary professor of natural philosophy in the university of Copenhagen. In 1812, he again visited Germany and France, after having published a dissertation by the title of danske Naturks Almindelige Lære, eller Forekomstens til den Almindelige Naturens, which in 1811. During his residence at Berlin, he wrote his famous essay on the identity of chemical and electrical forces, in which he first developed the ideas on which were based his great discovery of the intimate connection existing between magnetism and electricity and galvanism—a treatise which, during his residence in Paris, he translated into French, in conjunction with Marcel de Serres. In 1819, he made known these important truths in a Latin essay, entitled Experimenta circa effluencia in nuen Magnetismum, which he addressed to all the scientific societies and the leading savans of Europe and America, and thus made him good his claim to be regarded as the originator of the new science of electro-magnetism. This discovery which formed one of the most important eras in the history of modern physical science, obtained for Oersted the Copley medal from the royal society of England, and the principal mathematical prize in the gift of the Institute of Paris. The original and leading idea of this great discovery had been in his mind since 1800, when the discovery of the galvanic effect by Volta gave him the occasion to enter upon a course of experiments on the production of galvanic electricity. The connotation of his theory of electro-magnetism was followed by many important experiments in regard to the compression of water, and by numerous other chemical discoveries, among which we may instance his demonstration of the existence of the metal aluminium in alumina. The influence which Oersted exerted on the science of the day by his discoveries was recognized by the learned in every country, and honors increased upon him with increasing years. He was corresponding member of the French institute, perpetual secretary to the royal society of science in Copenhagen, a knight of the Prussian order of merit, of the French legion of honor, and of the Danish order of the dannebrog, and a councillor of state. Oersted's great object through life was to make science popular among all classes, in furtherance of which he wrote numerous works, contributed scientific papers to the newspapers and magazines of his own country and Germany, and in addition to his regular prelections in the university, gave courses of popular scientific lectures to the public including ladies. Among the works specially written to promote the diffusion of scientific knowl-
edge, those best known are Amden i Naturen (Kop. 1845), and Natur-arten's Mechanische Deel (Kop. 1847), both of which have been translated into several other European languages. The majority of his more important physical and chemical papers are contained in Poggendorf's Annalen, and were written by him in German or French, both of which he wrote with the same facility as his own language. At the close of 1850, a national jubilee was held in honor of the 50th anniversary of his connection with the university of Copenhagen—a festival which he did not long survive, as his death occurred at Copenhagen Mar. 9, 1851. A public funeral, attended by all persons distinguished by rank or learning in the Danish capital, bore testimony to the respect and esteem with which he was regarded by his fellow-citizens, among whom his memory is cherished, not merely as one of the greatest scientific benefactors of his times, but as a man who contributed largely, by his eloquent and earnest advocacy of liberal principles, to the attainment of the high degree of constitutional freedom which Denmark now enjoys.

OE SEL, an island of Russia, in the Baltic, belonging to the government of Livonia, and lying across the mouth of the gulf of Riga. It is about 80 m. in length from n.e. to s.w., and about 40 m. in greatest breadth, but the s.w. end consists of a comparatively narrow peninsula. A narrow strait separates the n.e. end from the island of Dago. The surface is undulating, broken by low hills, marshy, watered by numerous small streams, and well wooded. The coast is generally formed by high cliffs. The climate is milder than that of the neighboring continental districts. The rocks are generally calcareous, and the soil is in many places gravely; the chief crops are wheat, oats, rye, barley, and pease. The rearing of cattle, horses, and sheep, and fishing, are, however, the principal occupations of the inhabitants. The seal-fisheries are of some importance. Pop. 40,000, mostly Lutheran. The only town is Arensburg, on the s.e. coast, with a pop. (1867) of 3,256. Many of the inhabitants of Arensburg are of German descent, as are the nobles and clergy of the island; but the peasantry are Estonian. The islanders of Osel were in early times noted as pirates. The Danish king Waldemar conquered the island in the beginning of the 13th century. Albert von Buxhövden, bishop of Leed in Livonia, obtained it from Denmark in 1227, in order that he might reduce its inhabitants to subjection, and convert them to Christianity. Being partly subdued by the Teutonic knights, it remained for more than 300 years under its bishops, the seat of the bishopric being transferred to the island. The last bishop sold it to Denmark in 1559. It remained a Danish province till 1645, when it was given up to Sweden, and in 1721 fell into the hands of Russia.

EOSPHAGUS (Gr. oio, to convey, and phagen, to eat), or GULLET, a membranous canal, about 9 in. in length, extending from the pharynx to the stomach, and thus forming a part of the alimentary canal. It commences at the lower border of the cricoid cartilage of the larynx, descends in a nearly vertical direction along the front of the spine, passes through an opening in the diaphragm, and thus enters the abdomen, and terminates in the cardiac orifice of the stomach opposite the ninth dorsal vertebra. It has three coats—viz., an external or muscular coat (consisting of two strata of fibers of considerable thickness—an external, longitudinal, and an internal, circular); an internal or mucous coat, which is covered with a thick layer of squamous epithelium; and an intermediate cellular coat, uniting the muscular and mucous coats. In this tissue are a large number of esophageal glands, which open upon the surface by a long excretory duct, and are most numerous round the cardiac orifice, where they form a complete ring.

The esophagus is liable to a considerable number of morbid changes, none of which are, however, of very common occurrence.

The most prominent symptom of esophagitis, or inflammation of the esophagus, is pain between the shoulders, or behind the trachea or sternum, augmented in deglutition, which is usually more or less difficult, and sometimes impossible. The affection is regarded as a very rare one, unless when it originates from the direct application of irritating or very hot substances, or from mechanical violence—as, for instance, from the unskillful application of the stomach-pump or probang. Dr. Copland, however, is of opinion that it is not unfrequent in children, particularly during infancy, and observes that "when the milk is thrown up unchanged, we should always suspect the existence of inflammation of the esophagus," The ordinary treatment employed in inflammatory diseases must be adopted; and if inability to swallow exists, nourishing liquids, such as strong beef-tea, must be injected into the lower bowel.

Spasms of the esophagus—A morbid muscular contraction of the tube, producing more or less difficulty of swallowing—is a much more common affection than inflammation. The spasm generally comes on suddenly during a meal. Upon an attempt to swallow, the food is arrested, and is either immediately rejected with considerable force, or is retained a short time, and then brought up by regurgitation; the former happening when the contraction takes place in the upper part of the canal, and the latter when it is near the lower part. In some cases, solids can be swallowed, while liquids excite spasm; while in other cases the opposite is observed; but in general either solids or liquids suffice to excite the contraction, when a predisposition to it exists. The predisposition usually consists in an exstremely state of the nervous system, such as exists in hysteria, hypochondriasis, and
generally in a debilitated condition of the body. An attack may consist of a single paroxysm, lasting only a few hours, or it may be more or less persistent for months or even years. The treatment must be directed to the establishment of the general health, by the administration of tonics and anti-spasmodics, by attention to the bowels and the various secretions, by exercise in the open air, the shower-bath, a nutritious diet, etc.; and by the avoidance of the excessive use of strong tea, coffee, and tobacco. Care must also be taken not to swallow anything imperfectly masticated or too hot; and the occasional passage of a bougie is recommended. Bridlie relates a case that ceased suddenly on the removal of bleeding piles. Strychnia is deserving of a trial when other means fail; and if the affection assume a decidedly periodic form, quinia will usually prove an effectual remedy.

Paralysis of the oesophagus is present in certain forms of organic disease of the brain or spinal cord which are seldom amenable to treatment, and is often a very important part of the palsy that so frequently occurs in the most severe and chronic cases of insanity. In this affection there is inability to swallow, but no pain or other symptom of spasm; and a bougie may be passed without obstruction. The patient must be fed by the stomach-pump, and nutrient injections of strong beef-tea should be thrown into the lower bowel.

Permanent or organic stricture of the oesophagus may arise from inflammatory thickening and induration of its coats, or from scirrhous and other formations, situated either in the walls of or external to the tube. The most common seat of this affection is at its upper part. The symptoms are persistent and gradually increasing difficulty of swallowing, occasionally aggravated by fits of spasm; and a bougie, when passed, always meets with resistance at the same spot. When the contraction is due to inflammatory thickening, it may arise from the abuse of alcoholic drinks, or from swallowing boiling or corrosive fluids; and it is said that it has been induced by violent retching in seasickness. If unreplied, the disease must prove fatal, either by ulceration of the tube around the seat of the stricture, or by sheer starvation. When the affection originates in inflammation, some advantage may be derived from a mild course of mercury, occasional leeching, and narcotics; and especially from the occasional passage of a bougie, of a bell-probug (an ivory ball attached to a piece of whalebone), or of a piece of sponge moistened with a weak solution of nitrate of silver. If it is dependent upon malignant disease, and the tissues have become softened by the infiltration of the morbid deposit, the bougie must be directed with the greatest care through the stricture, as a false passage may be easily made into important adjacent cavities.

Foreign bodies not very infrequently pass into the oesophagus, and become impacted there, giving rise to a sense of choking and fits of suffocative cough, especially when they are seated in its upper part. They may not only cause immediate death by exciting spasm of the glottis, but if allowed to remain, may excite ulceration of the parts, and thus cause death by exhaustion. If the body is small and sharp (a fish-bone, for example), it may often be got rid of by making the patient swallow a large mouthful of bread; if it is large and soft (such as too large a mouthful of meat), it may generally be pushed down into the stomach with the probang; while large hard bodies (such as pieces of bone) should be brought up either by the action of an emetic, or by long curved forceps. If the offending body can neither be brought up nor pushed down, it must be extracted by the operation of oesophagotomy—an operation which can only be performed when the impacted body is not very low down, and which it is unnecessary to describe in these pages.

**OE STRIDE**, a family of dipterous insects, having a mere rudimentary proboscis or none, the palpi also sometimes wanting, and the mouth reduced to three tubercles; the antennae short and inclosed in a cavity in the forepart of the head; the abdomen large. They are generally very hairy, the hair often colored in rings. They resemble flesh-flies in their general appearance, and are nearly allied to muscidae. The perfect insect is very short-lived. The females deposit their eggs on different species of herbivorous mammals, and in particular bear a very favorable eggs a situation on the animal suitable to the habits of the larva, which are different in different species, although the larvae of all the species are parasites of herbivorous quadrupeds. The characters and habits of some of the most notable species are described in the article Borr. Animals seem generally to have a strong instinctive dread of the ostridae which infest them.

**OETINGER, FRIEDRICH CHRISTOPH, 1702-82; b. Göppingen, in Württemberg; studied at the university of Tübingen, where he met those who styled themselves the inspired, and devoted himself to the mystical philosophy of Leibnitz and Wolf. After finishing his course at the university he became intimate with Bengal, with whom he corresponded and whom he frequently visited. His aim was to infuse more of the biblical element into the philosophy of Wolf, and to ascertain therein the flual principles and highest unity of all thought.” He read carefully the church fathers, especially Augustine, and studied the Rabbin and their cabalistic speculations. He became acquainted with Francke, Spangenberg, and Zinzendorf. After traveling extensively he returned to Tübingen, where, having served as tutor and aided Zinzendorf in the translation of the Scriptures, he was appointed reader of theology in the university of Halle.**
post he resigned, and went to Holland to confer with its eminent theologians. Returning to Württemberg he was appointed in 1738 pastor at Hirschau. Having adopted the views of the Pietists, and the integrity of life, earnestness of manner, extensive theological requirements, and, perhaps, his mysticism of style, all combined to give him great influence," he became their leader in that part of Germany. About this time he became an earnest student of the writings of the mystic Böhme, and also an ardent disciple of Emanuel Swedenborg, some of whose writings he translated into German. He attempted to arrange a system of theology on the mystical interpretation of Scripture. In 1765 he published a treatise entitled Earthly and Heavenly Philosophy, which, with his translation of the works of Swedenborg, brought upon him the reprehension of his ecclesiastical superiors. Yet he was protected by the duke of Württemberg, and was nominated to the superintendence of the churches in the district of Weinsberg, afterward in that of Herrenberg, and subsequently appointed prelate at Murhard, where he continued till his death. He was held in high regard as a philosopher and theologian by those who adopted his views. He wrote several philosophical and cabalistical works, known in a much time in vindicating the purer traditions of his own autographic history. A complete edition of his works was published at Stuttgart in 1815, and a complete edition of his works was collected and edited in 1852 by Ehmann, who published his life and letters. The works of Oettinger amount to about seventy, the best of which is Theologiae et Libri Vite Deducta.

Oettingen, a former German co. in the Riesgen, Swabia, now divided between the Spielberg and Wallenstein lines, and belonging partly to Württemberg and partly to Bavaria. It existed from about 1200, and was medizinated 1806-10.

O'Fallon, John, b. Ky., 1791; served in the war of 1812 under gen. Harrison, being wounded at Tippecanoe; was a merchant of St. Louis, Mo., where he acquired vast wealth, and has given more than a million dollars to charitable and other institutions, among which is the O'Fallon polytechnic institution, which he endowed to the amount of $100,000.

Offen. See Buda, ante.

Offa's Dyke, a remarkable relic of antiquity, an entrenched line extending along the whole border of England and Wales, from the N. coast of Flintshire, on the estuary of the Dee, through the counties of Denbigh, Montgomery, Salop, Radnor, and Hereford, into Gloucestershire, where its southern termination is near the mouth of the Wye, in the grounds of Selbury park, which overlook the estuary of the Severn. In some places it is nearly obliterated by cultivation; in others it is of considerable height, although its appearance nowhere indicates that it can ever have been of much value as a rampart. It is therefore generally supposed to have been chiefly intended as a line of demarcation. Nearly parallel with it, but at a distance varying from a few hundred yards to 3 m., on the eastern or English side of it, is Watt's dyke, a similar relic of antiquity, which, however, seems never to have been so great a work, and is now in many places much obliterated. It has been conjectured that the space between them was neutral ground where the Anglo-Saxons and Welsh met for trading or other purposes. The principal dyke is ascribed by tradition to Offa, king of Mercia, who reigned in the 8th c.; but this is matter of tradition, and not of history.

Offenbach, a manufacturing t. of Hesse-Darmstadt, on the s. bank of the river Main, within the domains of the princes of Isenburg-Birstein, 4 m. s.e. of Frankfurt. Pop. '70, 22,691. Offenbach is pleasantly situated in one of the richest parts of the valley of the Main, and is one of the most important manufacturing towns in the province. Among the industrial products, its carriages have acquired a pre-eminent character for excellence; and next to these stand its bookbindings, articles of jewelry, gold and silver goods, carpets, and silk fabrics. It has also good manufactories of wax-cloth, papier-mâché snuff-boxes, tin-lackered wares, umbrellas and parasols, wax-candles, leather, hats, tobacco, sugar, and ginger-bread and spiced cakes. Offenbach has several churches, and a Jewish synagogue. The palace is the winter residence of the Isenburg-Birstein family, to whom the old castle, now in ruins, also belongs. A pontoon-bridge across the river, and a railway to Frankfurt, facilitate intercommunication, and tend materially towards the maintenance of its active trade.

Offenbach, Jacques, a composer of dramatic music, who enjoys high popularity over the continent, of German birth, but a naturalized Frenchman. He was born in 1819, became chef d'orchestre in the Théâtre Français in Paris in 1847, and afterwards manager of the Théâtre des Bouffes Parisiens. He has composed a vast number of light lively operettes, La Mariée de 1400, La Princesse de Montpensier, La Fille d'Elueso, Le Griffon, La Sylphide, perfect as musical trifles; but the productions by which he is best known are a series of buffoneries musicales, or burlesque operas, including Orphée aux Enfers; La Belle Hélène; La Barbe Bleue; La Grande Duchesse; Général de Brabant, and Roi Carotte, composed with the rather questionable aim of parodying music of a more serious description. Madame Favart has become almost as popular in England as in France.

Offenses Against Religion, Public Peace, etc. See Religion, Peace, etc.

Offer and Acceptance is one mode of entering into a contract of sale. At an auction, the highest offer is generally accepted as a matter of course; and when accepted, the contract is completed. An offer is often made by letter from one merchant to U. K. X.—51
another to buy or sell goods. In such a case, the party offering is bound to wait until he gets an answer by return of post or messenger; for until then the offer is supposed to be continuously made. But if A offer to B personally to sell, and B ask time to consider for a day, or any given time, A is not bound to wait a single moment, according to English law, and may withdraw at any time from the offer, because he had no legal consideration for waiting; whereas, in Scotland, in the same circumstances, A would be bound to wait the time agreed upon.

OFFERING. Under the head First-fruits (q.v.) have been described the various offerings prescribed in the Jewish law. We shall have occasion to consider, under the head of Sacrifice (q.v.), some further questions connected with the subject of offerings in public worship. In the Christian community there appears to have existed, from the earliest times, a practice of making voluntary offerings, for purposes not directly connected with public worship. See Offertory.

OFFERTORY (Lat. offertorium, from offero, I offer) is the name given to that portion of the public liturgy of the Roman Catholic church with which the eucharistic service, strictly so called, commences. In the Roman liturgy it consists of one or two verses from some book of Scripture, generally from the Old Testament, but sometimes also from the epistles. In the Ambrosian liturgy it consists of a prayer, similar in form to the offert or secret of the mass; and in both, this recital is followed by the preparatory offering up of the bread and wine, accompanied by certain ceremonies and forms of prayer.

This offering of the bread and wine in the public service became, from a very early period, the occasion of a voluntary offering, on the part of the faithful; originally, it would seem, of the bread and wine designed for the eucharistic celebration and for the communion of the priest and the congregation, sometimes even including the absent members, and also for the agape, or common sacred feast, which accompanied it. That portion of the offerings which remained in excess of what was requisite for these purposes was applied to the relief of the poor, and to the support of the clergy. These offerings were ordinarily made by the faithful in person, and were laid upon the altar: and the Ambrosian rite still preserves this usage in a ceremonial which may be witnessed in the cathedral of Milan. By degrees, other gifts were superadded to those of bread and wine—as of corn, oil, wax, honey, eggs, butter, fruits, lambs, fowl, and other animals; and eventually of equivalents in money or other objects of value. The last-named class of offerings, however, was not so commonly made upon the altar and during the public liturgy, as in the form of free gifts presented on the occasion of other ministerial services, as of baptism, marriages, funerals, etc.; and from this has arisen the practice in the Roman Catholic church of the mass-offering, or honorarium, which is given to a priest with the understanding that he shall offer the mass for the intention (whence the honorarium itself is often called an "intention") of the offerer. In some places, however, and among them in some parts of Ireland, offerings "in kind" are still in use, not indeed in the form of the ancient offertory, but in the shape of contributions of corn, hay, etc., at stated seasons, for the use of the parochial clergy. At weddings also, and in some places at funerals, offerings in money are made by the relations and friends of the newly married or of the deceased. In the liturgy of the English church allusion is made to the practice of oblations, and some of the recent controversies have turned upon the revival of the "offertory," which has found some advocates.

OFFICE, in law, may be ministerial or judicial, and is in law the right and duty of one or more persons to discharge the functions of some position of trust or honor, and to receive the emoluments appertaining thereto. An office is ministerial when its exercise depends on the command or direction of others: judicial, when the officer is called upon to employ his own discretion. An example of the first is a sheriff, of the second a judge of a court of law. The two are sometimes united in one. The office is held for the benefit of the public, may be abolished by legislation, unless such action be expressly forbidden by the constitution; and cannot be the subject of sale or devise, though in England certain ministerial offices are regarded as the property of the incumbent and may descend in the family. When the office is in its nature judicial, the duties cannot be performed by deputy, as the personal skill or judgment of the officer are the reasons for his holding the office. With ministerial offices the reverse is the case. Thus a sheriff or other court officer may appoint deputies, and their acts are good in law; while the appointing officer remains responsible for such acts. Statutes in most of the states provide that offices shall not be sold, and such a sale would be void anywhere as contrary to the policy of the common law. So any agreement between the officer and one who by influence procures his appointment, to divide the compensation received, would be altogether void. It was a principle of the common law that no term of office should be created so as to begin at a certain time in the future, nor for a fixed term of years, but should be held for life or during good behavior. This was to prevent the holding of offices for the performance of duties which had ceased, and to render it impossible that the office should survive the officer. It is common in this country to limit the term to the life of the incumbent and to the attaining of a certain age, as 70 years. Two offices cannot be held by the same person where one is in the nature of its duties inconsistent with the other. This inconsistency may be patent from the nature of the offices.
or it may be declared to exist by act of legislation. Where an office is filled in common by several persons, it has been held that if the office is of a public character all the officers must meet for consultation, but that a majority may act, while if the office is private, all must concur; but this is often governed by statute, and a decision by a majority, or even a majority of those present at any meeting, made binding. Members of state or national legislature are not usually termed officers, the word being confined in usage to those having executive or judicial authority. A de facto officer is one who is in possession of the authority and emoluments of an office without a good title thereto, while a de jure officer is one who has the legal right but not necessarily actual possession. It is evident that it would make much confusion and cause great injustice if all official acts of a de facto officer were to be considered as of no effect. Thus, in the case of a judge who was wrongfully on the bench, it would be a great hardship if all judgments given by him, and all criminal convictions of his court, should be set aside. But if suit be brought by a de facto officer in his public capacity, he may be debarred from recovery on the ground of defect in title, and the de jure officer may test the question of title by bringing a writ of quo warranto.

Public officers are appointed in the United States, under the provisions of the constitution, by the president with the advice and consent of the senate, with the exception that to congress is given the power to vest in the president alone, or in the heads of departments or courts of law, the appointment of "inferior officers." Ambassadors, public ministers and consuls, and supreme court judges are specified as not belonging to this "inferior" class, but beyond that the distinction is not clearly defined. In the various states the appointment of public officers is regulated by statutes, and even in the case of supreme court judges election is common. The appointee in most cases is required to take an oath to perform the duties of his office, and in some cases where the officer has charge of financial interests or his duties affect property rights, where he performs official acts before giving bond or taking oath, such acts will be valid unless he has been specially prohibited by statute or constitution from holding the office before the bond was filed or the oath administered. Compensation of officers may be fixed by law or may be obtained from fees. It is provided in the United States statutes that no officer of the government who holds an office with a salary of $2,500 or more shall receive extra compensation for performing the duties of any other office unless expressly authorized by law. Where an officer has been removed his salary will continue until proper notice of the appointment of his successor has been given him. Compensation does not begin until an officer is liable to duty. The law will presume that a public officer is acting within the scope of his duty until the reverse has been shown. Where discretionary power is given, the officer is made the exclusive judge of the facts. The officer is liable for wrongful acts both to the person thus deprived and to the state. In the first cast remedy is by action, in the second by indictment or impeachment. The order of a superior is no bar to an action arising from an unlawful act of the inferior, nor is negligence on the part of a subordinate ground for holding the head officer responsible. Contracts made by public officers are governed by the general law of agency and they cannot bind the government beyond the extent of their legal authority. If an appropriation is exceeded, the officer is liable. A court officer cannot be held if acting under the proper order of a court having jurisdiction, but may be where there is no jurisdiction. If a sheriff seize property which is by law exempt, he is personally responsible. Fraud and embezzlement are made criminal offenses by statute. Forfeiture of office will follow such offenses, the proceeding being by information or quo warranto. The method of removing a public officer is not provided for in the constitution, and the question arises whether the power belongs to the president alone or whether he must receive the consent of the senate. Such "inferior" officers as may be appointed by congress may also be removed by proper legislation. It is said on the one hand, as to other officers, that there is a distinction between the right to nominate and the power of appointment, and that therefore the consent of the senate must be obtained in removing any officers in whose appointment it had a share. On the other hand, it is urged that removal is an executive act, that the power of nominating implies the power to remove, and that the public interest demands that the president should have power to dismiss an incompetent or dishonest official without the delay which would be entailed by awaiting the action of the senate. The question has several times come before congress, and the power of the president to act alone was sustained by a very close vote. In the contest of authority between president Andrew Johnson and congress the discussion on this point was very bitter. By statutes of 1867 and 1869 it was provided that a civil officer appointed by the advice and consent of the senate shall hold his place until removed by the executive power. If the president's action of such an officer the senate may suspend such officer and appoint another to fill the duties of the position. The president is to make a nomination within 30 days after the beginning of the next session of the senate; and in case the senate directly refuse to confirm, he may nominate another person. These statutes are known as the tenure-of-office acts. State officers may in many cases be removed by the governor; the subject is governed by statutory enactments, which vary greatly in the different states. Elective offices cannot be vacated by an executive officer without showing cause, such as malfeasance or embezzlement. A term of office may be extended or reduced by action of the legislature.
unless it be prescribed by constitutional provision or be elective in its nature. Officers of the United States courts hold during good behavior, but those of the territorial courts do not fall within the clause of the constitution already referred to, and depend upon the action of congress for the limitation of their terms. If neither state nor national constitution prescribe the length of a term, the subject is under legislative control, and may be extended or shortened, or the office altogether abolished.

OFFICE, The Divine (Lat. officium, duty), is the name popularly given to the canonical hours (q.v.) prescribed to be read each day by bishops, priests, deacons, and sub-deacons in the Roman Catholic church. Under the head BREVIARY will be found a general description of the contents and the arrangement of that great service-book. The special portions assigned for any particular day constitute what is called the divine office for that day. Each portion begins and concludes in virtue of his order to recite the breviary, is obliged, under pain of sin, to read, not merely with the eye, but with distinct, although it may be silent, articulation, each and all these portions. The adjustment of the portions of the office of each day, the combination of the "ordinary" portions which are read every day in common, with the parts "proper" for each particular day, is a matter of considerable difficulty, and is regulated by a complicated system of rubrics (q.v.).

OFFICE COPY is a copy made of a document by some officer of a court in whose custody the document is; and in general such copies are receivable in evidence, without further proof, in the same court, but not in other courts, except some statute makes them evidence.

OFFICE FOUND. See Inquest of Office.

OFFICE, HOLY, Congregation of the. In the article inquisition (q.v.) it has been explained that that tribunal is sometimes called by the name holy office. That title, however, properly belongs to the "congregation" at Rome, to which the direction of the tribunal of the inquisition at Rome is subject. This congregation was established by Paul III, in 1542, and its organization was completed by Sixtus V. It consists of twelve cardinals, a commissary, consulters, and qualifieds, whose duty it is to examine and report on each case for the information of the cardinals. In the most solemn sessions of the holy office, the pope himself presides in the name of the cardinals. He cannot decide questions of heresy, inquires into crimes against faith, and judges ecclesiastical offenses, especially in the administration of the sacraments. In the present condition of the papal court the action of the holy office is much restricted.

OFFICERS, MILITARY AND NAVAL.—Military officers are combatant and non-combatant, the latter term, including paymasters, medical officers, commissariat, and other civil officers. The great divisions of rank are commissioned, warrant, and non-commissioned officers. Commissioned officers are those holding commissions from the crown, or a lord-lieutenant, and comprise all holding the rank of ensign, or corresponding or superior rank. Divided by duties, they are staff officers (see Staff), or regimental officers (see Regiment); divided by rank, general officers (q.v.), field officers (q.v.), and troop or company officers. The last are captains, lieutenants, and sub-lieutenants, and, except in the cavalry, are unmounted. Different systems of promotion for officers, and especially the intricacies of the late purchase system, will be explained under Promotion, Army, and Purchase System. The only warrant officers in the army are master-gunner (see Gunner) and schoolmasters. Non-commissioned officers are described under that heading.

Officers, naval, are commissioned, warrant, and petty officers. Commissioned officers are admirals, captains, commanders, lieutenants, and sub-lieutenants, described under their respective titles. Warrant officers (q.v.) are boatswains, carpenters, gunners, and one class of engineers. Petty officers will be described under that heading, and constitute a very important portion of the management in a ship-of-war.

OFFICIAL ASSESS, in English law, is an offer of the bankruptcy court, in which a bankrupt's estate vests the moment an adjudication of bankruptcy is made. He is the manager of the property, and can sell the estate under the directions of the court in urgent cases, such as where the goods are perishable; but, in general, he is assisted in the management by the creditor's assignees, who are selected from the body of creditors by the order of the court. If no assignee is appointed by the lord chancellor, being selected from the body of merchants, brokers, or accountants. He is bound to find security to the extent of £6,000. He is prohibited from carrying on trade on his own account. The salary is £1000.

OFFICIAL PLANTS (Lat. officina, a shop) are those medicinal plants which have a place in the pharmacopoeias of different countries, and which are therefore sold—or some of them are sold—under the names of them—by apothecaries and druggists. The medicinal plants cultivated to any considerable extent are all official, but many are also official which are not cultivated. See Medicinal Plants.

OFFSET, or Set-Off, the splay or sloping part of a wall, etc., joining parallel surfaces when the upper face recedes from the lower. This frequently occurs on buttresses. The
OFFSETs, a term used by gardeners to designate the young bulbs which, springing from the axils of the scales of a bulb (q.v.), grow beside it, exhausting its strength, but which serve for the propagation of the plant. A crop of shallots, or of potato onions, consists entirely of the offsets of the bulbs planted in spring; although the term is not commonly used except as to bulbous-rooted plants, prized for the beauty of their flowers.

OFFSETs. Let $\triangle ABC \ldots\triangle D\ldots\triangle E$ be a field with very irregular sides; take the points $A$, $O$, $M$, $C$, and as near the corners as convenient, the object being to inclose as much of the field as possible within the quadrilateral $AOMC$; and for this purpose, it is sometimes necessary, as in the present case, to include a corner (as $SRQ$) which is outside the field. The area $AOMC$ is found by dividing it into triangles and trapezoids by means of perpendiculars (to which the term offsets was originally applied, though it now denotes the irregular area before mentioned) from the corners $E$, $G$, $H$, etc. (see Triangle and Trapezoid), and adding together the areas of the separate figures $\triangle AEP$, $\triangle FGy$, $\triangle GHy$, etc. Similarly the

![Fig. 1](image)

areas of $OLN$, $D$ and $MDUW$ are found.

To the sum of these must be added the areas of the triangles $ATS, QUC$, diminished by the area of $SRQ$, and the result is the whole area of the field. If the offset have no distinct corners as (fig. 2) $\triangle ABLMN \ldots\triangle OK$, then the base $AK$ is divided into equal parts by perpendiculars $ABL, Mm, Nn$, etc., and the area of the offset is found approximately as follows: the whole offset $= ABL + LMM + MmNn + \cdots + PpOK = \frac{1}{2}(AB + Ll) + \frac{1}{2}(Mm + Nn) + \cdots + pK \times \frac{1}{2}(pP + OK) = \left(\text{since the divisions of the base are equal}\right) \frac{1}{2} \left( AB + 2Ll + 2Mm + 2Nn + \cdots + 2pP + OK \right); i.e., the area of an offset is found approximately by adding the intermediate perpendiculars to the semi-sum of the first and last and multiplying the sum total by the length of a division of the base, the divisions being equal; and the greater the number of perpendiculars, the nearer the result is to the true area.

OG, an Amoritis king of Bashan. He reigned over 60 cities, of which the chief were Ashtaroth and Edrei, at the time of the entrance of the Israelites into Canaan, B.C. 1618. He and his people were defeated and destroyed at Edrei immediately after the conquest of Sihon, his friend and ally. His walled cities were taken, and his kingdom, with its capital, transferred to the tribes east of the Jordan. He was one of the last of the race of the giants, and Scripture records the size of his iron bedstead preserved in "Rabbath of the children of Ammon," which was about 15 ft. long and 6 broad. This is supposed to have been one of the common flat beds used on the house-tops of eastern cities, but made of iron instead of palm-branches.

OGDEN, a village and co. seat of Weber co., Utah; on the Ogden river at the junction of the Weber river, and having importance as the place of intersection of the Union Pacific, Central Pacific, Utah Northern, and Utah Central railroads; pop. 70. 3,127. There are many machine and car shops, and the place is the center of a country of some agricultural and mining importance.

OGDEN, Aaron, LL.D., 1736-1839; b. Elizabethtown, N. J.; educated at Princeton college, where he graduated in 1773. In 1775 while engaged in teaching school he took part in the capture of a vessel containing supplies for the British troops off Sandy Hook. In 1777 he became a captain in the first New Jersey regiment, took part in the battle of Brandywine, and was made aide-de-camp to lord Stirling. In 1779 he was employed in the Indian campaign, and in 1781 commanded a regiment at Yorktown, where his gallantry received the personal commendation of Washington. At the close of the war he practiced law, held several minor offices, was elected United States senator from New Jersey in 1801, and in 1812 was governor of his state. He served in the Mexican war at the head of the New Jersey militia and was offered the rank of major-general, which he declined.
OGDEN, DAVID, 1707-1800; b. N. J., graduated at Yale college, class of 1728; studied law in New York city, rose rapidly in his profession, and attained great distinction in his native state. He was called one of the "giants of the law." In 1772 he was appointed judge of the supreme court, and inclined toward the opinions of the loyalists during the disturbances preceding the revolution, though disposed to assist in an amicable settlement, and originated a plan for the government of the colonies in case they should submit to the authority of Great Britain. His wavering ending in Toryism, his property was confiscated, and in 1776 he removed to New York, joined the refugees, became a member of the lower house of the legislature, and in 1785 went to England for a few years, returning to his native land in 1790, and died in Queens co., Long Island. Of his sons, one, Abraham, became a distinguished lawyer and United States district attorney under president Washington, and Isaac was judge of the court of king's bench.

OGDENSBURG, a city and port of entry in New York, on the south bank of the river St. Lawrence, at the mouth of the Oswegatchie, 210 m. n.w. of Albany, and at the western terminus of the northern railway. It has a large lake and river trade, mills, and factories, custom-house, town-hall, etc., and a steam-ferry to Prescott, Canada. Pop. in 1860, 7,410; in 1870, 10,076.

OGEE, a molding consisting of two curves, one concave and the other convex. It is called (in classic architecture) cymatum or cyma reversa (see MOULDING). The ogee is also much used in Gothic architecture. An arch having each side formed with two contrasted curves is called an ogee arch.

OGEECHEE LIME, Nyssa aquatica, a small tree; found in Georgia, Alabama, and other southern states. It belongs to the order cornaceae, and takes its name from the fruit, which is small and sour, but edible.

OCEMAY, a co. in n.e. Michigan; watered by Rifle river, on the Mackinaw branch of the Michigan Central railroad; 576 sq.m.; pop., '89, 1914—1166 of American birth. The surface is rolling, and well wooded. Co. seat, West Branch.

OGHAMS, the name given to the letters or signs of a secret alphabet long in use among the Irish and some other Celtic nations. Neither the origin nor the meaning of the name has been satisfactorily explained.

The alphabet itself is called hathlaimen, or hathlu, from its first two letters, "h," called "patronymic," and "l," called "the father of quicken). Its characters are lines, or groups of lines, drawn from their position on a single stem or chief line—over, under, or through which they are drawn either straight or oblique. In some cases, the edge of the stone or other substance on which the oghams are incised, serves the purpose of the stem or chief line. About eighty different forms of the alphabet are known. Five characters were afterwards added to represent diphthongs. The sign for the diphthong "eo" is said to be the only one which has been observed on ancient monuments. It is added that the sign for "ae" sometimes stands for "a," that the sign for "ie" sometimes stands for "i," and that the sign for "ae" stands also for "e," for "ee," for "ch," for "ach," and for "ugh.

Ogham inscriptions generally begin from the bottom, and are read upward from left to right to the top, when they are carried over, and run down another side or angle. Most of those which have been read give merely a proper name with its patronymic, both in the genitive case. The stones on which oghams are cut would seem, for the most part, to have been sepulchral. Oghams are of most frequent occurrence in Ireland, where they are found both written on books and inscribed on stones, metals, or bones. The oghams on stones are most numerous in the counties of Kerry and Cork. A few ogham inscriptions on stones have been discovered in Wales—as at St. Dogmael's, in Pembrokeshire; near Margam, in Glamorganshire; and near Cricbhowel, in Brecknockshire. There are a few in Scotland, as on the Newton stone and the Logie stone in Aberdeenshire, on the Golspie stone in Sutherland, and on the Bressay stone in Shetland. One has been found in England—at Fardel, in Devonshire. Oghams have been observed on an ancient MS. of Priscian, which belonged to the famous Swiss monastery founded in the 7th c. by the Irish missionary St. Gall (q.v.).

The difficulties of deciphering ogham inscriptions cannot be said to have been as yet altogether overcome. It is confessed by the most learned and judicious of ogham scholars, the Rev. Charles Graves, D.D., of Trinity college, Dublin, that the nature of the character is such that it does not at once appear which, of four different ways of reading, is the right one; that the words being written continuously, as in ancient MSS., there is great chance of error in dividing them; and that the Celtic names inscribed are generally Latinized in such a manner as not readily to be recognized.

The old school of Irish antiquaries contended that the oghams were of Persian or Phoenician origin, and were in use in Ireland long before the introduction of Christianity. But this theory is now generally discarded, as not only unsupported, but as contradicted by facts. A comparison of the Ogham alphabet with the alphabets of Persopolis and Carthage shows that there is no likeness between them. The great majority of ogham monuments, it has been observed, bear more or less distinct marks of Christian hands.
Several are inscribed with crosses, as old, to all appearance, as the oghams themselves. Many stand in Christian burying-grounds, or beside Christian cells or oratories. Some still bear the names of primitive saints. At least one is inscribed with a Christian name; and some of the inscriptions betray an undeniable knowledge of Latin. At the same time, it has been argued by one of the most learned of Celtic philologists, Mr. Whitley Stokes, that "the circumstance that genuine ogham inscriptions exist both in Ireland and in Wales which present grammatical forms agreeing with those of the Gaulish linguistic monuments, is enough to show that some of the Celts of the islands wrote their language before the 5th c. the time at which Christianity is supposed to have been introduced into Ireland. It has been observed by Dr. Graves, on the other hand, that there are many points of resemblance between the oghams of the Celts and the runes of the Norsemen; and, indeed, one Irish MS. asserts that the oghams came to Ireland from Scandinavia:

"Hither was brought, in the sword sheath of Lochlan's king.
The ogham across the sea. It was his own hand that cut it."

The ogham is said to have been in use so recently as the middle of the 17th c., when it was employed in the correspondence between king Charles I. and the earl of Glamorgan.

The best account of oghams is in the papers in the Transactions of the Royal Irish Academy, by Dr. Graves, now bishop of Limerick, vol. iv. pp. 70, 173, 183, 254; vol. v. pp. 234, 401; vol. vi. pp. 71, 209, 248, where also are some papers of value on the same subject by Mr. Samuel Fergusson; and the Catalogue of the Museum of the Royal Irish Academy, pp. 134-140; and in Mr. Whitley Stokes's Three Irish Glossaries, pp. 55-57, compared with Thomas Innes's Critical Essay on the Ancient Inhabitants of Scotland, vol. ii. pp. 440-463. The reader may also consult with advantage Astle's Origin and Progress of Writing; Petrie's Essay on the Royal Towers of Ireland; John Stuart's Sculptured Stones of Scotland, and Warburton's Antiquities of Ireland. Ogham inscriptions may be seen in the museum of the royal Irish academy at Dublin, in the museum of the society of antiquaries of Scotland at Edinburgh, and in the British museum at London.

OGILBY, JOHN, 1600-76; b. Scotland; resided in London. In 1633 he went to Ireland in the employ of Wentworth, earl of Strafford, then deputy of Ireland, pursuing his vocation of copyist and his profession of dancing-master. About 1650 he studied Greek and published a poetical translation of Virgil, 1649-50. He conducted the poetical exercises at the coronation pageant in 1661 which attended the restoration of Charles II. to the throne, and erected a printing-office in the city of London in 1667. Associated with James Shirley, the dramatist, he translated the Iliad, 1660; and the Odyssey into English verse, 1665, the typography of which was considered very elegant. He translated the works of Montanus, a native of Phrygia, the founder of a Christian sect of the 2d century. His works were splendidly illustrated by Hollar, the Bohemian engraver and designer. It was from his Homer that Pope, in his boyhood, drew the inspiration for his own classical work. In 1670 he published America, containing the Original of the Inhabitants and the Remarkable Voyages thither; havin 57 folding plates and maps, exclusive of those inserted in the text, among which is "the earliest view" of Nieu Amsterdam (New York). He was appointed royal cosmographer, and published many maps and geographical works; among them Atlas Japancensis, 1670, Atlas Chinensis 1671-73, Britanniarum, 1681.

OGILBY, JOHN D., D.D., about 1608-51; an Episcopal clergyman, in 1639 became rector of the grammar school of Columbia college, New York, from which institution he graduated that year, and held the position 12 months. In 1682 he became professor of languages at Rutgers college, New Brunswick, N. J. He filled the chair of professor of ecclesiastical history in the general theological seminary of the Episcopal church in New York from 1841 to the time of his death, which took place in Paris. He published in 1842 An Outline of the Argument against theValidity of Lay Baptism; and in 1844, The Catholic Church in England and America.

OGIVES, the arches in pointed Gothic vaulting which cross the vault diagonally from one angle to another.

OGLE, a co. in n. Illinois, drained by Rock river, Leaf river, and Pine creek; on the Chicago and Northwestern, Chicago and Iowa, and Illinois Central railroads; 730 sq. m.; pop. '80, 29,916—55,432 of American birth. The surface is rolling and the soil fertile with much prairie. The principal productions are corn, wheat, hay, barley, and potatoes. Co. seat, Oregon.

OGLE, BENJAMIN, 1749-1809; b. Md.; member of the Maryland council, and governor of that state 1798-1801.

OGLEBY, Richard James; b. Ky., 1824; studied law while living on a farm and working as a carpenter at Decatur, Ill.; and commenced the practice of law at Sullivan in 1845. He was a soldier of the Mexican war, and at the battles of Vera Cruz and Cerro Gordo served as fluent, in the 4th regiment Ill, volunteers. In 1847 he went back to Decatur and the practice of his profession, studying at the same time at the Louisville law school, graduating in 1848. In the gold excitement of 1849 he crossed the continent to the mining districts of California, returned in 1851 to Illinois, went to Decatur
and resumed the practice of law. In 1858 he was a defeated candidate for congress, but in 1860 he represented his district in the state senate. When the rebellion broke out in 1861 he resigned his seat to accept the position of col. of the 8th Ill. volunteers, and on March 21, 1862, was promoted to brig. gen. of volunteers for bravery at the battle of Fort Donelson, in which action he commanded a brigade. He was in the battle of Shiloh, or Pittsburg Landing, under gen. Grant, and was wounded at the siege of Corinth, where he fought under gen. Halleck and Rosecrans, ending in the defeat of the Confederates. He was unfit for duty until the following spring, when he was assigned to the 16th army corps as maj. gen. In May, 1864, he resigned his commission, and in the following November was elected governor of Illinois, and served from 1865 to 1869. In 1872 he was again elected governor, and was U. S. senator 1873-79.

Oglethorpe, a co. in n.e. Georgia, bounded by Oconee river on the s.w., and Broad river on the n.e.; drained by many creeks; intersected by the Athens branch of the Georgia railroad; 520 sq. m.; pop. ‘80, 15,400—15,369 of American birth, 9,934 colored. Surface broken and hilly and only moderately fertile; corn, cotton, and pork are the staples. Iron ore and granite are found. Co. seat, Lexington.

Oglethorpe, James Edward, 1690–1758; b. England; entered Oxford in 1714, but soon afterwards accepted a commission in the queen's guards, and went through the Turkish campaign of 1716 as an aide-de-camp of prince Eugene. He participated in the siege of Belgrade, and in 1722 returned to England and entered parliament. Having been appointed a trustee for the relief of insolvent debtors, he conceived a plan for the formation of a colony in America to improve their condition, and to afford a refuge for the persecuted Protestants of Europe. The unsettled country between Florida and South Carolina was selected as a site, and the government made a grant of £10,000. The colony received a charter, and in 1733 Oglethorpe, who was appointed governor, took out a party of colonists to Georgia. For his subsequent connection with the colony, see Georgia, ante. In 1745 he was made a maj. gen., and after the invasion of the Pretender was ordered to pursue the rebels, and for his failure to overtake them was court-marshaled, but acquitted. In 1752 he surrendered the charter of Georgia to the government, and in 1754 he resigned his seat in parliament. He was made lieut. gen. in 1747, and put upon half pay as gen. in 1765. He was offered the command of the British forces in America upon the withdrawal of Gage in 1775. He was ennobled by Pope, by Dr. Johnson, and by Thomson. The Memoirs of James Oglethorpe, by Robert Wright, appeared at London in 1867.

Ogobai, or Osowaf, a large river of western Africa, in the district between the Gaboon and Congo, which falls into the sea by many mouths, between s. lat. 0° 40 and 1° 20'. Its delta is not less than 1500 sq. m. in extent, and consists of a most complicated network of channels and creeks, with two main branches, the most northerly of which reaches the sea at Nazareth bay, the other principal mouth. The Bengo or Fernand Yaz, about 50 m. farther s., has its outlet at the lagoon of Cama or Neomi. The narrow mouths of the Chiollu, the first explorer, in 1566 and 1567: of Walker in 1866 and 1873; of de Coulonge, Marche, and Dr. Lenz in 1874, and in 1875-78 of M. Savorgnan de Brazza and Dr. Ballay, have all helped to increase our knowledge of this region. About 60 m. inland, above the head of the delta, the Ogobai flows for a distance of about 50 m. from the eastward, its average width being about 2,500 yards. It then bends n. for 15 m., and here occurs the junction of the Okanda river, from the n.e., with the Ngunie from the south. The bed of the main stream, the Okanda, is from 800 to 1000 yds. wide above the confluence, with a series of rapids on its upper waters, at a distance of 150 m. from the sea. In addition to a French commercial establishment on the lower river, there is a British and Hamburg station at Adelma Longa, below the Ngunie. This latter district is distinguished by numerous lakes, one of which, 15 m. long by 7 broad, is connected with the Ogobai by three rivers: Lake Azingo, to the n., is connected with the Ogobai by the river Koli. In 1857 M. de Brazza,探险家 at Lopé, and explored the Fan country; he then advanced to Doumé, 50 m. s. of the equator, where the course of the river is from the s.e. to the n.w. Interrupted by illness, he resumed his explorations in April, 1877, advancing to the Poulama falls, in 1° 45' s., where the Ogobai becomes an insignificant stream. Traveling eastward into unknown country, he crossed the water-parting, and discovered the Alima, a hitherto unknown river, which he found to be 150 yards wide, flowing eastward, and in all probability a tributary of the Congo. The region between the Ogobai and Alima is 50 m. across, and consists of hills of moderate height, with easy passes. The dense forests of the Ogobai are the main haunts of the gorilla (q.v.), and of several other anthropoid apes, amongst which are the nest-building apes (q.v.). Of the Ogobai dwell the Ashira and Apingi tribes, the latter being skillful weavers, though cannibals; between the Ogobai and the Gaboon are the Fans, first fully described by Du Chaillu, who are also cannibals, and have been moving westwards for some years; so that the whole Gaboon region is occupied by them. The Fans excel in smith-work, but they have deteriorated since their contact with the whites. Next in importance to the Fans are the Bakali, inhabiting the country around the confluence of the Ogobai and the Ngunie. Amongst the other tribes on the upper waters are the Okota, Oseyba (cannibals), and the Okanda. The rise of
the Ogobai corresponds with the heaviest rainfall, which takes place in March and April, and again in October and November. Inland, rain is more frequent than at the coast. The Ogobai seems to gather most of its volume from lands comparatively near the coast, and not to depend greatly on more remote tributaries.

**ÖGYGES**, the earliest king of Attica and Beocia named in Greek legend. In his time (according to Larcher, about 1759 B.C.) a great flood took place, called the Ogynian flood, which desolated all the lower districts of both countries, and destroyed their inhabitants. The different legends lead to the supposition that under Ögyges an Egyptian colony came to Beocia, and thence to Attica. From him Beocia took the name of Ogygia.

**ÖGYGIA**, a genus of trilobites peculiar to the Llandeilio flags of the lower Silurian period. Six species have been described.

**OHIO**, one of the United States, lies between lat. 38° 17' to 41° 54', and long. 80° 34' to 84° 40' w.; 225 m. in extent from e. to w., and nearly 200 m. from n. to s.; containing 39,964 sq.m., or 25,576,960 acres; bounded n. by Michigan and lake Erie, e. by Pennsylvania and Virginia, from which it is separated by the Ohio river, which also forms its southern boundary, separating it from Virginia and Kentucky, and w. by Indiana. The Ohio river forms its boundary for 436 m., and its lake shore is 250 miles. The high table-lands hilly, and in parts mountainous regions of Ohio, are drained by numerous rivers, among which are the Great and Little Miami, Scioto, Muskingum, and Mohican. The Ohio is the main river of the Ohio valley. The Maumee, Sandusky, Huron, Vermillion, Cuyahoga, and Ashtabula, which empty into lake Erie. Drift formations prevail in the n., alluvium in the s., with extensive coal-measures, and limestone strata, shales, marls, and gyspum, giving the whole state a wonderful fertility. The coal-beds of eastern Ohio cover 10,000 sq.m., with abundant deposits of iron ore. In the n. are valuable deposits of buhrstone, a fossiliferous flinty quartz, used for mill-stones. The salt produced in 1873 was reported at 4,154,187 bushels. Oil wells have also been opened, and 1,315,660 barrels of oil were refined in the state in 1873. The soil, rich everywhere, is so fertile in the river bottoms as to have borne heavy cereal crops 50 successive years without manuring; the climate is temperate, with a liability to a cold in winter reaching sometimes to 20° below zero. It is healthy, except lowlands liable to fever and ague. The forests are rich in oak, black walnut, maple, etc.; the chief agricultural productions are Indian corn, wheat, rye, oats, barley, hemp, peaches, apples, grapes, cattle, sheep, swine, the latter being one of its chief exports. The chief manufactures are iron, clothing, furniture, spirits, wines, cotton, and woolen. The wine called Catawba, produced upon the southern shore of lake Erie, compares very favorably with the similar wines of the Rhine. Farms occupy 21,712,120 acres, with an average size of 111 acres. A large commerce is carried on by the Ohio river, the lakes, canals, and numerous railways. The state is organized in 88 counties. The chief towns are Cincinnati, Cleveland, Columbus (the capital), Sandusky, Zanesville, etc. In 1874 there were 170 national and 243 private and other banks. The state revenue in the year ending Nov. 15, 1874, amounted to $5,768,799. Among the state institutions are 4 lunatic asylums, asylums for deaf and dumb, blind, idiots, penitentiary, reformatories, etc. In 1870 there were 11,932 establishments for education, including 9 universities, 33 colleges, 11 theological institutions, 10 medical, and 11,358 public schools. The total attendance was 2,750,000, which receives many benefit libraries, and has 895 newspapers. In 1874, 3,874 m. of railway were open for traffic.

Ohio was organized and admitted as a state in 1803. The pop. in 1800 was 45,365; '20, 581,431; '40, 1,519,467; '60, 2,339,599, of whom 111,257 were Germans, 51,562 Irish, 36,000 English and Scotch; '70, 2,675,468.

**OHIO (state). History.**—The cavalier de La Salle is the first white traveler of record on the soil of Ohio. His journey to discover the Ohio river was made in the winter and spring of 1669-70. See OHIO RIVER. No settlement followed that discovery for a hundred years. The whole territory w. of the Alleghenies was claimed alike by the English and the French, and each made it dangerous for the other to form any permanent settlements. The treaty between those powers in 1763 ceded the territory s. of the lakes to England. The English col. Boquet traversed the state with a military expedition against the Indians in 1764. The colony of Virginia claimed the whole n.w. territory ceded by France under grants from the crown. But Connecticut, New York, and other colonies, also claimed an interest in the same country by conflicting grants. Virginia patriotically ceded her claim to the general government in 1787. Connecticut obtained a recognition of her claim in a compromise by which a tract was set off to her on the s. side of lake Erie containing 3,606,921 acres, known as the ‘Western Reserve’ or ‘New Connecticut.’ In 1800 Connecticut relinquished her jurisdiction over the domain, but retained the title to the land and sold it through her own agents. Congress assumed jurisdiction over the north-west territory in 1787. In 1788 a company was organized in Boston under the lead of gen. Rufus Putnam, to buy a large tract in Ohio for colonization; but before the colony started they secured a grant of land from congress; other companies secured similar grants; and members of congress were largely interested in them. The lands so granted amounted to 5,600,000 acres, of which gen. Putnam’s party, known as the
Ohio.

Ohio company," were authorized to locate 1,500,000 acres. They selected lands injudiciously near the mouth of the Muskingum river. In April, 1878, a company of New England people, representing some of the most educated and estimable families, were conducted to that locality and founded the town of Marietta, so named in compliment to Marie Antoinette, queen of our French ally. A similar settlement was made at Cincinnati the autumn of the same year; and a few years later migrations from the leading social and industrial society of the eastern states settled in the western reserve. The Indians, however, were not dispossessed of their rights, and were much feared until the victories of gen. Wayne over them in 1794 at Tippecanoe in Indiana, and at Presque isle on the Maumee river. From that time forward emigration surged over the territory. It established a territorial government in 1800; adopted a state constitution, and was admitted into the union as a state in 1803. Chillicothe was the capital, 1800–10; Zanesville from 1810 to 1812; Chillicothe again from 1812 to 1816, when Columbus became, and remains, the seat of government.

North-western Ohio was the theater of some events of the war with England in 1812–15. Col. Croghan made a brilliant defense of a rude fort at Sandusky; gen. Harrison maintained fort Meigs, on the Maumee, against a combined force of British and their Indian allies under Tecumseh; and lent, afterwards commodore Perry, won a brilliant naval victory at the w. end of lake Erie over a British fleet which came down from Detroit to attack him. From that time to the present the progress of the state in population and towards a high average condition of comfort for all the people has been nobler than any of the more exciting events of war. Yet the people during the war of the rebellion, 1861–65, illustrated how "the peaceful even are the strong" by sending into the Union, as they were called, any thoroughly equipped, 310,000 men; and furnishing a large proportion of the most successful generals. The state has since inherited from Virginia the title of "the mother of presidents."

The following table shows the population of the state from the time it took a territorial government to the present:

The cities of Ohio which show a population of upwards of 10,000 by the census of 1880 are: Cincinnati, 255,708; Cleveland, 160,142; Columbus, 51,665; Toledo, 50,145; Dayton, 38,677; Springfield, 20,729; Zanesville, 18,120; Akron, 16,514; Sandusky, 15,588; Youngstown, 15,431; Canton, 12,556; Hamilton, 12,132; Steubenville, 12,038; Portsmouth, 11,514; Chillicothe, 10,988.

The population of the counties of the state by the census of 1890 is, as far as received:

- **Counties** | **Population** |
- Adams | 24,140 |
- Allen | 21,080 |
- Ashtabula | 27,323 |
- Athens | 36,701 |
- Belmont | 45,038 |
- Butler | 42,500 |
- Clermont | 32,713 |
- Cuyahoga | 22,661 |
- Defiance | 21,518 |
- Franklin | 49,956 |
- Fulton | 21,949 |
- Gallia | 21,341 |
- Greene | 30,349 |
- Guernsey | 27,317 |
- Hamilton | 313,308 |
- Hancock | 27,788 |
- Harrison | 30,475 |
- Henry | 30,350 |
- Highland | 30,269 |
- Hocking | 21,730 |
- Jackson | 23,260 |
- Jefferson | 38,018 |
- Lawrence | 30,081 |
- Logan | 47,296 |
- Meigs | 28,383 |

The population of the counties of the state by the census of 1890 is, as far as received:
Ohio.

**Topography.**—Lake Erie on the n. is 580 ft. above the level of the sea. The Ohio river, which forms the entire s.e. and s. boundary of the state, descends from an elevation of a little less than 1000 ft. where it leaves Pennsylvania and strikes the e. line of Ohio, and falls 600 ft. in the 436 m. of its course around the state to the Indiana line. The drainage divide of the state is about one-third of the distance from the n. to the s., so that about one-third of the state drains into the lake and two-thirds into the Ohio river. The summit level or dividing ridge runs from Trumbull co. in the n.e. to Mercer and DuBois counties in the s.e., with an average altitude of less than 600 ft. above the lake. The state has, therefore, a general plane of descent from the n.e. to s.w.; it exempt from the n. counties which rise on a gentle plane of ascent w. from the lake, into which they drain, through the Maumee into Maumee bay. The state has no mountains. Its greatest local elevation is in Logan co. near the middle of the western half of the state, 1540 ft. above the sea. The hilly or rolling surface of a large part of the Ohio river water-shed and the rounded bluffs that margin the large rivers are the remains of the great erosions by water of the original glacial plateaus. The Ohio river has worn its bed in many parts from 500 to 600 ft. below the hilly summits along its valley, and its tributaries have worn similar though less deep valleys. The main streams flowing into lake Erie, beginning at the e., are: the Cuyahoga river, emptying at Cleveland and forming its harbor; the Black river, 30 m. w.; the Vermilion, 12 m. farther; the Huron, 12 m. from it; the Sandusky, emptying into Sandusky bay; the Ottawa, emptying at Port Clinton; and the Maumee into Maumee bay. All of them have harbors at their mouths. Of these lake streams the Maumee drains much the largest country. The rivers flowing into the Ohio are the Muskingum, emptying at Marietta; the Hocking; the Sciota, having Portsmouth at its mouth; the Little Miami, emptying 6 m. above Cincinnati; and the Miami proper, or Big Miami, joining the Ohio about 20 m. below Cincinnati. All these river valleys are beautiful and fertile throughout; but growing richer in soil relatively from the e. westwardly: the two Miamis being the richest valleys on the Ohio slope; and the Maumee, the Portage, and the Sandusky, the streams flowing through the richest soils to the lake. Toledo, Sandusky, and Cleveland are the main lake ports. The low divide between the Cuyahoga and the Muskingum rivers early suggested the Ohio canal from Cleveland to Marietta. The still lower divide between the estuary of the Maumee and the Miami river led to the construction of the Miami and Erie canal, 247 m. long, from Toledo to Cincinnati, finished in 1839. The Ohio river, notwithstanding an average descent of 1.25 ft. to the m., is navigable its entire distance along the state for steamers of considerable size at high stages of the water, and for barges at all stages. See **Ohio River**. The lake shores indicate either a subsidence of the waters or a lifting of the land, as there are several old beaches or ridges that mark old water lines of the lake, now respectively from 100 to 250 ft. above its present level.

**Geology.**—The geological structure of the state is simple and varies little from the horizontal. Its surface is an erosion of the paleozoic system. There is no show of granite at the surface in the state. The carboniferous, Devonian, and Silurian systems form the surface-rock geology of the state. The quaternary or drift deposits cover a large part of the state, the lowest or first of these being the unstratified blue clay known as bowlder clay; the later deposit a laminated clay called by geologists the Erie clay; and above that vegetable deposits of varied character. The formation of the quaternary deposits is believed to have been going on during glacial periods, not only when the ice was going on by elevation and subsidence, but the climate was varying radically at different periods, the region being at one time under glacial action, and at another under a climate warmer than now. The bowlder clay is the deposit of the glacial period. The carboniferous system embraces about one-third of the state, beginning near Portsmouth on the Ohio river for its easterly line of outcrop, and taking a n.e. direction to near lake Erie; overlying the Devonian system which geologically forms the surface of the n.e. and n.w. portions of the state. The Cuyahoga shales, Berea grit, and other Ohio sandstones, from near the lake, belong to the Waverly or lowest group of the Devonian stratification. Limestone and conglomerate formations are shown in the outcrops of the w. parts of the state. The whole of the s.e. half is underlaid with the coal-bearing formations; and the geological surveys show seven distinct veins of coal of superior quality for domestic use or for making gas and smelting iron. The aggregate thickness of the coal beds which are convenient to work upon is about 50 feet. The outcrop of the coal is along the margins of an irregular belt reaching from Mahoning co. in the n.e. to the Ohio river in the s.; the two extremities of the belt being the most prolific in coal easily quarried, and the beds in the Hocking river valley being considered the great vein coal region of Ohio. The e. outcrop of the coal basin is seen along the Ohio river for hundreds of miles, where tunnels on the coal veins are run directly into the hills from the river slope. The most marked feature in the basic geology of Ohio is what prof. J. S. Newberry terms the Cincinnati arch, which he describes as "a great fold of the strata raised at the close of the lower Silurian age, when it formed two islands, one in Tennessee, the other in Kentucky and Ohio, around which the more recent rocks were deposited on a sloping shore. . . . In the coal-measure epoch, the Cincinnati arch was apparently a land area throughout its entire length, its northern end being then as now its highest portion, and connected with the highlands of
Ohio.

Canada," as shown "by the manner in which the coal-measure strata terminate on the western margin of the basin in Knox and Richland counties, where the coal-beds abut against pre-existent Waverly sandstone hills." The sandstones w. of Cleveland, n. e. of the coal belt, form a great export of Ohio, and are used in all the cities of the northern states and Canada for elegant buildings; also for grindstones.

Minerals.—Besides the coal fields already alluded to under the head of geology, iron ore of good quality has been found over an area embracing nearly one-third of the state, mostly in the e. and s. portion, along the s.e. margin of the great coal belt. Blacklead ore is found in n. e. Ohio, and extensively used in the iron establishments of Cleveland, Massillon, Dover, and Port Washington, where they are mixed with other ores. The amount of iron ore mined exceeds 600,000 tons. Salt is made in considerable quantities from salt-springs, the product in 1877 being 40,000 barrels. Petroleum has been raised from oil wells in the eastern part of the state to the amount of 1,500,000 galls. a year. Lime for building purposes, both quick and hydraulic, is an extensive manufacture, and largely exported.

Climate.—Like all the northern United States Ohio has a wide range of temperature, running from a tropical heat during a short summer term to an Arctic cold occasionally in winter. The difference between the n. and s. parts of the state is what would be expected from the difference of latitude and a slight difference in elevation; the n.e. part of the state, which is the highest in latitude and altitude, being the coldest in winter and summer; and the s.w., at Cincinnati, proportionally warmer. The shores of lake Erie are noted for their cooling breezes in July and August; receiving a land breeze in the morning, and a lake breeze in the afternoon. In spring, however, they are visited by winds blowing over ice fields floating down from the upper lakes, which chill the air in April and May, when the interior of the state has the most genial temperature. Below, is given the ranges of temperature at representative points in the state: Cleveland and Toledo being on or near the lake, Portsmouth and Cincinnati the s. points on the Ohio river, and Massillon representing the interior, on the divide s. of Cleveland. The latitude of each is given:

<table>

All portions of the state are healthful at present, though there was scarcely a part where malarious diseases were not prevalent in the settlement of the country, and particularly in the valleys of the streams flowing into the Ohio and the w. end of lake Erie, where those ailments are now extremely rare.

Productions.—There is probably no state of the union with less waste land than Ohio. The broken hills of the n.e., particularly noted for their products of coal and iron, are the least, and the central and w. the most, fertile. Every production of the temperate zone may be cultivated by some portion of the state, and every species of domestic animal is as profitable there as elsewhere. More than a fifth of the entire crop of the United States was produced in this state in 1870; nearly two-thirds of the flax; and of milk, butter, and cheese, only the state of New York produces more, or exceeds Ohio in the value of its farms per acre. The n.e. part of the state, known as the Western Reserve, or New Connecticut, is the most noted dairy region; the lake borders the most valued for fruit, especially grapes; the southern part for stock; and the w. and s.w. for corn; yet all portions grow pretty nearly the same crops, with a slight difference of adaptability.

The total value of farms in the state in 1870 was $1,054,485,292; of farming implements and machinery, $23,692,787; of all farm products, $192,256,907. The census return of 1880 will probably show a large increase in farm products, with but a small increase in farm valuations. The average product per acre in 1870 was, of wheat, 13.27 bush.; corn, 36.67 bush.; oats, 32.69 bush.; rye, 11.5 bush.; barley, 23.89 bush.; potatoes, 87 bush.; sweet potatoes, 77 bush.; hay, 1.05 tons; tobacco, 1253 lbs.

The fisheries of the state produce an important element of its commerce. Those conducted on a considerable scale are at the w. end of lake Erie, between the islands and the main-land for white fish, and in the Sandusky and Maumee bays and their tributaries for pickerel, bass, mullet, cat-fish, and mus-kallonge. The annual out-put from the fisheries of the lake and its rivers exceeds $1,500,000 of value. They are packed principally at Toledo and Sandusky for export, and are consumed in the interior.

Manufactures.—In 1870 Ohio ranked fourth among the states in the capital employed in manufacturing and in the value of manufactured products; first, the value of woollen, and second to Illinois in the making of agricultural implements. The census of 1880 may place this state at the head of the world in the latter industry. In iron-works Ohio ranked next to Pennsylvania and New York. The number of establishments that year was 22,783, employing upwards of 137,202 hands, of whom 119,635 were men, 11,575 women, and 5,941 boys and girls under 15 years of age. They used 4,586 steam engines, aggregating 129,577 horse-power, and 2,157 water-wheels, of 44,746 horse-power. The capital engaged was $411,923,964; the wages paid per year, $49,066,488; cost of raw materials, $151,311,697; and value of products, $369,713,610. The great business of all new and flourishing states—the manufacture of houses—does not enter specifically into the list of manufactures, and is not given fully or even approximately under the several heads of figures opposite to carpentering and building, brick, lumber, etc. The following table shows, otherwise, the main manufacturing interests of the state in 1870:
The coal and iron mining in the state in 1870 was represented by 553 companies, employing 11,241 men and 4,143 horse-power in steam engines. The capital invested was $9,017,197, and the product of that year was valued at $7,751,544. The out-pit of all the coal mines has greatly increased since that time, especially those of the Hocking valley coal fields, which have been opened up to a vast market, n. and w. by the completion of railroads to the lake at Toledo and Sandusky, crossing all the e. and w. railroads. The production of pig iron in 1872 was 399,743 tons; about one-seventh the whole product in the United States. Lawrence and Jackson counties lead in the production of these ores. The number of smelting works was about 1000. In 1873 there were 44 rolling mills, of which 15 were making railway iron; 4, Bessemer steel rails; and 7, other kinds of steel. The refinement of petroleum oil, which amounted in 1873 to 1,315,660 gallons, has since swelled to far greater proportions; and the manufacture of quick-lime, and water-lime cement, has become a great industry. Pork and other meat-packing has become, by the appliances of machinery to the work, one of the manufactures of the country. Ohio formerly outranked all the other states in the packing business, but is now second to Illinois. The records of the packing season of 1874-75 for Ohio show 871,796 hogs cut up, making 241,707,547 lbs. The lard product was 35,690,304 lbs.
Ohio.

Total value of the hogs packed, $16,597,400. Bacon, 465,075,171 lbs.; hams, 162,776,-
309 lbs.; shoulders, 186,030,068 lbs. See CINCINNATI.

Commerce.—Ohio has three U. S. customs districts, of which the ports of entry are
Toledo, Sandusky, and Cleveland, and Cincinnati is a port of entry in the district of
Louisiana for the state of Ohio. These customs ports represent only the foreign imports
and exports, which the position of Ohio on the lakes, adjoining Canada, and in communica-
tion with ocean commerce through the Canadian canals and the St. Lawrence, enables
her merchants to make direct to and from foreign countries. The same may be said of
Cincinnati, though its foreign trade must be done much more indirectly through the
Ohio and Mississippi rivers. The foreign commerce of Ohio is, however, insignificant
compared with the vast domestic commerce e. w., n., and s., along her lakes, railways,
canals, and great river. Lake Erie is still the greatest single highway of commerce for the
state.

Formerly the canals were expected to be second only to the lake and the Ohio river
in volume of commerce, but the railways have far surpassed them in carrying facilities,
so that the great value of the former is now to secure low rates on the railways by their
always cheaper, though slower, transportation. There are 690 m. of canal in the state,
including 36 m. of feeders and side cuts, besides 95 m. of slack-water navigation on the
Muskingum river from Marietta to Dresden. The Ohio canal, between Cleveland and
Portsmouth on the Ohio, and with its 22 m. of feeders, is 331 m. long. The Miami and
Erie canal, from Toledo to Cincinnati, is 246 m. long, with—

| Wabash feeder to Indiana state line | 18 miles |
| Sidney feeder | 14 |
| St. Mary's reservoir | 11 |
| Walhonding to Rochester | 25 |
| Hocking, Carroll to Athens | 56 |

Total | 360 miles |

The "Wabash feeder," as it is listed above, is really the main line of the Wabash
canal, extending from Toledo s.w. into Indiana, a distance of 423 miles. The Miami
and Erie being the first chartered, the Wabash merges its name from the junction down
to Toledo. The Wabash Canal, when it was finished in 1844, was the longest continuous
canal in the world. The business still transacted on all these canals is very great. On
the Ohio canal it has become principally of coal, iron ore, and bulky farm products; on
the Wabash and Miami and Erie canals, it is principally in corn, wheat, provisions, and
lumber, with a large business also in heavy merchandise, coal, iron, ice, etc.

Railroads.—About 60 different lines of railway form a net-work in every direction
through the state, making about 7,000 m. in length, without counting double or more
than double tracks. The following table gives the names of all the railway companies
doing business in Ohio, many of them wholly in the state, and others parts of long lines
which traverse the state mostly from e. to w.; also, the assessed values upon which such
roads so lying within the state were taxed in 1879:

</table>

Total valuation of all railways in the state for taxation in 1879, $75,513,859. Property in the state has usually been assessed at about one-third its cash value. It is presumed that the real value of railroad property in the state is about $225,000,000.

**Education.**—The total expenditures for school purposes in Ohio are about $10,000,000. Two mills on the dollar constitutes the state tax for the educational fund. The number
of school-houses in 1875 was about 12,000; enrolled pupils, 712,129; teachers employed, 22,492; average monthly wages of men teachers, $59.20; women, $45; average cost of instruction per head of enrolled pupils per annum, $17.29. Total value of public school-houses and grounds, $19,576,504. Private schools, 220; teachers, 265; pupils, 13,005. There are 10 normal schools, of which the state sustains only those of Cincinnati and Fostoria, the latter having the largest number of students. The others are sustained by the payment of tuition by students. There are 33 collegiate institutions. The state university and agricultural and mechanical college at Columbus was founded, in 1870, with a state endowment of $700,000; has buildings and grounds that cost $300,000; an income of $30,000 from its endowment; and is in these respects the strongest based institution in the state. Dennison university at Granville, and Oberlin college at Oberlin, both have scientific departments. Besides the colleges already mentioned by number, many, which are supported by denominational sympathy, there are 12 theological seminaries, 3 law schools, and 11 schools of medicine, pharmacy, surgery, and dentistry.

Libraries.—In 1853 a general school law was passed to raise a fund by a tax of one-tenth of a mill on the dollar yearly "for the purpose of furnishing school libraries and apparatus to all the common schools of the state." Within three years thereafter 392,579 volumes were placed in the school libraries. The law was suspended in 1857-58, and the libraries suffered to go down by neglect. In 1860 the law was re-enacted, and in 1865 350,000 volumes were in the common school libraries. But the system was too attenuated. The small and poor districts had not sufficient funds to maintain continuous care of a library, so that books became scattered and lost almost as fast as fresh purchases were made. The small local school libraries have since been turned over to town library associations under a general law passed in 1867. A law of Feb., 1868, authorized the city councils of any city of the second class to levy a tax, not exceeding one-half of a mill on the dollar, "for a free public library and reading-room, providing suitable accommodations are furnished without expense to the city." Under the action of this benign law noble public libraries are maintained in every large city, and smaller ones of great value in all small towns; and a local pride and public spirit is stimulated to promote their growth by private donations of every kind, to render them more creditable to the towns and cities. The Cincinnati public library is the smallest public library ever created from a public fund derived from annual taxation. The library building was begun in 1868, partially completed with about 31,000 volumes in 1870, and finished and dedicated Feb., 1874. It was at that time the finest library building in America, having a shelf capacity of 250,000 volumes. It opened with 70,000 volumes, and by June 30, 1875, by purchase and donations, the number had swelled to about 100,000 volumes. The number of readers in attendance on Sundays then averaged 1000. The annual income at the same time was $20,000, and increasing with the growth of the city. The creation of this public library at Cincinnati is a sample of the ambitious and successful development of smaller public libraries all over the state. This is exclusive of college and corporate society libraries of every kind.

Publications.—In 1875 the newspapers and periodicals of the state numbered 537, of which 35 were daily, 10 tri-weeklies, 5 semi-weeklies, 407 weeklies, 1 bi-weekly, 13 semi-monthlies, 66 monthlies, 1 bi-monthly, and 3 quarterlies. The dailies have a circulation of about 25,000 and 30,000 copies per week. The semi-weeklies have a circulation of about 10,000 copies per week. In Cincinnati there are great publishing houses, not of periodicals only, but of standard and light literature and of school-books. Cleveland, Toledo, and Columbus also have considerable publishing houses.

Religious Organizations.—In 1875 there were 8,120 religious societies of all denominations; 6,830 religious edifices; 5,391 ministers and priests; 513,506 members or communicants; and $83,328,000 value of church property. The Methodist denomination is strongest in numbers and value of property; the Roman Catholic next; and the Presbyterian third. Twenty-three names of Christian denominations appear on the census books, ranging in the number of their organizations from 2 to 2,572.

Public Charities.—These consist of the Athens asylum for the insane, maintained at an annual cost of about $120,000; the Cleveland asylum, about $100,000; the Columbus asylum, about $100,000; Dayton asylum, $80,000 to $100,000; Lucas county asylum, $85,000; these are for the mentally ill; for colored insane, $20,000; the deaf and dumb asylum at Columbus, from $75,000 to $80,000; the blind asylum, from $40,000 to $50,000; the asylum for imbeciles, from $75,000 to $90,000; the soldiers' and sailors' orphans' homes, from $75,000 to $100,000; the girls' industrial home, from $40,000 to $50,000; the reform farm school, at $60,000 to $70,000; and the Toledo house of refuge, at $20,000 to $30,000. The state penitentiary at Columbus is maintained at an expense of about $300,000 a year, against which is credited the receipts from convict labor, which in 1878 were $175,935. The inmates are employed in various trades and their work is let out to contractors. Faithful and good work is credited to the convict at the rate of five days less on the time of his sentence for each month of such labor, and a proportion, not to exceed one-tenth, of his earnings. If he passes his whole term of imprisonment without violating prison rules, he will be restored to citizenship. All the charitable institutions named are maintained out of state funds; but a still wider range of charities are maintained in the cities of the state by societies incorporated under general laws and carried on by contributions of voluntary workers.

Total on sinking fund account.................................................. | $1,394,702.00   |

Receipts on account of common school fund:

| Balance in treasury Nov. 15, 1878                                     | 889,209.87      |
| From taxes                                                           | 1,527,542.79    |

Total.................................................................................. | $1,616,752.36   |

The public debt of Ohio Nov. 15, 1879, was $6,476,805.30, due as follows:

| Payable in New York July 1, 1868, without interest                  | $8,500.00       |
| " " " " " June 30, 1881, bearing 6 per cent.                        | 4,072,640.30    |
| " " " " " after Dec. 31, 1883, bearing 6 per cent.                  | 2,490,000.00    |
| Canal loan payable at Columbus.                                     | 1,865.00        |

Total state funded debt.................................................................. | $6,476,805.30   |

| The total county debts of the state in 1879 were                     | $8,372,834.40   |
| " " of villages, townships, and school special dist's.               | 36,086,069.77   |

Total local debts........................................................................... | $41,490,574.33  |

By the bulletins of the U. S. census returns of 1880, showing the outstanding bonded indebtedness of cities and towns containing a population of 7,500 or upwards, it appears that Ohio towns and cities stand below the average of all the states in their city debts per capita, and above the average of the cities of the western states.

City debts in an average of all the states................................... | $58.33 per capita  |
| " " average in north-eastern states                                  | 62.15 " "        |
| " " " middle Atlantic states                                         | 76.51 " "        |
| " " " southern states                                                | 55.86 " "        |
| " " " western states (Ohio included)                                 | 32.28 " "        |
| " " of the state of Ohio                                             | 50.36 " "        |

It also appears by the same table that New England pays the lowest interest on its city debts, the middle Atlantic states next, the southern states third, and the western states the highest.

**Banks.**—There were in Ohio Nov. 1, 1879, 162 national banks in operation, with a paid in capital of $26,209,900, and an outstanding circulation of $21,914,388; and of banks organized in conformity to the state law of 1877 there were 73, with an aggregate
capital paid in of $1,939,542, and value of assets of $6,506,088; and of savings banks with $10 capital stock 4, aggregating $9,850,117, value of securities and stocks of the state of Ohio, long what remains of the old state bank system. 23, with an aggregate outstanding circulation of $60,288, and securities to meet it of $12,935. The average yearly dividend of national banks, for the five years following 1874, on their capital, was 10 per cent. Their loans and discounts range from $20,000,000 to $30,000,000, according to season and circumstances.

Government.—The constitution of 1851, with some amendments, and the laws passed under it, are now codified and published. The conditions of suffrage are to be a male, 21 years of age, native or naturalized, to be a resident one year in the state, 30 days in the county, and 20 days in the township, village, or ward, preceding the election where the vote is offered. The second Tuesday in October is the day of general elections. The legislature consists of a senate of 37 members, and a house of representatives of 111 members, elected for two years. The sessions are biennial, beginning the first Monday in January in even years. The governor has a salary of $4,100; lieutenant-governor, $2,400; secretary of state, $2,000; auditor, $3,000; treasurer, $3,000; comptroller of the treasury, $2,000; attorney-general, $1500 and fees; and commissioner of schools, $2,000. Their term is two years, except the auditor’s, which is four years, and the comptroller and school commissioner, who have three-year terms. The board of public works consists of three members, elected one at each general election for two years. The commissioner of railroads and telegraphs, superintendent of insurance, supervisor of public printing, gas commissioner, and state and law librarians, are appointed by the governor. The state board of agriculture consists of 10 members, five of whom are chosen annually for two years at a convention composed of the presidents of the county agricultural societies. Under the apportionment of 1870 the state was entitled to 20 members of congress.

Judiciary.—The judicial power of the state is vested in a supreme court, in district courts, courts of common pleas, courts of probate, justices of the peace, and such other courts as the legislature may from time to time establish. The supreme court consists of five judges, a majority of whom are necessary to form a quorum or to pronounce a decision. It has jurisdiction in quo warranto, mandamus, habeas corpus, and procedendo, and such appellate jurisdiction as may be provided by law. It must hold at least one term a year at the capital, and elsewhere as may be required by law. Supreme judges are elected for five years at general elections, one each year, and the judge having the shortest time to serve is the chief-justice for the year. The state is divided into nine common pleas districts, bounded by county lines. Hamilton county constitutes one district. Each district consisting of three or more counties is sub-divided into three subdistricts, in each of which one judge is elected for two years by the voters of that sub-division. Courts must be held at least once a year in every county in the district, and two or more judges may hold court in a county at the same time, taking cases alternately on the docket in their order. District courts are composed of the judges of the court of common pleas of a district, and one judge of the supreme court, or the latter, in the former, constitute a quorum, and have the same original jurisdiction as the supreme court and such appellate jurisdiction as may be fixed by statute. A probate judge is elected for three years by each county. The probate court has jurisdiction in probate and testamentary matters, the appointment of administrators and guardians, the settlement of their accounts and those of executors, and the power to limit and authorize their action. It is empowered also to try municipal cases involving the awards of damages for the condemnation of private property for public use; is a court of record, and has the issuing and record of marriage licenses. Vacancies of judges are filled by the governor for an unexpired term. The legislature has power to increase or diminish the number of judges, alter districts, and establish other courts. Judges may be removed by a concurrent resolution of both houses of the legislature, if two-thirds of all the members concur. Justices of the peace are elected in every township for three years.

The following is the list of governors:

Ohio in 1880 has 29 congressional districts and representatives in congress.

OHIO, a co. in s.e. Indiana, adjoining Kentucky; bounded on the e. by the Ohio, on the n.w. by Langhery creek; 100 sq. m.; pop. '80, 5,563—5,299 of American birth. The surface is uneven and hilly, and the soil fertile. The principal productions are corn, wheat, barley, oats, and potatoes. Co. seat, Rising Sun.

OHIO, a co. in w. Kentucky, bounded on the s.w. by Green river, watered by Rough creek; on the Paducah and Elizabethtown railroad; 780 sq. m.; pop. '80, 19,669—1404 colored. The surface is rolling and well-wooded, and contains coal and iron. The soil is fertile, and the principal productions are corn, tobacco, wheat, potatoes, wool, and hay. Co. seat, Hartford.

OHIO, a co. in n.w. West Virginia, adjoining Pennsylvania, bounded on the w. by the Ohio, intersected by Wheeling creek; on the Baltimore and Ohio railroad; 100 sq. m.; pop. '80, 37,457—856 colored. The surface is uneven and hilly, and contains deposits of bituminous coal. The soil is fertile, and produces good crops of corn, wheat, hay, and oats. There are many iron manufactories. Co. seat, Wheeling.

OHIO RIVER, a river of the United States of America, called by the French explorers after its Indian name, La Belle Riviére, next to the Missouri the largest affluent of the Mississippi, is formed by the union of the Allegheny and Monongahela, at the western foot of the Alleghenies, at Pittsburg, in Pennsylvania, and flows w.s.w. 975 m., with a breadth of 1200 to 8,000 ft., draining, with its tributaries, an area of 214,000 sq. miles. In its course it separates the northern states of Ohio, Indiana, and Illinois, from the southern states of Virginia and Kentucky. The principal towns upon its banks are Cincinnati, Louisville, Charleston, Westport, Wheeling, Maysville, Pittsburg, and Cairo. It is usually navigable from Pittsburg, but for larger steamers in summer only from Wheeling. The banks of the Ohio are generally high and terraced. It is often shallow, is sometimes frozen, and is subject to floods of 50 or 60 ft. above low-water. Bordering by a rich country, and great deposits of coal and iron, it is the channel of a vast commerce, which it shares with its chief branches, the Tennessee, Cumberland, Wabash, Green, etc.

OHIO RIVER (above). It is probably incorrect to name the Ohio river as the largest affluent of the Mississippi next to the Missouri, as the Arkansas river lays claim to that position both by its length and the volume of its waters. The distance from where the
Ohio begins at the confluence of the Allegheny and Monongahela at Pittsburg to its mouth is 975 m.; but the entire length of the river should include the whole length of the longest of its river sources, which is not less than 300 m. more. The river was discovered by the cavaliers de la Salle in the fall and winter of 1669-70. He had for several years been gathering information concerning it from the Iroquois who visited his seignory at La Chine above Montreal, and finally reached its source by the way of Niagara and up Cattaraugus creek; from which his Indian guide is supposed to have led him to French creek, one of the w. sources of the Alleghany, and only 14 m. from Lake Erie. It is supposed that his canoes were carried from Cattaraugus creek over to French creek, though it is possible that the portage may have been made from the upper waters of the Genesee river. With canoes launched on the stream of the Alleghany the discovery of the Ohio followed naturally, and was arrested only by the falls where Louisville now stands. There La Salle turned back, still undecided whether the stream emptied into the gulf of Mexico or into the Pacific ocean, but inclining to the latter opinion. It must have been from the time of this voyage that the river acquired the title of La belle rivière—the beautiful river, which it was subsequently called by the French. The source of the Alleghany is near the center of Poter co., Penn., the middle of the n. tier of counties, where the table-lands receive the rainfalls which hesitate which way to flow—whether to join the waters of the St. Lawrence, or to seek the valley that leads them to the gulf of Mexico. See Alleghany River. The junction of the Monongahela at Pittsburg forms the Ohio. These rivers, rising one n. and the other s. in the Alleghany range, meet in the heart of wooded hills like those through which they have flowed, and the Ohio for 500 m. of its course below, plows its way through a valley deepening and widening as it goes till the rounded hills along this part merge into the rolling prairies of southern Indiana and Illinois, and disappear in the lowlands below the junction of the Wabash. Here entire valley has been eroded by the action of the water, and though everywhere beautiful in a state of nature, is nowhere picturesque or wild. The geologic formations along its entire line are nearly level and little disturbed by any violent convulsion. The area of its drainage is 214,000 sq.m.; embracing a small part of the state of N. Y., one-third of Pennsylvania, two-thirds of Ohio, all of West Virginia, Kentucky, and Tennessee, small portions of North Carolina, Georgia, Alabama, and Mississippi, two-thirds of Indiana, and the s.e. part of Illinois. In this area are included the great valleys of the Tennessee and Cumberland rivers, which join the Ohio only near its mouth. The shores through much of the upper half of the river present a series of plateaus and broken bluffs that indicate successive wearings below the plane of its former flow, and exhibit a broad valley from 5 to 10 m. in width between its bounding hills. The immediate shores at ordinary stages of the water are cut through alluvium generally, with the marks of recent wear by water and craving of banks. From Pittsburg to Portsmouth the adjacent hills are mined for coal or iron in many places, and the loading of both into barges in the river is done to an unusual extent by those who own both mines and boats and market their own productions. The s.e. part of Ohio as well as w. of Pennsylvania is a landscape spotted with the smoke of furnaces for the manufacture of iron. Among the abrupt hills below Pittsburg the river is only 1000 ft. wide at low water, and 1200 at high water. It widens gradually below and its high stages frequently cover a vast extent of bottom lands. The range between its high and low stages of water is very great, 60 ft. being the greatest difference, and 45 ft. the mean difference. The navigation below Louisville is good for large steamers at all seasons, and is usually maintained for most of the summer up to Wheeling, and in good stages of water up to Pittsburg; but is often too low in summer to permit the “down river boats” to make their trips up to CINCINNATI. For rafting and for coal and iron barges it is good at all seasons. At Louisville are the only rapids. These fall 37 ft. in 23 m., and are passed by means of a ship canal with locks for the largest river steamers, and affording an abundant water-power. The immense passenger travel formerly by river steamers has largely been transferred to the railways. The rate of the current varies from one to three m. an hour, depending on the volume. The rivers which flow to the Ohio from the n. are the Alleghany, Muskingum, Hocking, Sciota, Big and Little Miami, and the Wabash; from the s. the Monongahela, Little Kanawha, Great Kanawha, Sandy, Licking, Kentucky, Green, Cumberland, and TENNESSEE. The principal cities and towns upon its banks are Pittsburg, Wheeling, Elizabethtown, Marietta, Parkersburg, Pomeroy, Gallipolis, Ironton, Portsmouth, Cincinnati, Covington, Newport, Laurencetburg, Madison, Louisville, New Albany, Leavenworth, Evansville, Paducah, and Cairo at its mouth where it joins the Mississippi.

OHIO WESLEYAN UNIVERSITY, at Delaware, Delware co., Ohio, was founded in 1844, under the auspices of the Methodists in Ohio. In 1877 the Ohio Wesleyan female college, founded in 1853, was united with the university. Its building is now known as the Monnett hall of the university, and is the home of the lady pupils. The productive endowment is over $350,000, the annual income $329,000. The grounds used for academic purposes lie in the lots, about half a mile apart. One is the original campus of the university, containing twenty-five acres, and having on it four large buildings. The other is the campus of the Monnett hall, containing ten acres, and having on it one very large building. The cabinet rooms are ample and admirably arranged. The collection contains about 100,000 specimens. In the departments of conchoLOGY
Ohio.  
Ohio cake.

and Ohio geology the series are quite complete. The philosophic and chemical apparatus is not so extensive, but sufficient for all academic work, and the laboratories are well equipped. There are two college libraries, aggregating 15,000 volumes, and a reading-room open and free to all the pupils. The number of professors in 1818 was 8, besides two vacancies, and there were 12 other regular instructors. The faculty of arts is the only one yet organized, but a beginning is made for a biblical course, and for scientific schools. There is also a department of fine arts for ladies. The number of students in the catalogue for 1879 was 615, of whom 182 were ladies. Ladies are admitted to all the courses of study, classical or scientific; but a special ladies' course is provided for those who do not elect one or the other. There is life for a normal course for those who would fit themselves for teaching. A preparatory department is maintained, with a three years' course of study, and most of the college students are here prepared. The college classes number 245, the normal class 48, the preparatory 325. The alumni number 750 gentlemen and over 400 ladies. President, Rev. Charles H. Payne, D.D., L.L.D.

OHLAU, OLAU, or OLAWA, a t. of Prussian Silesia, 17 m. s.e. from Breslau, on the Ober. OHLAU, which is on the railway between Breslau and Vienna, is an ancient town, with a royal palace and an old castle. At the present day, it is a place of considerable industrial activity. Being the capital of a circle, it has numerous district courts and offices. Pop. 75, 7,963.

OHM, unit of resistance. See Galvanism (Ohm's Law), ante.

OHM, GEORGE SIMON, 1789-1854; b. Germany; educated at Erlangen. After giving mathematical instruction in a number of places, he was called, in 1817, to a chair in the Jesuit college at Cologne, and the next year published an elementary treatise on geometry. He made a study of the laws of galvanic currents and finally discovered the theorem called "Ohm's Law," upon which the mathematical theory of electricity is founded. An exposition of this theory is contained in The Galvanic Chain, Mathematically worked out, 1827. Among his other works are: Elements of Analytical Geometry, 1849, and Principles of Physics, 1854. He left his professorship at Cologne in 1826, was director of the Nuernberg polytechnic school 1836-49, and was then called to the chair of physics at Munich.

OLDUM, an important genus of minute fungi of the section Hymeniomyces, growing on diseased animal and vegetable substances. They consist of minute tubular thread-like, forming flocks, white in some species, brightly colored in others, simple or irregularly branched, and in their upper part the form of strings of beads, which finally break up into elliptic spores. The species actually existing are probably much more numerous than those which have been fully ascertained. Among the most important of the vegetable parasites of man is O. albidus, which is found on the epithelium in the mouth and throat in the disease called aphtous, or thrush, and on that of the throat in diphtheria, also sometimes in the nostrils, stomach, and intestines, on the nails, the nipples, and other places. It is more common in children and in aged persons, than in those who are in the prime of life. It occurs frequently in the last stages of many diseases, when the mucous membrane is covered with nitrogenous decomposable matter. Indeed, it would seem that whatever may be the case as to other vegetable parasites, no species of Oldum begins its attack upon a perfectly healthy surface, either animal or vegetable; a diseased state of the tissue being to these fungi a necessary condition of vegetation. But as the yeast-plant will not vegetate save in a fermentable fluid, that is, in a solution which, in addition to sugar, contains some decomposable albuminous matter, the O. albidus appears to the naked eye as a white powdery substance, slightly elevated above the mucous membrane to which it adheres; but under the microscope, its filamentous structure is easily perceived. Its seat is at first on the upper surface of the epithelial cells, but its filaments soon penetrate deeply between them, and the upper epithelial layers are soon worn out, and thrown off by the rapid growth from below. However incapable the O. albidus may be of attacking a healthy surface, there can be no doubt that it greatly contributes to the extension of disease, and that it is very readily communicated from one patient to another when there is catarrh or other inflammatory affection of the mucous membrane.

Another species of oldum which has attracted great attention is O. Tuckeri, regarded by many as producing the grape disease, which, several years ago, injured the vineyards of many parts of the world, but in accordance with the views already expressed, perhaps rather to be regarded as merely accompanying and extending the disease. It may probably be that the increased cultivation of particular varieties of grape, and to a long continued cultivation on the same ground, have so impaired the vigor and healthfulness of the plants as to make them liable to the attacks of this parasite. O. Tuckeri makes its appearance at first in the form of a mycelium of webby, creeping, branching filaments, which send out upright or decumbent jointed stems. The beak-like joints of the stems become successively filled with spores, which are finally discharged in little clouds for the multiplication of the species. The grape disease was first observed in Kent, England, in the spring of 1845, on vines in the vineyard of Mr. Tucker. The ends of the
young shoots assumed a crispy appearance, began to wither, and then dried up. The unripe grapes were next attacked, becoming covered with a grayish-white bloom, the skin of the grapes being destroyed, and they rotted and dried up. The disease rapidly spread over other English vineyards; was observed about the same time in the vineyards of Paris, and soon in the vineyards of almost all parts of France, Italy, Greece, Tyrol, and Hungary; finally, and in a slighter degree, affecting the vineyards of the Rhine. Its ravages extended to Algeria, Syria, Asia Minor, and many other countries, among which is particularly to be noticed the island of Madeira, where it proved almost completely destructive to the grapes, and nearly put an end to the production of the celebrated Madeira wine. The importation of Madeira wine to Britain in 1831 amounted to 209,137 gallons; and in 1861 only to 28,749 gallons. It is probable that the complete isolation of the Madeira vineyards made the progress of the disease more rapid, and its results more complete than elsewhere, by causing a prevalence of the conditions favorable for it. No kind of vine escaped. The grape disease is first perceived in the leaves, which become whitish, in consequence of a mycelium spreading over the upper surface of the leaf. The leaves sometimes curl up, or they become black at the center, the blackness extending towards the circumference, and finally, they drop off. The plant, through loss of its leaves, now becomes more unhealthy; the shoots are attacked by the disease, the stalks of the bunches of grapes, and the grapes themselves. The parasite penetrates into the young wood, the shoots are covered with spots and blotsches of a reddish-brown, or even black color, and looks as if a red-hot iron had been applied to them. Sometimes they secrete a clammy inodorous fluid all over their surface; and in many cases they wither from the top down half their length. The affected grapes very often first exhibit the disease in a single whitish spot on a single grape of a bunch, which enlarges by radiating irregularly. If in a bunch there is one abortive grape, it often shows signs of the disease, whilst the rest remain free. The creeping branches of the mycelium are fixed upon the skin of the grape by rootlets, which do not penetrate into the juicy pulp. The mycelium sends up vertical fertile branches of nearly equal height, densely aggregated, and forming a velvet-like mass. The extremities of these become bluish, and at last the uppermost cell or bud increases in volume, becomes detached, and is carried off by some slight breath of air, to multiply the species by the dispersion of its spores. The other bead-like cells follow in succession.

Various means were resorted to for the prevention and cure of the grape disease. The application of pulverized sulphur was found useful, the fungus withering and drying up when brought into contact with a minute particle of sulphur. The application of sulphur must be frequent, as portions of the mycelium and some of the spores always escape. The use of sulphur was the chief means of checking the spread of oidium in French and European vineyards; it became general in the south of France and in Italy; and in consequence of its national importance, the duty on sulphur was reduced by the French government. Hydro sulphide of lime was also applied to vines with very beneficial effect. It is prepared by thoroughly mixing 68 ounces of flowers of sulphur with the same quantity of slaked lime, adding three or four quarts of water, boiling for about ten minutes, allowing it to settle, and decanting the clear liquor. When it is to be used, one quart is mixed with 100 quarts of water, and it is poured over the vines.

**Oil-cake.** The cake which remains in the press when seeds are crushed to express the oil which they contain. Oil-cake still retains a portion of the oil of the seed, along with almost all its other constituents, and is valuable either for feeding cattle or for manure. Linseed-cake is so much more largely used in Britain than any other kind that the name oil-cake is in general exclusively appropriated to it, the other kinds being known as rape-cake, poppy-cake, hemp-cake, colza-cake, etc., according to the plant from the seed of which they are produced. The use of oil-cake for feeding cattle has very much increased of late years, and it is an article of commercial importance. Large quantities are imported into Britain from different parts of the continent of Europe, and from North America. But English linseed-cake—cake made at oil-mills in England, mostly from imported seed—is preferred to any other, because heat being not so freely and uniformly admitted into the cake as in a most unadulterated cake, more oil is retained, and also because foreign cake often suffers from dampness both before and during the solvent process. Besides the oil which remains in it, linseed-cake contains from 24 to 33 percent of nitrogenous substances or protein compounds, which make it very valuable both for feeding cattle and for manure. The value of linseed-cake for feeding is greater than that of any kind of grain or pulse. Rape-cake is, next to linseed-cake, the kind of oil-cake best known in Britain. It is much cheaper than linseed-cake, but is not relished by cattle, having a hot taste, and a tendency to become rancid. Sheep, however, eat it readily, and it is often employed for fattening them. It is often also ground to a coarse powder (rape-dust), and used as a manure. Its fertilizing power is great, and it is used by the Flemish farmers as guano now is by those of Britain. Odon seed-cake is much used as a manure in some parts of North America. Consou-cake is used in the south of India, both for feeding cattle and for manure. Other kinds of cake are noticed, if sufficiently important, in the plantations from which they are derived. Their properties are generally similar to those of linseed-cake, although the pungency of some, as mustard-cake, renders them unsuitable for feeding cattle. See Oils.
OIL CITY, a borough of Oil Creek township, Crawford co., Penn., situated on e Alleghany river, at the mouth of Oil creek, 9 m. from Franklin; pop. '79, about 2,500; of township, 5,098. The city lies on a narrow stretch between the river and a steep bluff, on which are many of the private residences. It was founded in 1860 and incorporated in 1867. The first engagement in the history of petroleum on the Susquehanna was made here. Nearly 2,000,000 barrels are shipped from the oil wells of the vicinity yearly. There are 5 banks, 2 refineries, a daily and weekly paper, an oil exchange, and many churches and schools.

OIL-FUEL. A great incentive has been given by the discovery of copious wells of petroleum (see OIL WELLS AND OIL-TRADE) to the invention of some mode of using oil as a fuel for furnaces, and much recent attempts have been made before; but they assume a more aspect now that oil has become so much cheapened. Nearly half the carrying capacity of European steamships, and more than half in those which make long voyages, is taken up with the stowage of coal. Petroleum (q.v.) gives out nearly twice as much heat as a coal of anthracite or steam coal.

As respects the use of petroleum for raising steam, several reports have been made public, stating that it has been so employed with success; but a careful examination of the most reliable experiments plainly shows that as yet, at any rate, this cannot be done economically, except in rare instances, such as in the oil regions of the United States. In full and apparently a very reliable report on petroleum in all its bearings by Mr. J. Lawrence Smith, published in the general report of the judges of group, 111., Philadelphia exhibition of 1876, it is stated that the average price of anthracite coal in America is eight dollars per ton, and at this rate petroleum for equal heating-power would cost three times as much. In Great Britain, where paraffine oil is as cheap as petroleum, the advantage is even greater. The reports of Mr. T. Lloyd to the English admiralty, and by Mr. G. Oslerwood, chief of the bureau of engineering in the U. S. navy, agree in stating that, although mineral oils can be burned without difficulty for raising steam, it has yet to be proved whether they can be used successfully and safely at sea. The eminent French chemist, St. Claire Deville, has perhaps made what are as yet the most trustworthy experiments respecting the burning of mineral oils for raising steam in locomotives. He considers that only the heavy and thick-flowing kinds can be used to advantage in heating these engines; that with heavy oil steam can be got up in the same time as with coal; and that, as compared with the latter, the oil required is only about one-half the weight. On one of the railways in the s. of Russia, the petroleum found at Baku, on the Caspian sea, was burned for a time in the locomotives; but although a success from an engineering point of view, it was found to be too costly a fuel. For a drawing of the furnace used, see Engineering for Jan. 5, 1877.

The chief advantages of petroleum as a burning fuel in raising steam are its greater heating-power, the smaller storage space it requires, and its freedom from ash. Its disadvantages are greater cost, difficulty in burning without much smoke or tarry deposits, and the danger attending its use.

More success has attended the use of petroleum in metallurgical processes. Its freedom as a fuel from deleterious ingredients gives it at once a great advantage here. One of the best petroleum furnaces for working iron is that designed by Dr. C. J. Eames, now at work in Jersey City, U. S. The petroleum is made to drip over a series of shelves in an iron vessel, and is there converted into vapor and carried forward by superheated steam to be mixed with air, and is then immediately burned in the "combustion-chamber" at the end of the furnace, close to where the iron is piled. Steam in one condition or another is used to convert the petroleum into vapor in most furnaces where it is used. In furnaces for bending armor-plates, and also for working thinner iron plates, mineral oil has been found to have the advantage over coal of raising the heat required in a much shorter time. It also produces less scale on the iron, and with it the heat is more easily concentrated on a portion of the plate.

OILETTS, or Gillels, small openings, often circular, used in medieval buildings for discharging arrows, etc., through.

OIL MILL. See OILS.

OIL PALM, Eria, a genus of palms, of the same tribe with the cocoa-nut palm. The best known species, the oil palm of tropical Africa, sometimes attains a height of 60 to 80 feet. The stems are thickest in the middle, tapering chiefly upwards. The leaves are pinnate, their footstalks spiny. The flowers have a strong peculiar smell, like that of anise or chervil. The fruit forms an immense head, like a great pine-apple, consisting of a great number of bright orange-colored drupes, having a thin skin, an oily pulp, and a hard stone. The pulp of the drupes, forming about three-fourths of their whole bulk, yields, by bruising and boiling, an oil, which when fresh has a pleasant odor of violets, and when removed into colder regions acquires the consistency of butter. This oil is now very largely imported from tropical Africa into Britain, and is much used for many purposes, as for making candles, toilet soaps, etc., and for lubricating machinery and the wheels of railway carriages. When fresh, it is eaten like butter. See OILS. The nut was formerly rejected as useless after the oil had been obtained from the fruit; but from its kernel a fixed oil is now extracted, called PALM-NUT OIL, which is clear and limpid, and has become to some extent an article of commerce.
Oil palm abounds in mangrove swamps, but is also a conspicuous feature of the landscape on sandy coasts in the tropical parts of western Africa. It yields from its trunk abundance of a pleasant and harmless beverage, which, however, becomes intoxicating in a few hours, called *molave* in Angola, and much used there as an alcoholic stimulant. The unripe nuts of the oil palm are used in some parts of Africa for making an excellent kind of soup. The oil palm has been introduced into some parts of America, and is now abundant in them.

**OIL-REFINING.** Several oils, from the mode of their extraction, are necessarily impure, and various means are taken for refining or purifying them: thus, the so-called *fish-oils*—that is, whale, seal, cod, etc.—are clarified either by mixing them with a chemical solution, or by passing steam through them and filtering through coarse charcoal. The chemical solutions employed are various. One method is, to use a strong solution of oak bark, the tannic acid in which combines with the albuminous matters present in the oil, and precipitates it; another plan, is to agitate bleaching-powder, formed into a milk with water, with the oil; and then, after subsidence of the chloride of lime and water, to wash the oil with water, or jets of steam passed through it. A more simple and very effective plan, invented by Mr. Dunn, is to apply a steam heat not exceeding 200° F., and then pass a current of air of the same temperature through it continuously for some time: this effectively bleaches the oil.

Oil-vats, and so cannot be distilled without decomposition, and it is not until a temperature of between 500° and 600° is reached that they begin nearly simultaneously to boil and to undergo decomposition, giving off acroleine (an acid product of the distillation of glycerine) and other compounds. In consequence of this property, these oils are termed *fixed oils*, in contradistinction to a perfectly separate group of oily matters, on which the odoriferous properties of plants depend, and which, from their being able to bear distillation without change, are known as *volatile oils*. These, which are also known as essential or *etheral oils*, differ in toto in their chemical composition from the compounds we are now considering, and will be separately noticed in the latter part of this article. All the fats and oils are lighter than water, and are perfectly insoluble in that fluid. Their specific gravity ranges from about 0.91 to 0.94. They dissolve in ether, oil of turpentine (one of the volatile oils), benzole, and to a certain extent in alcohol; while, on the other hand, they act as solvents for sulphur, phosphorus, etc. If a fatty matter be shaken with a very solution of albumen, gum, or some other substance that increases the density of the water, and renders it viscid, the mixture assumes a milky appearance, in consequence of the suspension of the fat or oil in the form of microscopic globules, and is termed an *emulsion*. These bodies possess the property of penetrating paper and other fabrics, rendering them transparent, and producing what is well known as a greasy stain. They are not readily inflammable unless with the agency of a wick, when they burn with a bright flame. In a pure and fresh state they are devoid of taste and smell, but on exposure to the air they become oxidized and acid, assume a deeper color, evolve a disagreeable odor, and are acrid to the taste; or, in popular language, they become *rancid*. The rapidity with which this change occurs is considerably increased by the presence of mucilaginous or albuminous bodies. The rancidity may be removed by shaking the oil in hot water in which a little hydrated magnesia is suspended.

The oils and fats in the animal kingdom have been already described. (See Fats, Animal.) In the vegetable kingdom they are usually widely distributed, there being scarcely any tissue of any plant in which traces of them may not be detected; but they are especially abundant in the seeds. The seeds of the *cruciferous* are remarkably rich in oil; *rinacea* yielding fully 20 per cent and rape-seed about 40 per cent of oil; and some fruits, as those of the olive and oil-palm, yield an abundance of oil.

The uses of the oils and fats are numerous, and highly important, various members of this group being extensively employed as articles of food, as medicines, as lubricants,
ing agents, in the preparation of soaps, plasters, ointments, varnishes, pigments, candles and other means of illumination, for the purpose of dressing leather, etc. The following are the most important members of the group:

1. Vegetable Fats.—The chief solid fats of vegetable origin are cocoa-nut oil, nutmeg butter, and palm oil. The fluid vegetable fats or oils are divisible into the non-drying and the drying oils; the latter being distinguished from the former by their becoming dry and solid when exposed in thin layers to the air, in consequence of oxidation; while the former do not absorb oxygen, but are converted by hypodotropic acid or sub-oxide of mercury into chloride (as described in the article Oleine), a reaction which is not exhibited by the drying oils. Some of the drying oils, especially linseed oil, when mixed with cotton, wool, or tow, absorb oxygen so rapidly, and consequently become so heated as to take fire, and many cases of the spontaneous combustion of heaps of oily materials that have been employed in cleaning machinery have been recorded. The drying property may be much increased by treating the oils with a little litarge or oxide of manganese, and linseed oil thus treated is then known as boiled oil. The chief non-drying oils are olive oil, almond oil, and colza oil; while the most important drying oils are those of linseed, hemp, poppy, and walnut; castor oil seems to form a link between these two classes of oils, since it gradually becomes hard by long exposure to the air.

2. Animal Fats.—The chief solid fats are suet, lard, butter, goose grease, etc.; while among the fluid fats or oils, sperm oil, ordinary whale oil, cod-liver oil, and neat's-foot oil may be especially mentioned. In many of their characters, spermaceti and bees-wax resemble the solid fats, but, as will be shown in the articles on these subjects, they are not glycerides. As a general rule, stearic and palmitic, both of which have comparatively high freezing points (between 157° and 114°), predominate in the solid fats; while oleine, which is fluid at 32°, is the chief constituent of the oils.

One or two of the most important of the decompositions of the fats must be noticed. When any of these bodies are heated with the hydrated alkalies, they undergo a change which has long been known as saponification, or conversion into soap (q. v.), in which the fatty acid combines with the alkali to form a soap, while the sweet viscid liquid glycerine is simultaneously formed. The combination of a fatty acid with oxide of lead forms a plaster. For further details on these points, the reader is referred to the articles on Soap and Plasters.

The process of saponification affords a ready means of isolating the fatty acids, as the stearic or oleic acid may be at once separated from an alkaline stearate or oleate by the addition of hydrochloric or tartaric acid. When the fatty acids are, however, required on a large scale, as for the manufacture of the so-called stearine-candles, which in reality consist mainly of stearic and palmitic acids, sulphuric acid and the oil or fat are made to act upon each other at a high temperature. See Candle. The fatty acids may also be procured in a very pure form by the injection of superheated steam at a temperature of between 500° and 600° into heated fat—a process which, according to prof. Miller, “from its simplicity and from the purity of the products which it yields, bids fair to supersede those previously employed in the preparation of the fatty acids for illuminating purposes.”

The only fatty acids which have been specially mentioned in this article are those which occur in natural glycerides, such as stearic, palmitic, and oleic acids. The term fatty acid has, however, in chemistry a wide signification, and is applied to many acids homologous to stearic acid, but not occurring in any natural fats or oils. Thus stearic acid may be taken as the type of a group of acids (of which seventeen are already known) represented by the general formula, CnH2n+1CO2., commencing with formic acid (CnH2O2.), including acetic, propionic, butyric, valeric (or valerianic), caproic, caprilic, caprylic, pelargonic, capric, lauric, myristic, palmitic, stearic, arachidic and ceroeic acids; and terminating with melissic acid (CnH2n+2O2.). These are divided into the volatile and the true (or solid) fatty acids; the volatile acids being those from formic to caproic acid, while the remainder, beginning with lauric acid, are the true fatty acids. The volatile fatty acids are fluid, and for the most part oily at ordinary temperatures, may be distilled without change, possess a pungent odor, and are acid to the taste, and their solutions redden litmus paper strongly. The true fatty acids, on the other hand, are solid at ordinary temperatures, are devoid of taste and smell, cannot be distilled, except in vacuo, without decomposition, and only exert a slight action on litmus. The volatile acids occur in the animal and vegetable kingdoms (formic acid, for example, in red ants, and valeric acid in the root of valerian), and they are likewise produced by the oxidation and spontaneous decomposition of numerous animal and vegetable products. The entire series, up to capric acid, may be obtained by oxidizing oleic or lauric acid with nitric acid. The true or solid acids only occur as constituents of animal and vegetable fats.

Prof. Miller makes a second group of fatty acids, of which oleic acid is the type, and which have the general formula CnH2n+1CO2.; but as oleic acid is the only member of this group which is of any practical importance, it is sufficient to refer the reader to the special article on that acid.

A complete list of even the chief fats and fixed oils would take up far more space than we can command. In the article “Fixed Oils,” in The English Cyclopaedia, the reader will find 64 of the most important of these substances mentioned, with, in most
cases, a brief notice of the origin and properties of each. The British pharmacopoeia contains hog's lard, mutton suet, cod-liver oil, concrete oil (or butter) of nutmeg, and almond, castor, croton, linseed, and olive oils, besides the closely allied substances spermastick and wax.

The Volatile or Essential Oils exist, in most instances, ready formed in plants, and are believed to constitute their odorous principles. They form an extremely numerous class, of which most of the members are fluid; a few (oil of aniseed, for example) being solid at ordinary temperatures, but all of them are capable of being distilled without undergoing change. They resemble the fixed oils in their inflammability, in their solubility in the same fluids, and in their communicating a greasy stain to paper or any other fabric; but the stain in this case soon disappears, and they further differ in communicating a rough and harsh rather than an unctuous feeling to the skin. Their boiling points are in almost all cases far higher than that of water, but when heated with water they pass off with the steam—a property on which one of the chief modes of obtaining them depends. See Perfumery. The oils have characteristic penetrating odors, which are seldom so pleasant as those of the plants from which they are obtained, and their taste is hot and irritating. They vary in their specific gravity, but most of them are lighter than water, and refract light strongly. Most of them are nearly colorless when fresh, but darken on exposure to light and air; but a few are green, and two or three of a blue color. By prolonged exposure they absorb oxygen, and become converted into resins.

By far the greater number of them are products of the vital activity of plants, in which most of them exist ready formed, being inclosed in minute cavities, which are often visible to the naked eye. Although diffused through almost every part of a plant, the oil is especially abundant in particular organs of certain families of plants. In the Umbelliferae, it is most abundant in the seeds; in the Rosaceae, in the petals of the flowers; in the Myrtaceae and Labiatae, in the leaves; in the Aurantiaceae, in the rind of the fruit. As in the case of the animal and vegetable fats and fixed oils, so most of the essential oils occurring in plants are mixtures of two or more distinct chemical compounds, one of which usually contains no oxygen, while the others are oxidized. Of these, the former, which is a pure hydrocarbon, is the more volatile, and acts as a solvent for the others. Most of these oils, when cooled, separate into a solid and a fluid portion, to which the terms stearopten and deopten have been applied.

In the comparatively few cases in which the oils are not formed naturally, they are produced by a species of fermentation, as in the case of oil of bitter almonds and oil of mustard (q.v.), while others are the product of the dry distillation or of the putrefaction of many vegetable bodies. Some of the natural oils, as those of cinnamon, spicara, and winter-green, have also been artificially produced.

The essential oils are much employed in the fabrication of perfumery (q.v.), for the purpose of flavoring liquors, confectionery, etc., for various purposes in the arts (as in silversmithing), and in medicine. The special uses of the most important of these oils in medicine will be noticed subsequently.

The members of this group, which is an extremely numerous one (more than 140 essential oils being noticed in the article on that subject in the The English Cyclopædia), admit of arrangement under four heads. 1. Pure hydrocarbons; 2. oxygenous essential oils; 3. sulphurous essential oils; 4. essential oils obtained by fermentation, dry distillation, etc.

1. The pure hydrocarbons are for the most part fluid, and have a lower specific gravity, a lower boiling point, and a higher refractive power than the oxygenous oils. They absorb oxygen, and are converted into oxygenous oils and resins. They may be separated from oxygenous oils, with which they are usually associated, by fractional distillation. They include oil of turpentine (C10H16), and the oils of bergamot, birch, chamomile, caraway, cloves, elemi, hop, juniper, lemons, orange, parsley, savine, and valerian, most or all of which contain the same hydrocarbon as oil of turpentine (q.v.), and in addition to it an oxidized compound; oil of copaiva (C10H18), attar of roses (C10H16), etc.

2. The oxygenous essential oils may be either fluid or solid, the latter being also termed camphors. A stearopten separates from most of the fluid oils on cooling. They are more soluble in water and spirit of wine than the pure hydrocarbons. They may be divided into (1) those which are fluid at ordinary temperature, such as those of anise-seed, chamomile, cajeput, caraway, cinnamon, cloves, fennel, lavender, peppermint, rue, spiraea, thyme, winter-green, etc. Those marked with an (*) are associated with the pure hydrocarbons already described. (2) The camphors, such as ordinary camphor (C10H16O), Borneo camphor (C10H16O), etc.

3. The sulphurous essential oils are chiefly obtained from the Cruciferae. They probably all contain the radical allyl (C3H5). The oils of garlic and of mustard (both of which have been described in special articles), and those of horse-radish, scurvy-grass, and asafoetida, are the best illustrative of this division.

4. Among the essential oils obtained by fermentation, dry distillation, etc., may be mentioned the oils of bitter almonds and of black mustard, the oils of mignon, plantain, centaury, etc. (whose leaves have no smell until they have been moistened for some time with water, when a kind of fermentation is set up, and oil is yielded in abundance), furfuramide (q.v.), etc.
The British pharmacopoeia contains the essential oils of anise, cajeput, caraway, chamomile, cinnamon, cloves, copaiva, coriander, cubeb, dill, juniper, lavender, lemon, nutmeg, peppermint, pimento, rosemary, rue, savine, spearmint, and turpentine. Of these the oils of anise, cajeput, caraway, chamomile, coriander, dill, peppermint, pimento, and spearmint are used as stimulants and antispasmodics in cases of flatulence, griping, etc.; and to disguise the nauseous taste of various medicines. The oils of cajeput, cinnamon, and rue act similarly but more powerfully. The oils of copaiva and cubeb act in the same manner as the substances from which they are derived; oil of juniper is a powerful diuretic, and oil of savine (and to a less extent oil of rue) an emmenagogue. The oils of lavender and lemon are used to conceal the smell of sulphur ointment, and to give an agreeable odor to lotions, etc. The oil of rosemary is chiefly employed as a stimulating liniment, especially in cases of baldness; and the oil of nutmeg is seldom given medicinally except in the form of aromatic spirit of ammonia, into the composition of which it enters.

A very admirable paper on the essential oils was read Dr. Gladstone before the chemical society, in the month of Dec., 1863; and the reader who is anxious to pursue the subject further will find it advantageous to refer to this excellent production.

Bland oils—such, for example, as olive-oil—were much used by the ancients as external applications in various forms of disease. Celsus repeatedly speaks of the use of oil applied externally with friction in fevers, and in various other diseases. Pliny says that olive-oil warms the body and at the same time cools the head, and that it was used with these objects previously to taking cold baths. Arretius recommends a sitz-bath of oil in cases of renal calculi, and Josephus relates that a similar mode of treatment was employed in the case of Herod. Galen prescribed "oil and wine" for wounds in the head; and the parable of the good Samaritan affords additional evidence that this was a common mode of treating wounds. The use of oil preparatory to athletic exercises is referred to by numerous Greek and Latin writers.

As a cosmetic—that is to say, as a means of giving to the skin and hair a smooth and graceful appearance—its use has been prevalent in hot climates from the earliest times. There is abundant historical evidence of this usage of oil amongst the Egyptians, the Jews, the Greeks, and the Romans; and Pliny's statement that butter is used by the negroes, and the lower class of Arabs, for the purpose of anointing, is confirmed by the observation of all recent African travelers. In hot climates there is doubtless a practical as well as an aesthetic object in anointing. The oil, being a bad conductor of heat, affords a certain amount of protection against the direct action of the solar heat; it is likewise serviceable as a protection against the attacks of insects, and as a means of checking excessive perspiration. The fact of oily and fatty matters being bad conductors of heat, serves also to explain why the Esquimaux and other dwellers in Arctic regions have recourse to the inunction of the blubber, etc. In their case the oily investment serves to prevent the escape of the bodily heat.

The Greeks and Romans not only employed oil for the purposes already mentioned, but in the temporal as well as the sacred concerns; the bodies of their dead being anointed with oil, with the view probably of postponing incipient decomposition. A similar practice existed amongst the Jews, and in the Gospels we find various passages in which our Lord referred to his own body being anointed by anticipation. It appears from the evidence of St. Chrysostom, and other writers, that this ancient usage of anointing the bodies of the dead was long retained in the Christian church. See UNCTION: EXTREME UNCTION.

In conclusion we may remark that the ancient system of anointing as a means of medical treatment, has to a certain extent been revived in modern times. Many physicians of the present day combine the inunction of cod-liver oil with its internal administration, a combination first recommended by professor Simpson of Edinburgh; and sir Henry Holland advocates the practice of anointing the harsh, dry skin of dyspeptic patients with warm oils. There can, we think, be little doubt that there are many forms of disease in which the local application of medicinal oils would prove advantageous; but the great drawback to their use is that the time required for properly rubbing them into the skin is frequently the most fatal moment of all. For much curious information on the subject of this article, the reader is referred to a very interesting paper by Mr. Hunter, "On the External Application of Oils," in the second volume of The Edinburgh Medical and Surgical Journal.

OILS IN THEIR COMMERCIAL RELATIONS.—The solid animal oils found in commerce are butter and lard, tallow, mares' grease, goose grease, neat's-foot oil, and unrefined yolk of egg oils. The two first are fully described under their names. See BUTTER, LARD. Tallow is the fat of oxen and sheep, but more especially the fat which envelopes the kidneys and other parts of the viscera, rendered down or melted. The qualities of this solid oil render it particularly well adapted for making candles, and until the end of the first quarter of the present century, candles for ordinary use were almost wholly made of it, the high price of wax and spermaceti preventing their employment except by the most wealthy and for ecclesiastical purposes. Besides its use in making candles, tallow is most extensively used in the manufacture of soap, and for the purpose of preserving machinery from rust. The trade in tallow with Russia, which produces the best, and with North and South America, and even with India and other countries is very considerable; but it is declining, owing of course to the extension of gas and the enormous
development of the paraffin, and petroleum oils (q.v.), and other light-giving materials.

The quantities of tallow and stearine imported in five recent years into Britain were as follows:

The chief use of tallow in this country is now in the manufacture of soap (q.v.), and even in this it has yielded in importance to palm and coco-nut oils.

Mares' grease is not nearly so solid as tallow; it is a yellowish-brown grease, imported extensively from Monte Video and Buenos Ayres, where vast numbers of horses are slaughtered for their hides, bones, and grease; it is particularly valuable as a lubricant for machinery, and is chiefly employed for that purpose after much of its stearine has been removed for candle-making. The reason this material is called mares' grease is said to be from the circumstance that in South America horses are chiefly used alive, and mares are slaughtered as comparatively useless. Goose grease is another soft fat, much valued by housewives for many purposes, but excepting that it is sold in some districts as a remedial agent, it has no commercial importance. Neats-foot oil is a soft fat procured in the preparation of the feet and intestines of oxen for food as sold in the tripe-shops. The quantity obtained is not very great, but it is in much request by carvers for dressing leather. Yolk of egg oil is a hard oil, which, though little known in Britain, is extensively used in other countries where eggs are cheaper. In Russia, for instance, it is manufactured on so large a scale as to supply some of the largest makers of fancy soaps, and it forms the principal material in the celebrated Karan soap; and certain pomades are made of it which have a great reputation, and realize very high prices. This oil is not unlike palm-oil in color and consistency; but when refined, it is liquid, and has a reddish-brown tinge. Mace is as high as 6s. per lb.

The liquid animal oils are more numerous, and, excepting tallow, are far more important, the so-called fish oils being the principal. These are whale, porpoise, seal, cod, herring, shark, etc. The whales which are pursued for their oil are: 1. The sperm whale. This huge creature is from 60 to 70 ft. in length, and yields generally from 5,000 to 6,000 gallons of oil. The finest oil is taken from the great reservoir on the head. The oil of this species is all of a quality superior to others, and is known as sperm oil. For the method of procuring this oil, see CACHOLOT. 2. The right whale, which yields by far the largest proportion of whale oil. This, with that yielded by other less important species, is usually called train oil. The term trael is supposed to be a corruption of drain, and applies to the circumstance of the oil being drained out of the blubber; and in this sense it is also applied to sperm oil from the blubber of the cacholet, in contradistinction to the finer oil from the head matter. The right whale forms the chief object of the northern fisheries, but other species of balaena are pursued in different parts of the world for the sake of their oil. See WHALE.

Amongst the smaller cetaceans, the porpoises—called also dolphins ("puffydunters") on the east coast of Scotland)—and grampus yields an excellent oil, second only in value to that of regular oil whales; and to obtain it, large numbers are occasionally killed in the British seas. The price of sperm oil ranges from £80 to £95 per ton, and that of ordinary train oil from £40 to £45 per ton of 252 gallons. The imports and consumption of the various kinds of whale oil for the five years 1871 to 1875 were as follows:

<table>

A large quantity of very valuable oil is obtained from seals; and the seal-fishery, as a means of obtaining oil, is only second in importance to that of the whale. It is carried on chiefly on the shores of Newfoundland, Greenland, and Labrador. Like the whales, the seals have a thick layer of blubber in which the oil is contained. See SEAL. The first draining from the blubber is of a fine, clear, pale straw-color; the next, yellow or tinged; and the last is brown or dark. The price ranges in our markets at about £35 to £40 per ton for pale, £30 to £35 for yellow, and £28 to £30 for brown. The whale and the seal oils are nearly all used for burning in lamps, and for this purpose they are admirably adapted by their great illuminating power. They are also the best lubricants for machinery.

Of the true fish oils, that from the cod is first in importance, more especially since its medicinal properties were discovered. It is made only from the liver of the fish; and the attempt which was made to induce a popular belief that the so-called cod-liver oil was different from the ordinary cod oil of commerce, was simply a cheat; no difference exists, and the oil is obtained just as good from the oil merchant at a moderate price per gallon as from the empiric at an exorbitant price per pint. Indeed, the purer the oil
can be got, the better it is in a remedial point of view, notwithstanding the efforts made to convince the public that a certain color is better than any other.

Instead of the old and somewhat rude methods of preparing the oil (see Cod-liver Oil), much more complete and efficient arrangements are now adopted. The livers, when taken from the fish, are all examined, washed in clean water, and placed in sieves to dry. Thence they are transferred to pans heated with steam, and after being exposed to a gentle heat for about three-quarters of an hour, the heat is discontinued; and when cold, the oil which has separated is skimmed off, and strained through flannel bags into tubs. Here certain impurities subside, and the clear oil is poured off from the dregs, and the contents of numerous tubs are transferred to galvanized iron cisterns, in which a further settlement takes place. The oil is now ready for the filters, which are made of the strong cloth called moleskin, through which it is forced by atmospheric pressure into the store-tanks, which are also of galvanized iron. Hence it is pumped into the casks for export, which are usually hoisted on blocks, this being the usual mode of sending it abroad. The rate is about £34 to £40 per ton. The imports vary much according to the success of the fishery; they have reached nearly 1000 tons per annum. Besides its consumption in lamps, and for medicinal purposes, cod oil is used in making some kinds of soap. Oil is occasionally made from the herring, but not in very great quantities; it, however, forms a commercial article. It is made from the whole of the fish, the smell of which it retains to a very disagreeable extent.

The lightest of all the fixed oils is made from the liver of the common shark; it ranges from specific gravity 0.865 to 0.867. This, and the oil made from the livers of the common skate (Raja batis), the Thornback (R. clavata), and the white skate (Rhinobatis corniculata), are often substituted for the cod-liver oil used medicinally, but have not its valuable properties.

Under the name of lard oil, large quantities of the oleine of lard have been imported of late years from America. It is a secondary product, arising from the great manufacture of lard, used for candle-making which has been in that country. Lard oil is worth about £45 to £53 per ton, and is principally used as a lubricant for machinery.

The solid vegetable fixed oils which find a place in commerce are palm oil, cocoa-nut oil, kokum or vegetable tallow, and carapa or carap oil. The palm oil is an oil of a bright orange-yellow color and an agreeable violet odor; it is obtained from the not very thick covering of the hard seeds of the oil-palm (q.v.). The fruits, when gathered, are shaked out of the clusters, and are laid in heaps in the sun for a short time, after which the natives boil them slowly in water, when the oil separates and is skimmed off the surface, and carried in small quantities to the depots of the traders, who transfer it to casks which are prepared to receive it on board the ships. The quantity thus collected is enormous. The imports into Britain alone for the five years 1871-1875 were as follows, in tons weight: (1871) 53,294; (1872) 56,323; (1873) 59,897; (1874) 53,383; (1875) 45,228.

Previous to 1840, the chief use of palm oil was in making soap, but it was about that time found that the palmite or fat acid of this oil was admirably adapted for the manufacture of fats and waxes and soaps, and since then it has become of much greater importance.

Cocoa-nut oil is a white fat, with the peculiar smell of the kernel; it is made by grinding or pounding the kernel of the cocoa-nut. After it has been boiled in water for a short time, the paste is submitted to great pressure, and a large quantity of milky juice is obtained; this is slowly boiled, and the oil separates and rises to the surface in considerable quantity, and is skimmed off. Twenty ordinary-sized nuts will yield as much as two quarters of oil. This oil is now very largely imported, and, treated in the same way as palm oil, forms a stearine, which greatly improves that of palm oil when mixed with it in proper proportions; neither does so well separately, and the consumption of cocoa-nut oil has consequently very greatly increased. Most of it comes from Ceylon, where the tree is largely cultivated on purpose. The imports in 1870 were 9,980 tons; in 1872, 21,489 tons; and in 1875, 10,957 tons. By far the greater proportion of this vast quantity is used by the candle manufacturers, and the remainder in making confectionery and medicines (q.v.), and olive-oil poisoning in Argentina has brought it to the front among the vegetable oils.

Vegetable tallow, or kokum oil, is also used by the candle-makers; only small quantities, however, are imported. It comes from Singapore, and is produced from the seed of Garcinia purpurea, a species of the same genus with the mango-tree. Another kind of vegetable tallow is made in China, from the seeds of Stillingiaongoose.

Carapa, carap oil, crab, or Andiroba oil, is very extensively made in British Guiana and the West Indies, but it is nearly all used there, either as a pomade for preserving the hair, or as an unguent for rheumatism and neuralgic pains, for which purposes it is said to be very useful. See Carapa.

The Bassin oil is beginning to attract attention, and several importations have taken place from India, and some rather large quantities have reached Liverpool from Bombay, under the name of Muohwa oil. This oil is of a soft butter-like consistence, and yellowish-green color, and is well adapted for soap-making, and for machinery grease. See Bassin.

The liquid vegetable oils are very numerous, and several are of great commercial importance. First in rank is olive oil, made from the ripe fruit of the common olive (Olus European). When good and fresh, it is of a pale greenish-yellow color, with scarcely any smell or taste, except a sweetish nutty flavor, much esteemed by those who use it.
Oils.

The finest qualities are the Provence oil (rarely seen in Britain), Florence oil, and Lucca oil. These are all used for salads and for cooking. The Genoa is used on the continent for the same purposes; and Gallipoli, which is inferior, constitutes the great bulk of what is received in this country for cloth dressing, Turkey-red dyeing, and other purposes; the continental soap-makers also employ it extensively. The high price of the best qualities has led to much adulteration with poppy and other oils, but it is generally pretty safe when in the original flasks as imported. The mode of obtaining the finest kinds is by gentle pressure of the fruit. The cake is afterwards treated with hot water and strained, and the surface of which an inferior quality is skimmed. The Gallipoli oil is obtained by allowing the olives to ferment in heaps, and then to press them in powerful oil-presses; the cake or meal is then treated with water once or twice, until all the oil is removed; this inferior oil is darker in color, being a yellowish or brownish green. We receive the finest from Italy, and the commoner qualities from the Levant, Mogador, Spain, Portugal, and Sicily. The present values range from £44 to £54 for common kinds, and the finest Lucca is £1 the half-chest, or nearly £55 per ton measure. The total quantity imported during the four years 1872-75 was as follows: 1872, 28,904 tons; 1873, 35,311 tons; 1874, 22,720 tons; 1875, 35,435 tons.

Nearly all the other liquid vegetable oils of this class are obtained from seeds, and as they are mostly of treated in the same way, one description will suffice. First, the seeds are ground—and this in Britain is always done by vertical stones (see Milled)—into a kind of coarse meal, which is first warmed in pans, and then put in certain portions in woolen cloths or bags, so arranged as to be of uniform thickness; these are again wrapped in horse-hair cloths, and each parcel is placed between two flat boards slightly fluted on their inner sides, and then placed in the wedge press. In this a are two flannel bags filled with the meal and inclosed in horse-hair bags, each flattened between the flat boards, b, b, b, b. They are set upright, between the pressing-plates, i, i, i, i, one at each end of the press-frame, cee, which is made of great strength, and often of cast-iron. Next is placed the wedge d; the other wedge, e, is then suspended by a cord in the position represented; h, h are then placed, as seen in the drawing; the main wedge, g, is lastly inserted, and the press is ready for action. The operation is very simple: a heavy wooden Stamper, from 500 to 600 pounds weight, is raised by machinery about two, and moved to and fro, upon the wedge g. This tightens all the other wedges and pressing-plates, and exerts a pressure of about 60 tons on each bag when fully driven home. The pressing-plates, i, i, i, i, are pierced with holes, and so are the plates b, b, b, b; and through these holes the oil trickles and passes away through a pipe at the bottom.

One of the chief seed oils is that of linseed (q.v.). Very little linseed oil is imported into Britain; the improved machinery, and the great demand for the oil-cake (see OIl-cake), causes it to be manufactured at home, and at present it is exported in considerable quantities; thus, from Hull alone there was exported in 1875, of seed-oil, expressed chiefly from foreign seed, no less than 6,846,725 gallons, and over 10,000 tons of oil-cake; and from London and Liverpool together about the same quantity. The total production of Great Britain for 1868 was estimated at 65,000 tons; for 1869, 61,000 tons; for 1871, 69,000 tons; and for 1875, 67,000 tons. In 1873, 15,638,316 gallons of seed-oil were exported. It is worth about £36 per ton. Rape or colza oil is a name which covers the products of various species, chiefly of Brassica, turnips, rape, and other species of Brassica, rape, and other species of Brassica, turnips, and is of pretty high quality; it is generally hardened with a mustard-like flavor; its illuminating powers are excellent, and it is also well adapted for wool-dressing. Very large quantities are made in Great Britain, chiefly from sinapis oleracea and other Indian mustard seeds, which are imported under the name of Surree seed. The imports of these seeds are occasionally as much as 60,000 quarters per annum. Hemp seed yields a green oil which is much used in making soft soap, especially in Holland. In Russia it is eaten with various kinds of food, and is greatly liked by all classes.

The following are the names of a number of oils which are more or less used in this country: Cotton-seed oil. Palm-nut oil, a cleared limped oil from the hard nut of the oil-palm; this nut was formerly rejected as useless after the oil had been obtained from the fruit. Sunflower-seed oil, from the seeds of Helianthus annuus; it constitutes the real Macassar oil. Sunflower-seed oil, from seed imported from the Black sea provinces of Russia; a rapidly increasing trade is springing up in this excellent oil. Poppy-seed oil, from the seed of Pappaver somniferum, largely imported from India; it is as sweet as olive oil, and is extensively substituted for it, especially in France, where it is also very largely cultivated. Gingelli-seed oil, from the seed of Sesamum orientale, an important Indian staple of which we are large consumers; the oil is much used for wool dressing, etc. Ground-nut oil, from the seeds of Arachis hypogea, imported from western Africa and India; this oil is particularly adapted for fine machinery, as it is not affected by cold. Niger, til, or teel-seed oil, from the seeds of Guizotia abyssinica, much imported from Bombay. Croton oil, from the seeds of Jatropha curcas, largely used in wool dressing. The croton oil used in medicine is from croton tiglium, of which only small quantities are imported; whereas of the other 1200 or 1400 tons, besides a quantity of the seed, often reach us in one year. Another highly valuable medicinal oil, castor oil (q.v.), is of great commercial importance. Almond oil, chiefly used for perfumery purposes, is made from

831
the kernels of the sweet and bitter almond: it is the most free from flavor and odor of any oil in use, notwithstanding that the essential oil of bitter almonds is so strongly flavored.

Oils made from the seeds of the following plants have some commercial value in other countries: India selloe; argemone mericana; various species of gourds; garden cress (lepidium sativum); tobacco; and extensively, in the Orient, Russia, Turkey, and Austria; hazel-nuts; walnuts; nuts of stone pine; pistachio nuts: tea-seed: this in China is a common painter’s oil; the grape, from the seeds or stones, as they are called, saved from the wine-presses, used in Italy; Brazil-nuts (Bertholletia excelsa); eulophyllum inophyllum, called pinnacottay oil in India; melia azadirachta, called in India by the names neem and margosa; adansonia falcata, called in India almond oil, and much used for burning in lamps and torches; porwala corydia, called baw-chee-seed oil.

The seed is sometimes imported to this country for pressing. Ben-seeds (morinda plerogyrea); bon-due-nuts, the seeds of guaitilaia bondate and G. bondateia.

The following oils, new to European commerce, were shown in the international exhibition of 1852.

India.—Borah oil, from the seeds of burscica erucastrenim; capala oil, from the seeds of rottlera lacustris; cardamon oil, from the seeds of cattlera cardamoum; higuiche jallum oil, from the seeds of anacardium occidentale, or cashew-nut, now largely cultivated in India: cassia-seed oil; chaulmoogra oil, from the seeds of hydocrates arabic; checornige oil, from the seeds of Brachanenia latifolia; chenmarum oil, from the seeds of amara rohituki; Gresian-bean oil, from the seeds of adenostema repreminis; hoorhoorya oil, from the seeds of Polanisia icocauda; custard apple-seed oil, from the seeds of anona squamosa; exile oil, from the seeds of cebrena thecina; moonch-grain oil, from the seeds of dolichos orixijum; kannari oil, from the seeds of Canarium commune; khalizari oil, from the seeds of sornima antheomintis; malkungumee oil, from the seeds of ocalista puniculatus; takul oil, from the seeds of mimusops elegy; ranu oil, from the seeds of mimusops koki; moodoooga or puls oil, from the seeds of butea frondosa; mali or nageshril oil, from the seeds of mesta feror; hou-seed oil, from seeds of eulophyllum cabula; poonga, carom, or kurnig oil, from the seeds of pongaminigluma; vappaniey oil, from seeds of Wrighttia antidyerenteria; babool oil, from seeds of acorus Arubia; gamboge oil, from seeds of the gamboge tree (garrinia paniculata); meadow oil, from seeds of acacia falcata; kiikud oil, from the seeds of seladobera persia; macrot, surrate, or neeradamootoo oil, from the seeds of hylacarbus inhereus; and pundits oil, from the nutmeg of muchtarica malabarica.

From Brazil.—Oils from the seeds of fenile carvulofila. F. monosperma, anapomera passiflora, eucubia citrius, mabea fistuligera, aver gonac, myristica bicalaba, carpotroche Brachilexis, dipetrix odorata, theobroma cacao, acrocaria selnerocarpus, nectandra cybrita, and from the fat of the alligator and the tapir, all for medicinal and perfumery purposes; and oils from seeds of acorus Arubia; gamboge oil, from seeds of the gamboge tree (garrinia paniculata); meadow oil, from seeds of acacia falcata; kiikud oil, from the seeds of seladobera persia; macrot, surrate, or neeradamootoo oil, from the seeds of hylacarbus inhereus; and pundits oil, from the nutmeg of muchtarica malabarica.

From British Guiana.—Oil drawn from the stem of oredrato phigera; it resembles refined turpentine, and is suggested as a solvent for india-rubber. Wallaba oil, from the wood of the wallaba tree (epiceria fadora), medicinal.

The preparation of the essential oils is treated of under PERFUMERY.

The importance of the manufacture of oils is very great; in 1873 the value of the importations of Indian oils was £15,242,791. The aggregate of the other kinds was £2,471,590. In addition, 80,000,000 are imported for crushing in Great Britain; whilst the exports of oil amount in value to about £1,600,000. Thus, it will be seen that this trade represents a capital of about £14,000,000 sterling. See OIL-WEELS and OIL-TRADE.

OIL-WEELS AND OIL-TRADE. One of the most remarkable trades, suddenly sprung up into importance in modern times, is that in oil obtained from subterraneous sources. See NAPHTHA.

It is now known that oil-bearing mineral beds exist in various parts of America, as well as in the older continent; but the richest deposits hitherto discovered is in the United States, in Venango co., at a spot in Pennsylvania not far from the point of junction of that state and New York state with lake Erie. Oil had for many years been seen floating on the surface of the water of a well near Titusville, the oil was taken up by absorption by means of flannel, and applied to medicinal purposes. Dr. Bower, in 1853, suggested that it might possibly be used for lubricating and for illumination: and in the following year was formed the Pennsylvania rock-oil company. This company languished until 1858, when col. Drake, manager of the company, and Mr. Bowditch, resolved to sink a well purposely for oil. They were amply rewarded, for oil was pumped up at a rate varying from 400 to 1000 gallons daily. The news being spread abroad, adventurers quickly came to the district, which obtained the names of Oil Creek and Petrolia; and they experienced every degree of fortune from utter failure to splendid success. By 1860 it was known that oil existed beneath 190 sq. m. of country, at a depth varying from 70 to 500 feet. In 1861 the first large floating well was struck—that is, a well up which the oil rose so profusely as to flow over the surface, yielding 1000 barrels (of 40 gallons each) per day. "No mining enterprise had ever offered such sudden fortunes. A well costing
a few thousand dollars might yield from 100 to 2,000 barrels of oil daily with no expense for pumping. The Noble well yielded, in little more than one year, 500,000 barrels of oil. The Sherman flowed 450,000 barrels in about two years.

At first the uncertainty in this trade was something extraordinary. On one occasion a well was bored with the usual centerbit to a considerable depth without any oil being found. On withdrawing the bit, and putting in the rimmer or trimmer to widen the hole, a vein was struck at the side. The bit had just missed the vein, and the well would have been a failure had not the orifice been enlarged. This incident gives meaning to a phrase much used in America—that of "striking oil.

Another well was bored, flowing a large amount of oil; but by the time the owner had built tanks to collect it, the oil had altogether disappeared. The deepest well sunk in the district, more than 1,000 ft., yielded no oil whatever; and altogether only 15 per cent. of the borings were successful.

When the oil began to be sent in large quantities to New York and other towns, the cheapness of price led to its application as lamp oil, and in many other ways; the increasing demand brought the price up again to a reasonable figure at Petrolia; and the price induced the sinking of new wells. Small villages rose into large towns, with banks, hotels, and wealthy people, all, however, begrimed with oil. Titusville, which had 248 inhabitants in 1855, rose to nearly 9,000 in 1879. Oil city has now become a town of great importance. The new oil exchange is a handsome building, providing ample for the requirements of "the most important petroleum market in the world."

The following table shows the production of petroleum in 1870:

The production for the year ended June, 1878, had risen to the enormous figure of 619,000,000 gallons. The exports were about 66 per cent. of the production, and were valued at $46,574,970. In 1876 it was estimated that 20,000 oil-wells had been dug in Pennsylvania and West Virginia, at a cost of $192,000,000. They have yielded oil to the value of $300,000,000 at the wells, or rather more than $400,000,000 at the sea-board. An important new oil district has been discovered at Bradford, in McKean co., Penn.

In Canada there are four areas in which oil-springs are found—two in Enniskillen, a third in Moso and Oxford townships, and a fourth in Tilsonburg. The Canadian oil is more troublesome to purify than that found in the States. Although it occurs abundantly, the production in 1878 was not more on the average than 1200 barrels per day. As explained under NAPHTHA, natural petroleums and the paraffin oils distilled from shale or coal very closely resemble each other, so that both kinds are used for the same purposes. In Scotland the paraffine-oil industry is an important one, yielding more than 30,000,000 gallons of crude oil annually, from which solid paraffin and other products are obtained as well as lamp oil. See SHALE. In Prussian Saxony the same or very similar products are distilled on nearly as large a scale from an earthly lignite found in the brown coal formation between Weissenfels and Zeliz. In Galicia, chiefly in the Boryslaw district, there are both a native oil and a native bitumen (ozokerite) found, which in 1873 yielded burning oil and paraffin to the value of nearly £300,000, and the industry is still prospering. There appears to be also a considerable supply of petroleum or rock-oil in Roumania.

In 1865 a shale was discovered in New South Wales, similar to the Boghead coal or Torbanleek mineral of Scotland, but richer in oil, and more free from sulphur. When distilled at Sydney, from 100 to 150 gallons of oil were obtained from one ton of shale. The seam in the district is 51 ft. thick. Of this substance the South Wales shale and oil company raised 15,598 tons in 1876, valued at £46,794; and there appears to be an extensive deposit of it in the district. These shale-oil industries are held in check by the low price at which American petroleum is usually sold; and in July, 1879, it was lower than it had ever been, namely 6d. per gallon in the refined state in the London market.

OIRIR-GAEL, a name which, in the early times of Scottish history, was applied to the Gaels of the coasts, in contradistinction from the Gall-Gaill or Islesmen. There was long a struggle for superiority between these two races, represented respectively by Somerled of the Isles and the later Kings of Man, in which the latter were eventually successful, uniting under one head the dominion of Argyle and the Isles.

OISE, a river of France, one of the chief affluents of the Seine, rises in the vicinity of Roero, in the n. of the department of Ardennes, and flows s.w., joining the Seine at Conflans-Sainte-Honorine, after a course of 150 m., for the last 75 of which it is navigable. The fall of the river is very gradual, and its course is extremely sinuous. It is connected by canals with the Somme, the Sambre, and the Scheldt, and forms one of the chief commercial routes between Belgium and Paris. It becomes navigable at Chauny.
OISE, a department in the n. of France, is bounded on the e. by the department of Aisne, and on the w. chiefly by that of Seine-Inferieure, which intervenes between it and the English channel. Area, 2,250 sq. m., of which two-thirds are in arable land; pop. 76, 401,618. The principal rivers are the Oise—from which the department derives its name—and its tributaries the Aisne and Therain. The department is almost wholly included in the basin of the Oise; and as the course of that river indicates, the surfaces—consisting for the most part of extensive plains—has a general slope toward the s.w. This soil is of a general fertile, and agriculture is well advanced. The products are the usual grain-crops, with an immense quantity of vegetables, which are sent to the markets of the metropolis. The department is divided into the four arrondissements of Beauvais, Clermont, Compiegne, Senlis; capital, Beauvais.

OITI, Morusina tomentosa, a tree of the natural order Chrysobalanaceae—by many botanists regarded as a suborder of roraceae (p.v.)—a native of the n. of Brazil, and valuable on account of its timber, which is very good for ship-building.

OJEDA, Alonso de, 1465-1510; b. Spain; came to America with Columbus in 1493. He conducted an exploring expedition through Santo Domingo, and a second one through the Vega Real. In 1499 he left Spain at the head of a new expedition, in which Amerigo Vespucci joined him. On this voyage he discovered Venezuela, which he named. In 1501 he again set sail from Spain with Vespucci, and this time he discovered the Gulf of Trailla. In 1502 he went back to Spain in 1503, and towards the tribes of the interior of Nueva Andalucia, the modern Colombia, he brought over a colony of 300, one of whom was Francisco Pizarro. He laid the foundations of a town called San Sebastian on the gulf of Dajen, and, going to Hispaniola soon after for supplies and re-enforcements, was imprisoned by the owner of the ship in which he sailed. Transported to Cuba, he spent some years in fighting the Indians. He finally returned to Hispaniola exhausted by hardships, and soon died there.

OJIBWAYS, or CHIPPEWAS, a tribe of North American Indians of the Algonquin stock inhabiting the states of Michigan, Wisconsin, Minnesota, and the shores of lake Huron and lake Superior, with a rendezvous at La Pointe. They were discovered by the French about 1640, to which nation they were friendly, but continually at war with the Sioux. They were also allies of Pontiac, the great fighting chief of the Ottawas. When first discovered they were domiciled at Sault Ste. Marie, deriving the name of Saulteur from that place, by which they are still known to the Canadians. They have the customs of the Algonquins; they are brave and never knew defeat in their wars with the Foxes, Sioux, or Iroquois, their constant enemies. War had thinned their ranks, and in 1690 there were only 350 at the Sault. During the revolutionary war they were on the side of the British, but came over to the side of the colonists in 1785-89, turned against them subsequently and joined the Miami, but again made peace in 1795. In 1816 they gave up nearly all their possessions as far e. as lake Erie. In the war of 1812 they were again allies of the United States. Not until the 1840s did they lose all their lands in Ohio. In 1851 all but a few roving bands had been removed w. of the Mississippi and had ceded all their lands to the government except small reservations. The bands living near lake Superior and in Michigan are generally peaceable and industrious. Those w. of the Mississippi still have extensive tracts of land, amounting to more than 5,000,000 acres as established by treaties 1834-67. In 1872 the government owed them $750,000. In 1871 there were 1,747 of this tribe in different parts of Canada, 1,502 on the n. shore of lake Superior, and some scattering or living with other tribes. Missionaries have not been appreciated, the majority still clinging to their idols, although Roman Catholic and Protestant missions are still maintained. They believe in Kitchie Manitou, the great or good spirit, and Matchie Manitou, the evil spirit. Their priests are called medas. Their principal occupation is making mats and hunting and fishing; they have no taste for agriculture or hard work of any kind. They speak the language of the Algonquins which is found in Eliot's Indian Bible, but in their use it is so intermixed with others that few can understand it. There is a dictionary and grammar, by Bishop Burke, and the Rev. G. A. Belcourt, and treatises by Schoolcraft and others. A newspaper is printed in their language; and in 1851 George Copway, a native Ojibway wrote a Traditional History of the Ojibway Nation, and in 1861 Peter Jones of the same tribe was the author of a History of the Ojibway Indians.

O'KA, an important commercial river of central Russia, the principal affluent of the Volga from the s., rises in the government of Orel, and flows in a generally n. direction, forming a common boundary between the governments of Tula, Kaluga, and Moscow; and afterwards flowing through the governments of Riazan, Vladimir, and Nijni-Novgorod. It joins the Volga at the city of Nijni-Novgorod, after a course of 837 miles. Its basin, estimated at 127,000 sq. m. in extent, comprises the richest and most fertile region of Russia. The principal towns on its banks are Orel, Beleb or Bielev, Kaluga, Riazan, and Murom; the most important affluents are the rivers Moscow, Kliasma, and Tzna. During spring, the Oka is navigable from Orel to the Volga; but in summer the navigation is obstructed by sand banks. It communicates with the ports on the Baltic, Caspian, and White seas; and the cargoes annually shipped down the river amount in value to several million pounds sterling.
OKANAGANS, an Indian tribe, belonging to the Shuswap division of the Selish family, and living about the Okanagan river in Washington territory. They are semi-civilized, and have made some advances in agriculture. Their number is about 300.

O-kee-cho’-bee, a lake bordering on the Everglades of southern Florida (see Florida), about 120 m. in circuit, receiving several small rivers, and having for its outlet the river Caloo-sahatchee, which flows westerly into the gulf of Mexico.

OKEECHOBEE, Lake (oatue), s. of Brevard co., Fla., between Manatee co. and the Everglades; is about 33 m. in its greatest and 25 m. in the shortest diameter; about 1200 sq.m.; there are many inlets, of which the Kissimee river is the largest; the waters are drained off into the Everglades, but there is no outlet of any size. The region about is wild and made up of swamp and jungle. Alligators and poisonous snakes abound. There are a few small islands in the lake, on which it was formerly believed that there were ancient ruins, but this report is now discredited.

O’KEEFE, John, 1745-1833; b. Ireland; began to study painting when six years old with W. C. Ray and Irish paint-ray. At 18 he wrote a comedy, and at 18 a play of his was produced at Dublin. Soon after he joined a theatrical company, and wrote a number of small pieces, in which he appeared at his own benefit. His Tony Swampkin in Town was produced at the Haymarket, London, in 1778, and gained for its author an English reputation. He settled in London, and though threatened with blindness, continued to write for the stage. His dramatic pieces number 68, and of these 56 were played on the stage; and some of them, such as the operatic farces, The Highland Red, and The Agreeable Surprise, and the farce Wild Oats, are still on the stage. He stopped writing in 1798, when he had become almost totally blind. For some years afterward he was in straitened circumstances, till he was relieved by a pension from the crown. He published in 1826 Recollections of the Life of John O’Keefe, written by Himself. A collection of his pieces in verse was published in 1824 under the title of O’Keefe’s Legacy to his Daughter. He was himself a Roman Catholic, but his son became a clergyman.

Okefenokee Swamp, in Baker co., Florida, and Ware, Clinch, and Charlton counties, Ga. It covers an immense region, comprising many great forests and lakes.

O’KELLY, James, 1757-1836; of Irish birth; a noted pioneer preacher in the Methodist Episcopal church, and the leader in the first secession from it. He became a local preacher, and the people flocked to hear him. In 1778 he was admitted among the travelling ministers, and soon became prominent for earnestness and fervor. At the organization of the church in 1784 he was ordained as an elder. One of his contemporaries speaks of him as “laborious, zealous, given to prayer and fasting, . . . and hard against negro slavery in private and from the pulpit and press.” His labors and influence were confined chiefly to the southern counties of Virginia and the border counties of North Carolina. In 1790 he began to show dislike to what he thought the growing power of bishop Asbury, and called on him privately to suspend his episcopal functions for one year, if he did not wish to be publicly opposed. As this menace produced no effect he made the movement in the conference of 1791 that resulted in the withdrawal of himself and a few others from the church. At first they called themselves the republican Methodists, but afterwards changed their name to the Christian church. This company was soon divided and subdivided until only a few broken societies remained. O’Kelly lived many years, witnessing through them the failure of his plans. He saw his followers forsaking him and returning to the church which they had left. But he clung to his convictions to the last. See Methodist Episcopal Church. Divisions in.

Oken (originally Ockenhaffs), Lorenz, a celebrated German naturalist, was b. at Bohlsheim, in Württemberg. Aug. 1, 1779. He studied at Würzburg and Göttingen; became extraordinary professor of medicine at Jena in 1807, where his lectures on natural philosophy, natural history, zoology, comparative anatomy, vegetable and animal physiology, attracted much notice. In 1812 he was appointed ordinary professor of natural science; and in 1816 commenced the publication of a journal partly scientific and partly political, called Iris, which continued to appear till 1848. The opinions promulgated in the Iris led to government interference, and Oken resigned his chair, and became a private tutor, devoting his leisure to the composition of works on natural history. In 1828 he obtained a professorship in the newly-established university of Munich, but in 1832 exchanged it for another at Zürich, where he died. Aug. 11, 1851. Oken aimed at constructing all knowledge à priori, and thus setting forth the system of nature in its universal relations. The two principal works in which this idea is developed are his Lehrbuch der Naturphilosophie (Jena, 1808-11), and his Lehrbuch der Naturgeschichte (3 vols. Leip., 1819-27). The former has been translated into English, and published by the Ray Society under the title of Elements of Physic-philosophy. As Oken’s philosophic system of nature was very peculiar, and quite unlike anything that had preceded it, Oken invented a nomenclature of his own, which, however, in many cases is forced and pretentious, composed for the most part of new-coined words, and difficult to remember. It therefore found little favor, and Oken was long regarded—particularly by French and English savans—as a mere dreamer and transcendental theorist; nor can
it be denied that he is largely such, infected with the worst vices of the school of Schelling, to which he belonged; but some of his "intuitions"—if we may so term his scientific suggestions—were remarkably felicitous, and in the hands of rigorous demonstrators, have led to great results. In his work Die Zerung (On Generation, Bamb, 1805), he first suggested that all animals are built of vesicles or cells; in his Beiträge zur vergleichenden Zoologie, Anatomie und Physiologie (1806), he pointed out the origin of the intestines in the umbilical vesicle; and in the same year lighted accidentally upon the idea, since so prolific of results, that the bones of the skull are modified vertebrae. On account of this discovery he has been termed "the father of morphological science."

That Oken, and not Goethe, was the original discoverer of the vertebral relations of the skull, has been conclusively shown by Owen, in a valuable notice of Oken in the Encyclopaedia Britannica.

OKhotsk, Sea of, an extensive inlet of the n. Pacific ocean, on the e. coast of Russian Siberia. It is bounded on the n. by the wastes of Siberia, on the e. by the peninsula of Kamchatka, and is partially inclosed by the Kurile Islands on the s., and by the island of Sakhalien on the west. It is 1000 m. in length, and 509 m. in breadth. The river Ud, which enters it on the n., is 400 m. in length. Owing to climate and position the sea of Okhotsk is unlikely ever to become the scene of much commerce. On its northern shore, at the mouth of the Okhota—from which it derives its name—is the small seaport of Okhotsk, lat. 57° 21′ n., long. 143° 17′ east. This town has only 236 inhabitants, and has been entirely superseded by the ports of Ayan and Nikolayevsk.

OKRA, or OCHO. See Hibiscus, ante.

OKTIBBEHA, a co. in n.e. central Mississippi, watered by the Noxubee and Oktibbee rivers, traversed by a branch of the Mobile and Ohio railroad; about 500 sq. m.; pop. 80, 15,977—10,870 colored. The surface is level, and heavily wooded. The soil is fertile. The principal productions are corn, cotton, and pork. Co. seat, Starkville.

OKUBO, ToshiMichi, a Japanese statesman, b. in the province of Satsuma about 1850. As a member of the proudest of the Japanese clans, he was nurtured in the traditions of exclusivism and undying jealousy of and hatred towards the tycoons of Yedo. His sympathies were early enlisted in that literary movement, whose goal was the restoration of the ancient undivided power of the mikado. Going to Kioto he cultivated the friendship of those court nobles possessed of political capacity, and those patriotic students, who with himself finally overthrew the dual system of government. At the bombardment of Kagoshimi by the British fleet in 1854, he served in one of the batteries as a defender of the city. In 1865, having pushed forward the secret plans of the revolutionary coalition at Kioto, he precipitated the crisis of six hundred years, and stepped into the front rank of leaders in the new government. He urged the unfurling of the mikado's braided banner which stamped the tycoon as a traitor. He startled even the new government by urging the removal of the capital from Kioto to Yedo, the abandonment of the habits of excessive reverence to the sovereign, and his entrance into public life as the active ruler of his people. Such was the lively effect of Okubo's memorial, that within one month the mikado publicly took the oath on which the government of New Japan is built. The national capital was changed to Yedo, now called Tokio. Okubo theneforward represented in his own person the foreign influences which have shaped the course of Japan since 1868. His name is imperishably associated with the long list of reforms which have changed the insular empire from an agglomeration of feudal principalities to a compact modern state. Of all Japanese statesmen he was the least distinctly Japanese. A strong dash of the Caucasian in his character eminently fitted him to be the interpreter of foreign ideas to the mikado's court. In personal appearance his tall, arrowy form and luxuriant side whisksers gave him the appearance of a European rather than an Asiatic. He visited America with the embassy in 1872, and on his return was made minister of the interior. When the Saga rebellion broke out in 1873 he went in person on the battle-fields, and sat at the tribunal that condemned the insurgents to death. When the Japanese army landed in Formosa in 1874, to chastise the cannibals, and the Chinese demanded their withdrawal, Okubo was sent by the mikado to Pekin to present the ultimatum of Japan. The Chinese paid the indemnity demanded of 700,000 taels, and agreed to police the coasts of aboriginal Formosa. He was president of the Japanese commission to the centennial exposition at Philadelphia, but did not visit America. On the night of May 13, 1878, having been warned of his impending assassination (by fanatics who hated his progressive policy) he expressed before a party of friends his belief in the decree of heaven that would protect him if his work were not yet done; but which, otherwise, would permit his death, even though he were surrounded by soldiers. On May 14, while on his way to the mikado's palace, he was murdered by six assassins, who were said to have been runaways from the Satsuma rebellion, put down only a few months before. The mikado immediately conferred upon his dead servant the highest rank, and elevated his sons to the nobility. In the funeral cortiche, probably the most imposing ever seen in Tokio, rode the highest nobles, officials, and foreign diplomats. Okubo was unquestionably one of the ablest men Japan ever produced.
OKUMA SHIGENOBU, a Japanese statesman, b. in the province of Hizen in 1837. He was among the number of progressive young men who early studied the Dutch language and sciences, and went to Nagasaki for that purpose; whence he was called to Tokio, to a post in the foreign office. He was transferred to the finance department in 1869. There his conspicuous abilities brought him to the notice of the mikado, who created him a Sando or imperial counselor. In 1871 he was made president of the commissioners to the Vienna exposition. The ability displayed by Mr. Okuma Shigenobu in handling the finances of an Asiatic nation while in a transitional condition from medieval feudalism to modern forms of government, and through all the perplexities incident to not less than four great insurrections, have been acknowledged by many competent foreign observers. Under his administration the hereditary incomes of the samurai or gentry have been capitalized; an internal revenue and national banking system, based on those of the United States, have been established; the local paper money issues of the daimios replaced by national currency; loans raised, and the national credit maintained in Europe and at home. He is still, in 1880, a leading member of the Japanese cabinet.

OLAF, the saint, one of the most revered of the early Norwegian kings, was born in 995: and after having distinguished himself by his gallant exploits, and made his name a terror in several warlike expeditions on the coasts of Normandy and England, succeeded, in 1015, in wrestling the throne of Norway from Eric and Svein Jarl. The cruel severity with which he endeavored to exterminate paganism by fire and sword, alienated the affections of his subjects, many of whom sought security from his persecution in the territories of Knut or Canute the great, king of Denmark; and it was only through the powerful aid of his brother-in-law, the Swedish Anund Jacob, that his authority could be upheld. Olaf's hot-headed zeal, however, after a time exhausted the patience of the people, who hastened to tender their allegiance to Knut, on his landing in Norway in 1029, when Olaf fled to the court of his brother-in-law, Jaroslav of Russia, who gave him a band of 600 men, of the head of whom he returned, in 1039, and gave Knut battle at Stiklestad, where Olaf was defeated by the aid of his own subjects, and slain. The body of the king, which had been left on the field of battle, and buried on the spot by a peasant, having begun to work miracles, his remains were carefully removed to the cathedral of Trondheim, where the fame of their miraculous power spread far and wide, attracting pilgrims from all parts of the Scandinavian peninsula. Olaf was solemnly proclaimed patron saint of Norway in the succeeding century; and from that period till the reformation he continued to gather round him a rich heritage of mythical legends and popular sagas, the memory of which still lingers in the folklore of Norway. In 1847 the order of Olaf was created, in honor of the saint, by king Oscar I. of Sweden and Norway.

ÖLAND. See ÖLAND, ante.

OLBER, HEINRICH WILHELM MATTHIAS, a celebrated German physician and astronomer, was born at Arbergen, a small village of Bremen, Oct. 11, 1758. He studied medicine at Göttingen from 1777 till 1780, and subsequently commenced to practice at Bremen, where, both as a physician and as a man, he was highly esteemed by his fellow-citizens. In 1811 he was a successful competitor for the prize proposed by Napoleon for the best "Memoir on the Croup." Others wrote little on medical subjects, for, from 1779, all the leisure time which he could abstract from professional occupations was devoted to the enthusiastic study of astronomy. The first thing which brought him into notice was his calculation of the orbit of the comet of 1779, which was performed by him while watching by the bedside of a sick patient, and was found to be very accurate. Comets were the chief objects of his investigation, and he seems to have been seized with an irresistible predilection for these vagabonds of the solar system, which his two important discoveries of the planets Pallas (1802) and Vesta (1807) could not diminish. In 1781 he had the honor of first re-discovering the planet Uranus, which had previously been supposed, even by Herschel himself, to be a comet, and which had been sought for in vain. He also discovered five comets, in 1798, 1802, 1804, 1815, and 1821, all of which, with the exception of that of 1815 (hence called Olber's comet), had been some days previously observed at Paris. His observations, calculations, and notices of various comets, which are of inestimable value to astronomers, were published in the "Annales de Bode" (1782-1839), in the "Annaire de l'Europe" (1832), and in three collections by the baron de Zach. Most of these calculations were made after a new method, discovered by himself, for determining the orbit of a comet from three observations; a method which, for facility and accuracy, he considered as greatly preferable to those then in use. A detail of it appeared in a journal published at Weimar (1797), and a new edition by Encke in 1847. Olbers was one of that small band of astronomers who included also Schröter, Gauss, Plazzi, Bode, Harding, etc., who in the first ten years of the 19th c. devoted their energies to the observation of those planets which were coming to light between Mars and Jupiter. As above stated, two of them, the second and fourth in order of discovery, were detected by Olbers himself; and the general equality of the elements of the five planetoids led him to propound the well-known theory, that these, and the other planetoids (q.v.) since discovered, are but fragments of some large planet which formerly revolved round the sun at a distance equal to the mean of the distances of the planetoids
from the same luminary. It was this theory which led him, after the discovery of Pallas, to seek for more fragments of the supposed planet, a search resulting in the discovery of Vesta. Obers also made some important researches on the probable lunar origin of meteoric stones, and invented a method for calculating the velocity of falling stars. Obers died at Bremen, Mar. 2, 1840; and in 1850 his fellow-citizens erected a marble statue in honor of him. Obers, as a writer, possessed great powers of thought, combined with equal clearness and elegance of expression. The dissertations with which he enriched the various branches of astronomy are scattered through various collections, journals, and other periodicals.

OLD BURY, an important manufacturing t. of England, in the county of Worcester, 29 m. n. by. e. of the city of that name, on the river Teme. It contains numerous churches, meeting-houses, and schools. Owing to the extension of the iron trade, Oldbury has greatly increased in size and prosperity within recent years. There are coal and iron mines in the neighborhood; and in the town iron, steel, locomotive engines, mills, edge tools, draining-pipes, etc., are made and constructed. The Stour Valley railway passes close by the town, and there is a station here. Pop. '71, 16,410.

OLDCASTLE, Sir John, once popularly known as the "good lord Cobham," whose claim to distinction is that he was the first author and the first martyr among the English nobility, was born in the reign of Edward III.; the exact year is not known. He acquired the title of lord Cobham by marriage, and signalized himself by the ardor of his attachment to the doctrines of Wycliffe. At that time there was a party among the English nobles and gentry sincerely, and even strongly desirous of ecclesiastical reform—the leader of which was "old John of Gaunt—time-honored Lancaster." Oldcastle was active in the same cause, and took part in the presentation of a remonstrance to the English commons on the subject of the corruptions of the church. At his own expense he got the works of Wycliffe transcribed, and widely disseminated among the people, and paid a large body of preachers to propagate the views of the reformer throughout the country. During the reign of Henry IV. he commanded an English army in France, and forced the duke of Orleans to raise the siege of Paris; but in the reign of Henry V. he was accused of heresy, and having, in a disputation with his sovereign, declared that "as sure as God's word is true, the pope is the great Antichrist foretold in Holy Writ," he was thrown into the Tower, whence, after some time, he escaped, and concealed himself in Wales. A bill of attainder was passed against him, and 1000 marks set upon his head. After four years' hiding he was captured, brought to London, and—being reckoned a traitor as well as a heretic—he was hung up in chains alive upon a gallows, and fire being put under him, was burned to death, Dec., 1417. Oldcastle wrote Twelve Conclusions addressed to the Parliament of England, several monkish rhymes against "fleshy livers" among the clergy, religious discourses, etc.—See Life of Oldcastle, by Giphin.

OLD CATHOLICS, those members of the Roman Catholic church in Germany who, in 1870, took the ground that the dogma of the immaculate conception of 1854, the encyclical and syllabus of 1864, and the decree of papal infallibility had so changed the status of the Roman church that no man could continue in its communion and still adhere to the Catholic church of Christ. They disputed the eccumenical character of the general councils, and the infallibility and irrevocability of the pronouncement of the decree. In protest against it, the bishops withdrew and submitted after its proclamation, July 8, 1870. A large number of German theologians and civilians, however, denounced the course of the bishops, and prof. Michaelis openly charged the pope with heresy and apostasy. This was followed by a formal declaration and protest by Dr. Döllinger and 43 other professors of the university of Munich against papal infallibility and the validity of the Vatican decrees. A conference was held at Nuremberg, Aug., 1870, which, though purely consultative, drew up a united protest against the eccumenical character of the vatican council, and the binding authority of its acts. Prominent among the signers appeared the weighty names of Döllinger, Friedrich, Schulte, Michaelis, and Lutterbeck.

This formal protest induced the bishops forthwith to initiate repressive measures. In a pastoral, Sept. 10, they sounded the alarm and warned all true Catholics to submit; and when it became evident that the movement had not become popular with the clergy and laity, they went further in depriving the protesting theologians of their functions, excommunicated them, and forbade students to frequent their lectures. With the exception of a few lukewarm, timid adherents, the great body of the reformers remained firm in their convictions. Döllinger, in a letter to his diocesan, dated Mar. 28, 1871, declared that, "as a Christian, as a theologian, as an historian, and as a citizen," he could not accept the new dogma. He was excommunicated for it April 17, 1871. His excommunication became the starting point of revived energy throughout Germany. In a formal declaration of principles the promoters of the movement said: "Faithful to the inviolable duty of every catholic Christian, which is also a thing not denied by pope or bishop, to hold fast by the ancient faith, and to reject innovations, even if proclaimed by an angel from heaven, we persist in the rejection of the Vatican dogma." The first old Catholic congress met at Munich, Sept. 22, 1871. It was attended by about 300 delegates from Germany, Austria, and Switzerland, and friends from Holland, France, Russia, England, and elsewhere. In the resolutions adopted the body defined its theological
status, and said with regard to its relations to other members of the Catholic church: "We declare that the reproach of Jansenism against the Utrecht church is causeless; there is no dogmatic difference between her and ourselves. We hope for reunion with the oriental Greek and with the Russian churches, whose separation was without absolute cause, and is based on no irreconcilable dogmatic difference. We expect, in the assumption of the reforms which we attempt, and in the way of science, and of progressing Christian knowledge, a gradual understanding with the Protestant and Episcopal churches.” The disposition of Döllinger to stave off a complete ecclesiastical organization had to yield to the predominant opposite feeling. Meanwhile the old Catholic congregations were without episcopal supervision and ministrations, and the Bavarian congregations secured the friendly offices of the archbishop of Utrecht in the administration of confirmation. When the second old Catholic congress met at Cologne, Sept., 1872, the work of organization made progress. The church was to depend for episcopal functions temporarily on the bishops of the old Catholic church of Holland, and of the United Armenian church, whose attitude to Rome was analogous with their own. A commission was appointed to take order for the election of a bishop by the clergy and laity. Intercommunion with the Eastern and Anglican churches was sought to be established. The claim to recognition by the state, with a share of the church property, was asserted. In the following year (June 4, 1873) Dr. Joseph Hubert Reinkens, professor of theology at the University of Breslau, was elected missionary bishop for Germany, and consecrated Aug. 11, at Rotterdam, by the bishop of Deventer. The third Old Catholic congress was held Sept. 12-14 at Constance, whose crowning act was the adoption of a synodal constitution, which provides for diocesan, provincial, and general synods, composed of clerical and lay delegates, the latter on the basis of one delegate for every 200 constituents. The first synod, at Bonn, May 27, 1874, was attended by 28 clerical and 60 lay delegates. In the direction of reform its action was marked by conservative caution; confession, fasting and abstinence, and priestly celibacy were retained, the prevailing sentiment being the correction of Roman abuses and corruptions to the purer practice of the early church. The obnoxious features of so-called mixed marriages, i.e., marriages between Roman Catholics and Protestants, were set aside; the drafting of a new ritual and catechism was assigned to committees; a synodal representation or standing committee was appointed. The church at that time reported the existence throughout Germany of 133 parochial societies, numbering about 35,000 souls, 50 priests, and 12 theological students. The 4th congress, at Freiburg, in Baden, Sept. 5-9, 1874, took action to establish an equitable legal status of the Old Catholic church in Germany, and a pro rata share of the church property. The congress was followed by a conference aiming at church unity, at Bonn, Sept. 14-16, 1874, at which Dr. Döllinger presided, and in which, besides Old Catholics, Easterns and Anglicans participated. It was unanimously agreed that the insertion of the words filioque in the Nicene creed was unlawful, and that it was very desirable to have them expunged by the concurrent action of the different churches. Other points of agreement amongst Old Catholics, Anglicans, and orientals were also discussed; e.g., the place of the Apocrypha in the canon; the relation of versions of the Bible to the original text; the proper language (a dead one or the vernacular) for the conduct of divine service; the doctrines of supererogation and indulgences, and of the immaculate conception. The prevailing sentiment on these and kindred topics was decided in favor of the Roman, and agreement on them was regarded as a possible basis for the unification of Christianism.

The 5th Old Catholic congress was at Breslau, Silesia, Sept. 22-24, 1876, thinly attended, in part on account of the great distance of that city from the centers of the Old Catholic movement, and in part also on account of waning interest. The latter circumstance holds good also concerning the 6th congress, held Sept., 1878, at Bayonne, of which no official report has been published. There is doubtless great disappointment in the comparatively slow progress of the movement, which has failed to enlist popular enthusiasm, but the tide seems to have set in the direction of greater growth and revived energy, as will be seen from a subsequent paragraph.

The national church of Holland, generally but erroneously styled Jansenist, has heartily entered into the Old Catholic movement, and may be regarded as occupying identical ground.

The relation of the Old Catholic church of Germany to the Anglican communion is very friendly. Representatives of the church of England and the Protestant Episcopal church in the United States have been present at most of their congresses, and several of their synods; and the Anglican communion may be said to be in cordial sympathy with the Old Catholics. The presence of bishop Herzog at the general convention (Prot. Epis.) held at New York, Oct., 1880, has tended to strengthen that feeling (see below).

In Switzerland the old Catholic reform had a more pronounced effect on the people than in Germany. At Geneva it carried with it the majority of the Roman Catholics of the city. The cantonal government, moreover, aided it by speedy recognition. An old Catholic conference, held at Olten, Aug. 31, 1873, resolved upon drafting a constitution for a Swiss national church, and electing a bishop or bishops. At a like conference at the same place, Sept. 21, 1874, a constitution was adopted which provides for a national synod of "the Christian Catholic church of Switzerland," by which the Swiss Old Catholics are now known. Pastor Herzog of Olten was subsequently chosen and consecrated
bishop. The statistics of the church, presented to the synod in 1857, were: 66 parishes and 70 priests; baptisms for the year, 1182; number of persons confirmed, 3,068.

In Austria the Old Catholic movement has been very slow. There are several congregations in Bohemia, and under the influence of recent political changes the first lawfully authorized Old Catholic synod of Austria was held at Vienna, June 29, 1880, which adopted synodal and parochial regulations, and decreed the use of the language of the people in divine service.

In Russia, in the province of Volynia, are also several Bohemian communities attached to the Old Catholic church, served by three priests, recognized and supported by the state, who were, in Dec., 1879, taking steps looking towards the formation of a synodal council.

At the Swiss Christian Catholic synod, at Geneva, May 20, 1880, bishop Herzog reported that owing to peculiar state complications the church had lost in the canton of Bern 12 parishes and 10 priests; but that they numbered throughout Switzerland 59 priests in 48 established parishes. At this synod a prayer-book, framed after an Anglican model, was authoritatively set forth for present use. The executive council of Switzerland has issued a decree defining the right of possession of churches, to wit, that the majority in a parish, be they Roman or Old Catholic, are invested with the ownership, but that the minority are also entitled to worship in them without paying an indemnity.

The 5th Old Catholic congress, at Baden-Baden, Sept. 12-14, 1889, was attended by 150 delegates, at which bishop Reinkens reported favorably of progress in Germany, in which now are somewhat less than 50,000 adherents. The congress resolved unanimously upon the universal use of the German liturgy in public worship, and adopted a number of theses, which accurately describe the present attitude of the Old Catholics towards the Latin church.

1. It is impossible that there should be a real contradiction between belief, based on historical testimony, of the fundamental truths of Christianity, and science, based on the absolute facts of nature and mind. They mutually protect, aid, and complete each other.
2. The independence of national churches accords as much with the universal character of the church as national peculiarities in the state, in art, and in science accord with the general objects of culture.
3. It is an unfortunate error of many Protestants to regard that church, which the adherents of the Vatican are bound to acknowledge as so saving, as a shield of faith, a prop of authority to the state or society, and a bulwark against destructive social tendencies; and to receive its adherents as conservative allies.
4. History, the task and duty of self-preservation compel the German empire to oppose the Vatican system.
5. Negotiations with the infallible pope, or his organs, on all matters belonging to the legislative functions and the authority of the state should be repudiated. All such transactions conduce to the dissolution of the national state.

Ground, somewhat similar to that occupied by the Old Catholics, is held by the Armenian church, which, since 1867, felt greatly aggrieved by the course of the pope, who, in his bull Revorsornus, changed the manner of choosing their patriarchs and bishops. The third Vatican decree, declaring the pope’s universal episcopate, was especially distasteful to them. In Oct., 1870, they declared that while they had not fully decided as to the Vatican council, whose decrees many had refused to accept, who yet remained Catholics, they would not receive any decree which set aside that of Florence. In Nov., 1871, the pope excommunicated those of them who would not yield. They deposed their patriarch, and elected in his place Kiepelian, archbishop of Diarbekir. They have since been put in possession; by the Turkish government, of many of the united Armenian churches.

In France, M. Hyacinthe-Loyson may be regarded as generally representing Old Catholic views. His aim is the reformation of the Roman Catholic church in that country on the basis and principles of the old Gallican church.

OLDENBURG, a grand-duchy of northern Germany, consisting of three distinct and widely separated territories, viz., Oldenburg proper, the principality of Lübeck, and the principality of Birkenfeld. The collective area of these districts is now 2,461 square miles. Pop., in 1873, 319,514. Oldenburg proper, which comprises seven-eighths of this area, and four-fifths of the entire population, is bounded on the n. by the German ocean, e., s., and w. by the kingdom of Hanover. The principal rivers of Oldenburg are the Weser, the Jähhe, and the Haase, Vehne, and other tributaries of the Elbe. The grand-duchy of Oldenburg proper is divided into 8 circles. The country is flat, belonging to the arid, sandy plain of northern Germany, and consists for the most part of moors, heaths, marsh or fens, and uncultivated sandy tracts; but here and there, on the banks of the rivers, the uniform level is broken by gentle acclivities, covered with wood, or by picturesque lakes surrounded by fruitful pasture-lands. Agriculture and the rearing of cattle constitute the chief sources of wealth. The horses and cattle raised in the marsh lands are excellent of their kind, and in great request; the horse-markets at Oldenburg, and the cattle sales at Ovelgönne, being frequented by purchasers from every part of Germany. The scarcity of wood for fuel, and the absence of coal, are compensated for by the existence of turf-beds of enormous extent. With the exception of some linen and stocking looms, and a few tobacco works, there are no manufactories. There
are, however, numerous distilleries, breweries, and tan-yards in all parts of the duchy. The trade is principally a coasting trade, carried on in small vessels, from 20 to 40 tons, which can thread their way along the shallow channels connecting the larger rivers.

The exports are horses, cattle, linens, thread, hides, and rags, which find their way chiefly to Holland and the Hanseatic cities; while the imports include the ordinary colonial goods, and manufactures of numerous kinds.

The receipts for the collective grand-duchy were, in the budget for 1875, 7,104,150 marks, and the expenditure, 7,546,900. The public debt, at the close of 1874, was 34,575,912 marks.

The principality of Lübeck, consisting of the secularized territories of the former bishopric of the same name, is surrounded by the duchy of Holstein, and is situated on the banks of the rivers Schwartau and Trave. It contributes 189 sq. m. to the general area of the grand-duchy, and 34,085 inhabitants to the collective population. It is divided into four administrative districts. It has several large lakes, as those of Plön—noted for its picturesque beauty—Keller, Uklei, and Gross-Eutin; while in regard to climate, soil, and natural products, it participates in the general physical characteristics of Holstein. The chief town is Eutin (pop. in 1871, 3,700), pleasantly situated on the lake of the same name, with a fine castle surrounded by a magnificent park.

The principality of Birkenfeld, lying s.w. of the Rhine, among the Hunsrück mountains, and between Hessen Prussia and Lichtenberg, is an outlying territory, situated in lat. 49° 30"—5° 20", and long. 7° 30"—8° 30" e. Its area is 192 sq. m., and its pop. 37,093. The soil of Birkenfeld is not generally productive; but in the lower and more sheltered valleys, it yields wheat, flax, and hemp. Wood is abundant. The mineral products, which are of considerable importance, comprise iron, copper, lead, coal, and building-stone; while in addition to the rearing of cattle, sheep and swine, the polishing of stones, more especially agates, constitutes the principal source of industry. The principality is divided into three governmental districts.

Oldenburg is a constitutional ducal monarchy, hereditary in the male line of the reigning family. The constitution, which is based upon that of 1849, revised in 1852, is common to the three provinces, which are represented in one joint chamber, composed of 33 members, chosen by free voters. Each principality has, however, its special provincial council, the members of which are likewise elected by votes; while each governmental district within the provinces has its local board of councillors, and its several courts of law, police, finance, etc., as well as the highest judicial court of appeal, and the ecclesiastical and ministerial offices, are located at Oldenburg.

Perfect liberty of conscience was guaranteed by the constitution of 1849. The Lutheran is the predominant church, upwards of 200,000 of the population belonging to that denomination; while about 70,000 persons profess the Roman Catholic religion.

There are two gymnasiums, one higher provincial college, several secondary, and 500 elementary schools; but in consequence of the scarcity of villages in the duchy, and the isolated position of many of the houses of the peasantry, schools are not common in the country districts, and the standard of education of the lower classes is, from these causes, scarcely equal to that existing in other parts of northern Germany. The military forces of Oldenburg—above 2,000 men on the peace footing—form a portion of the Prussian army. The merchant navy in 1875 consisted of 361 vessels of 53,167 tons. Oldenburg is represented in the bundesrat or federal council of the German empire by one member, and in the reichstag or diet by 8 members. The territory now included in the grand-duchy of Oldenburg, was in ancient times occupied by the Teutonic race of the Chauci, who were subsequently merged with the more generally known Frisii, or Frisians; and the land, under the names of Ammergau and Lervigau, was for a long period included among the dominions of the dukes of Saxony. In 1180, the counts of Oldenburg and Delmenhorst succeeded in establishing independent states from the territories of Henry the Lion, which fell into a condition of disorganization after his downfall.

This family has continued to rule Oldenburg to the present day, giving, moreover, new dynasties to the kingdom of Denmark, the empire of Russia, and the kingdom of Sweden. See OLDENBURG, HOUSE OF. On the death, in 1667, of count Anthony Günther, the wisest and best of the Oldenburg rulers, his dominions, in default of nearer heirs, fell to the Danish reigning family, and continued for a century or more by viceroys nominated by the kings of Denmark. This union was, however, severed in 1772, when, by a family compact, Christian VII. made over his Oldenburg territories to the grand-duke Paul of Russia, who represented the Holstein-Gottorps branch of the family. Paul having renounced the joint countryships of Delmenhorst and Oldenburg in favor of his cousin, Frederick Augustus, of the younger or Kiel line, of the House of Oldenburg, who was prince-bishop of Lübeck, the emperor raised the united Oldenburg territories to the rank of a duchy. The present reigning family is descended from duke Peter Friedrich Ludwig, cousin to the prince-bishop, Frederick Augustus. For a time the duke was a member of Napoleon's Ilissen confederation, but French troops having, in spite of this bond of alliance, taken forcible possession of the duchy in 1811, and incorporated it with the French empire, the ejected prince joined the ranks of the allies. In recognition of this adhesion, the congress of Vienna transferred certain portions of
territory, with 5,000 Hanoverians and 20,000 inhabitants of the quondam French district of the Saar, to the Oldenburg allegiance. From these new acquisitions were organized the district Amme, and the principality of Birkenfeld; while Oldenburg was raised to the dignity of a grand-duchy. The revolutionary movement of 1848 was quite as productive of violent and compulsory political changes in this as in other German states; and in 1849, after having existed for centuries without even a show of constitutional or legislative freedom, it entered suddenly into possession of the most extreme of liberal constitutions. The reaction in favor of absolutism, which the license and want of purpose of the popular party naturally induced all over Germany, led in 1852 to a revision and modification of the constitution, which, however, in its present form, contains the essential principals of popular liberty and security, though it must be confessed this is more verbal than real. In the German-Italian war, Oldenburg sided with Prussia, and afterward joined the North German confederation. The duchy concluded, in 1866, a treaty with Prussia, by which the grand-duke renounced his claims to the Holstein succession, for the cession to him of a small portion of Holstein territory, and an indemnity of 1,000,000 thalers. Oldenburg is now included in the German empire.

OLDENBURG, capital of the grand-duchy of the same name, is pleasantly situated on the banks of the navigable river Hunte, 25 m. w.n.w. of Bremen. Pop. '75, 15,701. Oldenburg is the seat of the administrative departments, and the focus of the literary, scientific, and commercial activity of the duchy. It has a normal school, a military academy, a public library of 85,000 vols., a picture-gallery, museum, etc. The grand-ducal palace is worthy of note for its fine gardens, its valuable pictures, and other art collections, and its library. The principal church is St. Lambert's, containing the burying vaults of the reigning family. Oldenburg is the seat of an active river trade, and is noted for its excellent stails, and the great cattle and horse fairs which are annually held here in the months of June and August.

OLDENBURG, HOUSE of, which lays just claim to being one of the oldest reigning families of Europe, has been rendered still more illustrious by various matrimonial alliances, which, in the course of ages, have successively been the means of creating new royal dynasties. Thus, for instance, in 1448, a scion of this house being elected king of Oldenburg, under the title of Christian I., became the progenitor of the Danish house of Oldenburg, the imperial house of Russia, the late royal family of Sweden, and the collateral and junior Danish lines of Augustenburg, Kiel, and Sonderburg-Glücksburg. Christian I. was succeeded by his brother, Christian II., whose grandson, Adolph of Schleswig, who, when the throne was offered to him, in the sudden death of king Christopher, refused, on the ground of age, and proposed Christian of Oldenburg, who, as the direct descendant of Eric Glipping's daughter, princess Richissa, was allied to the old extinct house of Denmark. The death, in 1459, of Adolph, duke of Schleswig and count of Holstein, without male heirs, opened the question of succession to those states, which has since become one of such vexatious import. The ancient law of Denmark recognized hereditary feuds only in exceptional cases; crowned feuds being generally held for life or merely for a time ad gratiam. Such being the case, Schleswig might, on the death of Adolph, have been taken by the crown as a lapsed tenure; but Holstein, being held under the empire, would have been separated from it. Adolph and his subjects were alike anxious that Schleswig and Holstein should continue united; but although the Schleswig estates, at the wish of the duke Adolph, had recognized Christian as successor to the duchy before his accession to the thrones of Denmark, the Holstein chambers were divided on the question of succession, the majority showing a preference for the candidature of the counts of Schauenburg, who were descended from male agnates of the Holstein house. Christian in his eagerness to secure both states, was willing to sacrifice his rights in Schleswig to his schemes in regard to Holstein; and having bought over the Holstein nobles by bribes and fair promises, he was elected duke of Schleswig and count of Holstein at Ribe in 1460, where he signed a deed, alike derogatory to the interests and unworthy the dignity of his crown. In this compact, by which he bartered away the just prerogatives and independence of himself and his successors, for the sake of nominal present gain, he pledged his word for himself and his heirs, that the two provinces should always remain undivided,”"eigil blijen toosmente tungedelt," and not be dismembered by division or heritage. This document, which remained for ages unknown or forgotten, was discovered by the historian Dahlmann amid the neglected papers of the Holstein state archives at Preetz, and proclaimed in 1848 by that ardent admirer of Germany as the unchangeable fundamental law of the Schleswig-Holstein provinces. The confusion, dissension, and ill-will to which this fatal deed has given rise, are the fruits which Christian's unscrupulous desire to secure power at any cost has produced for his descendants, whose complicated claims on the dukies, resulted, in 1864, in a war which cost Denmark a large portion of her territorial possession. From Christian I. descend two distinct branches of the Oldenburg line: 1. The royal dynasty, extinct in the male line in Frederick VII., late king of Denmark, and the collateral branches of Sonderburg-Augustenburg and Sonderburg-Glücksburg; 2. The ducal Holstein-Gottorp line, descended from duke Adolph, who died in 1596, and was the second son of king Frederick I. This prince had received, during his father's life-time, a portion of the Schleswig and Holstein lands, which he was permitted, on the accession of his elder brother, Chris-
tian III., to retain for himself and his heirs. This line became illustrious by the marriage of prince Karl Friedrich, the son of Hedwig Soils, eldest sister of Charles XII. of Sweden (a direct descendant of duke Adolph) with the grand-duchess Anna, daughter of Peter the great, and thus gave to Russia the dynasty which still occupies the imperial throne; while Adolph-Friedrich, a cousin prince Karl Friedrich, by his election to the throne of Sweden in 1751, added another crown to those already held by the house of Oldenburg. The conduct of his descendants rendered the new dignity short-lived, for with the abdication of Gustavus IV., in 1809, the Holstein-Gottorp dynasty became extinct in Sweden.

The complicated relations of the house of Oldenburg in regard to the Danish succession, after giving rise to much angry discussion among the princes interested in the question, and the Danish people themselves, led the great powers to enter into a treaty, known as the London treaty of 1852, for settling the question of succession, on the ground that the integrity of the Danish monarchy was intimately connected with the maintenance of the balance of power and the cause of peace in Europe. England, France, Austria, Prussia, Russia, Sweden, and Denmark, were parties to this treaty, in the first article of which it was provided, that on the extinction of the male line of the royal house, prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, and his male heirs, according to the order of primogeniture, should succeed to all the dominions, then unified under the sway of the king of Denmark. The rights of succession, which rested with the Augustenburg family, were forfeited by a compact with the duke of Augustenburg, entered into for the surrender of his claims, in consideration of a sum of money paid to him by Denmark. The duke's morganatic marriage, and his subsequent rebellion in 1848, against the Danish king, were the causes which led to the arrangement of this family compact on the existing terms. This treaty, known as the London protocol of May, 1852, was followed in October of the same year by the publication of a supplementary clause, which stipulated, that on the extinction of the heirs-male of prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, the Holstein-Gottorp, or imperial Russian line should succeed to the Danish dominions. This article, even more than the original clauses of the treaty, met with the strongest opposition among the Danes, and after being twice rejected in the Landsting, the London treaty was only ratified after a new election of members, and on the assurance of the king that in excluding all female cognate lines from the succession, there was no definite intention of advancing the claims of Russia. King Frederick's death, in 1863, brought on the crisis of the much vexed question of the Danish succession, and although the London treaty was so far followed that prince Christian succeeded as king of Denmark, the evils that were anticipated from the measure were in 1864 made painfully manifest: for the duke of Augustenburg, notwithstanding the renunciation by his family of all claims to the succession, appealed to the federal diet for the recognition of his rights on Holstein; and the German powers, glad of a pretext to extend their influence beyond the Elber, occupied the Schleswig-Holstein (q.v.) territory, and succeeded, by force of superior numbers, in advancing the boundary of Germany to the borders of Jutland. This led, however, to grave results affecting the whole of Europe. Prussia and Austria took possession of the conquests in their own names. The former power offered the latter pecuniary compensation for their assistance in the war, while indicating a determination to annex the duchies to its own dominions. Austria refused, and this led to the disastrous battle of Königgrätz.

OLDHAM, a co. in n.w. Kentucky, bordering on Indiana, from which it is separated by the Ohio river, intersected by the Louisville, Cincinnati and Lexington railroad: 200 sq. m.; pop. '80, 7,685—7,476 of American birth; 2,222 colored. The surface is hilly but fertile. Wheat, cotton, Indian corn, oats, and pork are the chief products. Lime-stone is found. Co. seat, La Grange.

OLDHAM, a parliamentary borough and flourishing manufacturing t. of England, in the co. of Lancashire, stands on the Medlock, 6 m. n.e. of Manchester. It owes its rapid increase in population and in wealth to the extensive coal-mines in the vicinity, and to its cotton manufacture, which is remarkably within late years. It is not only the great center of the hosiery manufacture, but is also celebrated for its manufactures of fustians, velvetastic, cords, cotton, woolen, and silk goods. Numerous silk-mills, brass and iron foundries, machine-shops, tanneries, rope-works, etc., are in operation. The parish church, the town-hall, the blue-coat, and the grammar-schools, are the chief educ. Pop. in 1871 of municipal borough, 82,629; of parliamentary borough (which returns two members to parliament), 113,100.

OLDHAM, John; about 1590-1636; b. England; emigrated to Plymouth in 1623, and in association with Lyford endeavored to establish a separate worship of the Sabinth. He was also credited with the intention of changing the form of government at Plymouth. In 1633, he went from Dorchester to what is now Windsor, Conn., and his exploration resulted in the settlement of that town. He represented Watertown in the general court of 1634, and was killed in 1636 by Indians who came aboard his ship to trade. His murder brought on the Pequot war.

OLDHAM, John, 1655-83; b. England; educated at Oxford, where he won distinction by his proficiency in Latin and Greek, and by his English poetry. Want of means forced him to leave the university in 1674, and he soon secured employment as an usher at
the free school in Croydon, Surrey. The first of his published poems was a Pindaric ode, on the death of his friend, Richard Morwent; it is rich in comparisons, and shows a tenderness in strong contrast with the fierce satire of his later works. He continued to cultivate poetry as a relief from the drudgery of "beating Greek and Latin for his life," as he describes it; and some of his MS. poems attracted the notice of the reigning London wits, Sir Charles Sedley, the earl of Dorset, and the earl of Rochester, who paid him a visit at Croydon. By their influence he was made tutor to the sons of Sir Edward Thurlow, with whom he lived till 1690. At this time he was engaged upon his Satires upon the Jesuits, which appeared in 1679, when the excitement in regard to the so-called "Popish plot" was at its height. They are full of bitterness and Protestant rancor, and gained for Oldham a high reputation. While tutor to the son of Sir William Hicks, he became acquainted with Dr. Richard Lower, a famous London physician, and was induced to study medicine; but he abandoned it at the end of a year and, settling in London, devoted himself to literature. He was an intimate friend of Dryden and the other wits and satirists of the day. He refused the post of private chaplain to the earl of Kingston, who was his patron, and had proposed to have him enter holy orders. His last poem is called A Sunday Thought in Sickness, and is of a devotional character. His poems are forcible and vehement, but defective in versification. Oldham, in the opinion of Hallam, "ranks next to Dryden; he is spirited and pointed, but his versification is too negligent, and his subjects temporary."

OLDHAMIA, a genus of fossil zoophytes, dedicated by Forbes to prof. Oldham, who was their discoverer. Only two species are known, but they are of peculiar interest, because, with their associated worm-tracts and burrows, they are the first distinct evidence of life on the globe. They exist as mere tracings on the surface of the lamine of metamorphosed shales, all remains of the substance of the organism having entirely disappeared. The form of the hard polyprim is preserved, and shows a jointed main stem, giving off at each joint, in the one species, a circle of simple rays, and in the other a fan-shaped group. Forbes pointed out their affinities in some respects to the hydrozoa, and in others to the polyzoa. Khahan, who described the genus at some length, considers them to have been hydrozoa allied to sertularia; while Huxley places them among the polyzoa.

OLD MAN OF THE MOUNTAIN. See Assassins, ante.

OLDMIXON, John, 1673-1712; b. England. He superintended and revised the first edition of bishop Kennett's collection of English historians. In 1708 he published The British Empire in America, 2 vols., later edition in 1741. In 1715-16 Memoirs of North Britain and Memoirs of Ireland; in 1727, Claverdon and Whitlock Compared; and in 1730, "35, 39, 3 vols., containing histories of the reigns of Henry VII., Edward VI., Mary and Elizabeth, also of the Stuarts, William and Mary, Anne, and George I. In 1742 he published Memoirs of the Press, Historical and Political, for Thirty Years. He was a strong partisan, and was called a whig historian, defending whig principles even in his historical works. He was a severe and unscrupulous critic of Pope, Swift, Grey, and other celebrities of the time, in his contributions to the magazines, and his Prose Essay on Criticism, which Pope noticed in his Dunciad. As a reward for his services to the whig party, he was appointed collector of customs at the port of Bridgewater. He is said to have visited America.

OLD POINT COMFORT, a village and watering-place in Virginia, at the entrance of Hampton roads, and James river, 12 m. from Norfolk, and the site of fortress Monroe, the largest military work in the United States.

OLD RED SANDSTONE, the name given to a large series of perviscous rocks, of which red sandstones are the most conspicuous portions, but which contains also white, yellow, or green sandstones, as well as beds of clay and limestone. The group lies below the carboniferous strata, and was called "Old" to distinguish it from a newer series of similar beds which occur above the coal measures. The discovery that the highly fossiliferous carboniferous rocks of Devonshire and the continent occupied the same geological horizon, showed that the name was very; far from being descriptive of all the deposits of the period, and suggested to Murchison and Sedgwick the desirability of giving them a new designation. They consequently proposed Devonian, which has been extensively adopted; but it is liable to the same objection as that urged against the name it was intended to supplant, inasmuch as it incorrectly limits geographically what the other limits lithologically. Many names used by geologists are similarly at fault; there is therefore no good reason why the old name should be given up, especially as it has been rendered classical by the labors and writings of Hugh Miller, the original monographer of these rocks.

The position of the old red sandstone series is easily determined, though the sequence of the various beds which form it is somewhat obscure. All the rocks are situated between the beds of the Silurian and carboniferous periods. In Wales, Scotland, and Ireland it has been observed that there is an old series of red sandstones which are more or less conformable with the underlying Silurians, and a newer series unconformable with the older strata, but conformable with the overlying carboniferous rocks. The great interval represented by this break has been believed to be that during which the calcareous
Devonian rocks were deposited. The recent researches, however, of Mr. Salter show that the one set of beds do not alternate with the other, but that they are really contemporaneous—the coarse shallow water deposits of conglomerate and sandstone having been formed on the shores of that sea in whose depths the deposits of thicker mass, finer grain, and lighter color, full of marine shells and corals, were at the same time being aggregated.

The strata of the period have been arranged in four groups. 1. Upper old red sandstone, including the Marwood and Petherwin groups. 2. Middle old red sandstone, including the Dartmouth and Plymouth groups. 3. Lower old red sandstone, including the North Foreland and Torbay groups. 4. Tilestones or Ledbury Shales.

1. The upper old red sandstones are conformable with the inferior strata of the coal measures, and differ so little petrologically, or even palaeontologically from them, that they have been considered as the basement series of that period. They consist of yellowish and light-colored sandstones, which are at Dura Den, in Pitsfiehre, remarkably rich in some of their layers in the remains of Holopteychius, Pteriethys, Dendrodus, etc. In the south of Ireland, and at Dunse, similar beds contain a fresh-water shell very like the modern anodon, and fragments of a fern called cyclopertis hibernicus. Mr. Saltar has shown, from the intercalation of the marine beds with the red sandstone, and from the identity of the fossils, that the Devonian representatives of these beds are the Marwood and Petherwin groups. These consist of dark-colored calcareous and argillaceous beds, and gray and reddish sandstones. The fossils found in them are shells and land-plants, many of them belonging to the same genera, but different species to those which are found in the carboniferous system. The little crustacean Cypridina and Clymenia are so characteristic of this division, that in Germany the strata are known as the Cypridinien Schichten and Clymenien Kalk.

2. The middle old red sandstone is represented in the north of Scotland by the Caithness flags, a series of dark-gray bituminous schists, slightly micaceous or calcareous, and remarkably tough and durable. Throughout their whole thickness they are charged with fossil fish and obscure vegetable remains. The characteristic fishes belong to the genera Coccosteus, Asteroilepis, and Dipetius. The corresponding beds in Devonshire are the Dartmouth and Plymouth groups, which consist of extensive deposits of limestones and schists, all of them abounding in the remains of corals, trilobites, and shells. In the German equivalent, the Eifel limestone, but especially in the Russian, the characteristic invertebrate fossils of the Devonshire calcareous beds have been found associated with the remains of Coccosteus, showing beyond doubt the identity of these various beds. The Calcoda Schleiffer of German geologists belongs to the middle old red; it receives its name from the abundance in it of a singular brachiopod (calcoda sandata).

3. The lower old red sandstone consists of strata of red shale and sandstone, with beds of impure arenaceous limestone (cornstone), and frequently at the base great deposits of red conglomerate. The fossils peculiar to this division are the remarkable fish cephalaspis, and the huge crustacea of the genus Pterygotus, besides a few shells. To the south of the Grampians, the strata consists of a gray paving-stone and coarse roofing-slate. The Devonian representatives of this section are the sandstones and slates of the North Foreland, Linton, and Torbay, and the series of shaly beds and quartz ore sandstones developed on the banks of the Rhine near Coblenz. The Cephalaspis, so characteristic of the cornstones, has been found in the Rhens beds.

4. The tilestones or Ledbury Shales consist of finely laminated reddish and green micaceous sandstones, which have been noticed underlying the old red only on its western borders in Herefordshire. The fossils of those beds show a Silurian fauna with a number of old red forms; the tilestones are consequently referred sometimes to the one period, and sometimes to the other.

The old red sandstone occupies a considerable portion of the surface of Great Britain. In the north, it forms the boundary lands of the Moray firth; beginning even as far north as the Shetlands and Orkneys, it covers the whole of Caithness, and in more or less broken tracts the east of Sutherland, Ross, and Cromarty, and the north of Inverness, Nairn, and Elgin. In the great central valley of Scotland it is the setting in which the coal measures are placed, stretching across the country on the one margin from Forfar to Dumbarton, and occurring on the other in separated tracts in Lanark and Berwick. In the southern division of the island it is limited to a large triangular district in the southwest. The apex of the triangle is at Wenlock, in Shropshire; a line thence to Start point, in Devon, would limit it on the east, and a second to Milford haven would do so on the west. The Bristol channel bissects it. A depression in the Welsh portion is occupied with South Wales coal-field; and in a similar depression in Devon, the culm-beds are situated. In Ireland, strata of this age are found in the counties of Kilkenny, Waterford, Cork, and Kerry. The Devonian rocks have been carefully studied in Belgium and the Rhine district, and also in Russia, where they cover a larger district in the north of the empire. The American representatives of this period are extensively developed in New York, Pennsylvania, and Canada. The invertebrate animals found in the old red do not differ much from those of the Upper Silurian. Corals are remarkably abundant and beautiful in the Devonian limestones. Goniatites and Clymenia make their first appearance in this period, with several forms of lower mollusca. Trilobites are still
numerous. But the most striking feature in the period is the abundance of fish of curious forms, strongly protected outside by hard bony cases, or by a dense armor of ganoid scales.

OLDTOWN, a t. in Penobscot co., Me., on the w. bank of Penobscot river, and the European and North American, and the Bangor and Piscataquis railroads, 12 m. n. of Bangor; pop. 70,429. It was set off from Orono in 1840, and consists of the four villages, Oldtown, Pushaw, Great Works, and Upper Stillwater. It has a heavy water power, and many saw and lumber mills, one of which is said to be the largest in the world. A boom built across the Penobscot at a cost of $100,000 keeps lumber from drifting out to sea. The lumber trade is the chief business; furniture, carriages, barrels, and shingles are also made. There are a number of churches and a bank. A railroad bridge spans the Penobscot at this point.

OLDYS, WILLIAM, a most erudite and industrious bibliographer, was a natural son of Dr. William Oldys, chancellor of Lincoln, and advocate of the admiralty court, and was born in 1687. Regarding his early life little is known. His father dying in 1708 left him a small property, which Oldys squandered as soon as he got it into his own hands. The most of his life was spent as a bookseller's hack. He drank hard, and was so scandalously fond of low company that he preferred to live within the "rules" of the Fleet prison to any more respectable place. As may easily be supposed from his habits, the disolute old bookworm was often in extremely necessitous circumstances, and when he died (April 13, 1761) he left hardly enough to decently bury him. It is but fair to add that Oldys had some sterling merits. Capt. Grose, who knew him, praises his good-nature, honor, and integrity as a historian, and says that "nothing would ever have biased him to insert any fact in his writings which he did not believe, or to suppress any he did." For about ten years Oldys acted as librarian to the earl of Oxford, whose valuable collection of books and MSS. he arranged and catalogued. His chief works are: The British Librarian. Exhibiting a Compendious Review of all Unpublished and Valuable Books in all Sciences (London, 1737, anonymously); A Life of Sir Walter Raleigh, prefixed to Raleigh's History of the World (1728); a translation of Camden's Britannia (2 vols.); The Heretic Miscellany, or a Collection of Scurril, Curious, and Entertaining Tracts (8 vols. Lond. 1753). Besides these, Oldys wrote a great variety of miscellaneous literary and bibliographical "articles" for his friends the booksellers, which it would be tedious to mention.

OLEACEAE, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves and flowers in racemes or panicles. The calyx is in one piece, divided, persistent; the corolla is hypogynous, generally 4-cleft, sometimes of four petals, sometimes wanting; there are generally two, rarely four stamens; the ovary is free, 2-celled, the cells 2-seeded; the fruit is a drupe, a capsule, or a samara (see these heads); the coryledons are falcate. Nearly 150 species are known, mostly natives of temperate countries. Among them are the olive, as, lilac, privet, phillyrea, fringe tree, etc. Between some of these there is a great dissimilarity, so that this order is apt to be regarded as a very heterogeneous group; but the real affinity of the species composing it is manifested by the fact that even those which seem most unlike can be drafted one upon another, as the lilac or the olive on the ash. Bitter, astrigent, and tonic properties are prevalent in this order.

OLEANDER, Nerium, a genus of plants of the natural order apocynaceae, having a 5-parted calyx, set round on the inside at the base with many tooth-like points or glands, a salver-shaped 5-cleft corolla, in the throat of which is a 5-parted and toothed or lacerated corona, five stamens, the anthers adhering to the stigma, the fruit composed of two follicles. The species are evergreen shrubs with leathery leaves, which are opposite or in threes; the flowers in false umbels, terminal or axillary. The common oleander (N. oleander), a native of the south of Europe, the north of Africa, and many of the warmer temperate parts of Asia, is frequently planted in many countries as an ornamental shrub, and is not uncommon in Britain as a window-plant. It has beautiful red or sometimes white flowers. The English call it Rose Bay, and the French Rose Launel (laure rose). It attains a height of 8 or 10 feet. Its flowers give a splendid appearance to many ruins in the south of Italy. It delights in moist situations, and is often found near streams. All parts of it contain a bitter and narcotic-acrid juice, poisonous to men and cattle, which flows out as a white milk when young twigs are broken off. Cases of poisoning have occurred by children eating its flowers, and even by the use of the wood for spits or skewers in roasting meat. Its exhalations are injurious to those who remain long under their influence, particularly to those who sleep under it. A decoction of the leaves or bark is much used in the south of France as a wash to cure cutaneous maladies.—N. odoratum, an Indian species, has larger flowers, which are very fragrant.—N. plicatum (or Echallum plicatum), a perennial climber, a native of the Kasya hills, has a very fibrous bark, the fiber of which is used in India as hemp. The steeping of the stems in ponds kills fish.

OLEASTER. See ELAGNUS.

OLE BULL. See BULL, OLE BORNEMANN, ante.
OLEFIANT GAS \((C_7H_{14})\) is transparent and colorless, possesses a disagreeable allaceous odor, and acts as a poison when breathed. Its specific gravity is 0.981. It takes fire when brought in contact with a flame, and burns with a bright clear light. When this gas is mixed with oxygen or atmospheric air in the proportion of 1 volume with 3 volumes of oxygen, or with 15 volumes of atmospheric air, it forms a powerfully explosive mixture. It is more soluble in cold than in hot water—100 volumes of water at 15° absorbing 26.5 volumes of the gas, while at 68° they only absorb 14 volumes. It was liquefied by Faraday under great pressure, but remained unfrozen at 106°. If it be conducted through strongly-heated tubes, or if a continuous series of electric sparks be passed through it, it is decomposed into a very dense black carbon, and dioxide, its own volume of hydrogen; and if it is subjected to a less intense heat, the products of decomposition are carbon and light carbonated hydrogen or marsh gas \((C_2H_4)\). Chlorine acts upon this gas in a very remarkable manner. When the two gases are mixed in equal volumes, they combine to form a heavy oily liquid, to which the term chloride of olefiant gas, or Dutch liquid \((q.v.)\), is given. It is from this reaction that the term olefiant was originally applied to this gas.

Olefiant gas is a constituent of the gaseous explosive admixtures that accumulate in coal-pits, and of the gaseous products yielded by the distillation of wood, resinous matters, and coal; and the brightness of the flame of ordinary gas is in a great measure dependent upon the quantity of olefiant gas that is present.

This gas is most readily obtained by the action of oil of vitriol on alcohol; the reactions that ensue are too complicated to be described in these pages.

OLEIC ACID \((C_{18}H_{34}O_2\cdot\text{HO})\), at temperatures above 57°, exists as a colorless limpid fluid, of an oily consistence, devoid of smell and taste, and (if it has not been exposed to air) exciting no action on vegetable colors. At 40° it solidifies into a firm, white, crystal-like mass, and in this state it undergoes no change in the air; but when fluid it readily absorbs oxygen, becomes yellow and rancid, and exhibits a strong acid reaction with litmus paper. It is not a volatile acid, and on the application of a strong heat it breaks up into several substances, such as caproic, caprylic, and sebaic acids—the last named being the most characteristic product of the distillation. If oleic acid be exposed to the action of hyponitrous acid \((\text{NO}_2)\), it is converted into an isomeric, solid, fatty acid, termed \(\text{elatac acid}\). A very small quantity of hyponitrous acid (1 part to 200 of oleic acid) is sufficient to effect this remarkable change, the nature of which is unknown. When distilled with moderately strong nitric acid, it is oxidized into a large number of products, including all the volatile fatty acids represented by the formula \(C_{18}H_{34}O_n\), from formic acid \((C_2H_4\cdot\text{HO})\) to capric acid \((C_{18}H_{34}O_8)\), with six fixed dibasic acids of the formula \(C_{20}H_{38}O_4\), viz., succinic acid, lipic acid, adipic acid, pimelic acid, suberic acid, and anheicoic \((\text{oleargylic})\) acid. When heated with hydrated potash it breaks up into palmitic and acetic acids, as shown in the equation:

\[
C_{18}H_{34}O_4 + 2(\text{KO} \cdot \text{HO}) = C_{17}H_{32}O_3 \cdot \text{KO} + C_2H_6O_2 \cdot \text{KO} + 2\text{H}
\]

These decompositions and disintegrations seem to illustrate the facility with which, by the mere process of oxidation, which is perpetually at work in living structures, one organic acid can be converted into others.

Oleic acid is a constituent of \(\text{oleine} \,(q.v.)\), which exists in most of the fats and fatty oils of the animal and vegetable kingdoms, and most abundantly in the liquid fats or oils, and hence its name is derived. It is very difficult to obtain the acid in a state of purity, in consequence of the readiness with which it oxidizes; and we shall not enter into details regarding the method of its preparation. It is obtained in a crude form, as a secondary product, in the manufacture of stearine candles, but almond oil is generally employed when the pure acid is required.

Oleic acid forms normal (or neutral) and acid salts; but the only compounds of this class that require notice are the normal salts of the alkalies. These are all soluble, and by the evaporation of their aqueous solution form \(\text{soaps}\). Olate of potash forms a soft soap, which is the chief ingredient in \(\text{Naples soap}\); while olate of soda is a hard soap, which enters largely into the composition of \(\text{Marseilles soap}\).

The oleates of the alkalies occur in the animal body, in the blood, chyle, lymph, and bile; they have also been found in pus, in pulmonary tubercles, and in the excretions, after the administration of purgatives.

\(\text{OLEINE} \,(C_{18}H_{34}O_1\cdot\text{CO})\) is proved, by the researches of Berthelot, to be a triglyceride of oleic acid. See \(\text{GLYCERINE}\). Pure oleine is a colorless and inodorous oil, which solidifies into acicular crystals at about 23°; it is insoluble in water, and only slightly soluble in cold alcohol, but dissolves in ether in all proportions. By exposure to the air it darkens in color, becomes acid and rancid (from the gradual decomposition of the oleic acid), and finally assumes a resinoid appearance. Hyponitrous acid converts it into an isomeric, white, solid fat, named \(\text{elatacine}\)—the glyceride of the elatac acid described in the preceding article.

Pure oleine is obtained by cooling olive oil to 32°, which occasions the separation of the \(\text{stearine}\) and palmitine in a solid form. The fluid portion is then dissolved in alcohol, which on being cooled to 32° deposits in a solid form everything but oleine,
which is obtained in a pure state by driving off by heat the alcohol from the decanted or filtered solution.

The drying oils, such as those of linseed, hemp, walnut, poppy, etc., contain a variety of oleine, which is not converted into eolaidine by the action of hyponitric acid, or of subunrate of mercury, which, when prepared without the aid of heat, contains enough of the acid to produce a similar effect. Hence these substances may be used to detect fraudulent adulterations of olive or almond oil with poppy and other cheap drying oils.

OLEOMARGARINE, from the Latin oleum, oil, and marga (the latter from the Greek marginale) a pearl; margarine being the solid derived from olive and other oils under pressure, and so-called from its pearl-like appearance. The name is applied to a product of beef fat, and was given to it by act of the legislature of New York, with a view to prevent the sale of the article as dairy butter, by having it stamped or branded legally with this name under penalty duly applied for neglect thereof. The material of which the article is made is beef fat, excepting the suet and the fat of the kidneys, which run this is employed in the refining process. From the fat the meats and the intestines only are employed—except in cases of adulteration. The process of manufacture is as follows: the beef carcass having been permitted to hang until the animal heat has entirely left it, the fat is placed in tanks of cold water and thoroughly cleansed from all impurities, this process being three times repeated. It is next conveyed to the cutting-machine, an instrument supplied with revolving knives, which cut it into small bits, when it is forced as a pulp through a screen or colander. This pulp is now placed in the melting-kettle, in which it is subjected to a heat of 112° to 118°F., being at the same time vigorously stirred by an agitator, or paddler, worked by machinery. From the melting-kettle the melted fat is run into a series of vats, the refuse or residuum passing through a valve in the bottom of the kettle, and into receptacles for tallow. From the vats the oil is transported in metal-lined coolers (wagons drawn by hand) to a room which is kept at a temperature of 85° to 87°, when it becomes a granulated mass. In this form it is served to the following apparatus: a revolving horizontal wheel at the top, stands at a convenient height from the ground for service. On the outer extremity of the spokes of this wheel are arranged boxes in which the material is placed, being first packed in cloths; it thus takes form, like that of a square loaf of bread, being then transferred to metal plates in the press, plate after plate being covered in layers until the press is full. The power is then applied, when the pure oil runs off into a reservoir, and the refuse (stearine) is left in thin white sheets resembling paraffine. These are afterwards collected and packed in hogsheads, for disposal to those who make use of the article. The solid elements of the fat have now been entirely eliminated in the stearine, the tallow, and the refuse—the latter being the wash of the coolers, which is obtained by thoroughly scalding the latter. This is afterwards run through gutters into the tallow-room. Here it passes into a large tank, from which it is removed in barrels to an iron vat resembling a vertical boiler, where it is put under steam-pressure and the tallow obtained; the whole of which goes to the soap making-processes and tallow mun ters, the final refuse in the form of soap being expelled through a manhole, packed in casks, and disposed of for fertilizing purposes. From the press-room reservoir, the oil is pumped to the butter-room, where it is received in large churns worked by steam-power. In these, after being combined with a proportion of one-fifth milk, it goes through a churning process which occupies about forty minutes. From the churns the product is run into coolers containing broken ice, with which it is thoroughly mixed to solidify it, being afterwards separated from the ice on tables. The butter, being of unequal consistency and temperature, is next passed through a machine called a crusher, out of which it comes a perfectly homogeneous mass. It now goes to the salting-table, where it is salted and worked, after which it is packed in boxes, firkins, and barrels, every package being branded "oleomargarine" according to law. This manufacture in New York amounts to about 500,000 lbs. per week; there are manufactories in other cities as to which no statistics are available. In 1880 the article interfered so greatly with the sale of dairy butter, particularly in competition with the export trade in the latter, through false representation, as to arouse a powerful opposition to its manufacture and sale, both on the part of dairymen, and that of the New York produce exchange.

OLEOMETER, or ELAOMETER, an instrument for ascertaining the densities of fixed oils. It consists of a very delicate thermometer-tube, the bulb being large in proportion to the stem. It is divided into fifty degrees, and floats at zero in pure oil of poppy-seed, at 88° to 88°1 in pure oil of almonds, and at 50° in pure olive oil.

OLEOPHOSPHORIC ACID is a yellow viscid substance, which is insoluble in water and cold alcohol, but dissolves readily in boiling alcohol and in ether. When boiled for a long time with water or with alcohol, or when treated with an acid, it resolves itself into oleine and phosphoric acid; while alkalis decompose it into phosphoric acid, oleates, and glycine. It exists, according to Frémy and other chemists, in the brain, spinal cord, kidneys, and liver.

OLERON, Isle of (anc. Ulitarus), an island of France, forming a portion of the department of Charente-Inférieure, lies off the west coast of France, opposite the mouth of the river Charente. It is 19 m. long, and about 5 m. broad, and is unusually fertile, pro-
ducing abundantly all the crops grown in the department to which it belongs. See CHARENTE-INFÉRIEURE. At its northern extremity, is the light-house of Chassiron. In the sea-port of Oleron, distilleries, rope-walks, and ship-building yards are in operation. The town of Saint-Pierre-d'Oleron (pop. 1,575) stands near the center of the island. The pop. of the island is given at 10,000.

OLERON, LAWS of, or JUDGMENTS d'Oleron, a celebrated code of maritime law compiled in France in the reign of St. Louis, and so named from a groundless story, that it was enacted by Richard I. of England during the time that his expedition to Palestine lay at anchor at that island. The real origin of these laws was a written code, called Il Consolato del Mare, of about the middle of the 13th c., compiled either at Barcelona or at Pisa, forming the established usages of Venice and the other Mediterranean states, and acceded to by the kings of France and counts of Provence. Besides containing regulations simply mercantile, this system defined the mutual rights of belligerent and neutral vessels, as they have been since understood in modern international law. The so-called laws of Oleron were a code of regulations borrowed from the Consolato, which for several centuries were adopted as the basis of their maritime law by all the nations of Europe. Copies of the Jugeements d’Oleron are appended to some ancient editions of the Coutumier de Normandie. See NORMANDY, CUSTOMARY LAW OF.

OLGA, SAINT, a saint of the Russian church, wife of the duke Igor of Kiev, who, having undertaken an expedition against Constantinople, which proved unsuccessful, was slain on his return to his own dominions. His widow Olga avenged his death, assumed the government in his stead, and for many years governed with much prudence and success. Having resigned the government to her son Vratislav about the year 952, she repaired to Constantinople, where she was baptized, and received into the church, assuming at baptism the name of Helena, in honor of St. Helena, mother of Constantine. She returned to Russia, and labored with much zeal for the propagation of her new creed; but she failed in her attempt to induce her son, Swantoslaw, to embrace Christianity. Her grandson, Vladimir, having married Chrysoberga, the sister of the emperors of Constantinople, Basil and Constantine, was baptized in the year 988; but his grandmother did not live to enjoy this gratification, having died in 978, or, according to other authorities, as early as 970. She is held in high veneration in the Russian church. Her festival is held on July 21, and the practice of venerating her appears to date from the early period of the Russian church, before the schism between the Eastern and Western churches.

OLHAG, a t. of Portugal, on the sea-coast, near Capde St. Maria, and 5 m. e. from Faro. Pop. 7,025.

OLIBANUM, a gum-resin, which flows from incisions made in boswellia serrata, a tree found in some parts of the east. See Boswella. It is the lebannah of the Hebrews, libanos or libanous of the Greeks, thus of the Romans, of all which terms the ordinary English translation is frankincense (q.v.). It occurs in commerce in semi-transparent yellowish tears and masses, and has a bitter nauseous taste; in liquid, it forms a greenish deposit, being pulverized; and diffuses a strong aromatic odor when burned. It was formerly used in medicine, chiefly to restrain excessive mucous discharges; but its use for such purposes is now rare. It sometimes enters as an ingredient into stimulating plasters. It is chiefly employed for fumigation, and is used as incense in Roman Catholic churches. It is sometimes distinctively called Indian olibanum; a similar substance, in smaller tears, called African olibanum, being produced by boswellia papyrifera, a tree found growing on bare limestone rocks in the e. of Abyssinia, and sending its roots to a great depth into the crevices of the rock. The middle layers of the bark are of fine texture, and are used instead of paper for writing.

OLFANT'S RIVER. Two considerable streams of this name are found in the cape Colony. The Olifiant's river west rises in the Winterhoek mountains, and enters the Atlantic in lat. 31° 40', after a course of 150 m., and a basin of drainage of 25,000 sq.m.—The Olifiant's river east drains a great part of the district of George, and joins the Gauritz river 60 m., above the entrance of that river into the sea. Its course is upwards of 150 m. in length, and it is more available for irrigation than almost any other cape river.

OLIGARCHY (oligos, few, and archo, to govern), a term applied by Greek political writers to that perversion of an aristocracy in which the rule of the dominant part of the community ceases to be the exponent of the general interests of the state, owing to the cessation of those substantial grounds of pre-eminence in which an aristocracy originated. In practice, the term is applied to those bodies called oligarchies, whose efforts are chiefly devoted to their own aggrandizement and the extension of their power and privileges.

OLIGOCHETA, an order of annelids, of which the common earth-worm is a good example. Their locomotive appendages are in the form of bristles attached in rows to the sides and ventral surface of the body; no branchiae; all hermaphrodite; young pass through no metamorphosis. The order is divided into two families, terricola or earth-worms, and liniocola or mud-worms and water-worms. These families have also been named, respectively, lunabrida and naide. In the luniabrida or common earth-worm (q.v.), the edentulous mouth opens by a muscular pharynx and short esophagus to a muscular crop or pro-ventriculus, succeeded by a second muscular stomach or gizzard. Salivary

U. K. X.—54
glands open into the pharynx, and other digestive glands open into the gullet. The perivisceral cavity is lined by a cellular membrane, which is continuous with a yellow cellular layer covering the intestine and large vessels, and which casts off its cells into the perivisceral fluid. The blood circulating in the pseudo-hemal system is non-corpusculated, although red, while that contained in the body cavity is colorless, but contains corpuscles. In all the oligochaeta the segmental organs communicate with the perivisceral cavity, and also externally with the outer medium. The most common example of the naïde is the tubifex rivularum, found in the mud of ponds and streams. It has an outer shell of copper, long, and of a bright red color. The pseudo-hemal system is provided with two contractile cavities or hearts, and a system of tubes similar to that in the earth-worm, and also a system of lateral tubes opening externally. The reproduction is both non-sexual and sexual. Before maturity the young naïdes throws out a bud between two rings, at a point generally near the middle of the body, and the strange phenomenon of this bud developing into a new individual, as well as each of the two parts of the parent on either side of this point, takes place. That portion of the parent in front of the bud develops a tail, whilst the portion behind the bud develops a head. Besides their non-sexual reproduction the naïde after going through a metamorphosis attain sexual reproduction.

OLIN, Henry, 1757-1837; b. Vermont, and spent his earlier years in Addison county. He was a member of the general assembly consecutively from 1799 till 1825, excepting four years; also a member of three constitutional conventions. He was associate judge in 1801, chief judge in 1807, member of congress in 1824, and lieut.-gov. in 1827 Stephen Olin, the Methodist minister and educator, was his son.

OLIN, Stephen, D.D., LL.D.; 1797-1851; b. Vt.; oldest son of Henry, who was judge of the supreme court of Vermont, member of congress, and lieut.-gov. The son graduated at Middlebury college in 1820, with the highest honors of his class. His health being impaired by intense study, he went to South Carolina, and became the principal of Abbeville academy. While there, he abandoned the study of law which he had commenced, and entered the ministry of the Methodist Episcopal church, and in 1824 was admitted to the South Carolina conference. He was stationed in Charleston for two years, where, associated with another, he preached to four congregations, in which were 3,000 slaves. Of these he received 200 into the church. In July, 1826, he was elected professor of English literature in the university of Georgia, where he remained seven years. In 1834 he was inaugurated president of Randolph Macon college, Va., which under his administration had great prosperity. In 1837-41 he made an extended tour in Europe and the east, and in 1843 published in 2 vols. Travels in Egypt, Petra, and the Holy Land. His account of Egypt was pronounced "the best, on the whole, in the language." In his Travels he spoke of "a broken arch supposed to be the remains of an ancient bridge connecting the Temple with Mount Zion, as having been known to Mr. Catherwood, and other travelers and residents," for which he was accused in the North American Review of plagiarism, Dr. Robinson in his Biblical Researches and in the Bibliotheca Sacra, having claimed to be the discoverer of an arch and stream, and especially to have been the first to recognize in this fragment of an arch the remnant of the bridge spoken of by Josephus. A controversy ensued, in which Dr. Olin positively denied the charge of plagiarism, supporting his denial by the testimony of two missionaries, the rev. Dr. Hamlin and the rev. Mr. Homes, the latter declaring that he himself informed Dr. Robinson of the existence of the arch as a remnant of the bridge mentioned by Josephus. In 1842 Dr. Olin was elected president of the Wesleyan university in Middletown, Conn., where he remained till his death. During his administration the college prospered greatly, and attained a high rank. He excelled as an educator. He contributed to the Wesleyan Journal, The Christian Advocate and Journal, and the Methodist Quarterly Review; two volumes of Sermons, Lectures, and Addresses, also a work entitled Greece and the Golden Horn appeared after his death. In 1853 were published his Life and Letters, edited by Mrs. Olin, assisted by Dr. McClintock, Dr. Holdich, and other friends. The New Englander says of him: "He had the real celestial fire of sacred oratory. He had great power of insight and logic; but his chief strength lay in the enkindling and electric energy of his sympathetic and emotional nature."

OLINDA, a suburb of Pernambuco (q.v.).

OLINDA, a city of Brazil, in the province of Pernambuco, and 4 m. n.e. from Pernambuco. It was formerly the capital of the province, and there were bloody contests between Spain and Holland for the possession of it. It is still a bishop's seat, Pernambuco being included in the diocese. The whole aspect of the town is that of a place half deserted. Pop. 8,000.

OLINDA, Pedro de Araújo Lima, Marquis of, 1790-1870; b. in Pernambuco, Brazil; educated there and studied law at the university of Coimbra, Portugal. In 1820 he became a member of the Portuguese assembly, and on his return to Brazil was elected to that of Brazil, and was a member until his death. He was three times president of the chamber of deputies, four times minister of state, and twice regent in the minority of Pedro II. He was made viscount in 1841, and marquis in 1854. In politics he was liberal but not a radical.
OLIPHANT, Laurence. b. England, 1829; son of sir Anthony, chief justice of Ceylon. He went to India when quite young, and visited the Nepalese court. He published in 1852 a description of this visit, under the title of A Journey to Katmandu, or the Nepalese Ambassador at Home. He read law at the university of Edinburgh, and was admitted to the Scotch, and afterwards to the English bar. In 1852 he traveled through Russia and the Crimea, an account of which tour appeared in 1853 as The Russian Shores of the Black Sea. He was appointed private secretary to the earl of Elgin, gov.gen. of Canada, and was for a time superintendent of Indian affairs in Canada. In 1853 he he published an account of his travels in the United States and Canada, called Minnesota and the Far West; and soon afterwards a pamphlet on the Crimean war, called The Coming Campaign. In 1856 appeared his transvaalissian Campaign under Omer Pasha. He went to China in 1857, as private secretary and historiographer to lord Elgin. In 1860 he published A Narrative of the Earl of Elgin’s Mission to China and Japan; and Patriots and Incidents of Travel. In 1861 he was chargé d'affaires in Japan, where he was dangerously wounded by assassins. He was returned to parliament in 1862; but resigned in 1868, when, with his mother, lady Oliphant, he joined the community of the "brotherhood of the new life" at Portland, Chautauqua co., N. Y., where he remained for about two years. In 1870 he was at Paris, a correspondent of the London Times, and he was the American manager of the direct cable company, 1873-75. He published in 1870 Piccadilly; a Fragment of Contemporaneous Biography, and in 1881, The Land of Gilead. The latter work contains an account of his travels in Palestine for the purpose of finding a site for a proposed colony.

OLIPHANT, Mrs. Margaret (née Wilson), one of the most distinguished of our living female novelists, was born about the year 1820. The prevalent impression that she is a Scotchwoman, naturally enough derived from the obvious fondness with which in her earlier works she has treated Scottish character and incident, is not strictly correct. She is a native of Liverpool; her mother was, however, a Scotchwoman of a somewhat remarkable type, strongly attached to old traditions. In 1849 Mrs. Oliphant published her first work, Passages in the Life of Mrs. Margaret Mudlund of Sunnyvale, which instantly won attention and approval. Its most distinctive charm is the tender humor and merit, which regulate its exquisite delineation of Scottish life and character at once in their higher and lower levels. This work was followed by Morkland (1851); Adam Gravene of Mossgray (1853); Harry Muir (1853); Magdalen Heburn (1854). Lillie-leaf (1855); and subsequently by Zaidie, Katie Stewart, and The Quiet Heart, which originally appeared in succession in Blackwood’s Magazine. Though these are of somewhat various merit, in all of them the peculiar talent of the writer is marked. They are rich in the minute detail which is dear to the womanly mind; have nice and subtle insights into character, a flavor of quiet humor and frequent traits of delicacy and pathos in the treatment of the gentle emotions. It is, however, on the Chronicles of Carlingford that her reputation as a novelist was first secured. In the first of the two sections separately published, apart from its other merits, which are great, the character of little Netty, the heroine, vivifies the whole work, and may rank as an original creation. The other, Salem Chapel, perhaps indicates a wider and more vigorous grasp than is to be found in any other work of the authoress. Certain of the unlovelier features of the community are here gracefully sketched, and adapted with admirable skill to the purposes of fiction. The intrusion, however, in some portion of the work of a "sensational" element, as it is termed, though it subserves intensity of interest, must be noted as a little defective in art. In 1870, she published Three Brothers; in 1871, Squire Arden; in 1872, the most subtly thought and gracefully written of all her novels, Ombra; in 1874, A Rose in June; and in 1876, Phoebe Junior. Mrs. Oliphant has also published Life of Edward Irving; St. Francis of Assisi; Memoir of the Comte de Montalembert; and The Makers of Florence.

OLIVA, a genus of gasteropod mollusks of the family buccinidae, order Prosobranchiata. See INVERTEBRATE ANIMALS, sub-kingdom mollusca, division B, mollusca proper, class II., Gasteropoda, section A, order L., family 5. They are sometimes classed with the volutidae, see as above, family 5. The genus has the following characters: animal involved, compressed, with a small head terminated by a proboscis; tentacles approximated, enlarged at their base, and subulate at their extremities, carrying the eyes on small convexities about their middle part externally; foot very large, oblong, and slit transverse anteriorly; mantle with a single lateral lobe covering the shell in great part, with two tongue-like processes at the side of the branchial opening, and forming in front a very elongated siphon; a single branchial pecitation. Oliva is one of the richest in color of shell and in variety of species, which form considerable sections in the cabinets of many collectors. O. teretina, the "astrolabe," has a circumoral white shell, subreticulated with flexuous dotted lines, with two brown bands, covered with characters, as though hieroglyphic. This beautiful shell with its animal is found in the Antilles and New Guinea. O. maura has a cylindrical shell, with the apex rounded and a slight depression (retuse); aperture white, East Indian ocean and Australia. O. sanguinolenta has a cylindrical shell, very beautifully and delicately reticulated, with reddish-brown small lines, girt with two brown zones; the pillar orange-red. It is found in the East Indian ocean and on the coast of Timor. These species have been found at various depths, from...
OLIVAREZ, Don Gasparo de Guzman, Count of, Duke of San Lucas, and prime-minister of Philip IV. of Spain, was b. Jan. 6, 1587, at Rome, where his father was ambassador. He belonged to a distinguished but impoverished family, received a learned education, became the friend of Philip IV., his cousin in his amours, and afterwards his prime-minister, in which capacity he exercised almost unlimited power for 22 years. Olivarez showed ability for government, but his constant endeavor was to wring money from the country that he might carry on wars. His oppressive measures caused insurrections in Catalonia and Andalusia, and roused the Portuguese to shake off the Spanish yoke in 1640, and make the duke of Braganza their king, an event which Olivarez reported to Philip with satisfaction, as it enabled him to confiscate the duke's great estates in Spain. But the arms of Spain being unsuccessful, the king was obliged to dismiss the minister in 1643. He would probably have been recalled to the head of affairs, but for a publication in which he gave offense to many persons of influence. He was ordered to retire to Toro, and confine himself to that place, where he died, July 12, 1645. (Cespedes, Hist. De Felipe IV.)

OLIVE, Olea, a genus of trees and shrubs of the natural order oleaceae; having opposite, evergreen, leathery leaves, which are generally entire, smooth, and minutely scaly; small flowers in compound axillary racemes, or in thyrsi at the end of the twigs; a small 4-toothed calyx, a 4-cleft corolla, 2 stamens, a 2-cleft stigma; the fruit a drupe. The species are widely distributed in the warmer temperate parts of the globe. The Common Olive (O. Europea), a native of Syria and other Asiatic countries, and perhaps also of the s. of Europe, although probably it is there rather naturalized than indigenous, is in its wild state a thorny shrub or small tree, but through cultivation becomes a tree of 20-40 ft. high, destitute of spines. It attains a prodigious age. The cultivated varieties are very numerous, differing in the breadth of the leaves, and in other characters. The leaves resemble those of a willow, are lanceolate, entire, of a dull dark-green color above, seamy and whitish-gray beneath; the flowers small and white, in short dense racemes; the fruit greenish, whitish, violet, or even black, never larger than a pigeon's egg, generally oval, sometimes globular, or obovate, or acuminate. The fruit is produced in vast profusion, so that an old olive-tree becomes very valuable to its owner. It is chiefly from the pericarp that olive oil is obtained, not from the seed, contrary to the general rule of the vegetable kingdom. Olive oil is much used as an article of food in the countries in which it is produced, and to a smaller extent in other countries, to which it is exported also for medicinal and other uses (see Oils). Olives, gathered before they are quite ripe, are pickled in various ways, being usually first steeped in lime-water, by which they are rendered softer and milder in taste. They are well known as a restorative of the palate, and are also said to promote digestion. Disagreeable as they generally are at first, they are soon greatly relished, and in the s. of Europe are even a considerable article of food. Pickled olives are there also used, as well as from the earliest times, for culinary purposes, southwards as far as Crete, and northwards to the middle of France. They are very generally propagated by suckers, but where great care is bestowed on it,arching is practiced. It grows from cuttings. The climate of England is too cold for the olive, yet in Devonshire it ripens its fruit on a s. wall.—Olea sylvestris and several other species are useful trees of s. Africa, yielding a very hard and extremely durable wood. Some of them bear the name of Ironwood at the cape of Good Hope. The American Olive (O. Americana) is also remarkable for the hardiness of its wood. It is found as far n. as Virginia. It is a tree of 30-35 ft. high, with much broader leaves than the common olive. Its fruit is fit for use. Its flowers are fragrant. The Fragrant Olive (O. fragrans, or Osmanthus fragrans) of China and Japan has extremely fragrant flowers, which are used by the Chinese for flavoring tea.
OLIVENITE, a mineral consisting chiefly of arsenic acid and protoxide of copper, with a little phosphoric acid and a little water. It is generally of some dark shade of green, sometimes brown or yellow. It is found along with different ores or copper in Cornwall and elsewhere. It is often crystallized in oblique four-sided prisms, of which the extremities are acutely beveled, and the obtuse lateral edges sometimes truncated, or in acute double four-sided pyramids; it is sometimes also spherical, kidney-shaped, columnar, or fibrous.

OLIVENZA, a t. of Spain, near the Portuguese frontier, 19 m. s. by w. from Bada-joz, on a small river which flows into the Guadiana. The chief branches of industry are the expression of oil, weaving, and the making of earthenware. From the treaty for the cession of Oliuverza to Portugal in 1801, Godoy acquired his title of prince of the peace. Pop. 10,000.

OLIVER, Andrew, 1706-74; b. Boston; educated at Harvard college, and in 1743 elected to the general court, in which he served three terms. He was a member of the council, 1746-85, and secretary of the province, 1756-70. He succeeded Hutchinson as lieut. gov. in 1771. After the passage of the stamp act by parliament in 1765, he took the place of stamp-distributor, but was forced to resign after having been hanged in effigy on the "liberty tree." He was a brother-in-law of Hutchinson, whose political course he followed, and of whose unpopularity he had a full share. The zeal with which he seconded the measures of the British ministry was evident in his letters, which were sent over to this country by Franklin in 1772, and the general court petitioned George III. for his removal.

OLIVER, Peter, L.L.D., 1713-91; b. England; brother of Andrew, lieut. gov. of Massachusetts in 1770; graduated at Harvard, 1730. Not regularly bred to the law, he adopted that profession, and on Sept. 14, 1756, was appointed judge of the supreme court, and in 1771 chief-justice. When the colonies assumed control of their own judicial affairs, and sides were taken on the question of loyalty to the crown, he espoused the tory cause, and in Mar., 1774, refused the compensation offered him for his services, when required to give his word not to receive either pay or emolument from any other source than the assembly. He was impeached, and fled from Boston with the British troops in 1776. He was pensioned by the British government, and Oxford, in 1776, conferred upon him the degree of L.L.D. His son Peter was a graduate of Harvard, class of 1781, practiced medicine in Middleborough, also returned to England, and died there in 1822, at the age of 80. Peter, the elder, contributed a number of articles to The Censor, a tory paper, and published Speech on the Death of Isaac Lathrop (1756); Poem on the Death of Sir Wil- liam (1757); Secretary of War (1784-85); now ed. 1832. He transcribed the manuscript history of Wm. Hubbard, and collected many valuable records of the old colony, which he carried with him to England.

OLIVES, MOUNT OF, called also Mount Olivet, an incomparable ridge lying on the e. side of Jerusalem, from which it is only separated by the narrow valley of Jeho- sphat. It is called by the modern Arabs Jebel-el-Tur, and takes its familiar name from a magnificent grove of olive-trees which once stood on its western flank, but has now in great part disappeared. The road to mount Olivet is through St. Stephen's gate, and leads by a stone bridge over the now almost waterless brook Cedron. Immediately beyond, at the foot of the bridge, lies the garden of Gethsemane; and the road here parts into two branches, northwards toward Galilee, and eastwards to Jericho. The ridge rises in three peaks, the central one of which is 2,556 ft. above the level of the sea, and 416 ft. above the valley of Jehosaphat. The southern summit is now called "the mount of Offense," and was the scene of the idolatrous worship established by Solomon for his foreign wives and concubines. The northern peak is the supposed scene of the appearance of the angels to the disciples after the resurrection, and is remarkable in Jewish history as the place in which Titus formed his encampment in the expedition against the fated city of Jerusalem. But it is around the central peak, which is the mount of Olivet properly so called, that all the most sacred associations of Christian history converge. On the summit stands the church of the Ascension, built originally by St. Helen, the modern church being now in the hands of the Armenian community; and near it are shown the various places where, according to tradition, our Lord went over Jerusalem, where the apostles composed the apostles' creed, where our Lord taught them the Lord's prayer, etc. Near the church of the Ascension is a mosque and the tomb of a Mohammedan saint. In the garden of Gethsemane, at the foot of the hill, is shown the scene of our Lord's agony. The northern peak spreads out into a plain of considerable extent, which is painfully notable in Jewish history as the place where, after the Jews on occasion of the revolt under Bar-Kochebah, were debarred by Adrian from entering Jerusalem, they were wont to assemble annually on the anniver- sary of the burning of the temple to celebrate this mournful anniversary, and to take a distant look at their beloved Jerusalem. The scene is beautifully described, and with much dramatic feeling, by St. Jerome.—Con. in Sophoniam, t. iii. p. 1665.

OLIVETANS, a religious order of the Roman Catholic church, one of the many remarkable products of that well-known spiritual movement which characterized the 12th and 13th centuries. The Olivetans, or brethren of our lady of mount Olivet, are
an offshoot of the great Benedictine order (q.v.), and derive their origin from John Tolomei, a native of Sienna, born in the year 1272. Tolomei had been a distinguished professor of philosophy in the university of his native city; but his career was suddenly interrupted by the loss of his sight. Although he was cured of his blindness (and, as he himself believed, miraculously), this visitation convinced him of the vanity of earthly things; and in company with some friends he withdrew to a solitary place near Sienna, where he devoted himself to prayer and religious exercises. By the direction of the pope, John XXII., the new brethren adopted the Benedictine rule; but they chose as their especial province the cultivation of sacred science, and the duty of teaching. In the year 1319 Tolomei was chosen as the first general; and even in his lifetime the institute made rapid progress, especially in Italy. It numbered at one time eighty houses, but at present the number is reduced to four—namely, the parent house, so called, which is at Monte Oliveto, in the diocese of Arezzo in Tuscany, one at Rome, one at Genoa, and one at Palermo. The Olivetan order has produced many distinguished ecclesiastics.

OLIVINE. See CHRYSOELITE.

ÓL'LA POB'IDA (literally, putrid pot), a Spanish term, originally signifying an accumulation of remains of flesh, vegetables, etc., thrown together into a pot, but generally employed to designate a favorite national dish of the Spaniards, consisting of a mixture of different kinds of meat and veg-tables stewed together. It has also come to be figuratively applied to literary productions of very miscellaneous contents. The French equivalent is pot-pourri, and the Scotch hohol-potch, both of which, but especially the former, are also employed in a figurative sense.

OLLIVIER, EMILIE, b. in Marseilles, 1825, son of Démôsthène who was exiled from the time of the coup d'etat of Napoleon, in 1851, to 1860. Emilie was educated for the practice of law; was made commissary-gen. at Marseilles by Ledru Rollin in 1848, and thereafter prefect. In 1849 he resumed the practice of law in Paris; was elected a liberal member of the legislative assembly from Paris in 1857, and re-elected in 1863. In 1867 he was won over to the Bonapartists, and failed of an election in Paris the following year; but secured a seat by an election as deputy from the department of Var. In December of that year Napoleon made him minister of justice under the new constitution of the empire, which office he entered upon Jan. 3, 1870. He was chiefly noted for his subserviency to the policy of the emperor, and his pretensions to statesmanship. He assumed a superrific confidence in the French military superiority on the breaking out of the German war in 1870, and retired with his master after the first great reverses to French arms. Through imperial favor he had been made a member of the French academy in 1870, succeeding to the chair of Lamartine. In 1874 he read a eulogy of Napoleon before the academy, and afterward became its chancellor.

OLMSTED, a co. in s.e. Minnesota; drained by the Zumbro and Root rivers and their branches; intersected by the St. Peter and Winona railroad; 650 sq. m.; pop. '80, 21,543—16,983 of American birth. The surface is mostly a rolling prairie, and the soil very productive; wheat, oats, hay, and dairy products are the staples. This is the largest wheat producing county in the state. Co. seat, Rochester.

OLMSTED, DENISON, LL.D., 1791-1859; b. Conn.; graduated at Yale College, 1813, and was tutor 1815-17. He was professor of chemistry in the North Carolina university 1817-25; and from that time till his death was connected with Yale, holding a professorship of mathematics until 1836, and after that, of natural philosophy and astronomy. In 1831 he published a treatise on natural philosophy, and in 1840 one on School Astronomy, followed in 1841 by the Compendium of Astronomy. These text-books came into almost universal use in the colleges of this country, and in an abridged form, in many public schools. They are still used, though in general supplanted by the more modern works of prof. Loomis and others. Profs. Olmsted and Loomis were the first observers of Halley's comet of 1835. He wrote sketches of the lives of sir Humphry Davy, Roger Sherman, Eli Whitney, pres. Dwight of Yale, and others, and contributed a very large number of scientific and biographical papers to the American Journal of Science; New Englander; Journal of Commerce, and many other periodicals.

OLMSTED, FREDERICK LAW, b. Hartford, Conn., 1822; educated there, and at Yale college, making a specialty of agricultural science and engineering. He began life as a farmer and horticulturist; in 1850 traveled on foot through portions of England, Scotland, and the continent, and published, in 1852, a book of observations under the head of Walks and Talks of an American Farmer in England, which was replete with information, and widely read. In 1852-53 he traveled in the cotton states, gathering information which was published in 1856 in a book entitled A Journey in the Seaboard Slave States. This was followed by a Journey Through Texas, 1857, and A Journey in the Back Country, in 1890. Abstracts of these works were issued in two vols. in London in 1861 under the title of The Cotton Kingdom. In 1855 he was traveling in France, Italy, and Germany, studying especially their parks and horticultural arts. In 1857, when premiums were offered for the best plans for the Central park in New York, Mr. Olmsted associated himself in the preparation of plans with Mr. Calvert Vaux,
partner of A. J. Downing, the distinguished landscape gardener, who was preparing plans for the park when he died. Their combined labors produced the plan which was chosen out of a competition of 34 designs. During the next four years the park was developed under the plans of these gentlemen, in which the most cultivated taste was combined with economy and thoroughness. In 1859 Mr. Olmsted visited Europe to study park works. On the breaking out of the rebellion in 1861 he was appointed by president Lincoln on a commission to investigate the sanitary condition of the U. S. army, and resided for three years in Washington as the business head of the commission. He then spent two years in California, and was made one of the commissioners of the National park of the Yosemite. He returned to New York in 1866 to join Mr. Vaux in the execution of plans for Prospect park in Brooklyn, which they nearly completed under their own supervision. He has since been associated in designs for parks and other public works in Washington, Chicago, San Francisco, Buffalo, and Montreal.

OLMÜTZ, the chief fortress of Moravia, Austria, is the capital of a district of the same name, and is situated in lat. 49° 36' n., and in long. 17° 13' e., on an island of the river Morava, which, by means of sluices, can be opened into the moats, and thus made available for purposes of defense. Olmütz is the see of an archbishop, nominated by the chapter, and is the chief seat of the administrative departments. Its university, founded in 1581, and reorganized in 1827, was reduced to a theological faculty in 1853. Olmütz has a library of 65,000 volumes; good natural history, physical, and other museums; a gymnasium, an archiepiscopal seminary, artillery and infantry academies, polytechnic and other schools, a hospital, an asylum for widows and orphans, etc. The most noteworthy of its churches are the cathedral, a fine old building, and the church of St. Mauritius, completed in 1412, with its celebrated organ, having 48 stops and more than 2,000 pipes. The noble town-hall, with its complicated clock-work, set up in 1574, and the lofty column on the Oberring, with several fine fountains in the squares, and the splendid archiepiscopal palace and chapter-house, all contribute towards the picturesque aspect for which Olmütz is distinguished. The deficiency in public gardens has of late years been in part supplied by the draining and planting of some of the inner moats, and the conversion of some portions of the fortification-into-museums. A mile from the city lies the monastery of the Premonstratensians at Hradisch, founded in 1074, now a military hospital. Olmütz has a few manufactories of kerseymere, cloth, linen, and porcelain, and is the seat of an extensive trade in cattle from Poland and Moldavia. Pop. 69, 15,331. Prior to 1777, when Olmütz was raised into an archbishopric, its bishops had long been in the enjoyment of the rank of princes of the empire. The city suffered severely during the thirty years' war, and again in the seven years' war of Silesia, when it more than once fell into the hands of the Prussians. In 1848 Ferdinand I. signed his abdication here in favor of his nephew, Franz-Joseph I.; while in 1850 Olmütz was chosen as the place of conference between the Prussian, Austrian, and Russian plenipotentiaries, for the adjustment of the conflicting differences which had arisen in the German states generally, as the result of the revolutionary movement of 1848.

OLNEY, a t. the co. seat of Richland co., I.; on the Grayville and Mattoon, and the Ohio and Mississippi railroads, 130 m. s.e. of Springfield; pop. 70, 2,680. There are a court house, bank, 4 hotels, 2 weekly papers, and many churches and schools. The place was settled in 1845.

OLONETZ, a government in the n. of Russia, bounded on the w. by Finland, and on the e. and n.e. by Archangel. Area, exclusive of water, 49,104 sq. miles. Pop. 70, 296,392. Large lakes abound in this government, the chief, after lake Onega (q.v.), being lakes Wygo and Sego. The surface is in general elevated, and about four-fifths of it are covered with wood. The soil is sterile, and the climate is cold and damp. The chief of the government consists principally in its minerals. Its iron mines supply the iron-works of Petrasowodsk, and from its quarries marbles are sent to St. Petersburg. The principal employments of the inhabitants, who are principally Russians and Finns, and belong to the Greek church, are carving in wood, fishing, and hunting. Many of them also are employed in the iron-works and quarries. The women weave and spin. The government derives its name from the small but ancient town of Olonetz. Petrasowodsk is the center of administration.

OLORON, or OLORON-SAINTE-MARIE, a t. of France, in the department of Basses-Pyrénées, on the Gave d'Oloron, 15 m. s.w. of Pau. The church of St. Marie is in the transition style from Romanesque to Gothic. The principal articles of manufacture are the checkered handkerchiefs which form the chief favorite-dresses of the peasantry of Aragon and Gascony, and also the "barrets" or caps of the Bearrnais. Pop. 76, 7,223.

CLOT, a t. of Spain, in the province of Gerona, and 22 m. n.w. from Gerona, near the base of the Pyrenees, on the Fluvià. There are 14 volcanic cones close to the town; the crater of the largest is a mile in circumference and 445 ft. in depth. The whole district is volcanic. In many places, and even in the town itself, currents of air blow continuously from the porous lava. These are called bufadores and sopladores, and some of them are conducted beneath houses, and used as refrigerators in hot weather. They maintain the temperature of about 53° F. both in hot and cold weather, but the gust of air is strongest in hot weather. Olot was almost destroyed by an earthquake in 1421, but was soon rebuilt. Pop. 12,070.
OLSHAUSEN, HERMANN, 1786-1839; b. Oldesloc, in the duchy of Holstein. He studied theology in 1814-18 at Kiel and Berlin, hearing at the former the lectures of Twesten, and at the latter those of Neander and Schleiermacher. His first work was a prize-essay, Melanchthon's Characteristik aus seinen Briefen dargestellt. He became in 1818 licentiate in theology in the university; in 1821 was elected professor extraordinary at Königsberg, and in 1827 a regular professor. In 1834 he accepted a theological professorship at Erlangen, where he died at the early age of forty-three. Besides his prize essays he published Historie eccles. eideris monumentvm; Die Aehlichkeit der vier Kanonischen Evangelien aus der Geschichte der vier ersten Jahrhunderte; W. W. der Welt, sowie des Schriftst., Die Bild, Schriftstaulung, Noch ein Wm über alteren Schrifts.; in this last work he rejects a literal verbal inspiration of the Scriptures. His most valued work is his commentary on the New Testament, translated into English for Clark's foreign theological library, and revised and reprinted with Olshausen's tract on the Genuineness of the Writings of the New Testament, by prof. A. C. Kendrick, of Rochester university. 6 volumes.

OLYMPIA, the scene of the celebrated Olympic games (q.v.), is a beautiful valley in Elis, in the Peloponnesus, through which runs the river Alpheus. As a national sanctuary of the Greeks, Olympia contained, within a small space, many of the choicest treasures of Grecian art belonging to all periods and states, such as temples, monuments, altars, theaters, and multitudes of images, statues, and votive-offerings of brass and marble. In the time of the elder Pliny, there still stood here about 3,000 statues. The Sacred grove called the Altis of Olympia, inclosed a level space about 4,000 ft. long by nearly 2,000 broad, containing both the spot appropriated to the games and the sanctuaries connected with them. It was finely wooded, and in its center stood a clump of sycamores. The Altis was crossed from w. to e. by a road called the "Pompey way," along which all the processions passed. The Alpheus bounded it on the s., the Cladeus, a tributary of the, on the former, on the w., and rocky but gently swelling hills on the n.; westward it looked toward the Ilissus. The most celebrated building was the Olympicum, or Olympium, dedicated to Olympian Zeus. It was designed by the architect Libon of Elis in the 6th c. B.C., but was not completed for more than a century. It contained a colossal statue of the god, the masterpiece of the sculptor Phidas, and many other splendid figures; its paintings were the work of Panamus, a relative of Phidas. Next to the Olympicum ranked the Heraeum, dedicated to Hera, the wife of Zeus, and the queen of Heaven, containing the table on which were placed the garlands prepared for the victors in the games; the Pelopion, the Metron, the ten Theaer or treasures, built for the reception of the dedicatory offerings of the Greek cities, the temples of Eileithyia and Apirhode also deserve mention; the Stadium and the Hippodrome, where the contests took place, stood at the eastern end of the Altis. The plowshear now passes through the scene of these contests, but many ruins still attest the ancient magnificence of the buildings. In 1875 explorations, at the expense of the German government, were undertaken at Olympia, and already several important "finds" have been made.

OLYMPIA, the capital city of Washington territory, on Budd's inlet, at the s. part of Puget sound, about 100 m. n. by w. of Portland, Oregon, in lat. 47°10' n., long. 123° w.; pop. 75, 1500. The Des Chutes river, which enters the sound at this point, is spanned by a bridge 520 ft. long from Olympia to Tumwater, and there is a bridge over 2,000 ft. long across the inlet. The nearest railroad station is Teno, 15 m. s., on the Northern Pacific railroad. The surrounding country is covered with forests, and lies between the Coast and Cascade mountains. The streets are wide and regularly laid out, bordered with shade trees, and lined with handsome residences, many of which are inclosed by gardens. Among the public buildings are the state-house, court-house, and city hall. There are 4 hotels, 7 churches, a bank, an academy, and 2 libraries. There are 3 weekly newspapers. Boots and shoes, flour, soap, beer, and lumber are manufactured. The Des Chutes furnishes ample water-power. Steamers run almost daily to Victoria and other points on Puget sound, and a line of stages to the railroad station at Teno. Large vessels can come up the inlet to Olympia at high tide; but low tide uncovers a long mud flat which prevents even small boats from reaching the wharf. The difference between extreme high and low tides here is 24 ft., and the average ebb and flow 9.2 feet. Olympia was surveyed in 1851; made a city, 1839.

OLYMPIAD (Gr. olympias), the name given to the period of four years that elapsed between two successive celebrations of the Olympic games (q.v.); a mode of reckoning which forms the most celebrated chronological era among the Greeks. The first recorded dates from July 21 or 22, 776 B.C., and is frequently referred to as Corresponding to the olympiad by its number, frequently designate it by the name of the winner of the foot-race in the Olympic games belonging to that period, though at times both the number and the name of the conqueror are given. A slight indefiniteness is frequently introduced into Greek chronology, from the custom of mentioning only the olympiad, neglecting to specify in which year of the olympiad a certain event happened. As this era commenced in 776 B.C., the first year of our present era (A.D.) corresponded to the last half of the fourth year of the 194th with the first half of the first year of the 195th olympiad, and 394 A.D. corresponds to the second year of the 223rd olympiad, at which time reckoning by olympiads terminated. This era is used
only by writers, and is never found on coins, and very seldom on inscriptions. Another Olympic era, known as the "New Olympic Era," was commenced by the Roman emperors, and dates from 131 A. D.; it is found both in writings, public documents, and inscriptions.

OlymPias, the wife of Philip II., king of Macedon, and mother of Alexander the great. She was the daughter of Neoptolemus I., king of Epirus. She possessed a vigorous understanding, but was of a most passionate, fiery, and ambitious character. Philip having, on account of disagreements, separated from her and married Cleopatra, niece of Attalus (327 B.C.), she went to reside with her brother Alexander, king of Epirus, where she incessantly fomented intrigues against her former husband, and is believed to have taken part in his assassination by Pausanias, 337 B.C. On the accession of her son Alexander to the throne, she returned to Macedonia, where she contributed to bring about the murder of Cleopatra and her daughter. Alexander was filled with indignation, but Olympics was his mother, and he could not obey the dictates of justice. During his brief but magnificent career he always treated her with the utmost reverence and esteem, though he never allowed her to meddle with his political schemes. After his death she endeavored to get possession of the vacant throne, and obtained the support of Pausanias in her designs. In 317 the two defeated Arrhidæus, the weak-minded step-brother and successor of Alexander, and fled, with her son, to the Peloponnesus, besieged her in Pydna, and forced her to surrender in the spring of 316 B.C. She was immediately afterward put to death. Olympics was a woman of heroic spirit, but of fierce and uncontrollable passions, and in the perpetration of crime, when she reckoned it necessary, displayed an unscrupulous peculiarly feminine.

OLYMPIC GAMES, the most splendid national festival of the ancient Greeks, were celebrated every fifth year in honor of Zeus, the father of the gods, on the plain of Olympia (q.v.). Their origin goes back into prehistoric ages. According to the myth elaborated or preserved by the Elean priests, they were instituted by the Idaean Herakles in the time of Kronos, father of Zeus; according to others, by the later Herakles, son of Zeus and Alkmene; while Strabo, rejecting the older and more incredible legends, attributes their origin to the Herakleide after their conquest of the Peloponnesus. But the first glimpse of anything approaching to historic fact in connection with the games is their so-called revival by Iphitos, king of Elis, with the assistance of the Spartan lawgiver, Lycurgus, about 884 B.C.; or, according to others, about 828 B.C., an event commemorated by an inscription on a disk kept in the Heraeum at Olympia, which Pausanias (loc. cit.) saw. That festive games were celebrated here—in other words, that Olympia was a sacred spot long before the time of Iphitos, can indeed hardly be doubted; the universal tradition that the Elean king had only "revived" the games proves this; but nothing whatever can be historically ascertained concerning their origin, character, or frequency, in this remoter time. Iphitos may, therefore, be regarded as their founder, yet the reckoning of time by olympiads (q.v.)—the real dawn of the historical period in Greek history—did not begin till more than a century later. At first, it is conjectured, only Peloponnesians resorted to the Olympic games, but gradually the other Greek states were attracted to them, and the festival became Panhellenic. Originally, and for a long time, none were allowed to contend except those of pure Hellenic blood; but after the conquest of Greece by the Romans, the latter sought and obtained this honor, and both Tiberius and Nero figure in the list of Roman victors. Women—with one exception, the priestess of Demeter Chamyne—were forbidden to be present, on pain of being thrown headlong from the Tayesan rock. The games were held from the 11th to the 18th of the Athenian month Δεκαμβριον (our July-August), during which, first throughout Elis, and then throughout the rest of Greece, heralds proclaimed the cessation of all intestine hostilities; while the territory of Elis itself was declared inviolable. The combatants were required to undergo a preparatory training for 10 months in the gymnasia at Elis, and during the last of these months the gymnasium was as numerously attended as the games themselves. Much uncertainty prevails as to the manner in which the contests were distributed over the different days. Krause (Olympia, p. 106) suggests the following order: On the first day the great initiatory sacrifices were offered, after which the competitors were properly clapped and arranged by the judges, and the contests of the trumpeters took place; the second day was set apart for the boys who competed with each other in foot-races, wrestling, boxing, the pentathlon, the chariot-race, horse-races; the third and principal day was devoted to the contests of men in foot-races of different kinds (as, for example, the diadromos, once over the course; the doleskos, in which the competitors had to run the distance twice; and the doleskos, in which they had to run it seven or twelve times); wrestling, boxing, the pentathlon (in which all the powers and skill of the combatants were exhibited), and the race of hoplites, or men in heavy armor; on the fourth day came off the pentathlon (contest of five games —viz., leaping, running, throwing the discus, throwing the spear, and wrestling), the chariot and horse races, and perhaps the contests of the heralds; the fifth day was set
apart for processions, sacrifices, and banquets to the victors (called Olympiadjon), who were crowned with a garland of wild olive twigs cut from a sacred tree which grew in the Altis (see OLYMPIA), and presented to the assembled people, each with a palm branch in his hand, while the heralds proclaimed his name, and that of his father and country. On his return home, he was received with extraordinary distinction; songs were sung in his praise (14 of Pindar's extant lyrics are devoted to Olympiadjon); statues were erected to him, both in the Altis and in his native city; a place of honor was given him at all public spectacles; he was in general exempted from public taxes, and at Athens was boarded at the expense of the state in the Prytaneion.

The regulation of the games belonged to the Eleans, from whom were chosen the hetairoi, or judges, whose number varied. At first there were only two, but as the games grew in importance more and more national, and consequently more numerous, they were gradually increased to ten, sometimes even to twelve. They were instructed in their duties for ten months beforehand at Elis, and held their office only for one year. The officers who executed their commands were called alytia, and were under the presidency of an alytarch.—See Crause's Οlympia oder Darstellung der grossen Olympischen spiele (Wien, 1889).

OLYMPIODORUS, one of the latest of the Alexandrian Neoplatonists, flourished in the first half of the 6th c. after Christ, during the reign of the emperor Justinian. Regarding his life nothing is known. Of his writings, we possess a Life of Plato, with commentaries or scholia on several of his dialogues, the Gorgias, Philebus, Phaedo, and Alcibiades I. In these he appears as an acute and vigorous thinker, and as a man of great erudition. Olympiodorus's Life of Plato was published by Wetstein (1692). Etywall (Lond. 1771), and Fischer (Leips. 1789); the best edition of the scholia is that of Mystoxides and Schinas (Venice, 1816).

OLYMPUS, the ancient name of several mountains or chains of mountains—e.g., of the north-western continuation of Taurus in Mysia, of a mountain in the island of Cyprus, of one in Lycia, of another in Elis, of one on the borders of Laconia and Arcadia, and of another on the frontiers of Thessaly and Macedonia. Of these, the last-mentioned (now called Lybome) is the most famous. Its eastern side, which fronts the sea, is composed of a line of vast precipices, cliffed by ravines, filled with forest-trees. Oak, chestnut, beech, plane, and oak, plane tree, are scattered abundantly along its base, and higher up appear great forests of pine, as in the days of the old poets of Greece and Rome. With Euripides, it is polvendreus Olympus; with Virgil, frondosus Olympus; and with Horace, opaca Olympus. Its highest peak is 9,754 ft. above the level of the sea, and is covered with snow for about nine months of the year. It was regarded by the ancient Greeks as the chief abode of the gods, and the palace of Zeus was supposed to be upon its broad summit. According to Greek legend, it was formerly connected with Ossa, but was separated from it by an earthquake, allowing a passage for the Peneus through the narrow vale of Tempe to the sea. The philosophers afterwards transferred the abode of the gods to the planetary spheres, to which they likewise transferred the name of Olympus.

OLYNTIUS, an ancient city of Macedonia, situated on the Toroniac gulf. It was probably founded by the Eubean Eturians and Chalcidians. At the time of the second Persian invasion the town was captured and sacked by Artabazus, one of Xerxes's generals. When Brasidas overthrew the Athenian power in Chalcidice, Olynthus gradually gained importance and became the head of an alliance among the northern Greek states, which soon provoked the jealousy of Athens and Macedoniam. When the annexation of Appollonia and Acanthus was threatened by Olynthus, 383 B.C., an army of 10,000 men was sent against that republic by the Peloponnesian states, under the command of Teleutias, a Spartan. The Olyntians were driven back into their city; but, in a sortie, surprised the enemy and threw them into a panic. Teleutias being killed while trying to rally his forces. Agesipolis then took command, and had gained the advantage, when he died, and Polybiades, his successor, compelled the surrender of the city in 379 B.C. The confederation was broken up. For some time they had an alliance with Philip of Macedon; but, two years after they had completed a league with Athens, 352 B.C., war broke out between Olynthus and Macedonia. It was in advocacy of the policy of supporting the Olyntians that Demosthenes uttered the Olynthiacs, among the best of his orations. Some aid was sent by Athens, but it was totally inadequate, and in 347 B.C. Philip razed the city to the ground and sold the inhabitants as slaves.

OM is a Sanskrit word which, on account of the mystical notions that even at an early date of Hindu civilization were connected with it, acquired much importance in the development of Hindu religion. Its original sense is that of emphatic or solemn, affirmation or assent. Thus, when in the White-Tajur-Veda (see VEDA) the sacrificer invites the gods to rejoice in his sacrifice, the god Savir'ri assents to his summons by saying: "Om (i.e., be it so); proceed!" Or, when in the Brhad-aranyaka-Upanishad, Prājāpati, the father of gods, men, and demons, asks the gods whether they have understood his instruction; he expresses his satisfaction with their affirmative reply, in these words: "Om, you have fully comprehended it!" and, in the same Upanishad, Pravahana asks the question of S'wetaketu, as to whether his father has instructed him, by uttering the word "Om," i.e., "forsooth (I am)." A portion of the Rigveda, called the Aitareya-Brāhmaṇa, where describing a religious ceremony at which verses from
the Rigveda, as well as songs called Gāthās, were recited by the priest called Hotrī, and responses given by another priest, the Adhvaryu, says: "Om is the response of the Adhvaryu to the Rigveda verses (recited by the Hotrī), and likewise tathā (i.e., thus) his response to the Gāthās, for Om is (the term of assent) used by the gods, whereas tathā is (the term of assent) used by men" (the Rigveda verses being, to the orthodox Hindu, of divine, and the Gāthās of human, authorship). In this, the original sense of the word, it is little doubtful that om is but an older and contracted form of the common Sanskrit word aum, "thus," which, coming from the pronounal base a—one in some derivations)-Brahman to "aum"—may have at one time occurred in the form aum, when by the elision of the vowel following a—for which their are numerous analogues in the Vedic and even in the Sūtras—Sanskrit-aum would become aum, and hence, according to the ordinary phonetic laws of the language, om. This etymology of the word, however, seems to have been lost, even at an early period of Sanskrit literature; for another is met with in the ancient grammarians, enabling us to account for the mysticism which many religious and theological works of ancient and medieval India suppose to inhere in it. According to this latter etymology, om would come from a radical aum by means of an affix man, when om would be a curtailed form of aum or auman; and as aum implies the notion of "protect, preserve, save," om would be a term implying "protection or salvation;" its mystical properties and its sanctity being inferred from its occurrence in the Vedic writings, and in connection with sacrificial acts, such as are alluded to before.

Hence Om became the auspicious word with which the spiritual teacher had to begin, and at the close of each reading of his reading of the Veda. "Let this syllable," the existing Prātipādā, or grammar of the Rigveda, enjoins, "be the head of the reading of the Veda, for, alike to the teacher and the pupil, it is the supreme Brahman, the gate of heaven." And Manu (q.v.) ordains: "A Brahman, at the beginning and end (of a lesson on the Veda), must always pronounce the syllable Om; for unless Om precede, his learning will slip away from him; and unless it follow, nothing will be long retained." At the time when another class of writings, the Purāṇas (q.v.), were added to the inspired code of Hinduism, for a similar reason, Om is their introductory word.

That the mysterious power which, as the foregoing quotation from the law-book of Manu shows, was attributed to this word, must have been the subject of early speculation, is obvious enough. A reason assigned for it is given by Manu himself. "Brahmā," he says, "extracted from the three Vedas the letter a, the letter u, and the letter m (which combined result in Om), together with the (mysterious) words Bhūth, (earth), Bhul, (breath), and Sāvah, (soul); and in these words, preceded by the syllable Om, and (the sacred Rigveda verse, called) Gāyatrī, consisting of three lines, must be considered as the mouth (or entrance) of Brahman (the Veda)—or, as the commentators observe—the means of attaining final emancipation: and "The syllable Om is the supreme Brahman, (three) regulated breathings (accompanied with the mental recitation of Om, the three mysterious words, Bhūth, Bhul, Bhuvah, Sāvah, and the Gāyatrī), are the highest devotion. . . . . . All rites ordained in the Veda, such as burnt and other sacrifices, pass away; but the syllable Om must be considered as imperishable, for it is a (symbol of) Brahman (the supreme Spirit) himself, the Lord of Creation." In these speculations, Manu bears out, and is borne out by, several Upanishads. See VEDA. In the Katha-Upanishad, for instance, Yāma, the god of death, in replying to a question of Nachiketas, says: "The word which all the Vedas record, which all the modes of penance proclaim, of which the righteous and the religious students perform their duties, this is Om, I will tell thee how Om is divided. Om has many meanings. Om is Brahman and the supreme (Brahman). Whoever knows this syllable, obtains whatever he wishes." And in the Prāsaṇa-Upanishad, the saint Pippalāda says to Satyakāma: "The supreme and the inferior Brahman are both the word Om; hence the wise follows by this support the one or the other of the two. If he meditates upon its one letter (a) only, he is quickly born on the earth; him carry the verses of the Rigveda to the world of man; and if he is devoted there to austerity, the duties of a religious student, and faith, he enjoys greatness. But, if he meditates in his mind on its two letters (a and u), he is elevated by the verses of the Yajur-Veda to the intermediate region; he comes to the world of the moon, and having enjoyed there power, returns again (to the world of man). If, however, he meditates on the supreme Spirit by means of its three letters (a, u, and m), he is produced in light, in the sun; as the snake is liberated from its skin, so he is liberated from sin." According to the Māndākā-yāna-Unapānished, the nature of the soul is summarized in the three letters a, u, and m, in their isolated and combined forms, as being Vaiswānara, or that form of Brahman which represents the soul in its waking condition; u, Taïjasa, or that form of Brahman which represents the soul in its dreaming state; and m, Prājna, or that form of Brahman which represents it in its state of profound sleep (or that state in which it is temporarily united with the supreme Spirit); while a, u, m, combined, i.e., Om, represent the fourth or highest condition of Brahman, "which is unaccountable, in which all manifestations have ceased, which is blissful and without duality, Om, therefore is soul; and by this soul, he who knows it enters into (the supreme) soul." Passages like these may be considered as the key to the more enigmatic expressions used, for instance, by the author of the Yoga (q.v.) philosophy, where, in three short sentences, he says: "His (the supreme Lord's name) is Prañāāv (i.e., Om); its muttering (should be made) and reflection on its
signification; hence comes the knowledge of the transcendental spirit and the absence of the obstacles" (such as sickness, languor, doubt, etc., which obstruct the mind of an ascetic). But they indicate, at the same time, the further course which superstition took in enlarging upon the mysticism of the doctrine of the Upanishads. For as soon as every letter of which the word Om consists was fancied to embody a separate idea, it is intelligible that other sectarian explanations were grafted on them, to serve their special purposes. Thus while Sankara, the great theologian and commentator on the Upanishads, is still contented with an etymological punning, by means of which he transforms "a" (or rather "ä") into an abbreviation of šaṭi (pervading), since speech is pervaded by Vaisvānara; "u" into an abbreviation of utkārṣa (superiority), since Tājāsa is superior to Vaisvānara; and "m" into an abbreviation of māti (destruction), Vaisvānara and Tājāsa, at the destruction and regeneration of the world, being, as it were absorbed into Prājna—the Parāś (q.v.) make of "a" name of Vīshnū; of "u," a union of the mystical propensities of the Vaisvānara; and they see in "m" the Triad, Brāhma, Vīshnū, and Śiva; the first being represented by "m," the second by "u," and the third by "m"—each sect, of course, identifying the combination of these letters, or Om, with their supreme deity. Thus, also, in the Bhagavatagīrī, which is devoted to the worship of Vīshnū in his incarnation as Krīṣhna, though it is essentially a poem of philosophical tendencies, based on the doctrine of the Yoga, Krīṣhna in one passage says of himself that he is Om; while, in another passage, he qualifies the latter as the supreme Spirit.—A common designation of the word Om—for instance, in the last named passages of the Bhagavatagīrī—is the word Prāṇāvā, which comes from a so-called radical vr, "praise," with the prefix pra, amongst other meanings, implying emphasis, and therefore literally means "eulogium, emphatic praise." Although Om, in its original sense, as a word of solemn or emphatic assent, is, properly speaking, restricted to the Vedic literature, it deserves notice that it is nowdays often used by the natives of India in the sense of "yes," without, of course, any acknowledgment of the mystical propensities which are ascribed to it in the religious works. See also the article Om MAN'S PĀDME Hī'ta.

There that exists no connection whatever, as has been supposed by some writers to be the case, between Om and Amen, requires scarcely any remark, after the etymological explanations given above; but it may not be without interest to observe that, though the derivation of Om, as a curtailment of ar-man, from ar, "protect, save," is probably merely artificial, and, as stated before, invented to explain the later mystical use of the Vedic word, it seems more satisfactory to compare the Latin omne with a Sanskrit arman, "protection," as derived by the grammarians from ãr (in the Latin ãre-o), than to explain it in the fashion of the Roman etymologists: "Omen, quod ex ore primum elatum est, omnis dictum;" or, "Omen velit oromen, quod fit ore augurium, quod non avibus albo modo fit." And since pra-āvā, from Sanskrit āv, "praise," is, like Om, used in the sense of "the Deity," it is likewise probable that nāmen does not come, as is generally believed, from Latin nāmen (ere), "nod," but from a radical corresponding with the Sanskrit āv, "praise."

OMAGH (Irish, Oigh magh, "Seat of the chiefs"), an ancient t., capital of the co. of Tyrone in Ireland, situated on the river Strule, distant 34 m. s. from Londonderry, and 110 m. n.w. from Dublin, with both which cities it is connected by railway. Omagh grew up around an abbey founded in the year 792, but is first heard of as a fortress of Art ÓNial in the end of the 15th c., about which time it was forced to submit to the English, although its possession long continued to alternate between Irish and English hands. It is the seat of James 1's "Plantation" grants, and was strongly garrisoned by Mountjoy. On its being evacuated by the troops of James II. in 1689, it was partially burned, and a second fire in 1743 completed its destruction. But has it been well rebuilt, and is now a neat and prosperous town. Pop. '71, 3,724. Omagh contains a very handsome court-house, where the assizes for county Tyrone are held, several neat churches (Roman Catholic, Episcopal, and Presbyterian), a conveni, several partially endowed and national schools, a district lunatic asylum, and the work-house of the Poor-Law Union of which it is the center. There is also a barracks station—it being within the Belfast military district. Its trade is chiefly in brown linens, corn, and agricultural produce.

OMAHA, the chief city of the state of Nebraska, is on the right bank of the Missouri, opposite Council Bluffs, and 20 m. n. of the mouth of the Nebraska river. Besides the government offices, it has a large trade by the rivers, and across the prairies, and is the eastern terminal of the Union Pacific railway, and also of the Omaha and North-western, and the Omaha and South-western lines. Pop. in 1850, 1912; in 1870, 16,683.

OMAHA (ente), the chief city of Nebraska, though not its capital, on the w. bank of the Missouri river, lat. 41° 30' n. and long. 96° w. of Greenwich. Its site is upon a hilly plateau from 50 to 150 ft. above the river, and 950 ft. above the level of the sea, with plains fairly adapted to city improvements. Its name is derived from that of the tribes of Dakota Indians. The t. was laid out in 1854, became an incorporated city in 1859, and was plated on a scale of magnitude that anticipated the growth of a great city. The territorial capital was first located here, but was subsequently fixed at the city of
Lincoln. It is the county seat of Douglas county. Omaha is 490 m. westerly by rail from Chicago; pop. 60, 1883; 70, 16,063; 80, 30,518. Before the construction of the Union Pacific road, which began at this point, it was the most northerly outfitting place for overland trains to the "far west.

The aid of the government in the construction of the Union Pacific railway, and the choice of Omaha as its starting point on the Missouri in 1864, made it the theater of great speculation in the belief that it was destined to an extraordinary growth. Its growth has in fact been rapid, though less so than was anticipated by some enthusiasts. It now has connections by the Union bridge across the Missouri, connecting it with the city of Council Bluffs on the e. side, with a great radiating system of railroads to all points eastward, and with the country to the n., w., and s., by other roads of which it is the terminus.

The city is lighted with gas, has several street railway lines, a U.S. court-house and post office, which is the finest building in the city, and in which the U.S. court for the district of Nebraska sits; large and excellent school buildings, extensive railway structures, hotels, the state institution for the deaf and dumb, and many elegant residences and business houses. It is the sausa, and in 1875 it was valued at $9,500,000. It then had a banking capital of $600,000, with bank deposits to the amount of $2,700,000. It has extensive iron works for making and rolling railroad iron, machine shops, and one of the most complete establishments in the country for smelting, separating, and refining the ores of gold, silver, copper, lead, and zinc; which come to Omaha to be treated from the mining regions of all the territories along the line of the Union Pacific and Central railroads. The city has 3 daily and 6 weekly newspapers, 3 monthlies, and 24 churches.

OMAHA, an Indian tribe of the Dakota family, living when visited by the early explorers along the St. Peter's river, divided into two tribes, Ishatasundas and Hongashanos, and 13 clans, one of which had charge of a sacred shell, kept in a temple. One of their customs forbade a man's speaking with his father-in-law or mother-in-law. They could, at one time, muster 700, but in 1802 small-pox had reduced their number to 300. They now left their settlements and for some years led a roving life, constantly harassed by the Sioux. The explorers Lewis and Clarke found them in 1805 living along the Quicoue river. Their number was then 600. Between 1815 and 1854, they ceded large portions of their lands. Missions were established among them in 1839, and again in 1846, but met with little success. They had succeeded in making a permanent treaty of peace with the Poncas and Pawnees in 1839, but were continually at war with the Sioux, who several times forced them to withdraw to the Elkhorn. In 1848 they negotiatcd a treaty with the Sauk and Fox, and in 1853 another with the Winnebago. They were famous of their chiefs, Logan Fontanelle, was slain by the Sioux in 1855. For the last generation they have followed agriculture, and have become more prosperous; and their number has increased to about 1000. They have establised schools and a church, and hold property valued at $75,000. They live on an extensive reservation in Blackbird co., Nebraska.

OMAN, the most eastern portion of Arabia, a strip of maritime territory, extending between Ras-el-Jiboul and Ras-el-Had, bordered on the n. by the gulf of Oman, and on the s. by the deserts of the interior. It is about 370 m. in length; its greatest breadth is 120 miles. At a distance of from 20 to 40 m. from the coast, a chain of mountains runs parallel to it, which reaches in its highest ridge, called Gebel Aeddar ("Great Mountain"), an elevation of 6,000 ft.; the average height is 4,000 feet. There are a few not inconsiderable streams, and some richly fertile tracts in this region, but the greater part is a waste of sand, with here and there a small oasis, where, however, the vegetation is most luxuriant. Groves of almond, fig., and walnut-trees, tower to an enormous height, overshadowing the orange and citron trees, but are themselves overtopped by the splendid date-palms. The most powerful state of Oman is Muscat (q. v.).

OMAR, Abu-Hafsa-bin-al-Khattab, the second caliph of the Moslems, was b. about 581. His early history is little known, but previous to his conversion he was an ardent persecutor of the Prophet and his followers. After his conversion he became as zealous an apostle as he had formerly been persecutor, and reached a very high position in all his warlike expeditions. After Mohammed's death, he caused Abu-bekr to be proclaimed caliph, and was himself appointed hajib, or prime-minister. Though of a fiery and enthusiastic temperament, he proved a sagacious advisor, and it was at his suggestion that the caliph put down with an iron hand the many dissensions which had arisen among the Arabs after the prophet's decease, and resolved to strengthen and consolidate their new-born national spirit, as well as propagate the doctrines of Islam, by engaging them in continual aggressive wars. On the death of Abu-bekr, Omar, succeeded as caliph, and pushed on the wars of conquest with increased vigor. He was summoned to Jerusalem in 637, to receive the keys of that city, and before leaving gave orders to build a mosque, now called by his name, on the site of the temple of Solomon. Omar now took the command of a portion of the army, and reduced the other chief cities of Palestine. He then planned an invasion of Persia, which was commenced the same year, and by 642 the whole of what is now known as Persia was subdued. In the meantime the war in Syria was vigorously prosecuted, and the Byzantine armies,
repeatedly defeated, at length gave up the contest. In 639, Amr, one of his generals, had invaded Egypt with a considerable force; but such was the prestige of the Arabs, or the incapacity of the lieutenants of the emperor Heraclius, that this valuable country, with its six millions of people, was reduced under the caliph's authority without a single contest, and only two towns, Misr and Alexandria, were twice attempted to be taken. (For the story which was till lately believed concerning the destruction of the Alexandrian library, see Alexandrian Library.) Barea and Tripoli were next subdued by Amr. On the n., Armenia was overrun in 641, and the caliph's authority now reached from the desert of Khiva to the Syris, an enormous extension in ten years. In 644 Omar was assassinated in the mosque of Medina by a Persian slave from motives of revenge. He languished five days after receiving the wound, but refused to appoint a successor, and named six commissioners who were to choose one from themselves. He was buried in the mosque of Medina, near the prophet and Abu-bekr, and his tomb is still visited by pilgrims.

Omar may be called the founder of the Mohammedan power, as from a mere sect he raised it to the rank of a conquering nation, and left to his successor an empire which Alkmand, the great might have envied. In him we find a rare combination of qualities, the ardent zeal of the apostle side by side with the cautious forethought and calm resolution of the monarch. His great military talents, and severity to "obstinate unbelievers," rendered him formidable to his enemies, and his inexorable justice rendered him no less obnoxious to the more powerful of his subjects, and gave rise to many attempts at his assassination. Omar was the founder of many excellent institutions; he assigned a regular pay to his soldiers, established a night-policc in towns, and made some excellent regulations for the more lenient treatment of slaves. He also originated the practice of dating from the era of the Hedjrah (q.v.). He assumed the title of Emir-al-mumenin ("Commander of the Faithful") in preference to that of Khalifah-rasooli-Bahl, the ordinary designation; and to the present day his name is held in the greatest veneration by the orthodox or Sunf sect of Moslems.

OMAR PASHA, a celebrated Turkish general, was b. at Plaski, an Austrian village in the Croatian military frontier, in 1806 (according to some authorities, in 1811). His real name was Mkkal Latcis, and his father being an officer in the Austrian army, Mulk was educated at the military school of Thurn, near Carlstadt, where he greatly distinguished himself. He afterward joined one of the frontier regiments as a cadet, and was employed as secretary by the military inspector of roads and bridges; but having some breach of discipline rendered himself amenable to punishment, he fled to Bosnia, where he became book-keeper to a Turkish merchant, and embraced Mohammedanism. He was next employed by Hussein Pasha, the governor of Widin, as tutor to his sons; and in 1834 was sent in charge of them to Constantinople, where his beautiful calligraphy gained for him the post of writing-master in the military school. Omar Effendi (as he was now called) was next appointed writing-master to Abdul-Medjid, the heir to the throne, and received the honorary rank of cap. in the Turkish army, and the hand of a rich heiress. On his pupil's accession in 1859, Omar was raised to the rank of col., and sent to Syria to aid in the suppression of disturbances which had broken out in that province, and in 1842 he was appointed military governor of the Lebanon district. The severe measures which he undertook from designing to have him as chief of the mountain; but in the following year he was recalled, received the title of pasha, and was sent, along with Redschid Pasha, against the revolted Albanians. The skill and energy with which he suppressed this insurrection, as well as others in Bosnia and Kardistan, raised him high in favor with the sultan. Towards the end of 1852 he opened the campaign against the Montenegrins, who were being rapidly subdued, when Austria interfered and compelled a treaty. On the invasion of the principalities by the Russians (July 1853), Omar collected at Schumali an army of 60,000 men to cover Constantinople; but being no less a politician than a soldier, he soon divined that the Russians would not immediately cross the Danube, and accordingly pushed on to Widin, where he crossed the river in presence of the enemy and intrenched himself at Kahafat. Another part of the Turkish army moved down the Danube to Turtukai, near Silistria, crossed the river at that place, and intrenched themselves at Oliteniz. On Nov. 4, the latter division were attacked by 8,000 Russians, whom they totally defeated with a loss of nearly 4,000 men and almost all their officers. The Russians also received two severe checks at Kahafat, on Jan. 6, and March 15, 1855. Omar kept up the spirit of his troops by occasional successful skirmishes with the Russians, and threw a garrison of 8,000 men into Silistria. In the following spring the Russians passed the Danube at two points, and laid siege to Silistria (q.v.), but their assaults were invariably repulsed with severe loss. The Russians then withdrew from the principalities, and Omar entered Bucharest in triumph in August, 1854. On Feb. 9, 1855, he embarked for Eupatoria, where, on the 17th of the same month, he was suddenly attacked by 40,000 Russians, who were repulsed with great loss. He was soon afterward (Oct. 3, 1855) sent to relieve Kars, but arrived too late, and the armistice which followed (Feb. 29, 1856) put a stop to his military career. He was subsequently made governor of Bagdad; but having been accused of maladministration, was banished to Karport in 1859. He was recalled in the following year, and in September, 1861, was sent to pacify Bosnia and Herzeogovina, which were again in
insurrection. This being accomplished, he attacked the Montenegrins, captured their chief town of Cetinji, and overran the country in 1892. Omar held the grand cross of the legion of honor, and was a knight of the Russian order of St. Anne. He ceased to take part in public life in 1869, being thereafter regarded as a minister without portfolio; and died in 1871.

OMBAY, or MALOEW (Maluwa), an island between Celebes and the n.w. coast of Australia, lies to the n. of Timor, from which it is separated by the strait of Ombay, lat. 8° 8' to 8° 28' s., long. 124° 17' to 125° 7' e. est. Area, 961 sq. miles. The pop. amounts to about 193,800. The hills of Ombay are volcanic, and the coasts steep and difficult to approach. The inhabitants are dark brown, have thick lips, flat nose, and woolly hair; appearing to be of mixed negro and Malay origin. They are armed with the bow, spear, and creese, and live on the produce of the chase, with fish, cocoa-nuts, rice, and honey. A portion of the island formerly belonged to the Portuguese, but since Aug. 6, 1851, it is entirely a Netherlands possession. The Dutch post-holder resides at the village of Alor, to which iron wares, cotton goods, etc., are brought from Timor, and exchanged for wax, edible nests, provisions, and other native products. Ombay has copra, rice, and sugar. Amber is also found, and the Buc- gineers of Celebes import European and Indian fabrics, exchanging them for the produce of the island, which they carry to Singapore.

O'MEARA, BARRY EDWARD, was b. in Ireland in the year 1786. Otherwise without claim to be remembered, his name remains notable from his connection with the first Napoleon, whom he accompanied to St. Helena as household physician. At the age of 18 he entered the British army as assistant-surgeon. In 1806, being stationed at Messina, he became concerned in a duel as second, under circumstances which must more or less have been held discredi-ble, as his dismissal from the service by sentence of court- martial was the result. Afterward he succeeded in procuring an appointment as surgeon in the navy, and as such for some years is certified to have discharged his duties with zeal and efficiency. As it chanced, he was serving with capt. Maltland in the Bellerophon, when the emperor Napoleon (q.v.) surrendered himself to that officer. During the voyage from Rochefort to Plymouth he was introduced to Napoleon, on whom the impression he produced was favorable, leading to a proposal that he should accompany the emperor into exile as private physician, an arrangement to which he acceded, stimulating that he should retain his rank in the navy, and be permitted to return to it at pleasure. By Napoleon, with whom he remained in daily intercourse at St. Helena for about three years, he seems to have been admitted to something more or less like intimacy; and occasionally it might well be, as he says, that the great captive would kill the creeping hours by loose talk with his attendant over the events of his strange life. Of these conversations O'Meara naturally enough took notes, which he afterward published. Meantime he became involved in the interest of Napoleon, in the series of miserable and petty squabbles which he waged with the governor, sir Hudson Lowe (q.v.). The result of these, as regards O'Meara, was that in 1818, after a violent altercation with sir Hudson, he was committed to close arrest, and was authorized by the emperor to resign his post. On his return to England, he addressed a letter to the admiralry, in which, among other things, he accused sir Hudson Lowe of intentions against the life of his captive, and even of having, by dark hints to himself, insinuated a desire for his services as secret assassin. For this he was instantly dismissed the service. The accusation was plainly monstrous and incredible. In 1822, after Napoleon's death, O'Meara published Napoleon in Exile, by which book alone he is now remembered. As conveying to the world the first authentic details of the prison-life of the great diseased, it made on its appearance an immense sensation, and—though for obvious reasons everywhere to be accepted, if at all, with caution—it is still not utterly without interest. The last years of O'Meara's life were passed in obscurity in the neighborhood of London, where, in 1836, he died.

OMELLET, or OMELETTE, French, a dish chiefly composed of eggs. These are broken, and their contents put into a proper vessel, in which they are whipped into a froth, which is poured into a very clean and dry frying-pan, with the addition of hard or butter to prevent sticking and then fried carefully, so that the outside is nicely browned. Before frying, one of a number of ingredients may be added to vary the omelet, such as chopped savory herbs, minced ham or bacon, salt-fish, shell-fish, game, etc. Or sweet omelets may be made by placing preserved fruits upon them when quite or nearly cooked. The omelet is an excellent dish, and, simple though it be, it requires much skill to prepare it successfully.

O'MEN (for the deriv., see Om), or PRODIGY (generally said to be from pro and die, but more probably from pro and age, to lead; hence anything conspicuous, or extraordinary, the same given by the Romans to signs by which approaching good or bad fortune was supposed to be indicated. The terms omen and prodigy were not, however, exactly synonymous; the former being applied rather to signs received by the ear, and particularly to spoken words; the latter to phenomena and occurrences, such as monstrous births, the appearance of snakes, locusts, etc., the striking of the foot against a stone or the like, the breaking of a shoe-tie, and even sneezing, etc. If an omen or prodigy was promised on the part of a god, it was to be interpreted according to the promise; but otherwise, the interpretation was extremely arbitrary. It was supposed
that evil indicated as approaching might be averted by various means, as by sacrifices, or by the utterance of certain magic formulas; or by an extemporaneous interpretation, as when Caesar, having fallen to the ground on landing in Africa, exclaimed: "I take possession of thee, Africa." Occasionally, it is true, we read of a reckless disregard of omens; as, for example, when P. Claudius, in the first Punic war, caused the sacred chickens, who would not leave their cage, to be pitched into the sea, saying: "If they won't eat, they must drink." Still the belief in them was universal, and in general the greatest care was taken to avoid unfavorable omens. The heads of the sacrificial priests were covered, so that nothing distracting might catch their eyes; silence was enjoined at the commencement of every sacred undertaking, and at the opening of the holy Book. Before every sacrificial procession ran the heralds, calling on the people to "pay respect to it," and admonishing them to cease working till it should have passed, that the priests might not hear unfavorable sounds. At the beginning of a sacrifice the bystanders were addressed in the words "firceto lingu6s" ("speak no word of evil import"), and the aid of music was sought to drown whatever noises might prove unpropitious. Compare Auguries AND AUSPIICIA, and DIVINATION. See also Fallati, Ueber Begriff und Wesen des Boms. Omen (Tüb. 1836).

The belief in omens has existed in all ages and countries, and traces of it linger even yet in the most civilized communities; in the dread, for instance, that many entertain at sitting down to table in a party of thirteen. Not a little of the philosophy of omens is contained in the Scottish proverb: "They who follow freets, freets follow;" meaning, that a fatalistic belief in impending evil paralyses the endeavor that might prevent it.

OMENTUM. See Peritoneum.

OMISH, or AMISH, a branch of the Mennonites, founded in 1693, in Alsace, by Jacob Amman, from whom they derive their name. His special tenets were plainness in dress, absolute separation from the excommunicated, and washing of feet. His followers did not use buttons on their clothing, and were hence called Hutterer, or "Hooker" Mennonites, while the rest of that body was called Knüpfer, or "Buttonites." Their number in this country is next to that of the old Mennonites.

OM' MAN' I PADME HUM is the "formula of six syllables" which has acquired much celebrity from the conspicuous part which it plays in the religion of the Buddhists, and especially in that form of it called Lavanam (q.v.). It is the first subject which the Thibetans and Mongols teach their children, and it is the last prayer which is muttered by the dying man; the traveler repeats this formula on his journey, the shepherd when attending his flock, the housewife when performing her domestic duties, the monk when absorbed in religious meditation, etc. It is met with everywhere: on flags, rocks, trees, walls, columns, stone-monuments, domestic implements, skulls, skeletons, etc. It is looked upon as the essence of all religion and wisdom, and the means of attaining eternal bliss. "These six syllables," it is said, "concentrate in themselves the favor of all the Buddha, and they are the root of the whole doctrine . . . ; they lead the believer to re-birth as a higher being, and are the door which bars from him inferior births; they are the torch which illuminates darkness, the conqueror of the five evils;" etc. They are likewise the symbol of transmigration; each syllable successively corresponds with the six worlds in which men are reborn; or they are the mystical designation of the six transcendental virtues, each successive syllable implying self-offering (āhāna), endurance (kohotā), chastity (śīla), contemplation (dhyāna), mental energy (śīrya), and religious wisdom (prajāya). The reputed author of this formula is the Dhyāna-Bodhisattva, or deified saint, Avalokitesvara, or, as the Thibetans call him, Padmapani (i.e. the lotus-handed). It would not belong, accordingly, to the earliest stage of Buddhist philosophy, nor is it found in the oldest Buddhist works of the north of India or of Ceylon. Its original source is rather obscure. Some suppose that it means Om! (om), the jewel (mani) in the lotus (padma), amen (hīm); "the jewel" being an allusion to the saint Avalokiteswara himself, and the word "padma, or in the lotus," to the belief that he was born from a lotus. It is probably, however, more correct to interpret the formula thus: "Salvation (om) [is] in the jewel-lotus (mani-padma), amen (ahīm);" when the compound word "jewel-lotus" would mean the saint and the flower whence he arose. If this interpretation be correct, the formula really nothing more than a salutation addressed to Avalokiteswara or Padmapāni; and the mystical interpretation put upon each syllable of it, would then be analogous to that which imparted a transcendental sense to each of the letters of the syllable Om (q.v.). Dr. Emil Schlagintweit, in his valuable work on Buddhism in Thibet (Leipzig, 1863), relates (p. 120) that "in a prayer-cylinder which he had the opportunity of opening, he found the formula printed in six lines, and repeated innumerable times upon a leaf 49 feet long and 4 inches broad. When Baron Schilling de Canstadt paid a visit to the temple Subulinn, in Siberia, the lamas were just occupied with preparing 100,000,000 of copies of this prayer to be put into a prayer-cylinder; his offer to have the necessary number executed at St. Petersburg was most readily accepted, and he was presented, in return for the 150,000,000 of copies he forwarded to them, with an edition of the Kanjur, the sheets of which amount to about 40,000. When adoring the head of religious books, or when engraved upon the slabs resting on the prayer-walls, the letters of the formula are often so combined as to form an amantra. The longitudinal lines occurring
in the letters "mâni podâne hâm" are traced close to each other, and to the outer longitudinal line at the left are appended the curved lines. The letter "'om" is replaced by a symbolical sign above the anagram, showing a half-moon surrounded by a disk indicating the sun, from which issues a flame. Such a combination of the letters is called in Thibetan wâm chû angâd.i.n, "the ten entirely powerful (viz., characters, six of which are consonants, and four vowels);" and the power of this sacred sentence is supposed to be increased by its being written in this form. These kind of anagrams are always bordered by a pointed frame indicating the leaf of a fig-tree."—See also E. Burnouf, Introduction à l'Histoire du Bouddhisme Indien (Paris, 1844); C. F. Koeppen, Die Religion des Buddha (Berlin, 1857-59); and the works quoted by these authors.

OMMIADES (Ommaiades, or Ommeayades), a dynasty (deriving its name from an ancestor, Ommeyah) which succeeded to the Arabian caliphate on the death of Ali, the fourth caliph after Mohammed, and possessed it till superseded by the Abbasides (q.v.) in 750. Moawiyah, the founder of the dynasty, was the son of Abu-Sofian, who defeated Mohammed at Bedr, and his mother was the notorious Hinda. After the death of Othman the third caliph, Moawiyah, who was his cousin, claimed the throne and during the whole of Ali's reign ruled over the western provinces of Syria and Egypt; but it was not till the death of that caliph, and the abdication of his son Hassan in 661, that Moawiyah's authority was fully recognized. In that year he transferred the seat of the caliphate to Damascuse; Kufa having been the residence of Ali, and Medina of the first three caliphs. The Arabs continued to extend their conquests during his reign; the Turks in Khurasan were subdued, Turkestan invaded, and several important acquisitions made in Asia Minor. But besides aggrandizing his empire, the caliph neglected no means of consolidating it, and partly for this reason he made the succession hereditary, and caused his son YEZID (680-83) to be recognized as his heir. The reigns of Yezid and his successors, MOAWIYAH II. (683) and MERWAN I. (683-85), are devoid of importance, as their sway extended only over Syria and Palestine. ABDULMELEK (685-705), an able and warlike prince, after a long and varying struggle of eight years, succeeded him, securing himself as the sole ruler of the Mohammedan world (692), but the latter part of his reign was much disturbed by rebellions in the eastern provinces. He was the first caliph who interested himself in the promotion of liberal knowledge, by causing the most celebrated poetical and other works of the Persians to be translated into Arabic; and under his reign coined money was first introduced. It was to this prince that his court-fool related the celebrated fabulous conversation between the owl of Bassora and that of Mosul. Four of his sons, WALID I. (695-16), SULIMAN (716-17), YEZID II. (720-33), and HESHM (723-42), successively occupied the throne, and a fifth son, Mossalemah, was, from his great military abilities and zealous devotion to the interests of his brothers, the terror of all their enemies, both domestic and foreign. Under Walid, the Ommiade caliphate reached the summit of its power and grandeur; northern Africa (709), and Spain (712), Turkestan (707), and Gu'atia (710) were conquered; while toward the close of his reign, his empire was extended even to the distant shores of the Caspian. The masterpiece of the Ommiades in the art of mosque architecture was OMAIR II. (717-20), who, in the justice and mildness of his government, surpassed the whole of the race of Ommeyah, was appointed to succeed Suliman; but having excited discontent among his relatives, by suppressing the formula of malediction, which had hitherto been regularly pronounced at all public ceremonies against Ali and his descendants, he was poisoned. During his reign, Mossalemah had completed the conquest of Asia Minor, and even compelled the emperor Leo to submit to the humiliation of walking beside his horse through the principal streets of Constantinople itself, and paying a large ransom (equivalent to about £140,000) for his capital. Hesim, though like his immediate predecessor, fond of pleasure, possessed all the qualities necessary for a sovereign. The Greeks, who still strove for the possession of Asia Minor, were repeatedly defeated: the fierce Turks of northern Persia and Turkestan, were kept in stern subjection; and the civil affairs of the empire carefully and strictly administered. The turbulent character of the house of Ommeyah, so long as the line of the Ommiades lasted, was to have been the signal for insurrection; the descendants of Ali raised the standard of revolt, and no sooner were they subdued than Ibrahim, the fourth in direct descent from Abbas the uncle of Mohammed, solemnly invested the celebrated Abu-Mosslem (stated to be a descendant of Kohler, one of the most distinguished heroes of Firdusi's work the Shah-namah) with the arduous duty of enforcing his long-agitated claims to the throne. During this reign the progress of Arab conquest in western Europe was checked by Charles Martel, who inflicted upon the Arabs a severe defeat at Tours (732), and almost annihilated their army at Narbonne (736). The reigns of WALID II. (742-48), YEZID III. (745-44), and IBRAHIM (744), though of ephemeral duration, were long enough to produce a complete disorganization of the empire; and though MERWAN II. (744-50), the next and last caliph of the house of Ommeyah, was both an able and politic ruler, and a skilful warrior, the declining fortune of his family was beyond remedy. Abu-Mosslem, who had passed his youth on the borders of the Alasiades, was at the age of 475 in 750, when he was in the field at the head of a small but zealous band, and carried the black flag of the Abbasides from victory to victory, till before the close of the following year the whole of Khorasan acknowledged his authority. Irak was subdued in 749; and though Ibralim
the Abbasid claimant was seized by Merván, and executed in the same year, his brother Abd-Abbas succeeded to his claims, and the unfortunate caliph, defeated in two engagements, fled to Egypt (750), whither he was pursued and slain. Abdallah, the uncle of the successful claimant, treacherously invited the remaining members of the house of Omeyyah to a conference, and ordered a general massacre of them. Two only escaped: the one to the s.e. of Arabia, where he was recognized as caliph, and his descendants reigned till the 16th c.; the other, Abderrahman, to Spain, where he founded the caliphate of Cordova.

OMMIADES OF SPAIN.—Abderrahman I. (755–787), on accepting the Spanish throne, which was offered him by the Arab chiefs, assumed the title of Caliph and Emir al-Mumunin, as the successor of numerous revolts, strengthened and extended his power in Spain, till with the exception of Asturias and the country n. of the Ebro, his authority was everywhere acknowledged. His defeat of Charlemagne at Roncesvalles (q.v.) is too widely known to require further notice. He divided his kingdom into six provinces, whose rulers, with the walls of the twelve principal towns, formed a sort of national diet. His successors, Hesham I. (787–93) and Al-Hakem I. (796–821), were much troubled with internal revolts, under cover of which the Christians in the n.e. established the state known as the "Spanish March." Abderrahman II. (821–32) re-established internal quiet, and occupied his subjects with incessant wars against the Christians. These conflicts developed among the Arabs that chivalrous heroism which is found nowhere else in the Mohammedan world. Abderrahman, himself a man of learning, greatly encouraged the arts and sciences, and diffused information among his people; he also attempted, by regulating the laws of succession to property, to constitute his kingdom on a basis analogous to that of other European nations. During his reign Mohammedan Spain was the best governed country in Europe. His successors, Mohammed I. (852–80), Mondihar (880–82), and Abdallah (892–912), followed in his footsteps. Abderrahman III. (912–61), after suppressing some dangerous revolts which had gathered head during his minority, conquered the kingdom of Fez from the Edristes, and brought a long and exhausting war with the powers of Asturias and Leon to a victorious conclusion. This period is justly termed the golden age of the Arab domination in Spain, for at no period was their power so consolidated, and their prosperity so flourishing. Abderrahman, like his predecessors, was a great encourager of learning, and a poet of no mean ability. He founded schools which far surpassed those in other parts of Europe. His son, Al-Hakem II. (961–76), was in every way worthy to be his successor, but his premature death was the cause of the downfall of the Ommiades in Spain. Hesham II. (976–987/8), a child of eight years, now occupied the throne; but fortunately his mother, Sobelia, possessed the abilities necessary for such an emergency, and appointed as her son’s vizier Mohammed ben Abdallah, surnamed Al-Mansur, who had originally been a peasant. This remarkable man gained the affections of all ranks by his pleasing manners and great abilities; his administration was equally just and judicious, and his encouragement of literature, science, and art alike liberal and discriminating. But it is as a warrior that he is chiefly remembered; he had vowed eternal enmity to the Christians, and in all his numerous expeditions fortune seemed chained to his standard. The lost provinces were recovered; Castile, Leon, and Barcelona were conquered; and Navarre was on the point of sharing the same fate, when a rebellion in Fez compelled him to detach a portion of his force for service in Africa, and the combined armies of the four Christian monarchies, seizing this opportunity, inflicted upon the Arabs a sanguinary defeat in 1001. Mohammed’s spirit was completely broken by this blow, and he died a few days afterwards. With him the star of the house of Omeyyah set for ever. The rest of Hesham’s reign was a scene of disorder and civil war. Pretenders to the caliphat arose, while the “walls” of the various provinces set up as independent rulers, and the invasions of the Christians added to the confusion. Hesham finally resigned the throne about 1019; and, with the exception of the brief reign of Hesham III. (1027–51), from this time the family of Omeyyah, which had for more than two centuries so happily and brilliantly governed the greater part of Spain, disappears from history. One remarkable feature of their rule deserves mention, as it contrasts them so favorably with the contemporary and subsequent rulers of Spain, even to the present time, and that is their universal toleration in religious matters.

OMNIBUS (Lat. omnibus, “for all,“) familiarly contracted into “bus,” is the largest kind of public street conveyance, and is appointed to travel between two fixed stations, starting at certain fixed hours, and taking up or setting down passengers at any point on its route. Vehicles of this sort were first started in Paris in 1662, when it was decreed, by a royal edict of Louis XIV., that a line of voituret à cinq sous (“twopence-halfpenny omnibuses”), each containing eight places, should be established for the benefit of the infirm, or those who, requiring speedy conveyance from one part of the town to another, were unable to afford a hired carriage for themselves; these "caroses" were bound to run at fixed hours from one station to another, whether full or empty. The public inauguration of the new conveyances took place March 18, 1662, and was the occasion for a grand fête; and the novelty took so well with the Parisians, that the omnibuses were for some time monopolized by the wealthier classes. However, when the rage for them died away, it was found that those for whose special benefit they were instituted
made no use of them, and they, in consequence, gradually disappeared. The omnibus was not revived in Paris till 1827, when it was started in its present form, carrying from 15 to 18 passengers inside, with only the driver above and the conductor behind; and on July 4, 1829, they were introduced into London by a Mr. Shillibeer. Shillibeer’s conveyances, which for some time afterwards were known as shillibers (an epithet still in common use in New York), were of larger size than the French ones, carrying 22 passengers inside, and were drawn by three horses abreast. The omnibus was introduced into Amsterdam in 1830, and since that time its use has been extended to all large cities and towns in the civilized world. The seats of the omnibus are generally placed lengthwise, and the door behind. The omnibus is managed by a driver and a conductor. In New York, omnibuses are drawn on street-railways; and this practice is now being extensively employed in the chief towns of Great Britain, where the omnibuses are called tramway cars, and the railway a tramway.

OMNIAUM, a term used at the stock exchange to express the aggregate value of the different stocks in which a loan is funded. See M’Culloch’s Dictionary of Commerce.

OMSK, a t. of the Russian province of Central Asia, in the government of Akmolinsk, stands at the confluence of the Om—a river upwards of 200 m. in length—with the Irtil; 2,253 m. from St. Petersburg. Lat. 54° 59’ n., long. 73° 30’ e. It was built in 1716, as a defense against the Kirghiz; but is now of no importance as a fortress. It was till a recent date the center of government for Western Siberia, the center of the administration of the Siberian Kirghiz, the seat of the courts of justice, and of the Siberian corps of cadets. It contains manufactories and mining works. Hitherto its commerce has been limited to a trade with the Kirghiz, who drive up their cattle to this place; but its advantageous position on the great post-road and commercial line of traffic from Europe across the whole of Siberia to the Chinese frontier, makes it probable that it will some day become an intermediate station for extensive commercial exchanges. Pop. ’67, 26,722.

OMUL, Salmo migratorius, a fish of the salmon and trout tribe, abounding in lake Baikal and other waters of the e. of Siberia, from which great quantities are sent salted to all the western parts of that country. In size it is rarely more than 15 or 16 in. long. Its flesh is very white and tender. It ascends rivers in shoals for the purpose of spawning.

ON. See HELIOPOLIS, ante.

ONAGER. See Ass.

ONAGER. See BALISTA.

ONAGRACEAE, ONAGRARLLE, or GENOTHERACEAE, a natural order of exogenous plants, consisting chiefly of herbaceous plants, but including also a few shrubs; with simple leaves, axillary or terminal flowers; the calyx superior, tubular, sometimes colored, its limb usually 4-lobed; the petals inserted into the throat of the calyx, generally equal in number to its segments; the stamens generally 4 or 8, rarely 1 or 2, inserted along with the petals; the ovary generally 4-celled, sometimes 2-celled; the style thread-like, the fruit a capsule or a berry. There are about 450 known species, natives chiefly of temperate climates, among which are some much cultivated for the beauty of their flowers, particularly those of the genera fuchsia, godetia (evening primrose), cerasia, and godetia. The British genera are epilobium (willow-herb) and cerasia (enchanter’s nightshade). A few species produce edible berries, and the roots of 1 or 2 are edible; but none are of economical importance. The root of inuwrub alternifolia, found in the marshes of Carolina, and called Bowman’s root, is eucotic. Some species of Justicia are used in dying in Brazil.

ONAGRACEAE (ante), a natural order of exogenous herbs constituting the evening primrose family, principally found in America, but also inhabiting temperate latitudes in the eastern continent. There are several genera, the principal of which are cirea, epilobium antheroid, and Ludelvirea. Circeae, or enchanter’s nightshade, named from Circe the enchantress, is a low perennial, growing in cool or damp woods; calyx tube slightly prolonged, deciduous; lobes 2, reflexed; petals 2, inversely heart-shaped; stamens 2; pod does not split open. Two species from Europe, C. butelliun, and C. alpina. Epilobium or willow herb, has several species in this country, most of them brought from Europe. The great willow herb, E. angustifolium, has a simple, tall stem from 4 to 7 ft. high, with lanceolate leaves, and grows on low grounds, in newly cleared lands; flowers pink-purple, very showy. E. alpina is found on the summits of the White mountains, and also the Adirondacks. It is only from 2 to 6 in. high, near the base of the stem simple; leaves ovate-oblong, obtuse, on short leaf stalks; flowers few or solitary, drooping in the bud; petals purple; pods long, smooth. E. molle (Torrey), native in bogs from Rhode Island to Pennsylvania and Michigan northward. It grows from one to two foot and a half high; soft-downy all over; erect, branching toward the top; leaves crowded; linear-oblong or lanceolate; petals rose color, small. Genothera, or the evening primrose, is the principal genus. E. biennis, or the common evening primrose, has ovate-lanceolate leaves, acute, obscurely notched; flowers in a terminal spike; calyx much prolonged; petals inversely cordate, light yellow color; pods oblong; several varieties, as muricata, grandiflora, purpurea, crucifera, and oakesiana. The other species of
Onchidera, Oncida.

686

sonothera are rhombipetala (having rhombic petals), sinuata, glance, fruticosa (sundrops), riparia, linearis, chrysantha, serrulata, and pumila. This latter grows southward along the Alleghanies, flowering in June. The Oz. serrulata is found at the falls of St. Anthony, and in Wisconsin and westward. In the genus Ludenia, or false loosestipe, the calyx tube is not at all prolonged beyond the ovary; petals 4, small or wanting; stamens 4; pod short, many seeded; seeds minute and naked. Named in honor of Christian G. Ludwig, professor of botany at Leipsic, contemporary with Linneus. The seed-box and water purslane are species belonging to this genus, the former growing in swamps along the coast, the latter in swamps or ditches, and very common.

ONCIDIADÆ, a family of gasteropod mollusks, belonging to the section pulmonifera, division inoperculata. The animal is slug-like and without a shell. The body resembles that of the garden slug, but has a shield-like leathery covering to the back; head continuous with the body, and the eyes at the end of non-retractile cylindrical pedices which spring from near the antero-lateral margins. There are no tentacles, and the lingual ribbon is broad, with nearly uniform teeth in numerous, straight, transverse rows. There are several genera, the species living in damp places near either fresh or salt water, and they are supposed to live on vegetable food. They are tropical, or inhabit warm climates, with the exception of one species, peroniu celleitus, which is British.

ONKEN, Johann Gerhard, b. at Varel, Oldenburg, Germany, about the year 1800. In early life he was a domestic servant; afterward lived in England, where he married. At Hamburg he joined an English Independent church, opened a book-store, and acted as agent of the Lower Saxony tract society and the Edinburgh Bible society. In 1834 he organized a Baptist church with 6 others, and became its pastor. In 1835 the American Baptist general convention appointed him their missionary. As such he visited nearly all Germany and Denmark. He was imprisoned several times in Hamburg for preaching and baptizing, but the kindness shown by his family and congregations to those who had suffered by them there in 1842 led them to grant a unconditional liberty of worship. Since that time Onken has zealously performed his mission work, preaching, baptizing, distributing the Scriptures, writing, and publishing religious books and tracts, establishing churches in Denmark, Switzerland, Austria, and some of the states of Germany, editing, with the aid of his daughter, a religious periodical in English, and another in German. In 1852 he visited the United States to obtain funds for the erection of chapels. The number of churches which he established in 30 years was 76, with 11,289 church members. Connected with these churches are 95 Sunday-schools, 240 teachers, and 2,662 scholars.

ONOCAROPSIS, a genus of trees of the natural order anacardiaceæ. One of the most remarkable trees of the Fiji Islands is O. utra, or O. rigidus, a tree about 60 ft. high, with large oblong leaves and a corky fruit, somewhat resembling the seed of a walnut; the sap of which, if it comes into contact with the skin, produces a pain like that caused by red-hot iron. The wood is often called itch-wood, because of the effect produced on persons who ignorantly or incautiously bark it whilst the sap is fresh, even the exhalations causing an intolerable itching and innumerable pustules, with excessive irritation for several days, whilst the effects continue to be unpleasantly felt even for months.

ONDORONK, Benjamin Tredwell, D.D., LL.D., 1751-1861; b. New York; graduated at Columbia college 1808; ordained a presbyter in the Protestant Episcopal church 1813; was a professor in the General theological society 1826-35; bishop of the diocese of New York 1830-45; when, having been tried by the house of bishops on charges preferred against him, he was suspended from the exercise of his official functions.

ONDORONK, Henry Ustick, LL.D., 1789-1858; b. New York; graduated at Columbia college 1805; studied medicine in London, and took the degree of M.D. at Edinburgh 1810; studied theology and was ordained deacon in the Protestant Episcopal church 1815; settled at Camandaigua, N. Y., 1816-20; rector of St. Ann’s church, Brooklyn, N. Y., 1820-27; assistant bishop, and, on the death of bishop White, bishop of the diocese of Pennsylvania 1827-47, when, having been tried by the house of bishops, on charges preferred against him, was suspended; was restored 1856, but did not resume the active exercise of his office.

ONEALI, John Belton, LL.D., 1793-1863; b. S. C., a graduate of the university of South Carolina at Columbia, class of 1812, and was a teacher in the Newberry academy. He studied law, but left his reading to carry a musket in the war with England that occurred in that year, returning in due time to the more limited field of litigation, was admitted to the bar in 1814, inaugurating a successful practice. He represented his district in the legislature of his native state in four sessions, 1816, 22, 24, and 29; was elected speaker in ’24 and again in ’26. He rose rapidly to distinction as a jurist. In 1828 he was appointed associate judge; in 1830 judge of the court of appeals; in 1830 presiding judge of the court of errors and the court of law appeals, and filled the office of chief justice of the supreme court of South Carolina. In 1839 he gave up the use of stimulants, and in 1841 was elected president of the state temperance society. He was an active philanthropist, and in 1852 was elected to fill the highest office in the order of sons of temperance of North America. He wrote A Digest of the Negro Law of South Carolina, Annals of Newberry, S. C., and Biographical Sketches of the Bench and Bar of
South Carolina, and contributed reminiscences of the revolution to the Southern Literary Messenger.

**ONEGA,** a small t. and sea-port in the n. of Russia, in the government of Archangel, and 90 m. s.w. of the city of that name. It stands at the mouth of a river, and on the shore of a gulf of the same name; the latter a branch of the White sea. Lat. 63° 54' n., long. 39° 7' east. Pop. '67, 2,200, employed in connection with the saw-mills of the "Onega Trading Wood Company." In these mills, where numerous men are at work, an English steam-engine has been erected. About 50 ships leave the port annually for England, with cargoes of deals and timber to the value of £37,000.

**ONEGA, LAKE,** an extensive lake in the n. of Russia, government of Olonetz, and, after Ladoga, the largest lake in Europe; is 59 m. in greatest breadth, and about 150 m. in length. Area, 3,730 sq. miles. It is fed by numerous rivers, and receives through the river Wodlo the waters of the lake of that name. Its only outlet is the river Swir, which flows s.w. into lake Ladoga. By means of the Marinisky system of communication, lake Onega communicates with the Volga, and thence with the Caspian sea on the s., and with the Dwina, and thence with the White sea on the north. The clear and beautiful waters of this lake are rich in fish, and embrace many islands. The depth ranges from 550 to 700 ft. The navigation of the lake is dangerous, and commerce is chiefly confined to the Onega canal, which extends from the town of Vytxega on the river of that name to the river Swir.

**ONEGLIA,** a t. of n. Italy, in the province of Porto Maurizio, on the gulf of Genoa, 40 m. e.n.e. from Nice, at the mouth of the Impero, a small river which rushes down from the Apennines. The harbor is not good. The principal article of export is oil. Andrea Doria, the great Genoese admiral was born here. Pop. about 8,000.

**ONEIDA,** a c. in s.e. Idaho, having Montana on the n., Wyoming on the e., Utah on the s., and the Snake river and its tributaries on the n. and w.; 17,850 sq. m.; pop. '80, 6,965—5,028 of American birth, 72 colored. It is drained by the Snake river, Port Neuf, Bearfoot, and John Grey's, the Port Neuf irrigating a large section of arable land set off for an Indian reservation. Bear lake valley in the s.e. contains a Mormon settlement, whose inhabitants are engaged principally in farming. Gold is found, and there are salt, medicinal, and hot springs. In the n.e. portion the land rises into three high mountains, one of them, Mount Hayden, 13,858 ft. above the level of the sea. A large proportion of the county is covered with pine forests, the elevated portions affording excellent pasturage. The soil of the river bottoms is very fertile; but for the most part uncultivated. Co. seat, Malad City.

**ONEIDA,** a c. in central New York, having Oneida lake and Oneida creek for a portion of its w. boundary, and West Canada creek on the e.; drained by the Mohawk, Black, Oriskany, and Fish rivers; 1215 sq. m.; pop. '80, 115,475—92,038 of American birth, 622 colored. It contains the head-waters of the Chenango and Unadilla rivers, and Trenton falls of West Canada creek, having 5 cascades and a total descent of 400 ft. in a course of 2 miles. Near the falls are quarries of Trenton limestone; other mineral products are iron ore, gypsum, peat, and marl. Its soil is exceptionally fertile, especially in the Mohawk valley extending across the county from e. to w., and spreading out into broad green fields diversified by lands of superior elevations, celebrated for its wild and rough, but charming scenery. N. and s. of this valley the surface is hilly. It is intersected by the Erie and Chenango canal, the Black River canal, and Oneida Lake canal, also by the New York Central and Hudson River railroad, the Utica and Black River, the Rome, Watertown and Ogdensburg, and the Utica, Chenango and Susquehanna Valley railroads. Its agricultural products are grain, live stock in great numbers, dairy products, maple sugar, hops, and potatoes. The leading industries are the manufacture of furniture, wooden-ware, lime, cement, cotton and wooden goods, metallic wares, boots, and shoes, hosiery, iron castings, etc. It has distilleries, breweries, flour, saw, and lumber mills. Co. seat, Utica.

**ONEIDA,** a village in Lenox township, Madison co., N. Y., at the junction of the New York and Oswego Midland, and the New York Central and Hudson River railroads; pop. '70, 3,302. There are 3 weekly newspapers, 2 banks, and an academy. The village is the center of a flourishing country trade.

**ONEIDA COMMUNITY** (Perfectionists, ante), after continuing 50 years unemasculated in the practice of what they called "complex marriage," every man being considered as married to every woman and every woman to every man, found themselves surrounded with a state of public opinion that led to a resolute effort to break up this offshoot of the PA of their association. In 1879 a conference of clergymen of different denominations and from the principal cities in the state of New York, was held at Syracuse to form a plan for eradicating the evil. A committee then appointed proceeded to collect evidence bearing on the actual practices of the community. Before their report was published the effect of the agitation of the subject was manifested in a proposition made by the leader of the community to its managers to abandon the distinctive feature of their association; not because they were convinced of its immorality, but in deference to the public sentiment that was evidently rising against it. This proposition having been accepted by the managers, an announcement was afterward publicly made
that the Oneida community had abandoned what they had called "complex marriage," and would hereafter be divided into the regularly married and those who prefer to remain single. And this was followed in due course by articles of association being filed, according to law under the name of the Oneida community "limited," which was to be the same as the old association of the same name, except that the marital relations of its members were changed.

ONEIDA LAKE, in central N. Y., 18 m. long by 6 m. wide, and 12 m. n. e. of Syracuse, occupying portions of Oneida, Madison, Oswego, and Onondaga counties. It is 369 ft. above the level of the sea, abounds in fish of excellent quality, and empties into the Oneida river.

ONEIDAS, a tribe of American Indians whose name signifies "tribe of the granite rock." Originally belonging to the Mohawks, they were set off from them and formed part of the Iroquois confederation of Six Nations. Their possessions included the section of country between Deep Spring near Syracuse, Onondaga co., N. Y., and a point directly e. in the vicinity of Utica, Oneida co., and embracing the lake which takes its name from them. Their totem, or symbol, was a stone in a forked stick. The tribe was divided into 3 clans, the wolf, bear, and turtle, and 9 sachemships. In the earliest years of the settlement of Canada they sustained hostile relations with the French, and the Hurons, and Montagnas, who were friendly to the Canadian settlers—only occasionally relaxing their enmity sufficiently to permit the visits of missionaries; and although their fellow members of the confederation, the Onondagas, made peace with the French in 1665, they kept up the war until 1666; the French making two raids into their country. At the time of the treaty they were reduced to 150 warriors, who joined in the general treaty of peace with the French, Sept. 8, 1700, being governed thereafter in their movements by the English, until the revolution, when they with the Tuscaroras were faithful to the colonists. This was owing to the influence of Samuel Kirkland, a Congregational minister, appointed missionary in 1766 by a missionary board in Connecticut who settled in the midst of the tribe and was with them when the war broke out. He left them at that time to fill a chaplaincy in the army, but was engaged in negotiations with them throughout the war, and accompanied some of their warriors in 1791 to the meeting of congress in Philadelphia. By their fidelity to the colonists they incurred the enmity of other tribes, who, led by Joseph Brant or Thayendanega, a famous chief of the Mohawks and Iroquois, drove them from their homes and burned their church and houses; in this aided and abetted by the British and Indians. At the close of the war they with the Tuscaroras were the only members of their confederation who remained in the United States, the remainder settling on Grand river in Canada. By the treaty of fort Stanwix, Oct. 23, 1784, they were confirmed in their title to their lands, and in 1785 and 1788 the state of New York purchased their lands, with the exception of a reservation for each, which was never to be sold, and leased only in part. The Brotherton and Stockbridge Indians retained their lands which they had received from them and now live on the same reservation. In 1840, 430 emigrated to Canada. Those who settled at Green bay, Wisconsin, purchased the lands, and have erected churches, and availed themselves of educational privileges, advancing as fast as possible in agriculture and mechanical arts. There are 65,000 acres of land in this reservation, the inhabitants numbering 1279 in '73. They are mostly Episcopalians, the book of Common Prayer having been translated into their language. There were in 1873, 663 on the Thames, in the province of Ontario, and 266 in New York near Oneida castle, 20 m. s. of Utica, having 2 schools. The number in the year indicated belonging to the tribe is larger than at any time since the advent of white population into their domain, and double their number at the close of the war. Several works have been written on this tribe and the Iroquois confederacy, beginning with Colden's History of the Five Nations, 1727, and leading up to works on the celebrated chieftains which were published as late as 1864 and 1866. In the war of 1812 the English and American parties in the Iroquois confederation were as sharply divided and took the same sides as in the revolution, but the Oneidas stood by the Americans always, and have since been at peace.

ONEROUS CAUSE, in Scotch law, means a pecuniary or valuable consideration.

ONGARO. See DALL' ONGARO, FRANCESCO, ante.

ONION (Fr. oignon, from Lati. unio, a pearl, but found in Columella, signifying a kind of onion), the name given to a few species of the genus Allium (q. v.), and particularly to A. cepa (Lat. cepa), a biennial bulbous-rooted plant, with a swelling stem, leaves, and the base bearing fistular leaves, a reflexed spathe, a large globose umbel, usually not bulbiferous, the lobes of the perianth obtuse and hooded, not half as long as the stamens. The bulb is simple—not composed of cloves like that of garlic; and in the common variety is solitary, showing little tendency to produce lateral bulbs. The native country of the onion is not certainly known, some supposing it to be India and some Egypt, in both of which it has been cultivated from the most remote antiquity. The part chiefly used is the bulb, but the young leaves are also used and young seedlings drawn from onion beds are a very common ingredient in soups and sauces in the beginning of summer. These are known in Scotland as scypers (evidently another form of the word edbol). In warmer climates the onion produces a larger bulb.
and more of delicate flavor than in Britain; and is more extensively used as an article of food, being with us whether fresh or pickled, generally rather a condiment. In Spain and Portugal a raw onion is often eaten like an apple, and often with a piece of bread forms the dinner of a working-man. The onion is, however, very nutritious. It contains a large quantity of nitrogenous matter and of uncrystallizable sugar; with an acrid volatile sulphurous oil, resembling oil of garlic. The oil of the onion is dissipated by boiling so that boiled onions are much milder than raw onions. In Britain onions are sown either in spring or in August. Great fields of them as of other favorite vegetables are cultivated for the London market; and large quantities of onions are also imported from more southern regions. The Bermudas are celebrated for their onions. The onion loves a rich light soil and a dry subsoil. The transplanting of onions is often practiced, especially of onions sown in autumn which are transplanted in spring, and when these are placed so that the small bulbs are on the surface of the ground, and surrounded with decayed manure, very large bulbs are obtained. The frequent stirring of the soil is of great advantage. The bulbs are taken up when the leaves decay, and after being dried in the open air or in a loft, may be kept for a considerable time.—The *Potato Onion*, also called the *Egyptian* or *Ground Onion*, is a perennial variety which produces offset bulbs at the root like the shallot; but the bulbs are much larger than those of the fleshy or bulbous *garlic*, although stronger than those of the common onion. It is sometimes said to have been introduced into Britain from Egypt by the British army in 1805, but erroneously, as it was cultivated in some parts of Britain long before. It is in very general cultivation among the peasantry in some parts of Scotland.—The *Pearl Onion* is a similar variety with much smaller bulbs.—The *Tree Onion* is also generally regarded as a variety of the common onion. It produces bulbs at the top of the stem, the umbels becoming viviparous.—Onions are similar to garlic (q.v.) in medicinal properties, but milder. As a condiment or article of food they agree well with some stomachs and stimulate digestion, but are intolerable to others. Roasted onions with oil make a useful emollient and stimulating poultice for suppurating tumors. The use of onions stimulates the secreting organs.—The *Chiet* or *Welsh Onion* (*A. fistulosum*), a native of Siberia, cultivated in Britain but more generally in Germany, has a perennial fibrous root with no bulb, very fistular leaves and a strong odor. It is used in medicine, supplying tender green leaves for culinary use in the beginning of spring, like the chive, and somewhat earlier in the season. It is much larger than the chive but its use is similar.

**ONISCU**. See *Woodlouse*.

**ON KELOS**, the supposed author of an Aramaic version (Targum) of the Pentateuch. The name seems a corruption from that of Akilas, one of the Greek translators of the Old Testament (see *Aquila*). The translation said to be by Onkelos is, in its present shape, probably a copy of the Babylonic or School of the 3d and 4th centuries a.d. At first orally transmitted, various portions of it began to be collected and written down in the 2d c., and were finally reduced about the time mentioned. The history of the origin and growth of Aramaic versions in general will be treated under *Targum* (Versions). The idioms of Onkelos closely resembles that of Ezra and Daniel. The translation itself is executed in accordance with a sober and clear, though not a slavish exegesis, and keeps closely to its text in most instances. In some cases, however, where the meaning is not clear it expands into a brief explanation or paraphrase, uniting the latter sometimes with Haggadistic by-work, chosen with tact and taste, so as to please the people and not to offend the dignity of the subject. Not unfrequently it differs entirely from the original, as far e.g., as anthropomorphisms and anthropotheologies—anything, in fact, which might seem derogatory to the Deity—are concerned. Further may be noticed a repugnance to bring the Divine Being into too close contact, as it were with man. It is a general rule that the interposition of a kind of spiritual barrier ('Akk. *mishpat*, Heb. *guf*; *mishpat*, *guf*; the English "glory") when a conversation or the like is reported between God and man. Its use lies partly in a linguistic, partly in a theological direction; but little has been done for its study as yet. Notwithstanding the numerous MSS. of it extant in almost all the larger libraries of Europe, and in spite of the grossly incorrect state of our current printed editions, no critical edition has ever been attempted.

**ONOBRY CHIS**. See *Saintfoin*.

**ONOMICRITUS**, a celebrated religious poet of ancient Greece, lived at Athens in the time of the Peisistratids. He collected and expounded—according to Herodotus—the prophecies or oracles of Museus (q.v.), but is said to have been banished from the city by Hipparchus, about 516 B.C., on account of interpolating something of his own in these oracles. He then, we are told, followed the Peisistratids into Persia, and while there was employed by them in a very dishonorable way. They got him to repeat to Xerxes all the ancient sayings that seemed to favor his meditated invasion of Greece. Some critics, among whom is Aristotle, have inferred from a passage in Pausanias that Onomacritus is the author of most of the so-called Orphic hymns. More certain, however, is the view which represents him as the inventor of the great Orphic myth of Dionysus Zagreus, and the founder of Orphic religious societies and theology. Pausanias states that "Onomacritus established orgies in honor of Dionysus, and in his poems represents the Titans as the authors of the sufferings of Dionysus." See Müller's _Geschichte der_
ONOMATOPEIA, the Latin form of the Greek word onomatopoeia, means literally the making or invention of names, and is used in philology to denote the formation of words in imitation of natural sounds, as in eueko, Lat. eueu (ins); pec-cit, Scan. pee-weip, Dutch, kiewel; rock: chuk, rap, tap, quack, rumble, whizz, clang. Such words are sometimes called onomatopoeias; more properly they are onomatopoeic, or composed on the principle of onomatopoeia. In a more extended sense, the term is applied to the rhetorical artifice by which writers (chiefly poets) seek, through the choice and arrangement of words, to make the "sound," throughout whole phrases and sentences, "an echo to the sense," as in Homer's well-known polychilosobo thanasses, expressive of the breaking of the waves upon the sea-shore; or where Tennyson makes the sea

Roar rock-thwarted under bellowing caves.

The occurrence of so many obviously onomatopoeian words in all known languages, suggests the question, whether the same principle may not have been concerned in producing the original germs or roots of the great bulk of words. There is little hope that the question will ever be conclusively settled either way; for the changes of time have made it, in most cases at least, impossible to say what the first form and signification of a root were; but the balance of arguments seems in favor of the affirmative answer." "The action of the mind," as it has been expressed, "produced language by a spontaneous repercussion of the impressions received." Now, the articulate sound first affixed in this way to an object or an action as its sign cannot be conceived as arbitrary; nor is there any mysterious and inherent correspondence between any one conception of the mind, and a particular articulate sound. The sound uttered must have been suggested by something connected with the object or action itself; and by what more naturally than by the inarticulate sound which the object or action itself emits?

The chief objection to this theory is, that if the first words were merely reproductions of natural sounds, the same natural objects would have had the same names all the world over. "To which it is answered, that the mind in its first efforts at naming did not seek an exact reproduction of the sound, but a suggestive imitation; primitive words were not echoes, but "artistic representations." Now, the sounds of nature are not simple, but composite. Like other concrete phenomena, they present a variety of aspects; and according as one or another aspect seemed the most prominent to the observer, a different vocal sound would suggest itself as the appropriate symbol. Thus when professor Max Müller argues (Science of Language, Lond. 1861) that if the "bow-wow" theory, as he nicknames it, was true, men would have everywhere spoken of a moo, as is done in the nursery, and not of a cow; it seems a valid answer to say, that the Indian gu, the Tent. kuh (Eng. cow), and the Greco-Lat. bow, are really as suggestive imitations of the animal's actual voice as moo. To take a more striking instance: few words differ more in sound and aspect than the Eng. thunder (Ger. donner, Lat. tonitura, Fr. tonnerre) does from the Mexican name for the same thing, tlaltlatmitzal, and yet it would be difficult to say which is the more suggestive of the natural sound.

It is no doubt true that the great bulk of names are derived from roots having a general predicable power; but this by no means excludes the principle of onomatopoeia. Thus, to take one of the instances adduced by professor Müller himself, that of raven or corw (Sansk. kārava, Lat. corvus, Gr. καράκoν): this is derived from the root ru or krw, which means to cry or call, and the bird was called a kārava, or crow, not in imitation of his voice, but because he was "a shouter, a caller, a crier. The name might have been applied to many birds, but it became the traditional and recognized name of the crow." But how came the articulation ru or krw to be chosen to convey the general meaning of crying or calling? may we not suppose that it was suggested by the voice of birds of the crow kind, whose notes are most markedly cries or calls to their fellows, as distinguished from singing? Once adopted in this particular case, it would naturally be extended to any kind of cry or call, from the harshest to the softest.

ONONDAGA, a co. in central New York, separated from lake Ontario by Oswego co., and bounded also on the n.e. by Oneida lake and river, and on the s.w. by Skaneateles lake; drained by Seneca river and Chittenango and Onondaga creeks; intersected by the Erie canal, the New York Central railroad, and minor lines centering at Syracuse (q.y.); pop. '80, 117,887—94,509 of American birth. The surface is level in the w. and undulating or hilly in the east. There is excellent farming land, producing all the cereals. The dairy products are large and noted for their excellence. Salt, gypsum, and limestone suitable for building purposes are found. Co. seat, Syracuse; there are about thirty other towns and villages.

ONONDAGA LAKE, in Onondaga co., N. Y., near Syracuse, is 5 m. long, about a mile wide, and its greatest depth is 63 feet. Its waters are saltish and stagnant, and, as there are extensive salt formations in the vicinity, it is supposed that the lake was formed by the gradual dissolving of the salt rock and the consequent falling in of the ceiling of the cave thus formed. Seneca river is the outlet.

ONONDAGA, one of the five tribes of Iroquois Indians which inhabited and gave their name to Onondaga county, N. Y.; these five tribes forming a confederacy, which
was ruled over successively by 14 great sachems, the atotaho, the Onondaga chief, being the first; they had charge of the wampum belts, the treaties, and the council fires, and their dialect was considered the purest and grandest of the confederacy. Their principal village was about 5 m. from Syracuse. It is not known in what year the confederacy was formed, but as early as 1609 they were waging war with their neighbors, the Hurons, against whom they were bitterly hostile; and in 1649 gathered their forces and devastated the settlement of the Hurons, many of whom were killed and some made prisoners, the whole tribe being scattered. Then followed an unsuccessful war with the Eries and Susquehannas. In 1653 a treaty of peace of short duration was effected with the French, who, at the solicitation of the Onondagas, sent missionaries among them, and established a settlement there, which was abandoned a year later on the settlers discovering a plot for their massacre by the Indians. The Onondagas were continually at war with the Algonquins of Canada, and in 1662 they devastated Montreal island and killed the renowned Indian fighter Lambert Cloose. In 1668 the French again settled among them. Onondaga county became alternately the rendezvous for the French and Indians for the latter a few years later building a fort there at the desire of the Indians before their withdrawal from the town during Frontenac's incursion in 1696.

A general treaty of peace was signed in 1700, between the French and the Onondagas at Montreal, which lasted 9 years. They took sides with the English in the French and Indian war, 1756-68, and also during the latter part of the revolutionary war, in which they suffered severely. They ceded the most of their land to New York in 1798, reserving a small portion for themselves, where about 340 of them still remain, some of whom have been converted to Christianity. About 400 of the tribe are found in Ontario, Canada, and a few have joined the Senecas and Tuscaroras. They number about 890 in all.

ONSLOW, a co. in s.e. North Carolina, bounded on the s.e. by the Atlantic ocean, watered by the New river; about 700 sq. m.; pop. '70, 7,369. The surface is even, much of it swamp or sandy barrens. The soil is fertile, and produces good crops of Indian corn, sweet-potatoes, rice, and cotton. Tar and turpentine are manufactured. Co. seat, Jacksonville.

ONSLOW, GEORGE, 1784-1858; b. France; descended from a noble English family, son of hon. Edward Onslow, the youngest son of the earl of Onslow, who married a French lady and settled in France. He married a wealthy lady of Rouen, was rich himself, and passed his life in elegant retirement on his estate near Clermont. Devoting his time to the study of music, in which he had been carefully instructed by Dussek, Cramer, and Hulmandel, on the piano-forte, and in harmony and composition by the celebrated Reicha, a professor of the conservatoire. He cultivated his talent with such success that he early won distinction among the artists of his time. He was the author of a number of concertos for the piano-forte with orchestral accompaniments, quartets, quintets, symphonies, and sonatas, which are still performed. The most esteemed are his quintets for 2 violins, viola, and two violincellos. He wrote in 1824 L'Alcobe de la Vega, and in 1827 Le Chapeleur, both operas of which he received, and in 1857 Le Due de Guise. He was a member of the academy of fine arts, being the successor of Cherbino, and when he died, Halley pronounced his eulogy.

ONTARIO, the easternmost and smallest of the five great lakes of North America, lies in 42° 10' to 44° 8' n. lat., and 76° 30' to 80° w. long. At its s.w. corner it receives the waters of the upper lakes by the Niagara, and at its n.e. corner it issues into the St. Lawrence; which for some distance below is called the lake of the Thousand Isles. Its surface, which varies a few feet with the seasons, is about 390 ft. below that of lake Erie and 234 ft. above tide-water. Its bottom, therefore, must be considerably lower than the level of the Atlantic, as it is in some places 600 ft. deep. It is 190 m. long, 55 in its widest part, and about 480 in circumference. Sufficiently deep throughout for vessels of the largest tonnage, it has many convenient and thriving ports, of which the chief are Kingston, Port Hope, Cobourg, Toronto, Hamilton, on the Canadian shore, and Oswego, Sackett's Harbor, Port Genesee in the United States. Its navigation has been facilitated by the erection of 15 light-houses on the American side, and 13 on the Canadian; while it is connected with lake Erie by the Welland canal, with the Erie canal and New York by the Oswego canal, and by the Rideau canal with the Ottawa. Lake Ontario is subject to violent storms, and it is probably owing chiefly to the constant agitation of its waters that it freezes only for a few miles from the shore. The shores of lake Ontario are generally very flat, but the bay of Quinte, a long, crooked arm of the lake, which stretches from 30 m. possesses a well known scenery. Burlington bay, on which Hamilton lies, is a large basin, almost inclosed by a natural, but strangely accumulated bank of sand, which forms a beautiful drive.

ONTARIO, the province. See Canada.

ONTARIO, Province of, formerly Upper Canada or Canada West, the most populous of the three in the Dominion of Canada. On the n.e. and e. it is bounded by the province of Quebec; on the s.e. by the s.e. of the St. Lawrence river, the great lakes, and the district of Keewatin; and on the n.w. and n. by Hudson's bay and the North-West territories. Its length from s.e. to n.w. is about 750 m.; from n.e. to s.w. about 500 m.;
Ontario.

The area 107,780 sq. miles. The face of the region is diversified by rivers and lakes. A ridge of high land extends in the s.e. portion from Niagara falls n.w. to lake Huron and along the peninsula between that lake and Georgian bay. Other ranges of hills are the Laurentian, crossing the Ottawa river at Quebec, and extending s. and thence w. to Georgian bay and the Blue mountains, s. of Georgian bay, which attain a height above lake Huron of 1900 feet. The topography is generally gradual and the valleys wide. In the s.w. lies a great plain, extremely fertile and valuable, underlaid by the Devonian limestones, sandstones, and shales, on which are found beds of clay and gravel.

Many of this region abounds in hard-wood forests, and is fertile in wheat, corn, and all kinds of farm products. The principal rivers of the province are the tributaries of the Ottawa river, which forms the boundary between Ontario and the province of Quebec; the French, the Magnetawan, the Severn, and the Nottawasaga, falling into Georgian bay; the Saugene, the Maitland, and Aux Sables, falling into lake Huron; the Thames, running s. into lake St. Clair; the Grand, flowing s.e. into lake Erie; the Trent, in part of its course called the Otonabee, and the Moira, flowing s.e. into the bay of Quinte; and the Niagara, falling into lake Ontario. The great lakes Superior, Huron, Erie, and Ontario, with their connecting waters, afford a water front to the province of about 4,000 m., with many good harbors. The principal minor lakes are Nipigon, Simeoe, and Nipissing; and the chief bays are the Georgian, Nottawasaga, Owen sound, Long Point, Burlington, and Quinte. The winters throughout the country are very cold and the heat during summer is occasionally extreme; but the climate is considered healthy.

Ontario, like the rest of Canada, was first settled by the French, and together with the province of Quebec passed into the control of the English in 1760. It became a separate province in 1867. It is divided into 49 counties, subdivided into 88 electoral districts. The principal cities are Toronto, the capital, pop. 56,092; Ottawa, the capital of the dominion, pop. 21,545; Kingston, pop. 12,407; Hamilton, pop. 26,716; and London, pop. 15,816. The largest towns are Brantford, 8,107; St. Catharines, 7,864; Belleville, 7,305; Guelph, 6,878; Chatham, 5,873; Port Hope, 5,114, and Brockville, 5,102. In 1871 the total population of the whole province was 1,620,851, of which 530,442 were Irish; 489,429 English; 328,889 Scotch; 158,608 German; 75,585 French; 19,992 Dutch; 5,282 Welsh; and 12,978 Indians. At that period 228,708 persons were engaged in agricultural pursuits; 29,082 in commercial occupations; 26,085 in domestic; 38,871 in industrial, 16,750 in professional; and 68,199 were unclassified. The greatest number of the inhabitants are in the s. and w. parts of the province. According to the foregoing statistics indicate, agriculture is the chief occupation. A large proportion of the soil is of excellent quality, and in the s.w. the influence of the surrounding bodies of water aids the natural richness of the soil. Large crops of wheat are raised, also oats, barley, Indian corn, rye, potatoes, turnips, etc.; and in the s.w. the apple orchards are very productive; and pears, plums, grapes, cherries, and various kinds of berries thrive. The regions lying between the Ottawa river and the Georgian bay contain large tracts of fertile ground, and produce a variety of husbandry consisting chiefly of white and red pine. In this district lumbering is extensively carried on, and the sawing of timber is among the principal industries of the province. Chief among the other manufactures are cotton and woollen goods, linen, furniture, iron and hardware, paper, soap, starch, hats, boots, and shoes, steam-engines and locomotives, sewing machines, wooden-ware, and agricultural implements. The foreign trade in 1874 in exports amounted to $29,157,— 687; and in imports to $49,443,977. The principal merchandise imported was sugar, tea, coal, Indian corn, wheat, iron, hardware, and tobacco in goods.

In railroads the province has made great progress during the past 15 years. In 1878 there were 3,528 m. of road in operation, with about 1000 additional m. either under charter or in process of construction. Chief among these were the Canada Southern; the western division of the Grand Trunk; and the Great Western. There are also a number of canals, the principal of which are the Welland, 28 m. long, from Port Dalhousie to Port Colborne; and the Rideau, from Kingston to Ottawa, 126 miles.

The school system affords all children free education, and is under the general management of a chief superintendent. Besides the common schools, the law provides for the establishment and maintenance of classical and English high schools for both sexes; and collegiate institutes. In 1873 there were 4,562 common schools; 108 high schools; 265 academies and private schools; 170 Roman Catholic separate schools; 3 normal schools, and 16 colleges and universities. The total amount expended for educational purposes during the same year was $3,258,125. The public and private libraries in 1873 numbered 4,152, with about 75,393 volumes. The number of newspapers and periodicals published in the province is about 250, among which are 23 daily newspapers, 212 weeklies, and 16 monthlies. The prevailing religious denomination is the Methodist, which in 1871 had 1924 edifices, and 462,264 adherents. Among the other denominations were: Baptist, 279 churches; Episcopal, 511; Presbyterian, 697; and Roman Catholic, 298. The M. E. church in Canada and the British M. E. church each have a bishop. The Anglicans have three dioceses—Toronto, Ontario, and Huron. The Roman Catholics have an archbishop at Toronto, and bishops at London, Hamilton, Kingston, and Ottawa.

The provincial government is administered by a lieutenant-governor, appointed by the governor-general of the Dominon for five years, assisted by an executive council of
five members, which includes an attorney-general, commissioner of agriculture, secretary, registrar, treasurer, commissioner of crown lands, and commissioner of public works. The legislative assembly has only one house of 82 elective members. Voting is by ballot, and the right of suffrage is conferred on all male British subjects 21 years of age, possessed of some property qualification. The judicial power is vested in a court of error and appeal, a court of queen's bench, a court of common pleas, a court of chancery, and minor courts. In the dominion parliament the province of Ontario is represented by 24 senators and 88 members of the house of commons. See Canada, ante.

ONTARIO, a co. in W. New York, having Seneca lake for its s.e. boundary, Canandaigua lake, 16 m. long, on the s., drained by Flint, Honeoye, and Mud creeks, and Canandaigua outlet; 640 sq. m.; pop. '80, 49,377—41,739 of American birth, 589 colored. The surface is composed of hills and valleys, and crossed by high ridges furnishing excellent pasturage, and in some portions covered with groves of ash, beech, elm, sugar-maple, and forests of hardwood timber. It is intersected by the New York Central and Hudson River and the Northern Central railroads; and the s. terminus of the Sodus Point and Southern railroad is at Canandaigua. The shores of its picturesque lakes, Canandaigua and Seneca, are attractive for summer resort; and the smaller bodies of water, lakes Honeoye, Canadice, and Hemlock, are noted for their beauty. Its soil is a fertile sandy loam with a mixture of clay in some places; having a foundation of limestone and sandstone, and deposits of gypsum and water-limestone. The country is suited to stock-raising, and every variety of grain is produced; also fruit, wool, dairy products, potatoes, and hops. The leading industries are the manufacture of cooperage, saddlery, agricultural implements, tin, copper, and sheet iron ware, bricks, carriages, and wagons, iron castings, leather, malt, woolen goods, lumber, and flour. Co. seat, Canandaigua.

ONTARIO, a township of Wayne co., N. Y.; consisting of the villages of Ontario and Ontario Center, situated on the Ontario Shore branch of the Rome, Watertown, and Ogdensburg railroad; 50 m. from Oswego; pop. '70, 2,263. There are foundries, and railroad machine and repair shops. It is the center of a large fruit-growing region.

ONTENIENTÉ, a t. of Spain, in the province of Valencia, 45 m. s. by w. from Valencia, on the right bank of the Clariano, and near the railway which connects Valencia with Madrid. Linen and woolen fabrics are manufactured here; there are also numerous oil-mills. Pop. 3,508.

ONTOLGY. See Metaphysics.

ONTONAG'ON, a co. in extreme n.w. Michigan, bounded n.w. by lake Superior, s.w. by Wisconsin; drained by the Montreal, Ontonagon, Fire Steel, Iron, Presque isle and Black rivers; 2,300 sq. m.; pop. '70, 2,845. The surface is rugged and covered with forests. The mining of copper and iron is the chief employment. Co. seat, Ontonagon.

ONUS PROBANDI, i.e., the burden of proof, is often a difficult question in litigation; but, as a general rule, the plaintiff who institutes the suit is bound to give proof of the allegations on which he relies. There are many nice and technical rules on the subject, both in suits and actions, which are too minute to be here stated.

ONYX, an agate formed of alternating white and black, or white and dark-brown stripes of chalcedony. More rarely, a third color of stripes occurs. The finest specimens are brought from India. Onyx is in much esteem for ornamental purposes. The ancients valued it very highly, and used it much for cameos. Many of the finest cameos in existence are of onyx. The name onyx, however, appears to have been applied by the ancients more extensively than it now is, and even to striped calcareous alabaster, such as is now called onyx marble. The sardonyx of the ancients is a variety of onyx, in which white stripes alternate with stripes of a dark-red variety of carnelian, called sard or sarda. It is one of the rarest and most beautiful kinds of onyx, and is more valued than carnelian.

ONYX MARBLE, a very beautiful material, which first came into general notice in this country in 1862, when the French made a large display of it in the international exhibition. It is a stalagmitic formation, which was discovered by the French in making roads in the province of Oran in Algiers. It is a translucent limestone, containing traces of magnesia and carbonate of iron; its specific gravity is 2.730. The quarries are worked by a company, and the artistic workmen of France are turning it to good account, in the manufacture of very beautiful ornamental works.

OIJIEIN. See UJIEIN.

OOLITE (Gr. egg-stone), a variety of limestone, often very pure calcareous spar, distinguished by its peculiar structure, being composed of grains connected together by a calcareous cement; the whole much resembling the roe of a fish. The grains are not unfrequently hollow. Many oolites, as in the south of England, are excellent building-stones. There is no important mineralogical differences between oolite and pisolite, or pebble stone. Oolite, as a geological term, is extended far beyond its mineralogical and original signification.

OOLITE or JURASSIC GROUP (in Geology), an extensive and important series of strata of secondary age, underlying the chalk formation, and resting on the trias. In Britain
they received the name Oolite because in the district where they were first examined and described by Dr. W. Smith, the limestones contained in them had an oolitic structure (see foregoing article). The name Jurassic has been given to them on the continent because the range of the Jura mountains in the n.w. of Switzerland is almost entirely composed of them. The strata of the group have been arranged in the following order. The maximum thickness of each division is given in feet:

**Upper Oolite.**

It is apparent from this table that the oolitic rocks consist of three extensive clay deposits, each of which forms the basis of a smaller and variable set of sands and limestones; the upper oolites resting on the Kimmeridge clay, the coral rag on the oxford clay, and the lower oolite on the lias.

1. The Purbeck beds, unlike the other oolitic rocks, are chiefly freshwater deposits. Though lithologically they are very similar throughout, the peculiarities of the contained fossils have caused them to be grouped into three series—upper, middle, and lower. The upper Purbecks are purely fresh-water, containing beds of limestone and shale, which abound in shells of lake and river mollusca and cyprides. The stone called Purbeck marble, formerly so extensively used in the ornamental architecture of English churches and other buildings, belongs to this division; it consists of the shells of Paludina, held together by a somewhat argillaceous paste. The middle Purbecks are partly fresh-water, and partly brackish or marine. The “cinder-bed,” composed of a vast accumulation of shells of Ostrea distorta, occurs in this section, and near it is the narrow layer from which Mr. Beckles recently obtained the remains of several mammals. The lower Purbecks are chiefly fresh-water, with some intercalated brackish or marine beds, and one or two old vegetable soils called by the quarrymen “dirt-beds,” which contain the stems of cycadaceous and coniferous plants. 2. The Portland beds consist of oolitic and other limestones interstratified with clays, and passing below into sands and sandstones, from which the well-known building-stone is obtained, of which St. Paul’s and many of the principal buildings in London are built. 3. The Kimmeridge clay is generally a dark-gray bituminous shale, with intercalated beds of sand, calcareous grit, and layers of septaria. The dark shale in some places passes into an impure brown shaly coal. 4. The coral rag contains, as its name implies, an abundance of corals, in bluish limestone beds mixed with layers of calcareous grit. The Solenhofen lithographic stone, with its beautifully preserved and varied fossil remains, belongs to this division. 5. The Oxford clay is a dark-blue or blackish clay without corals, but having a large number of beautifully preserved Ammonites and Belénmites. Beds of calcareous sandstone, called Kelloway rock, occur in its lower portion. 6. The cornbrash consists of thin beds of cream-colored limestone, with sandstones and clays, and the forest marble (so named from Wychwood forest) is composed of an argillaceous limestone, with numerous marine fossils, blue marls and shales, and yellow silicious sand. At Bradford, Wiltshire, the forest marble is replaced by a considerable thickness of blue unctuous clay. 7. The great oolite is composed of shelly limestones, sandstones, and shelly calcareous sandstones, and the Stonesfield slate is a slightly oolitic shelly limestone, which splits into very thin slabs, erroneously called “slates;” it is
remarkable for the remains of terrestrial reptiles and mammals found in it. The Bath oolite, a celebrated building-stone, belongs to this division. 8. The fuller's-earth group is a local deposit found near Bath; it consists of a series of blue and yellow shales and marls, some of which have properties fitting them for the use of the fuller. 9. The inferior oolite is composed of a series of beds of pisolithic and shelly limestones, brown marl, and brown sandy limestone, all abounding in fossils. 10. The lias (q.v.) is a great-clay deposit. It is divided into the upper and lower lias, which consist of thin beds of limestone scattered through a great thickness of blue clay, and, separating these two groups, the marlstone, or calcareous or ferruginous sandstone. The lias abounds in beautifully preserved fossils.

The oolite occupies, in England, a zone nearly thirty miles in breadth, extending across the country from Yorkshire to Dorsetshire. In Scotland, patches of lias and Oxford clay occur in the islands of Mull and Skye, and on the western shores of the mainland, and beds belonging to the lower oolite are found at Brora, on the east coast of Sutherland, which contain an impure coal. The only oolite rocks in Ireland are a few isolated patches in Antrim, which abound with the fossils of the lower lias. On the continent, rocks of this age occur in Germany and France, but they have been most extensively studied in the Jura mountains, which, though having a height of 6,000 ft, are entirely composed of oolite and cretaceous rocks. The strata are greatly bent and contorted, and as they approach the Swiss Alps, the great mass of which is also formed of oolite, they become completely metamorphosed into clay slates, mica schists, gneisses, and crystalline limestones. Beds of oolite have been noticed in Cutch, in India. In Australia similar beds occur on the western coast, and probably some of the coal-beds of New South Wales, Victoria, and Tasmania belong to the oolite. In both North and South America, fossils, apparently of oolitic age, have been found; but these deposits require to be more exactly examined.

The oolite is remarkable for the abundance of its fossils, and is in this respect in striking contrast to the immediately preceding Trassic and Permian periods. The several fresh-water deposits, and the ancient vegetable surfaces, contain the remains of a considerable number of plants. Ferns still abound, and with them are associated species that are evidently related to the living genera *cupressus*, *aureovaria*, and *semum*.

Corals abound in several of the beds. The brachiopods are the only division of the molluscs that is not largely represented. The conchoferns and gastropods show a great number and variety of new genera, which are nearer the forms of the present day than those that preceded them. But the remarkable feature of molluscan life is the enormous development of the ecephalopods. Whole beds are almost entirely made up of their shells. No less than 600 species of ammonites have been described, chiefly from the rocks of this period, and the belemnites were also very numerous. The crinoids have become scarce, but are replaced by star-fishes and sea-urchins. The fresh-water beds contain the remains of many insect forms. The heteroecral-tailed fish give way to the more modern homocercals, and the true sharks and rays make their appearance, though the old cestracionts are still represented by some survivors. The characteristic feature of the oolitic period was its reptiles. The land, the sea, and the air had each their fitting inhabitants of this class. The various species of pterodactyles, some not larger than the bat, others surpassing, in the stretch of their membraneous "wing," the size of the largest living bird, were the terrors of the air; while their allies, the monster ichthyosaurus and pliosaurus, ruled the mysteries of the waters; and the huge megalosaurus, some not less than 30 ft, in length, trod the earth. The few mammalian remains hitherto found have a special interest from their antiquity, being the first evidence of this high order of animals on the globe. They belong, apparently, to marsupial animals; one species is, however, supposed by Owen to have been a hoofed and herbivorous placental mammal.

**OORGA.** See Ural'sk.

**ORFA.** See Urfa.

**ORI.** or LIMPopo RIVER, an important river system of south-eastern Africa, rising in lat. 26° s. in the high plateau called the Magaliesberg, which forms the northern limit of the basin of the Orange river. Throughout a great part of its course, the Limpopo bounds on the n. the Transvaal territory which its southern affluents drain. It flows in a north-easterly direction through the plateau in which it rises, then turns sharply to the s.e. and s., when it enters the lowlands. It reaches the Indian ocean about 100 m. n. of Delagoa—considerably further s. than was till recently believed. Its course cannot be
less than 800 or 900 m. long, and it has numerous large tributaries, the Mariqua, Lipalula, etc. Yet, like most South African rivers, it is navigable only 60 m. from its mouth, which is blocked by a double bar.

OOROOMEYAH, town and lake. See Urumeyah.

OSTERHOUT, a flourishing town in the Netherlands, province of North Brabant, 6 m. n.w. from Breda, is situated in a well-wooded, fertile district of country. Pop. 71, 8,753, of whom 8,435 belonged to the Roman Catholic church. Much business is done in the grain and cattle markets. There are 14 tanyards, several flourishing beer-brewing establishments, 5 potteries, and 4 brick-works. Oosterhout has a grammar-school, and a nunnery, the inmates of which employ themselves in teaching the children of the poor. The handsome town-house and great Roman Catholic church stand on the market-place, which is shaded with linden trees.

Near Oosterhout is an extensive wood, where are the ruins of the house of Streyen or Oosterhout, formerly the residence of the counts of Streyen, under whose jurisdiction were not only the town and barony of Breda, but also the marquisate of Bergen-op-Zoom.

OOTACAMUND', the chief town in the Neiggherry hills, and the great sanitarium of southern India. These hills are situated between 11°—12° n. lat., and 78°—79° e. long. The elevation of Ootacamund is 7,400 feet above the sea; the mean temperature being about 49°, the maximum 77°, and the minimum 38°. The average rainfall is 46 inches. It is 345 miles from Madras, and it is easy of access, as the railway now conveys the traveler to the foot of the hills. The other stations on the Neiggherry lines are Coonoor, Kottaggherry, and Jackatala, or Wellington. In the last place there is a fine range of barracks for European troops. The number of European settlers on these hills is increasing. There are thriving plantations of tea and coffee, and the cinchona or quinine plant. Pop. '72, 9,982.

OOTRUM, an Indian fiber, derived from the stem of dinia extensa, a plant of the natural order asclepiadaceae, abundant in many parts of Hindustan. The fiber is soft, white, silky, and strong, and is regarded as a promising substitute for flax.

O PAH, or King-Fish, Lumpris glutatus or L. luna, a fish of the dory (q.v.) family (zeide), occasionally found in the British seas, but more common in the northern regions, and found not only in the Atlantic and Arctic oceans, but also in the Pacific, as on the coasts of China and Japan. It is of an oval form, greatly compressed, with small thick scales, the mouth small and destitute of teeth, a single dorsal fin much elevated in front and extending almost to the tail. This fish attains a large size, being sometimes 5 ft. long and 150 lbs. in weight. It is brilliantly colored; the upper part of the back and sides rich green, reflecting purple and gold in different lights, the lower parts yellowish-green; round yellowish-white spots above and below the lateral line; all the fins bright vermilion. The flesh is much esteemed; it is red like salmon, and is said to resemble it in flavor.

O PAL, a mineral which differs from quartz in containing from 5 to 18 per cent of water, its only other essential constituent being silica, although a little alumina, oxide of iron, etc., is often present. It is never found crystallized, and does not exhibit a crystal-line structure like quartz. It has a conchoidal fracture, and is very easily broken. There are many varieties, which pass into one another, so that their precise limits cannot be defined, from which has arisen no little confusion of names. The finest kind is called precious opal or noble opal, and sometimes oriental opal. It is semi-transparent or translucent, usually of a brilliant white color, yellow, by, transmitted light, and exhibits a beautiful play of brilliant colors, owing to minute fissures which refract the light. It is much valued for setting in rings, brooches, etc., and is polished with a convex surface, never cut into facets, both because of its brittleness, and because its play of colors is thus best exhibited. The ancient opals very highly. The Roman senator Nonius preferred an opal to the most celebrated opal now known to exist. It is 5 in. by 24 inches. The finest opals are almost all brought from Kaschian in Hungary, where they are found disseminated in a trachytic conglomerate. They are mostly very small, but even a very small opal, if really beautiful, is worth four or five pounds; and the price increases very rapidly with increase of size.

Precious opal is found also in Saxony, in South America, etc. When the colors are not equally diffused, but in detached spots, jewelers call it harlequin opal. There is a dark or blackish variety, apparently tinged by oxide of iron, which occasionally exhibits very beautiful reflections, and is then much prized. Girodoit (q.v.) and cachalot (q.v.) are varieties of opal. What lapidaries call prime d'opal is clay-porphry, or other stone containing many small grains of opal. It is cut into slabs, and made into boxes and other ornamental articles; the stone which contains the opals being often artificially blackened by boiling in oil, and afterwards exposing to a moderate heat. Common opal is semi-transparent, white, yellow, green, red, or brown, and does not exhibit any play of colors. It is not a rare mineral, and is chiefly found in clay-porphry. Semi-opal is more opaque. Wood
opal is a petrifaction, and exhibits the form and structure of wood, the place of which has been taken by the siliceous mineral. Hyalite and menilite are varieties of opal.

O'PATAS, an Indian tribe about the Mayo and Yaqui rivers in s. Sonora, Mexico. They number about 30,000, are semi-civilized, and govern themselves. They are often employed by the state authorities to fight the Apaches.

OPELika, a t., the co. seat of Lee county, Ala.; 66 m. n.e. of Montgomery, 30 m. n.w. of Columbus; on the Alabama and Cincinnati, the Savannah and Memphis, and the Western Alabama railroads; pop. 70, 585. There are factories of chairs, blinds, and carriages; a bukk, 2 weekly papers, and 7 churches. The town is the center of a large country trade.

OPELOUSAS, chief t. of St. Landry's parish, Louisiana, situated on Vermilion river, 50 m. w. of Baton Rouge, 217 m. n.w. of New Orleans; pop. 70, 1546. There are a court-house, 2 banks, 3 weekly papers; and it is the seat of 2 convents. Large quantities of cotton are shipped up the river from this point.

OPEN-BILL, Anastomus, a genus of birds of the heron family (ardeidae), natives of the East Indies and of Africa, remarkable for the structure of the bill, the mandibles being in contact only at the base and tip, with a wide interval between their edges in the middle. They frequent the sea-coast and rivers, and prey on fish and reptiles. One species is well known in India as the Coromandel heron.

OPEN DOORS, Letters of, in Scotch law mean a writ authorizing a messenger to point or seize goods deposited in lockfast-places, and to break open the locked doors in order to effect the seizure. See House.

OPERA, a musical drama, in which music forms an essential part, and not a mere accessory accompaniment. As in the higher drama, poetry supersedes the prose of ordinary life, so in the opera, with perhaps as great artistic right, the language of music is introduced at a considerable sacrifice of probability. The libretto or words are, in the modern opera, a peg on which to hang the music, rather than the music an accessory to the written drama. The component parts of an opera are recitatives, duets, trios, quartets, chorus, and finales, accompanied throughout by an orchestra, and the whole is preceded by an instrumental overture (q.v.). Recitative is declamation, which, in its succession of musical sounds and rhythm, strives to assimilate itself as much as possible to the accents of speech, and therefore does not entirely conform to musical rhythm. The accessories of scenic representation are also present, and a ballet (q.v.) is also frequently introduced.

In some of the German operas, and in the French opera comique, spoken dialogue without music takes the place of recitative. Among the different varieties of the opera enumerated are the great opera or opera seria, of a dignified character; the romantic opera, embracing an admixture of the grave and lively; the comic opera, or opera buffa; as well as many intermediate varieties.

The idea of the opera may in part have arisen from the Greek drama, which possessed, to a considerable extent, the operatic character; the choral parts were sung, and the dialogue was delivered in a sustained key, probably resembling operatic recitative more than ordinary speech. The earliest extant example of any composition resembling the lyric drama of the moderns is Adan de la Hale's comic opera of L'igeus (le jou de Robin et de Marian), composed in the 15th c., the music of which is wonderful for its date. The next appearance of anything like opera is in the 16th c., when various musical dramas were produced in Italy. An opera composed by Zarlino is said to have been performed at Venice when Henry III passed through that city on his way from Poland to France. About the same time a pastoral called Dafne, written by the poet Rinucci, was set to music by Peri; and the same poet and musician conjointly produced the lyric tragedy of La Morte di Euridice, which was represented at the theatre of Florence in 1600. Claudio Monteverde, one of a society of amateurs known as the "Florentine academy," who devoted themselves avowedly to the study and revival of Greek music, soon afterwards produced his Orfeo, a "favola di musica," in whose performance an orchestra of no fewer than 36 performers was called into requisition, most of the instruments being, however, only used in twos or threes, and never more than ten at a time. From these beginnings, the opera advanced into one of the permanent institutions of Italy—a development of music at first strongly opposed in character and style to the music of the church. With the progress of music, and the perfecting of the musical instruments which went to form the orchestra, the lyric drama began, towards the middle of last century, to approach its present character. Of the innumerable Italian operas of last century, only Cimarosa's Matrimonio Segreto retains its place on the stage.

Cherubini, the first of the more modern school, after producing his Quinto Falso at Milan, became naturalized in France: Rossini, who succeeded him in Italy, is the greatest name in the Italian opera. Nothing can exceed the deliciously fresh character of the best-known operas of this truly great musician, Il Barbile di Siviglia; Otello; La Gazza Ladra; Semiramide; and Guillaume Tell. Next to them rank the equally well-known works of Bellini, Norma; La Sonnambula; and Pari Bianchi; Lucia di Lammermoor; Lucrezia Borgia; and L'Elisir d'Amore, the three chefs-d'oeuvre of Donizetti, alone rivalling them in public estimation. A newer school of opera has recently sprung up in Italy, more ingenious, if less fresh, of which the chief master is Verdi, whose Ernani; Nabuccodonosor; I Lomb.
The works onwards, which now exclusively Handel's Handel of importation airs of cell, elements.

rise opera Aulide in Paris, during which Handel, a_"music of the future," has produced the operas of Tanhauser, Lohengrin, etc., which, enjoy at present a large share of public favor in Germany, and have also become known in England.

In France, the earliest operatic representation of which we have any record was in 1582. About 1669 the abbot Perrin obtained from Louis XIV, the privilege of establishing an opera in the French language at Paris, and in 1672 the privilege was transferred to Lulli, who may be considered the founder of the French lyrical drama. Lulli's popularity continued during a long period, and was only put an end to by the rise of the German Gluck, who, naturalized in Paris, produced there his Iphigénie en Aulide and Alceste. It is greatly through Gluck's influence that the modern French opera has become what it is, a composite work combining French, German, and Italian elements. Its best-known productions include Mélisande, Joseph, Halévy's Juive, Anber's Mazarin, Fria Diarolo, and Damnans de la Couronne, and Gounod's recent opera of Faust. The Italian opera, introduced in Paris in 1646 by cardinal Mazarin, and superseded in 1670, was revived in the beginning of the present century, and has since flourished side by side with the national opera of France.

The possibility of a national English opera seems first to have been shown by Purcell, who through Humphreys, had learned much from Lulli. His music to Dryden's King Arthur is very beautiful, though kept throughout subordinate to the business of the drama. The Beggar's Opera, as set to music by Dr. Pepusch, was a selection of the airs most popular at the time. It has retained its place on the stage, as also has Dr. Arne's Artaxerxes, a translation from Metastasio adapted to music rich in melody. The importation of the Italian opera put a stop, for a time at least, to the further development of an opera in England. In 1766 Armindo, with English words adapted to Italians airs, was performed at Drury Lane. In 1710 Almahade, wholly in Italian, was performed exclusively by Italian singers at the Haymarket theater; and a succession of attempts of the kind ended in the permanent establishment of the Italian opera. The arrival of Handel in England decided the future progress of the opera. That great master was during the greater part of his life an opera composer and opera manager. He composed for the London stage no fewer than 44 operas, German, Italian, and English. These now forgotten operas were of course not the complex compositions of a later period, which could not have been performed in the then imperfect state of orchestral instruments. A recitative was set to music nearly as fast as the composer could put notes on paper, and the songs were accompanied in general by only one violin and bass, the composer sitting at the harpsichord, and supplying what was wanting. From Handel's time onwards, the opera flourished as an exotic in Britain the singers being foreign, and the works performed being either Italian or occasionally German or French. Attempts crowned with some measure of success have latterly been made to establish an opera of a national character in England. Balfe's Bohemian Girl and Rose of Castile are the best works which this school has produced, and have attained, with other operas by Balfe, Wallace, and Macfarren, a considerable measure of popularity. See Hogarth's Memoirs of the Opera (London, 1851).
